

# Engineering Economy

[1-2]

Introduction

Examples and Additional Concepts

# Example [1]

## Time Value of Money

- You have \$1,000 and you want to buy a \$1,000 machine
- Suppose that you can invest money at 6% interest, but the price of the machine increases only at an annual rate of 4% due to inflation. After a year, you can still buy the machine and you will have \$20 left over (earning power exceeds inflation)
- If the price of the machine increases at an annual rate of 8% instead, you will not have enough money to buy the machine a year from today. In this case, it is better to buy it today (inflation exceeds earning power)

# Example [2]

## The Concept of Equivalence

- Demonstrate the concept of equivalence using the different loan repayment plans described below. Each plan repays a \$5,000 loan in 5 years at 8% interest per year
- Plan 1: *Simple interest, pay all at end*. No interest or principal is paid until the end of year 5. Interest accumulates each year on the principal only
- Plan 2: *Compound interest, pay all at end*. No interest or principal is paid until the end of year 5. Interest accumulates each year on the total of principle and all accrued interest
- Plan 3: *Simple interest paid annually, principal repaid at end*. The accrued interest is paid each year, and the entire principal is repaid at the end of year 5
- Plan 4: *Compound interest and portion of principal repaid annually*. The accrued interest and one-fifth of the principal is repaid each year

## The Concept of Equivalence – Plan 2

The screenshot shows a Microsoft Excel spreadsheet titled "Engineering Economy". The spreadsheet contains a table with the following data:

|    | A  | B                      | C                         | D                   | E |
|----|--|------------------------|---------------------------|---------------------|---|
| 13 | End of year                                      | Interest owed for year | Total owed at end of year | End-of-year payment |   |
| 14 | <i>Plan 2: Compound interest, pay all at end</i> |                        |                           |                     |   |
| 15 | 0  |                        |                           |                     |   |
| 16 | 1  | \$400.00               | \$5,400.00                | -                   |   |
| 17 | 2  | \$432.00               | \$5,832.00                | -                   |   |
| 18 | 3  | \$466.56               | \$6,298.56                | -                   |   |
| 19 | 4  | \$503.88               | \$6,802.44                | -                   |   |
| 20 | 5  | \$544.20               | \$7,346.64                | \$7,346.64          |   |
| 21 | Total  |                        |                           | \$7,346.64          |   |
| 22 |  |                        |                           |                     |   |
| 23 |  |                        |                           |                     |   |

The spreadsheet interface includes a menu bar (File, Edit, View, Insert, Format, Tools, Data, Window, Help), a toolbar with various icons, and a status bar at the bottom showing "Ready" and the page number "5".

# Example [2]

## The Concept of Equivalence – Plan 3

The screenshot shows a Microsoft Excel window titled "Engineering Economy". The active sheet is "Sheet1". The table below is displayed in the spreadsheet, with columns A through E and rows 23 through 32. The table details the financial structure of Plan 3, showing annual interest payments of \$400.00 and a final payment of \$5,400.00 at the end of year 5, totaling \$7,000.00.

|    | A   | B                             | C                                | D                          | E |
|----|---|-------------------------------|----------------------------------|----------------------------|---|
| 23 |   |                               |                                  |                            |   |
| 24 | <b>End of year</b>  | <b>Interest owed for year</b> | <b>Total owed at end of year</b> | <b>End-of-year payment</b> |   |
| 25 | <i>Plan 3: Simple interest paid annually, principal repaid at end</i> |                               |                                  |                            |   |
| 26 | 0   |                               |                                  |                            |   |
| 27 | 1   | \$400.00                      | \$5,400.00                       | \$400.00                   |   |
| 28 | 2   | \$400.00                      | \$5,400.00                       | \$400.00                   |   |
| 29 | 3   | \$400.00                      | \$5,400.00                       | \$400.00                   |   |
| 30 | 4   | \$400.00                      | \$5,400.00                       | \$400.00                   |   |
| 31 | 5   | \$400.00                      | \$5,400.00                       | \$5,400.00                 |   |
| 32 | <b>Total</b>  |                               |                                  | <b>\$7,000.00</b>          |   |

# Example [2]

## The Concept of Equivalence – *Comments*

\$5,000 at time 0 is equivalent to each of the following:

- Plan 1: \$7,000 at the end of year 5 at 8% simple interest
- Plan 2: \$7,346.64 at the end of year 5 at 8% compound interest
- Plan 3: \$400 per year for 4 years and \$5,400 at the end of year 5 at 8% simple interest
- Plan 4: Decreasing payments of interest and partial principal in years 1 (\$1,400) through 5 (\$1,080) at 8% compound interest

# Just Keep in Mind

- **Simple interest:**  $F = P(1+ni)$
- **Compound interest:**  $F = P(1+i)^n$

*where*

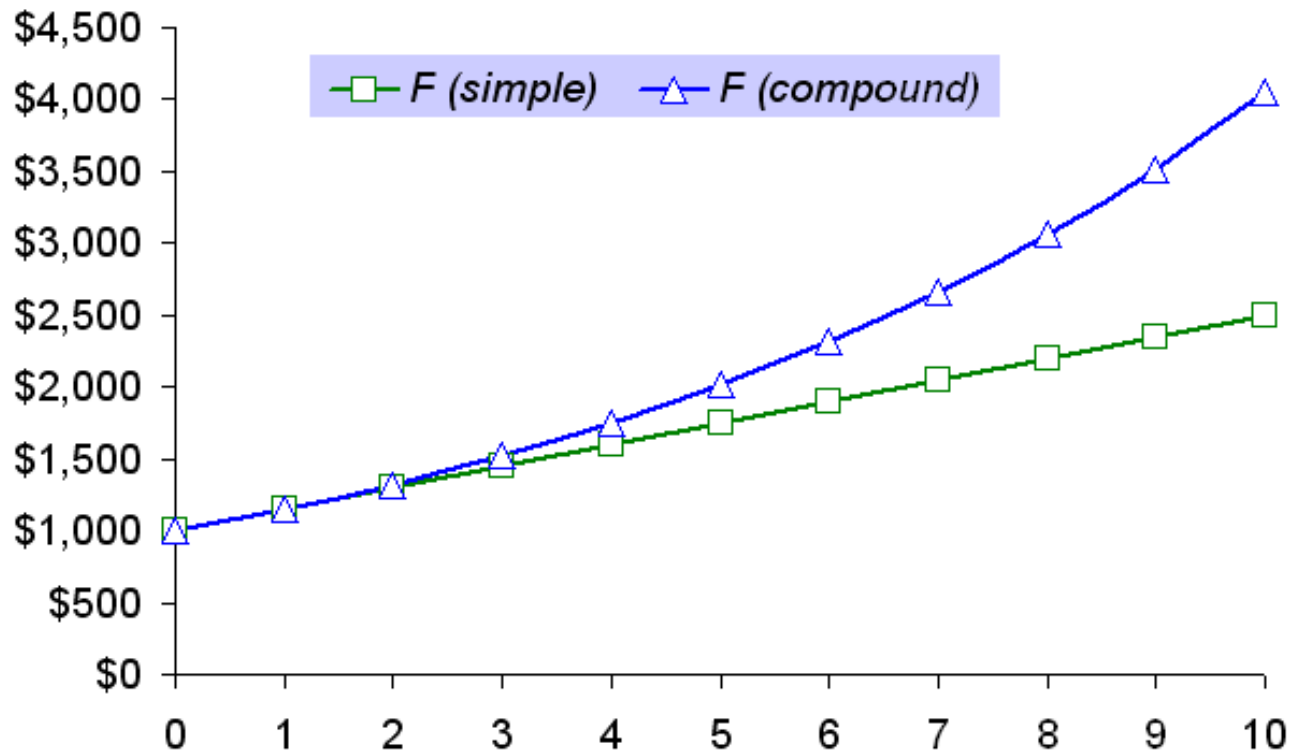

*F: future worth*

*P: present worth*

*i: interest rate*

*n: number of*

*interest periods*

# Simple and Compound Interest Comparison

- The total amount with simple interest grows linearly
- The total amount with compound interest grows exponentially
- This exponential growth is referred to as the power of compounding

# Terminology and Symbols

- The equations and procedures of *engineering economy* utilize the following terms and symbols:
- P: [dollars] value or amount of money at the present time (time 0). P is referred to as present worth (PW), present value (PV), net present value (NPV), discounted cash flow (DCF), and capitalized cost (CC)
- F: [dollars] value or amount of money at some future time. Also F is called future worth (FW) and future value (FV)

# Terminology and Symbols

- A: [dollars per year, dollars per months] series of consecutive, equal, end-of-period amounts of money. Also A is called the annual worth (AW) and equivalent uniform annual worth (EUAW)
- n: [years, months, days] number of interest periods
- i: [percent per year, percent per month, percent per day] interest rate or rate of return per time period.  
Assume compound interest if not specified
- All engineering economy problems involve the elements of interest period n and interest rate i

# Example [3]

## The Concept of Equivalence

- You are given the alternative of receiving either \$3,000 at the end of five years or P dollars today
- What value of P would make you *indifferent* to \$3,000 at the end of five years if the interest rate is 8%?

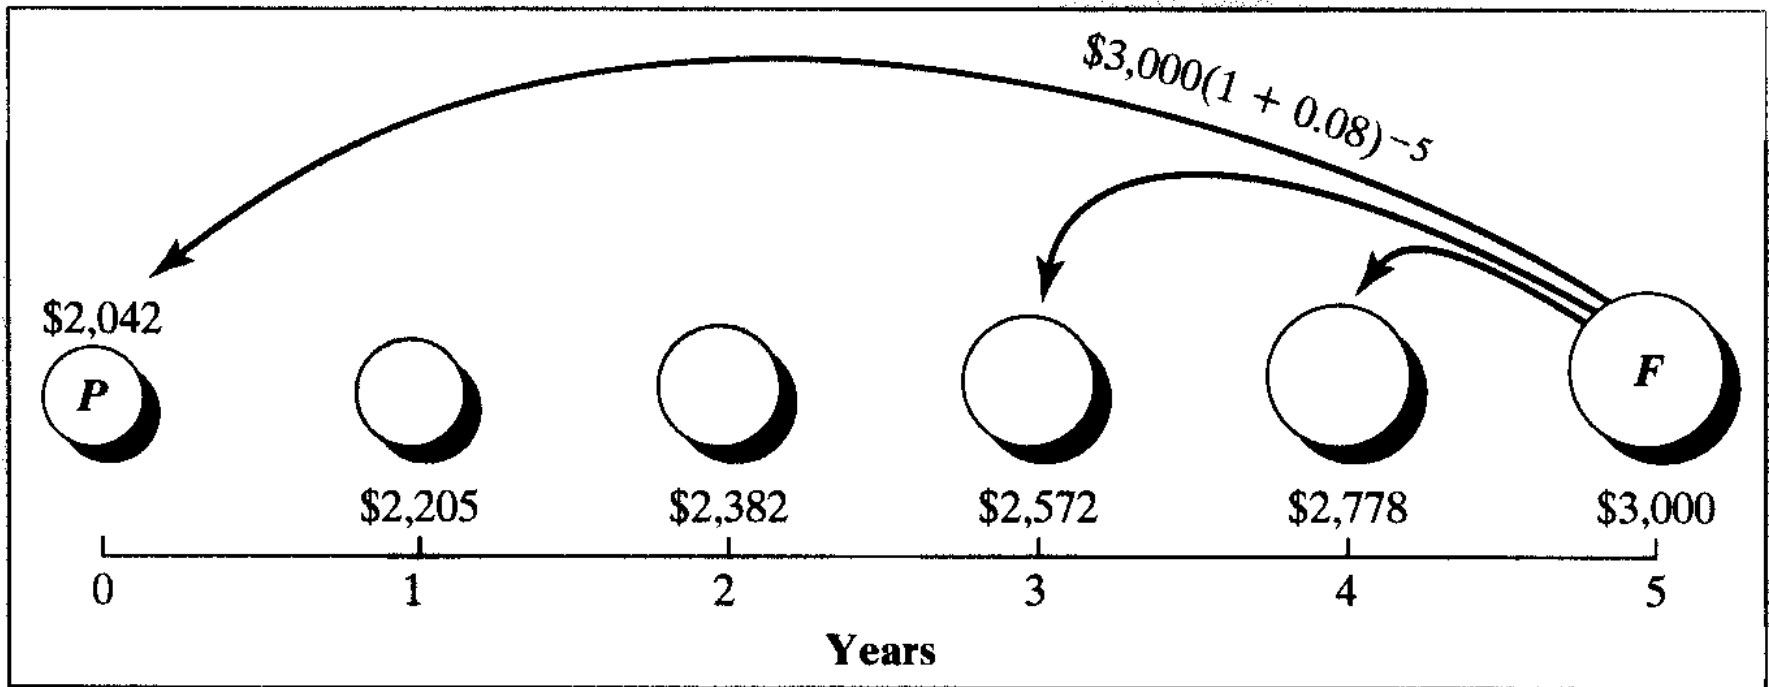

Symbols are as follows:  $F = \$3,000$ ,  $n = 5$  years, and  $i = 8\%$ . Find P

We know that  $F = P(1+i)^n$

Substituting yields  $P = \$2,042$

# Example [3]

## The Concept of Equivalence

Various dollar amounts that will be economically equivalent to \$3,000 in five years given an interest rate of 8%

# Example [4]

## Terminology and Symbols

- Someone plans to borrow \$10,000 now to help in buying a car
- He arranged to repay the entire principal plus 8% per year interest after 5 years
- *Identify the engineering economy symbols* involved and their values for the total owed after 5 years

# Example [4]

## Terminology and Symbols

- We have  $P = \$10,000$ ,  $i = 8\%$ , and  $n = 5$  years
- You must find the value of  $F$  which represents the amount to be repaid after 5 years

# Example [5]

## Terminology and Symbols

- Assume you borrow \$2,000 now at 7% per year for 10 years and you must repay the loan in equal yearly payments
- Determine the symbols involved and their values

# Example [5]

## Terminology and Symbols

- We have  $P = \$2,000$ ,  $i = 7\%$  per year, and  $n = 10$  years
- We need to find the value of  $\underline{A}$  which represents the yearly equal (uniform) payments

# Example [6]

## Terminology and Symbols

- Last year Jane's grandmother offered to put enough money into a savings account to generate \$1,000 to help pay Jane's expenses at college
- Identify the symbols
- Calculate the amount that had to be deposited exactly 1 year ago to earn \$1,000 *in interest* now if the rate is 6% per year

# Example [6]

## Terminology and Symbols

- We have  $i = 6\%$  and  $n = 1$
- We know that the amount of interest is \$1,000
- Since  $F = P(1+i)^n$  and  $F = P + \text{interest amount}$
- Then  $P = \$16,666.67$  which represents the amount to be deposited at the beginning

# Example [7]

- What is the present worth of a lump sum of one million dollars to be received 50 years from today if the interest rate is 10%?
- $F = P(1+i)^n$  and or  $P = F(1+i)^{-n} \rightarrow$   
 $P = \$1,000,000 \times (1+10\%)^{-50} \approx \$8,519$

# Example [8]

- Show the yearly payments a borrower has to pay to the bank for the following **three** repayment plans. The loan is \$10,000 and must be repaid to the bank in 5 years at 10% interest per year
- Plan 1: *Compound interest*. However, there is **no interest** in the third year. Pay all at end. No interest or principal is paid until the end of year 5
- Plan 2: *Compound interest*. However, you pay the **interest** plus **one-quarter** of the principal by the end of each year
- Plan 3: Same as Plan 2 except in the third year you pay only the interest

# Example [8]

| End of year                                      | Interest owed for year | Total owed at end of year | End-of-year payment |
|--|------------------------|---------------------------|---------------------|
| <i>Plan 1: Compound interest, pay all at end</i> |                        |                           |                     |
| 0  |                        |                           |                     |
| 1  | \$1,000.00             | \$11,000.00               | -                   |
| 2  | \$1,100.00             | \$12,100.00               | -                   |
| 3  | \$0.00                 | \$12,100.00               | -                   |
| 4  | \$1,210.00             | \$13,310.00               | -                   |
| 5  | \$1,331.00             | \$14,641.00               | \$14,641.00         |
| <i>Total</i>                                     |                        |                           | <i>\$14,641.00</i>  |

# Example [8]

| End of year   | Interest owed for year | Total owed at end of year | End-of-year payment |
|---|------------------------|---------------------------|---------------------|
| <i>Plan 2: Compound interest and portion of principal repaid annually. The <b>accrued interest</b> and <b>one-fourth</b> of the principal is repaid each year</i> |                        |                           |                     |

|---|------------------------|---------------------------|---------------------|
| <p><i>Plan 3: Compound interest and portion of principal repaid annually. The <b>accrued interest</b> and <b>one-fourth</b> of the principal is repaid each year except in the third year where you pay only the interest</i></p> |                        |                           |                     |
| 0   |                        |                           |                     |
| 1   | \$1,000.00             | \$11,000.00               | \$3,500.00          |
| 2   | \$750.00               | \$8,250.00                | \$3,250.00          |
| 3   | \$500.00               | \$5,500.00                | \$500.00            |
| 4   | \$500.00               | \$5,500.00                | \$3,000.00          |
| 5   | \$250.00               | \$2,750.00                | \$2,750.00          |
| <i>Total</i>  |                        |                           | <i>\$13,000.00</i>  |

# Solution by Excel

- Using the symbols P, F, A, i, and n exactly as defined earlier, the Excel functions that most used in engineering economy are the following:
  - P:  $PV(i\%,n,A,F)$
  - F:  $FV(i\%,n,A,P)$
  - A:  $PMT(i\%,n,P,F)$  Just equal values
  - n:  $NPER(i\%,A,P,F)$
  - i:  $RATE(n,A,P,F)$
