CHAPTER 1 FUNCTIONS

1.1 FUNCTIONS AND THEIR GRAPHS

1. domain = $(-\infty, \infty)$; range = $[1, \infty)$
2. domain = $[0, \infty)$; range = $(-\infty, 1]$
3. domain = $[-2, \infty)$; y in range and $y = \sqrt{5x+10} \geq 0 \Rightarrow y$ can be any positive real number \Rightarrow range = $[0, \infty)$.
4. domain = $(-\infty, 0] \cup [3, \infty)$; y in range and $y = \sqrt{x^2 - 3x} \geq 0 \Rightarrow y$ can be any positive real number \Rightarrow range = $[0, \infty)$.
5. domain = $(-\infty, 3) \cup (3, \infty)$; y in range and $y = \frac{4}{3-t}$, now if $t < 3 \Rightarrow 3-t > 0 \Rightarrow \frac{4}{3-t} > 0$, or if $t > 3 \Rightarrow 3-t < 0 \Rightarrow \frac{4}{3-t} < 0 \Rightarrow y$ can be any nonzero real number \Rightarrow range = $(-\infty, 0) \cup (0, \infty)$.
6. domain = $(-\infty, -4) \cup (-4, 4) \cup (4, \infty)$; y in range and $y = \frac{2}{t^2-16}$, now if $t < -4 \Rightarrow t^2 - 16 > 0 \Rightarrow \frac{2}{t^2-16} > 0$, or if $-4 < t < 4 \Rightarrow -16 \leq t^2 - 16 < 0 \Rightarrow -\frac{2}{16} \geq \frac{2}{t^2-16}$, or if $t > 4 \Rightarrow t^2 - 16 > 0 \Rightarrow \frac{2}{t^2-16} > 0 \Rightarrow y$ can be any nonzero real number \Rightarrow range = $(-\infty, -\frac{1}{8}] \cup (0, \infty)$.
7. (a) Not the graph of a function of x since it fails the vertical line test.
(b) Is the graph of a function of x since any vertical line intersects the graph at most once.
8. (a) Not the graph of a function of x since it fails the vertical line test.
(b) Not the graph of a function of x since it fails the vertical line test.
9. base = x ; $(\text{height})^2 + \left(\frac{x}{2}\right)^2 = x^2 \Rightarrow \text{height} = \frac{\sqrt{3}}{2}x$; area is $a(x) = \frac{1}{2}(\text{base})(\text{height}) = \frac{1}{2}(x)\left(\frac{\sqrt{3}}{2}x\right) = \frac{\sqrt{3}}{4}x^2$;
perimeter is $p(x) = x + x + x = 3x$.
10. $s =$ side length $\Rightarrow s^2 + s^2 = d^2 \Rightarrow s = \frac{d}{\sqrt{2}}$; and area is $a = s^2 \Rightarrow a = \frac{1}{2}d^2$
11. Let $D =$ diagonal length of a face of the cube and $\ell =$ the length of an edge. Then $\ell^2 + D^2 = d^2$ and $D^2 = 2\ell^2 \Rightarrow 3\ell^2 = d^2 \Rightarrow \ell = \frac{d}{\sqrt{3}}$. The surface area is $6\ell^2 = \frac{6d^2}{3} = 2d^2$ and the volume is $\ell^3 = \left(\frac{d}{\sqrt{3}}\right)^3 = \frac{d^3}{3\sqrt{3}}$.
12. The coordinates of P are (x, \sqrt{x}) so the slope of the line joining P to the origin is $m = \frac{\sqrt{x}}{x} = \frac{1}{\sqrt{x}} (x > 0)$.
Thus, $(x, \sqrt{x}) = \left(\frac{1}{m^2}, \frac{1}{m}\right)$.
13. $2x + 4y = 5 \Rightarrow y = -\frac{1}{2}x + \frac{5}{4}$; $L = \sqrt{(x-0)^2 + (y-0)^2} = \sqrt{x^2 + \left(-\frac{1}{2}x + \frac{5}{4}\right)^2} = \sqrt{x^2 + \frac{1}{4}x^2 - \frac{5}{4}x + \frac{25}{16}}$
 $= \sqrt{\frac{5}{4}x^2 - \frac{5}{4}x + \frac{25}{16}} = \sqrt{\frac{20x^2 - 20x + 25}{16}} = \frac{\sqrt{20x^2 - 20x + 25}}{4}$
14. $y = \sqrt{x-3} \Rightarrow y^2 + 3 = x$; $L = \sqrt{(x-4)^2 + (y-0)^2} = \sqrt{(y^2 + 3 - 4)^2 + y^2} = \sqrt{(y^2 - 1)^2 + y^2}$
 $= \sqrt{y^4 - 2y^2 + 1 + y^2} = \sqrt{y^4 - y^2 + 1}$

29. (a) Line through (0, 0) and (1, 1): $y = x$; Line through (1, 1) and (2, 0): $y = -x + 2$

$$f(x) = \begin{cases} x, & 0 \leq x \leq 1 \\ -x+2, & 1 < x \leq 2 \end{cases}$$

30. (a) Line through (0, 2) and (2, 0): $y = -x + 2$

Line through (2, 1) and (5, 0): $m = \frac{0-1}{5-2} = \frac{-1}{3} = -\frac{1}{3}$, so $y = -\frac{1}{3}(x-2) + 1 = -\frac{1}{3}x + \frac{5}{3}$

$$f(x) = \begin{cases} -x+2, & 0 < x \leq 2 \\ -\frac{1}{3}x + \frac{5}{3}, & 2 < x \leq 5 \end{cases}$$

4 Chapter 1 Functions

(b) Line through $(-1, 0)$ and $(0, -3)$: $m = \frac{-3-0}{0-(-1)} = -3$, so $y = -3x - 3$

Line through $(0, 3)$ and $(2, -1)$: $m = \frac{-1-3}{2-0} = \frac{-4}{2} = -2$, so $y = -2x + 3$

$$f(x) = \begin{cases} -3x - 3, & -1 < x \leq 0 \\ -2x + 3, & 0 < x \leq 2 \end{cases}$$

31. (a) Line through $(-1, 1)$ and $(0, 0)$: $y = -x$

Line through $(0, 1)$ and $(1, 1)$: $y = 1$

Line through $(1, 1)$ and $(3, 0)$: $m = \frac{0-1}{3-1} = \frac{-1}{2} = -\frac{1}{2}$, so $y = -\frac{1}{2}(x-1) + 1 = -\frac{1}{2}x + \frac{3}{2}$

$$f(x) = \begin{cases} -x & -1 \leq x < 0 \\ 1 & 0 < x \leq 1 \\ -\frac{1}{2}x + \frac{3}{2} & 1 < x < 3 \end{cases}$$

(b) Line through $(-2, -1)$ and $(0, 0)$: $y = \frac{1}{2}x$

Line through $(0, 2)$ and $(1, 0)$: $y = -2x + 2$

Line through $(1, -1)$ and $(3, -1)$: $y = -1$

$$f(x) = \begin{cases} \frac{1}{2}x & -2 \leq x \leq 0 \\ -2x + 2 & 0 < x \leq 1 \\ -1 & 1 < x \leq 3 \end{cases}$$

32. (a) Line through $(\frac{T}{2}, 0)$ and $(T, 1)$: $m = \frac{1-0}{T-(T/2)} = \frac{2}{T}$, so $y = \frac{2}{T}(x - \frac{T}{2}) + 0 = \frac{2}{T}x - 1$

$$f(x) = \begin{cases} 0, & 0 \leq x \leq \frac{T}{2} \\ \frac{2}{T}x - 1, & \frac{T}{2} < x \leq T \end{cases}$$

$$(b) f(x) = \begin{cases} A, & 0 \leq x < \frac{T}{2} \\ -A, & \frac{T}{2} \leq x < T \\ A, & T \leq x < \frac{3T}{2} \\ -A, & \frac{3T}{2} \leq x \leq 2T \end{cases}$$

33. (a) $\lfloor x \rfloor = 0$ for $x \in [0, 1)$

(b) $\lceil x \rceil = 0$ for $x \in (-1, 0]$

34. $\lfloor x \rfloor = \lceil x \rceil$ only when x is an integer.

35. For any real number x , $n \leq x < n+1$, where n is an integer. Now: $n \leq x < n+1 \Rightarrow -(n+1) \leq -x < -n$.
By definition: $\lceil -x \rceil = -n$ and $\lfloor x \rfloor = n \Rightarrow -\lfloor x \rfloor = -n$. So $\lceil -x \rceil = -\lfloor x \rfloor$ for all real x .

36. To find $f(x)$ you delete the decimal or fractional portion of x , leaving only the integer part.

43. Symmetric about the origin
Dec: nowhere
Inc: $-\infty < x < \infty$

44. No symmetry
Dec: $0 \leq x < \infty$
Inc: nowhere

45. No symmetry
Dec: $0 \leq x < \infty$
Inc: nowhere

46. Symmetric about the y-axis
Dec: $-\infty < x \leq 0$
Inc: $0 \leq x < \infty$

47. Since a horizontal line not through the origin is symmetric with respect to the y -axis, but not with respect to the origin, the function is even.

48. $f(x) = x^{-5} = \frac{1}{x^5}$ and $f(-x) = (-x)^{-5} = \frac{1}{(-x)^5} = -\left(\frac{1}{x^5}\right) = -f(x)$. Thus the function is odd.

49. Since $f(x) = x^2 + 1 = (-x)^2 + 1 = f(-x)$. The function is even.

50. Since $[f(x) = x^2 + x] \neq [f(-x) = (-x)^2 - x]$ and $[f(x) = x^2 + x] \neq [-f(x) = -(x)^2 - x]$ the function is neither even nor odd.

51. Since $g(x) = x^3 + x$, $g(-x) = -x^3 - x = -(x^3 + x) = -g(x)$. So the function is odd.

52. $g(x) = x^4 + 3x^2 - 1 = (-x)^4 + 3(-x)^2 - 1 = g(-x)$, thus the function is even.

53. $g(x) = \frac{1}{x^2-1} = \frac{1}{(-x)^2-1} = g(-x)$. Thus the function is even.

54. $g(x) = \frac{x}{x^2-1}$; $g(-x) = -\frac{x}{x^2-1} = -g(x)$. So the function is odd.

55. $h(t) = \frac{1}{t-1}$; $h(-t) = \frac{1}{-t-1}$; $-h(t) = \frac{1}{1-t}$. Since $h(t) \neq -h(t)$ and $h(t) \neq h(-t)$, the function is neither even nor odd.

56. Since $|t^3| = |(-t)^3|$, $h(t) = h(-t)$ and the function is even.
57. $h(t) = 2t + 1$, $h(-t) = -2t + 1$. So $h(t) \neq h(-t)$. $-h(t) = -2t - 1$, so $h(t) \neq -h(t)$. The function is neither even nor odd.
58. $h(t) = 2|t| + 1$ and $h(-t) = 2|-t| + 1 = 2|t| + 1$. So $h(t) = h(-t)$ and the function is even.
59. $s = kt \Rightarrow 25 = k(75) \Rightarrow k = \frac{1}{3} \Rightarrow s = \frac{1}{3}t$; $60 = \frac{1}{3}t \Rightarrow t = 180$
60. $K = cv^2 \Rightarrow 12960 = c(18)^2 \Rightarrow c = 40 \Rightarrow K = 40v^2$; $K = 40(10)^2 = 4000$ joules
61. $r = \frac{k}{s} \Rightarrow 6 = \frac{k}{4} \Rightarrow k = 24 \Rightarrow r = \frac{24}{s}$; $10 = \frac{24}{s} \Rightarrow s = \frac{12}{5}$
62. $P = \frac{k}{v} \Rightarrow 14.7 = \frac{k}{1000} \Rightarrow k = 14700 \Rightarrow P = \frac{14700}{v}$; $23.4 = \frac{14700}{v} \Rightarrow v = \frac{24500}{39} \approx 628.2$ in³
63. $v = f(x) = x(14 - 2x)(22 - 2x) = 4x^3 - 72x^2 + 308x$; $0 < x < 7$.
64. (a) Let h = height of the triangle. Since the triangle is isosceles, $(\overline{AB})^2 + (\overline{AB})^2 = 2^2 \Rightarrow \overline{AB} = \sqrt{2}$. So,
 $h^2 + 1^2 = (\sqrt{2})^2 \Rightarrow h = 1 \Rightarrow B$ is at $(0, 1) \Rightarrow$ slope of $AB = -1 \Rightarrow$ The equation of AB is
 $y = f(x) = -x + 1$; $x \in [0, 1]$.
- (b) $A(x) = 2xy = 2x(-x + 1) = -2x^2 + 2x$; $x \in [0, 1]$.
65. (a) Graph h because it is an even function and rises less rapidly than does Graph g .
 (b) Graph f because it is an odd function.
 (c) Graph g because it is an even function and rises more rapidly than does Graph h .
66. (a) Graph f because it is linear.
 (b) Graph g because it contains $(0, 1)$.
 (c) Graph h because it is a nonlinear odd function.
67. (a) From the graph, $\frac{x}{2} > 1 + \frac{4}{x} \Rightarrow x \in (-2, 0) \cup (4, \infty)$
 (b) $\frac{x}{2} > 1 + \frac{4}{x} \Rightarrow \frac{x}{2} - 1 - \frac{4}{x} > 0$
 $x > 0$: $\frac{x}{2} - 1 - \frac{4}{x} > 0 \Rightarrow \frac{x^2 - 2x - 8}{2x} > 0 \Rightarrow \frac{(x-4)(x+2)}{2x} > 0$
 $\Rightarrow x > 4$ since x is positive;
 $x < 0$: $\frac{x}{2} - 1 - \frac{4}{x} > 0 \Rightarrow \frac{x^2 - 2x - 8}{2x} < 0 \Rightarrow \frac{(x-4)(x+2)}{2x} < 0$
 $\Rightarrow x < -2$ since x is negative;
 sign of $(x-4)(x+2)$
-
- Solution interval: $(-2, 0) \cup (4, \infty)$

68. (a) From the graph, $\frac{3}{x-1} < \frac{2}{x+1} \Rightarrow x \in (-\infty, -5) \cup (-1, 1)$

(b) Case $x < -1$: $\frac{3}{x-1} < \frac{2}{x+1} \Rightarrow \frac{3(x+1)}{x-1} > 2$
 $\Rightarrow 3x+3 < 2x-2 \Rightarrow x < -5$.

Thus, $x \in (-\infty, -5)$ solves the inequality.

Case $-1 < x < 1$: $\frac{3}{x-1} < \frac{2}{x+1} \Rightarrow \frac{3(x+1)}{x-1} < 2$

$\Rightarrow 3x+3 > 2x-2 \Rightarrow x > -5$ which is true if $x > -1$. Thus, $x \in (-1, 1)$ solves the inequality.

Case $1 < x$: $\frac{3}{x-1} < \frac{2}{x+1} \Rightarrow 3x+3 < 2x-2 \Rightarrow x < -5$

which is never true if $1 < x$, so no solution here.

In conclusion, $x \in (-\infty, -5) \cup (-1, 1)$.

69. A curve symmetric about the x -axis will not pass the vertical line test because the points (x, y) and $(x, -y)$ lie on the same vertical line. The graph of the function $y = f(x) = 0$ is the x -axis, a horizontal line for which there is a single y -value, 0, for any x .

70. price = $40 + 5x$, quantity = $300 - 25x \Rightarrow R(x) = (40 + 5x)(300 - 25x)$

71. $x^2 + x^2 = h^2 \Rightarrow x = \frac{h}{\sqrt{2}} = \frac{\sqrt{2}h}{2}$; cost = $5(2x) + 10h \Rightarrow C(h) = 10\left(\frac{\sqrt{2}h}{2}\right) + 10h = 5h(\sqrt{2} + 2)$

72. (a) Note that 2 mi = 10,560 ft, so there are $\sqrt{800^2 + x^2}$ feet of river cable at \$180 per foot and $(10,560 - x)$ feet of land cable at \$100 per foot. The cost is $C(x) = 180\sqrt{800^2 + x^2} + 100(10,560 - x)$.

(b) $C(0) = \$1,200,000$

$C(500) \approx \$1,175,812$

57. $y = 3x^2 - 3$

58. $y = (2x)^2 - 1 = 4x^2 - 1$

59. $y = \frac{1}{2} \left(1 + \frac{1}{x^2} \right) = \frac{1}{2} + \frac{1}{2x^2}$

60. $y = 1 + \frac{1}{(x/3)^2} = 1 + \frac{9}{x^2}$

61. $y = \sqrt{4x+1}$

62. $y = 3\sqrt{x+1}$

63. $y = \sqrt{4 - \left(\frac{x}{2}\right)^2} = \frac{1}{2} \sqrt{16 - x^2}$

64. $y = \frac{1}{3} \sqrt{4 - x^2}$

65. $y = 1 - (3x)^3 = 1 - 27x^3$

66. $y = 1 - \left(\frac{x}{2}\right)^3 = 1 - \frac{x^3}{8}$

67. Let $y = -\sqrt{2x+1} = f(x)$ and let $g(x) = x^{1/2}$, $h(x) = \left(x + \frac{1}{2}\right)^{1/2}$, $i(x) = \sqrt{2} \left(x + \frac{1}{2}\right)^{1/2}$, and $j(x) = -\left[\sqrt{2} \left(x + \frac{1}{2}\right)^{1/2}\right] = f(x)$. The graph of $h(x)$

is the graph of $g(x)$ shifted left $\frac{1}{2}$ unit; the graph of $i(x)$ is the graph of $h(x)$ stretched vertically by a factor of $\sqrt{2}$; and the graph of $j(x) = f(x)$ is the graph of $i(x)$ reflected across the x -axis.

68. Let $y = \sqrt{1 - \frac{x}{2}} = f(x)$. Let $g(x) = (-x)^{1/2}$, $h(x) = (-x + 2)^{1/2}$, and $i(x) = \frac{1}{\sqrt{2}} (-x + 2)^{1/2} = \sqrt{1 - \frac{x}{2}} = f(x)$. The graph of $g(x)$ is the graph of $y = \sqrt{x}$ reflected across the x -axis. The graph of $h(x)$ is the graph of $g(x)$ shifted right two units. And the graph of $i(x)$ is the graph of $h(x)$ compressed vertically by a factor of $\sqrt{2}$.

69. $y = f(x) = x^3$. Shift $f(x)$ one unit right followed by a shift two units up to get $g(x) = (x-1)^3 + 2$.

70. $y = (1-x)^3 + 2 = -[(x-1)^3 + (-2)] = f(x)$.
 Let $g(x) = x^3$, $h(x) = (x-1)^3$, $i(x) = (x-1)^3 + (-2)$,
 and $j(x) = -[(x-1)^3 + (-2)]$. The graph of $h(x)$ is the
 graph of $g(x)$ shifted right one unit; the graph of $i(x)$
 is the graph of $h(x)$ shifted down two units; and the
 graph of $f(x)$ is the graph of $i(x)$ reflected across
 the x -axis.

71. Compress the graph of $f(x) = \frac{1}{x}$ horizontally by a
 factor of 2 to get $g(x) = \frac{1}{2x}$. Then shift $g(x)$
 vertically down 1 unit to get $h(x) = \frac{1}{2x} - 1$.

72. Let $f(x) = \frac{1}{x^2}$ and $g(x) = \frac{2}{x^2} + 1 = \frac{1}{\left(\frac{x}{\sqrt{2}}\right)^2} + 1$
 $= \frac{1}{\left(\frac{x}{1.4}\right)^2} + 1 = \frac{1}{\left[\left(\frac{1}{1.4}\right)x\right]^2} + 1$. Since $\sqrt{2} \approx 1.4$, we see
 that the graph of $f(x)$ stretched horizontally by
 a factor of 1.4 and shifted up 1 unit is the graph
 of $g(x)$.

73. Reflect the graph of $y = f(x) = \sqrt[3]{x}$ across the x -axis
 to get $g(x) = -\sqrt[3]{x}$.

74. $y = f(x) = (-2x)^{2/3} = [(-1)(2x)]^{2/3} = (-1)^{2/3}(2x)^{2/3} = (2x)^{2/3}$. So the graph of $f(x)$ is the graph of $g(x) = x^{2/3}$ compressed horizontally by a factor of 2.

 (i) $(g \circ g)(-x) = g(g(-x)) = g(-g(x)) = -g(g(x)) = -(g \circ g)(x)$, odd

57. According to the figure in the text, we have the following: By the law of cosines, $c^2 = a^2 + b^2 - 2ab \cos\theta$
 $= 1^2 + 1^2 - 2\cos(A - B) = 2 - 2\cos(A - B)$. By distance formula, $c^2 = (\cos A - \cos B)^2 + (\sin A - \sin B)^2$
 $= \cos^2 A - 2\cos A \cos B + \cos^2 B + \sin^2 A - 2\sin A \sin B + \sin^2 B = 2 - 2(\cos A \cos B + \sin A \sin B)$. Thus
 $c^2 = 2 - 2\cos(A - B) = 2 - 2(\cos A \cos B + \sin A \sin B) \Rightarrow \cos(A - B) = \cos A \cos B + \sin A \sin B$.

58. (a) $\cos(A - B) = \cos A \cos B + \sin A \sin B$
 $\sin \theta = \cos\left(\frac{\pi}{2} - \theta\right)$ and $\cos \theta = \sin\left(\frac{\pi}{2} - \theta\right)$
 Let $\theta = A + B$
 $\sin(A + B) = \cos\left[\frac{\pi}{2} - (A + B)\right] = \cos\left[\left(\frac{\pi}{2} - A\right) - B\right] = \cos\left(\frac{\pi}{2} - A\right) \cos B + \sin\left(\frac{\pi}{2} - A\right) \sin B$
 $= \sin A \cos B + \cos A \sin B$
- (b) $\cos(A - B) = \cos A \cos B + \sin A \sin B$
 $\cos(A - (-B)) = \cos A \cos(-B) + \sin A \sin(-B)$
 $\Rightarrow \cos(A + B) = \cos A \cos(-B) + \sin A \sin(-B) = \cos A \cos B + \sin A(-\sin B) = \cos A \cos B - \sin A \sin B$
 Because the cosine function is even and the sine functions is odd.

59. $c^2 = a^2 + b^2 - 2ab \cos C = 2^2 + 3^2 - 2(2)(3) \cos(60^\circ) = 4 + 9 - 12 \cos(60^\circ) = 13 - 12\left(\frac{1}{2}\right) = 7$.
 Thus, $c = \sqrt{7} \approx 2.65$.

60. $c^2 = a^2 + b^2 - 2ab \cos C = 2^2 + 3^2 - 2(2)(3) \cos(40^\circ) = 13 - 12 \cos(40^\circ)$. Thus, $c = \sqrt{13 - 12 \cos 40^\circ} \approx 1.951$.

61. From the figures in the text, we see that $\sin B = \frac{h}{c}$. If C is an acute angle, then $\sin C = \frac{h}{b}$. On the other hand, if C is obtuse (as in the figure on the right in the text), then $\sin C = \sin(\pi - C) = \frac{h}{b}$. Thus, in either case,
 $h = b \sin C = c \sin B \Rightarrow ah = ab \sin C = ac \sin B$.

By the law of cosines, $\cos C = \frac{a^2 + b^2 - c^2}{2ab}$ and $\cos B = \frac{a^2 + c^2 - b^2}{2ac}$. Moreover, since the sum of the interior angles of triangle is π , we have $\sin A = \sin(\pi - (B + C)) = \sin(B + C) = \sin B \cos C + \cos B \sin C$
 $= \left(\frac{h}{c}\right) \left[\frac{a^2 + b^2 - c^2}{2ab}\right] + \left[\frac{a^2 + c^2 - b^2}{2ac}\right] \left(\frac{h}{b}\right) = \left(\frac{h}{2abc}\right)(2a^2 + b^2 - c^2 + c^2 - b^2) = \frac{ah}{bc} \Rightarrow ah = bc \sin A$.

Combining our results we have $ah = ab \sin C$, $ah = ac \sin B$, and $ah = bc \sin A$. Dividing by abc gives
 $\frac{h}{bc} = \frac{\sin A}{a} = \frac{\sin C}{c} = \frac{\sin B}{b}$.
 law of sines

62. By the law of sines, $\frac{\sin A}{2} = \frac{\sin B}{3} = \frac{\sqrt{3}/2}{c}$. By Exercise 59 we know that $c = \sqrt{7}$. Thus $\sin B = \frac{3\sqrt{3}}{2\sqrt{7}} \approx 0.982$.

63. From the figure at the right and the law of cosines,
 $b^2 = a^2 + 2^2 - 2(2a) \cos B$
 $= a^2 + 4 - 4a\left(\frac{1}{2}\right) = a^2 - 2a + 4$.

Applying the law of sines to the figure, $\frac{\sin A}{a} = \frac{\sin B}{b}$
 $\Rightarrow \frac{\sqrt{2}/2}{a} = \frac{\sqrt{3}/2}{b} \Rightarrow b = \sqrt{\frac{3}{2}} a$. Thus, combining results,

$a^2 - 2a + 4 = b^2 = \frac{3}{2}a^2 \Rightarrow 0 = \frac{1}{2}a^2 + 2a - 4 \Rightarrow 0 = a^2 + 4a - 8$. From the quadratic formula and the fact that $a > 0$, we have $a = \frac{-4 + \sqrt{4^2 - 4(1)(-8)}}{2} = \frac{4\sqrt{3} - 4}{2} \approx 1.464$.

64. (a) The graphs of $y = \sin x$ and $y = x$ nearly coincide when x is near the origin (when the calculator is in radians mode).
 (b) In degree mode, when x is near zero degrees the sine of x is much closer to zero than x itself. The curves look like intersecting straight lines near the origin when the calculator is in degree mode.

69. The function $g(x)$ is also one-to-one. The reasoning: $f(x)$ is one-to-one means that if $x_1 \neq x_2$ then $f(x_1) \neq f(x_2)$, so $-f(x_1) \neq -f(x_2)$ and therefore $g(x_1) \neq g(x_2)$. Therefore $g(x)$ is one-to-one as well.
70. The function $h(x)$ is also one-to-one. The reasoning: $f(x)$ is one-to-one means that if $x_1 \neq x_2$ then $f(x_1) \neq f(x_2)$, so $\frac{1}{f(x_1)} \neq \frac{1}{f(x_2)}$, and therefore $h(x_1) \neq h(x_2)$.
71. The composite is one-to-one also. The reasoning: If $x_1 \neq x_2$ then $g(x_1) \neq g(x_2)$ because g is one-to-one. Since $g(x_1) \neq g(x_2)$, we also have $f(g(x_1)) \neq f(g(x_2))$ because f is one-to-one; thus, $f \circ g$ is one-to-one because $x_1 \neq x_2 \Rightarrow f(g(x_1)) \neq f(g(x_2))$.
72. Yes, g must be one-to-one. If g were not one-to-one, there would exist numbers $x_1 \neq x_2$ in the domain of g with $g(x_1) = g(x_2)$. For these numbers we would also have $f(g(x_1)) = f(g(x_2))$, contradicting the assumption that $f \circ g$ is one-to-one.

- (b) $y = \frac{50}{1+1.1^{-x}} \rightarrow 1+1.1^{-x} = \frac{50}{y} \rightarrow 1.1^{-x} = \frac{50}{y} - 1 \rightarrow \log_{1.1}(1.1^{-x}) = \log_{1.1}\left(\frac{50}{y} - 1\right) \rightarrow -x = \log_{1.1}\left(\frac{50}{y} - 1\right)$
 $x = -\log_{1.1}\left(\frac{50}{y} - 1\right) = -\log_{1.1}\left(\frac{50-y}{y}\right) = \log_{1.1}\left(\frac{y}{50-y}\right)$.
 Interchange x and y : $y = \log_{1.1}\left(\frac{x}{50-x}\right) \rightarrow f^{-1}(x) = \log_{1.1}\left(\frac{x}{50-x}\right)$
 Verify.

$$(f \circ f^{-1})(x) = f\left(\log_{1.1}\left(\frac{x}{50-x}\right)\right) = \frac{50}{1+1.1^{\log_{1.1}\left(\frac{x}{50-x}\right)}} = \frac{50}{1+1.1^{\log_{1.1}\left(\frac{50-x}{x}\right)}} = \frac{50}{1+\frac{50-x}{x}} = \frac{50x}{x+50-x} = \frac{50x}{50} = x$$

$$(f^{-1} \circ f)(x) = f^{-1}\left(\frac{50}{1+1.1^{-x}}\right) = \log_{1.1}\left(\frac{\frac{50}{1+1.1^{-x}}}{50-\frac{50}{1+1.1^{-x}}}\right) = \log_{1.1}\left(\frac{50}{50(1+1.1^{-x})-50}\right) = \log_{1.1}\left(\frac{1}{1.1^{-x}}\right) = \log_{1.1}(1.1^x) = x$$

74. $\sin^{-1}(1) + \cos^{-1}(1) = \frac{\pi}{2} + 0 = \frac{\pi}{2}$; $\sin^{-1}(0) + \cos^{-1}(0) = 0 + \frac{\pi}{2} = \frac{\pi}{2}$; and $\sin^{-1}(-1) + \cos^{-1}(-1) = -\frac{\pi}{2} + \pi = \frac{\pi}{2}$.

If $x \in (-1, 0)$ and $x = -a$, then $\sin^{-1}(x) + \cos^{-1}(x) = \sin^{-1}(-a) + \cos^{-1}(-a) = -\sin^{-1} a + (\pi - \cos^{-1} a)$
 $= \pi - (\sin^{-1} a + \cos^{-1} a) = \pi - \frac{\pi}{2} = \frac{\pi}{2}$ from Equations (3) and (4) in the text.

75. (a) Begin with $y = \ln x$ and reduce the y -value by 3 $\Rightarrow y = \ln x - 3$.

 (c) Begin with $y = \ln x$, replace x with $x + 1$, and increase the y -value by 3 $\Rightarrow y = \ln(x + 1) + 3$.
 (d) Begin with $y = \ln x$, reduce the y -value by 4, and replace x with $x - 2 \Rightarrow y = \ln(x - 2) - 4$.
 (e) Begin with $y = \ln x$ and replace x with $-x \Rightarrow y = \ln(-x)$.
 (f) Begin with $y = \ln x$ and switch x and $y \Rightarrow x = \ln y$ or $y = e^x$.

76. (a) Begin with $y = \ln x$ and multiply the y -value by 2 $\Rightarrow y = 2 \ln x$.
 (b) Begin with $y = \ln x$ and replace x with $\frac{x}{3} \Rightarrow y = \ln\left(\frac{x}{3}\right)$.

77. From zooming in on the graph at the right, we estimate the third root to be $x \approx -0.76666$.

78. The functions $f(x) = x^{\ln 2}$ and $g(x) = 2^{\ln x}$ appear to have identical graphs for $x > 0$. This is no accident, because
 $x^{\ln 2} = e^{\ln 2 \cdot \ln x} = (e^{\ln 2})^{\ln x} = 2^{\ln x}$.

79. (a) Amount = $8\left(\frac{1}{2}\right)^{t/12}$
 (b) $8\left(\frac{1}{2}\right)^{t/12} = 1 \rightarrow \left(\frac{1}{2}\right)^{t/12} = \frac{1}{8} \rightarrow \left(\frac{1}{2}\right)^{t/12} = \left(\frac{1}{2}\right)^3 \rightarrow \frac{t}{12} = 3 \rightarrow t = 36$

80. $500(1.0475)^t = 1000 \rightarrow 1.0475^t = 2 \rightarrow \ln(1.0475^t) = \ln(2) \rightarrow t \ln(1.0475) = \ln(2) \rightarrow t = \frac{\ln(2)}{\ln(1.0475)} \approx 14.936$
 It will take about 14.936 years. (If the interest is paid at the end of each year, it will take 15 years.)

81. $375,000(1.0225)^t = 1,000,000 \rightarrow 1.0225^t = \frac{8}{3} \rightarrow \ln(1.0225^t) = \ln\left(\frac{8}{3}\right) \rightarrow t \ln(1.0225) = \ln\left(\frac{8}{3}\right)$
 $\rightarrow t = \frac{\ln\left(\frac{8}{3}\right)}{\ln(1.0225)} \approx 44.081$
 It will take about 44.081 years.

82. $y = y_0 e^{-0.18t}$ represents the decay equation; solving $(0.9)y_0 = y_0 e^{-0.18t} \Rightarrow t = \frac{\ln(0.9)}{-0.18} \approx 0.585$ days

CHAPTER 1 PRACTICE EXERCISES

1. The area is $A = \pi r^2$ and the circumference is $C = 2\pi r$. Thus, $r = \frac{C}{2\pi} \Rightarrow A = \pi\left(\frac{C}{2\pi}\right)^2 = \frac{C^2}{4\pi}$.
2. The surface area is $S = 4\pi r^2 \Rightarrow r = \left(\frac{S}{4\pi}\right)^{1/2}$. The volume is $V = \frac{4}{3}\pi r^3 \Rightarrow r = \sqrt[3]{\frac{3V}{4\pi}}$. Substitution into the formula for surface area gives $S = 4\pi r^2 = 4\pi\left(\frac{3V}{4\pi}\right)^{2/3}$.
3. The coordinates of a point on the parabola are (x, x^2) . The angle of inclination θ joining this point to the origin satisfies the equation $\tan \theta = \frac{x^2}{x} = x$. Thus the point has coordinates $(x, x^2) = (\tan \theta, \tan^2 \theta)$.

period = 2π

61. (a) $\sin B = \sin \frac{\pi}{3} = \frac{b}{c} = \frac{b}{2} \Rightarrow b = 2 \sin \frac{\pi}{3} = 2 \left(\frac{\sqrt{3}}{2} \right) = \sqrt{3}$. By the theorem of Pythagoras,
 $a^2 + b^2 = c^2 \Rightarrow a = \sqrt{c^2 - b^2} = \sqrt{4 - 3} = 1$.

(b) $\sin B = \sin \frac{\pi}{3} = \frac{b}{c} = \frac{2}{c} \Rightarrow c = \frac{2}{\sin \frac{\pi}{3}} = \frac{2}{\left(\frac{\sqrt{3}}{2} \right)} = \frac{4}{\sqrt{3}}$. Thus, $a = \sqrt{c^2 - b^2} = \sqrt{\left(\frac{4}{\sqrt{3}} \right)^2 - (2)^2} = \sqrt{\frac{16}{3} - 4} = \sqrt{\frac{4}{3}} = \frac{2}{\sqrt{3}}$.

62. (a) $\sin A = \frac{a}{c} \Rightarrow a = c \sin A$

(b) $\tan A = \frac{a}{b} \Rightarrow a = b \tan A$

63. (a) $\tan B = \frac{b}{a} \Rightarrow a = \frac{b}{\tan B}$

(b) $\sin A = \frac{a}{c} \Rightarrow c = \frac{a}{\sin A}$

64. (a) $\sin A = \frac{a}{c}$

(b) $\sin A = \frac{a}{c} = \frac{\sqrt{c^2 - b^2}}{c}$

65. Let h = height of vertical pole, and let b and c denote the distances of points B and C from the base of the pole, measured along the flat ground, respectively. Then, $\tan 50^\circ = \frac{h}{c}$, $\tan 35^\circ = \frac{h}{b}$, and $b - c = 10$. Thus, $h = c \tan 50^\circ$ and $h = b \tan 35^\circ = (c + 10) \tan 35^\circ$
 $\Rightarrow c \tan 50^\circ = (c + 10) \tan 35^\circ$
 $\Rightarrow c(\tan 50^\circ - \tan 35^\circ) = 10 \tan 35^\circ$
 $\Rightarrow c = \frac{10 \tan 35^\circ}{\tan 50^\circ - \tan 35^\circ} \Rightarrow h = c \tan 50^\circ$
 $= \frac{10 \tan 35^\circ \tan 50^\circ}{\tan 50^\circ - \tan 35^\circ} \approx 16.98 \text{ m.}$

66. Let h = height of balloon above ground. From the figure at the right, $\tan 40^\circ = \frac{h}{a}$, $\tan 70^\circ = \frac{h}{b}$, and $a + b = 2$. Thus, $h = b \tan 70^\circ \Rightarrow h = (2 - a) \tan 70^\circ$ and $h = a \tan 40^\circ \Rightarrow (2 - a) \tan 70^\circ = a \tan 40^\circ$
 $\Rightarrow a(\tan 40^\circ + \tan 70^\circ) = 2 \tan 70^\circ$
 $\Rightarrow a = \frac{2 \tan 70^\circ}{\tan 40^\circ + \tan 70^\circ} \Rightarrow h = a \tan 40^\circ$
 $= \frac{2 \tan 70^\circ \tan 40^\circ}{\tan 40^\circ + \tan 70^\circ} \approx 1.3 \text{ km.}$

67. (a)

- (b) The period appears to be 4π .
 (c) $f(x + 4\pi) = \sin(x + 4\pi) + \cos\left(\frac{x + 4\pi}{2}\right) = \sin(x + 2\pi) + \cos\left(\frac{x}{2} + 2\pi\right) = \sin x + \cos \frac{x}{2}$
 since the period of sine and cosine is 2π . Thus, $f(x)$ has period 4π .

68. (a)

- (b) $D = (-\infty, 0) \cup (0, \infty); R = [-1, 1]$
 (c) f is not periodic. For suppose f has period p . Then $f\left(\frac{1}{2\pi} + kp\right) = f\left(\frac{1}{2\pi}\right) = \sin 2\pi = 0$ for all integers k .
 Choose k so large that $\frac{1}{2\pi} + kp > \frac{1}{\pi} \Rightarrow 0 < \frac{1}{(1/(2\pi)) + kp} < \pi$. But then $f\left(\frac{1}{2\pi} + kp\right) = \sin\left(\frac{1}{(1/(2\pi)) + kp}\right) > 0$
 which is a contradiction. Thus f has no period, as claimed.

**CHAPTER 1 ADDITIONAL AND ADVANCED EXERCISES**

- There are (infinitely) many such function pairs. For example, $f(x) = 3x$ and $g(x) = 4x$ satisfy $f(g(x)) = f(4x) = 3(4x) = 12x = 4(3x) = g(3x) = g(f(x))$.
- Yes, there are many such function pairs. For example, if $g(x) = (2x + 3)^3$ and $f(x) = x^{1/3}$, then $(f \circ g)(x) = f(g(x)) = f((2x + 3)^3) = ((2x + 3)^3)^{1/3} = 2x + 3$.
- If f is odd and defined at x , then $f(-x) = -f(x)$. Thus $g(-x) = f(-x) - 2 = -f(x) - 2$ whereas $-g(x) = -(f(x) - 2) = -f(x) + 2$. Then g cannot be odd because $g(-x) = -g(x) \Rightarrow -f(x) - 2 = -f(x) + 2 \Rightarrow 4 = 0$, which is a contradiction. Also, $g(x)$ is not even unless $f(x) = 0$ for all x . On the other hand, if f is even, then $g(x) = f(x) - 2$ is also even: $g(-x) = f(-x) - 2 = f(x) - 2 = g(x)$.
- If g is odd and $g(0)$ is defined, then $g(0) = g(-0) = -g(0)$. Therefore, $2g(0) = 0 \Rightarrow g(0) = 0$.

5. For (x, y) in the 1st quadrant, $|x| + |y| = 1 + x$
 $\Leftrightarrow x + y = 1 + x \Leftrightarrow y = 1$. For (x, y) in the 2nd quadrant, $|x| + |y| = x + 1 \Leftrightarrow -x + y = x + 1$
 $\Leftrightarrow y = 2x + 1$. In the 3rd quadrant, $|x| + |y| = x + 1$
 $\Leftrightarrow -x - y = x + 1 \Leftrightarrow y = -2x - 1$. In the 4th quadrant, $|x| + |y| = x + 1 \Leftrightarrow x + (-y) = x + 1$
 $\Leftrightarrow y = -1$. The graph is given at the right.

6. We use reasoning similar to Exercise 5.

- (1) 1st quadrant: $y + |y| = x + |x|$
 $\Leftrightarrow 2y = 2x \Leftrightarrow y = x$.
 (2) 2nd quadrant: $y + |y| = x + |x|$
 $\Leftrightarrow 2y = x + (-x) = 0 \Leftrightarrow y = 0$.
 (3) 3rd quadrant: $y + |y| = x + |x|$
 $\Leftrightarrow y + (-y) = x + (-x) \Leftrightarrow 0 = 0$
 \Rightarrow all points in the 3rd quadrant satisfy the equation.
 (4) 4th quadrant: $y + |y| = x + |x|$
 $\Leftrightarrow y + (-y) = 2x \Leftrightarrow 0 = x$. Combining these results we have the graph given at the right:

7. (a) $\sin^2 x + \cos^2 x = 1 \Rightarrow \sin^2 x = 1 - \cos^2 x = (1 - \cos x)(1 + \cos x) \Rightarrow (1 - \cos x) = \frac{\sin^2 x}{1 + \cos x} \Rightarrow \frac{1 - \cos x}{\sin x} = \frac{\sin x}{1 + \cos x}$
 (b) Using the definition of the tangent function and the double angle formulas, we have

$$\tan^2\left(\frac{x}{2}\right) = \frac{\sin^2\left(\frac{x}{2}\right)}{\cos^2\left(\frac{x}{2}\right)} = \frac{\frac{1 - \cos\left(2\left(\frac{x}{2}\right)\right)}{2}}{\frac{1 + \cos\left(2\left(\frac{x}{2}\right)\right)}{2}} = \frac{1 - \cos x}{1 + \cos x}$$

8. The angles labeled γ in the accompanying figure are equal since both angles subtend arc CD . Similarly, the two angles labeled α are equal since they both subtend arc AB . Thus, triangles AED and BEC are similar which implies $\frac{a - c}{b} = \frac{2a \cos \theta - b}{a + c}$

$$\begin{aligned} \Rightarrow (a - c)(a + c) &= b(2a \cos \theta - b) \\ \Rightarrow a^2 - c^2 &= 2ab \cos \theta - b^2 \\ \Rightarrow c^2 - a^2 + b^2 &= 2ab \cos \theta. \end{aligned}$$

9. As in the proof of the law of sines of Section 1.3, Exercise 61, $ah = bc \sin A = ab \sin C = ac \sin B$
 \Rightarrow the area of $ABC = \frac{1}{2}(\text{base})(\text{height}) = \frac{1}{2}ah = \frac{1}{2}bc \sin A = \frac{1}{2}ab \sin C = \frac{1}{2}ac \sin B$.

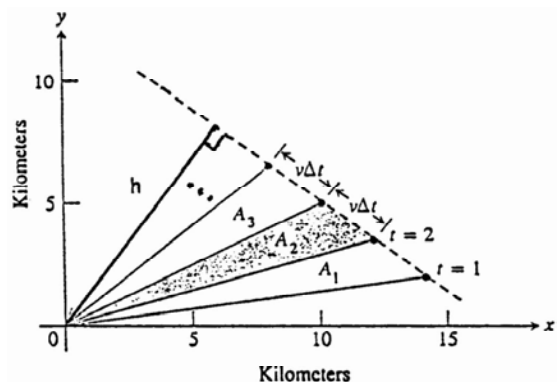

10. As in Section 1.3, Exercise 61, $(\text{Area of } ABC)^2 = \frac{1}{4}(\text{base})^2(\text{height})^2 = \frac{1}{4}a^2h^2 = \frac{1}{4}a^2b^2 \sin^2 C$
 $= \frac{1}{4}a^2b^2(1 - \cos^2 C)$. By the law of cosines, $c^2 = a^2 + b^2 - 2ab \cos C \Rightarrow \cos C = \frac{a^2 + b^2 - c^2}{2ab}$. Thus,

$$\begin{aligned} (\text{area of } ABC)^2 &= \frac{1}{4}a^2b^2(1 - \cos^2 C) = \frac{1}{4}a^2b^2 \left(1 - \left(\frac{a^2 + b^2 - c^2}{2ab}\right)^2\right) = \frac{a^2b^2}{4} \left(1 - \frac{(a^2 + b^2 - c^2)^2}{4a^2b^2}\right) \\ &= \frac{1}{16} \left(4a^2b^2 - (a^2 + b^2 - c^2)^2\right) = \frac{1}{16} [(2ab + (a^2 + b^2 - c^2))(2ab - (a^2 + b^2 - c^2))] \\ &= \frac{1}{16} [((a + b)^2 - c^2)(c^2 - (a - b)^2)] = \frac{1}{16} [(a + b + c)((a + b) - c)(c + (a - b))(c - (a - b))] \\ &= \left[\left(\frac{a + b + c}{2}\right)\left(\frac{-a + b + c}{2}\right)\left(\frac{a - b + c}{2}\right)\left(\frac{a + b - c}{2}\right)\right] = s(s - a)(s - b)(s - c), \text{ where } s = \frac{a + b + c}{2}. \end{aligned}$$

Therefore, the area of ABC equals $\sqrt{s(s - a)(s - b)(s - c)}$.

11. If f is even and odd, then $f(-x) = -f(x)$ and $f(-x) = f(x) \Rightarrow f(x) = -f(x)$ for all x in the domain of f . Thus $2f(x) = 0 \Rightarrow f(x) = 0$.
12. (a) As suggested, let $E(x) = \frac{f(x) + f(-x)}{2} \Rightarrow E(-x) = \frac{f(-x) + f(-(-x))}{2} = \frac{f(-x) + f(x)}{2} = E(x) \Rightarrow E$ is an even function. Define $O(x) = f(x) - E(x) = f(x) - \frac{f(x) + f(-x)}{2} = \frac{f(x) - f(-x)}{2}$. Then $O(-x) = \frac{f(-x) - f(-(-x))}{2} = \frac{f(-x) - f(x)}{2} = -\left(\frac{f(x) - f(-x)}{2}\right) = -O(x) \Rightarrow O$ is an odd function $\Rightarrow f(x) = E(x) + O(x)$ is the sum of an even and an odd function.
- (b) Part (a) shows that $f(x) = E(x) + O(x)$ is the sum of an even and an odd function. If also $f(x) = E_1(x) + O_1(x)$, where E_1 is even and O_1 is odd, then $f(x) - f(x) = 0 = (E_1(x) + O_1(x)) - (E(x) + O(x))$. Thus, $E(x) - E_1(x) = O_1(x) - O(x)$ for all x in the domain of f (which is the same as the domain of $E - E_1$ and $O - O_1$). Now $(E - E_1)(-x) = E(-x) - E_1(-x) = E(x) - E_1(x)$ (since E and E_1 are even) $= (E - E_1)(x) \Rightarrow E - E_1$ is even. Likewise, $(O_1 - O)(-x) = O_1(-x) - O(-x) = -O_1(x) - (-O(x)) = -(O_1(x) - O(x)) = -(O_1 - O)(x) \Rightarrow O_1 - O$ is odd. Therefore, $E - E_1$ and $O_1 - O$ are both even and odd so they must be zero at each x in the domain of f by Exercise 11. That is, $E_1 = E$ and $O_1 = O$, so the decomposition of f found in part (a) is unique.
13. $y = ax^2 + bx + c = a\left(x^2 + \frac{b}{a}x + \frac{b^2}{4a^2}\right) - \frac{b^2}{4a} + c = a\left(x + \frac{b}{2a}\right)^2 - \frac{b^2}{4a} + c$
- (a) If $a > 0$ the graph is a parabola that opens upward. Increasing a causes a vertical stretching and a shift of the vertex toward the y -axis and upward. If $a < 0$ the graph is a parabola that opens downward. Decreasing a causes a vertical stretching and a shift of the vertex toward the y -axis and downward.
- (b) If $a > 0$ the graph is a parabola that opens upward. If also $b > 0$, then increasing b causes a shift of the graph downward to the left; if $b < 0$, then decreasing b causes a shift of the graph downward and to the right. If $a < 0$ the graph is a parabola that opens downward. If $b > 0$, increasing b shifts the graph upward to the right. If $b < 0$, decreasing b shifts the graph upward to the left.
- (c) Changing c (for fixed a and b) by Δc shifts the graph upward Δc units if $\Delta c > 0$, and downward $-\Delta c$ units if $\Delta c < 0$.
14. (a) If $a > 0$, the graph rises to the right of the vertical line $x = -b$ and falls to the left. If $a < 0$, the graph falls to the right of the line $x = -b$ and rises to the left. If $a = 0$, the graph reduces to the horizontal line $y = c$. As $|a|$ increases, the slope at any given point $x = x_0$ increases in magnitude and the graph becomes steeper. As $|a|$ decreases, the slope at x_0 decreases in magnitude and the graph rises or falls more gradually.
- (b) Increasing b shifts the graph to the left; decreasing b shifts it to the right.
- (c) Increasing c shifts the graph upward; decreasing c shifts it downward.

15. Each of the triangles pictured has the same base $b = v\Delta t = v(1 \text{ sec})$. Moreover, the height of each triangle is the same value h . Thus $\frac{1}{2}(\text{base})(\text{height}) = \frac{1}{2}bh = A_1 = A_2 = A_3 = \dots$. In conclusion, the object sweeps out equal areas in each one second interval.

16. (a) Using the midpoint formula, the coordinates of P are $\left(\frac{a+0}{2}, \frac{b+0}{2}\right) = \left(\frac{a}{2}, \frac{b}{2}\right)$. Thus the slope of $\overline{OP} = \frac{\Delta y}{\Delta x} = \frac{b/2}{a/2} = \frac{b}{a}$.
- (b) The slope of $\overline{AB} = \frac{b-0}{0-a} = -\frac{b}{a}$. The line segments \overline{AB} and \overline{OP} are perpendicular when the product of their slopes is $-1 = \left(\frac{b}{a}\right)\left(-\frac{b}{a}\right) = -\frac{b^2}{a^2}$. Thus, $b^2 = a^2 \Rightarrow a = b$ (since both are positive). Therefore, \overline{AB} is perpendicular to \overline{OP} when $a = b$.

17. From the figure we see that $0 \leq \theta \leq \frac{\pi}{2}$ and $AB = AD = 1$. From trigonometry we have the following:

$$\sin \theta = \frac{EB}{AB} = EB, \cos \theta = \frac{AE}{AB} = AE, \tan \theta = \frac{CD}{AD} = CD, \text{ and } \tan \theta = \frac{EB}{AE} = \frac{\sin \theta}{\cos \theta}. \text{ We can see that:}$$

$$\text{area } \triangle AEB < \text{area sector } \overline{DB} < \text{area } \triangle ADC \Rightarrow \frac{1}{2}(AE)(EB) < \frac{1}{2}(AD)^2 \theta < \frac{1}{2}(AD)(CD)$$

$$\Rightarrow \frac{1}{2} \sin \theta \cos \theta < \frac{1}{2} (1)^2 \theta < \frac{1}{2} (1)(\tan \theta) \Rightarrow \frac{1}{2} \sin \theta \cos \theta < \frac{1}{2} \theta < \frac{1}{2} \frac{\sin \theta}{\cos \theta}$$

18. $(f \circ g)(x) = f(g(x)) = a(cx+d) + b = acx + ad + b$ and $(g \circ f)(x) = g(f(x)) = c(ax+b) + d = acx + cb + d$
Thus $(f \circ g)(x) = (g \circ f)(x) \Rightarrow acx + ad + b = acx + bc + d \Rightarrow ad + b = bc + d$. Note that $f(d) = ad + b$ and $g(b) = cb + d$, thus $(f \circ g)(x) = (g \circ f)(x)$ if $f(d) = g(b)$.

19. (a) The expression $a(b^{c-x}) + d$ is defined for all values of x , so the domain is $(-\infty, \infty)$. Since b^{c-x} attains all positive values, the range is (d, ∞) if $a > 0$ and the range is $(-\infty, d)$ if $a < 0$.
- (b) The expression $a \log_b(x-c) + d$ is defined when $x-c > 0$, so the domain is (c, ∞) . Since $a \log_b(x-c) + d$ attains every real value for some value of x , the range is $(-\infty, \infty)$.

20. (a) Suppose $f(x_1) = f(x_2)$. Then:

$$\frac{ax_1+b}{cx_1+d} = \frac{ax_2+b}{cx_2+d}$$

$$(ax_1+b)(cx_2+d) = (ax_2+b)(cx_1+d)$$

$$acx_1x_2 + adx_1 + bcx_2 + bd = acx_1x_2 + adx_2 + bcx_1 + bd$$

$$adx_1 + bcx_2 = adx_2 + bcx_1$$

$$(ad-bc)x_1 = (ad-bc)x_2$$

Since $ad - bc \neq 0$, this means that $x_1 = x_2$.

- (b) $y = \frac{ax+b}{cx+d}$
 $cx + dy = ax + b$
 $(cy - a)x = -dy + b$
 $x = \frac{-dy+b}{cy-a}$

Interchange x and y .

$$y = \frac{-dx+b}{cx-a}$$

$$f^{-1}(x) = \frac{-dx+b}{cx-a}$$

21. (a) $y = 100,000 - 10,000x, 0 \leq x \leq 10$

(b) $y = 55,000$

$100,000 - 10,000x = 55,000$

$-10,000x = 55,000$

$x = 4.5$

The value is \$55,000 after 4.5 years.

22. (a) $f(0) = 90$ units

(b) $f(2) = 90 - 52 \ln 3 \approx 32.8722$ units

$[0, 4]$ by $[-20, 100]$

23. $1500(1.08)^t = 5000 \rightarrow 1.08^t = \frac{5000}{1500} = \frac{10}{3} \rightarrow \ln(1.08)^t = \ln \frac{10}{3} \rightarrow t \ln 1.08 = \ln \frac{10}{3} \rightarrow t = \frac{\ln(10/3)}{\ln 1.08} \approx 15.6439$

It will take about 15.6439 years. (If the bank only pays interest at the end of the year, it will take 16 years.)

24. $A(t) = A_0 e^{rt}; A(t) = 2A_0 \Rightarrow 2A_0 = A_0 e^{rt} \Rightarrow e^{rt} = 2 \Rightarrow rt = \ln 2 \Rightarrow t = \frac{\ln 2}{r} \Rightarrow t \approx \frac{0.7}{r} = \frac{70}{100r} = \frac{70}{(r\%)}$

25. $\ln x^{(x^x)} = x^x \ln x$ and $\ln(x^x)^x = x \ln(x^x) = x^2 \ln x$; then, $x^x \ln x = x^2 \ln x \Rightarrow x^x = x^2 \Rightarrow x \ln x = 2 \ln x \Rightarrow x = 2$.

Therefore, $x^{(x^x)} = (x^x)^x$ when $x = 2$.

26. (a) No, there are two intersections: one at $x = 2$ and the other at $x = 4$.

(b) Yes, because there is only one intersection.

27. $\frac{\log_4 x}{\log_2 x} = \frac{\left(\frac{\ln x}{\ln 4}\right)}{\left(\frac{\ln x}{\ln 2}\right)} = \frac{\ln x}{\ln 4} \cdot \frac{\ln 2}{\ln x} = \frac{\ln 2}{\ln 4} = \frac{\ln 2}{2 \ln 2} = \frac{1}{2}$

28. (a) $f(x) = \frac{\ln 2}{\ln x}, g(x) = \frac{\ln x}{\ln 2}$

(b) f is negative when g is negative, positive when g is positive, and undefined when $g = 0$; the values of f decrease as those of g increase.

(c) $\frac{\ln 2}{\ln x} = \frac{\ln x}{\ln 2} \Rightarrow (\ln 2)^2 = (\ln x)^2$
 $\Rightarrow (\ln 2 \ln x)(\ln 2 + \ln x) = 0 \Rightarrow \ln x = \ln 2$
 or $\ln x = -\ln 2 \Rightarrow e^{\ln x} = e^{\ln 2}$ or
 $e^{\ln x} = e^{\ln(1/2)} \Rightarrow x = 2$ or $x = \frac{1}{2}$.

Therefore, the two curves cross at the two points $\left(\frac{1}{2}, \frac{\ln(1/2)}{\ln 2}\right) = \left(\frac{1}{2}, -1\right)$ and $\left(2, \frac{\ln 2}{\ln 2}\right) = (2, 1)$.

- (b) Approximately 16 m/sec

- (b) $\frac{\Delta p}{\Delta t} = \frac{174-62}{2014-2012} = \frac{112}{2} = 56$ thousand dollars per year
- (c) The average rate of change from 2011 to 2012 is $\frac{\Delta p}{\Delta t} = \frac{62-27}{2012-2011} = 35$ thousand dollars per year.
The average rate of change from 2012 to 2013 is $\frac{\Delta p}{\Delta t} = \frac{111-62}{2013-2012} = 49$ thousand dollars per year.
So, the rate at which profits were changing in 2012 is approximately $\frac{1}{2}(35+49) = 42$ thousand dollars per year.

NOTE: Answers will vary in Exercises 21 and 22.

21. (a) $[0, 1]: \frac{\Delta s}{\Delta t} = \frac{15-0}{1-0} = 15$ mph; $[1, 2.5]: \frac{\Delta s}{\Delta t} = \frac{20-15}{2.5-1} = \frac{10}{3}$ mph; $[2.5, 3.5]: \frac{\Delta s}{\Delta t} = \frac{30-20}{3.5-2.5} = 10$ mph

(b) At $P\left(\frac{1}{2}, 7.5\right)$: Since the portion of the graph from $t = 0$ to $t = 1$ is nearly linear, the instantaneous rate of change will be almost the same as the average rate of change, thus the instantaneous speed at $t = \frac{1}{2}$ is $\frac{15-7.5}{1-0.5} = 15$ mi/hr. At $P(2, 20)$: Since the portion of the graph from $t = 2$ to $t = 2.5$ is nearly linear, the instantaneous rate of change will be nearly the same as the average rate of change, thus $v = \frac{20-20}{2.5-2} = 0$ mi/hr. For values of t less than 2, we have

Q	Slope of $PQ = \frac{\Delta s}{\Delta t}$
$Q_1(1, 15)$	$\frac{15-20}{1-2} = 5$ mi/hr
$Q_2(1.5, 19)$	$\frac{19-20}{1.5-2} = 2$ mi/hr
$Q_3(1.9, 19.9)$	$\frac{19.9-20}{1.9-2} = 1$ mi/hr

Thus, it appears that the instantaneous speed at $t = 2$ is 0 mi/hr.

At $P(3, 22)$:

Q	Slope of $PQ = \frac{\Delta s}{\Delta t}$	Q	Slope of $PQ = \frac{\Delta s}{\Delta t}$
$Q_1(4, 35)$	$\frac{35-22}{4-3} = 13$ mi/hr	$Q_1(2, 20)$	$\frac{20-22}{2-3} = 2$ mi/hr
$Q_2(3.5, 30)$	$\frac{30-22}{3.5-3} = 16$ mi/hr	$Q_2(2.5, 20)$	$\frac{20-22}{2.5-3} = 4$ mi/hr
$Q_3(3.1, 23)$	$\frac{23-22}{3.1-3} = 10$ mi/hr	$Q_3(2.9, 21.6)$	$\frac{21.6-22}{2.9-3} = 4$ mi/hr

Thus, it appears that the instantaneous speed at $t = 3$ is about 7 mi/hr.

- (c) It appears that the curve is increasing the fastest at
- $t = 3.5$
- . Thus for
- $P(3.5, 30)$

Q	Slope of $PQ = \frac{\Delta s}{\Delta t}$	Q	Slope of $PQ = \frac{\Delta s}{\Delta t}$
$Q_1(4, 35)$	$\frac{35-30}{4-3.5} = 10$ mi/hr	$Q_1(3, 22)$	$\frac{22-30}{3-3.5} = 16$ mi/hr
$Q_2(3.75, 34)$	$\frac{34-30}{3.75-3.5} = 16$ mi/hr	$Q_2(3.25, 25)$	$\frac{25-30}{3.25-3.5} = 20$ mi/hr
$Q_3(3.6, 32)$	$\frac{32-30}{3.6-3.5} = 20$ mi/hr	$Q_3(3.4, 28)$	$\frac{28-30}{3.4-3.5} = 20$ mi/hr

Thus, it appears that the instantaneous speed at $t = 3.5$ is about 20 mi/hr.

22. (a)
- $[0, 3]: \frac{\Delta A}{\Delta t} = \frac{10-15}{3-0} \approx -1.67 \frac{\text{gal}}{\text{day}}$

- $[0, 5]: \frac{\Delta A}{\Delta t} = \frac{3.9-15}{5-0} \approx -2.2 \frac{\text{gal}}{\text{day}}$
- ;
- $[7, 10]: \frac{\Delta A}{\Delta t} = \frac{0-1.4}{10-7} \approx -0.5 \frac{\text{gal}}{\text{day}}$

- (b) At
- $P(1, 14)$
- :

Q	Slope of $PQ = \frac{\Delta A}{\Delta t}$	Q	Slope of $PQ = \frac{\Delta A}{\Delta t}$
$Q_1(2, 12.2)$	$\frac{12.2-14}{2-1} = -1.8$ gal/day	$Q_1(0, 15)$	$\frac{15-14}{0-1} = -1$ gal/day
$Q_2(1.5, 13.2)$	$\frac{13.2-14}{1.5-1} = -1.6$ gal/day	$Q_2(0.5, 14.6)$	$\frac{14.6-14}{0.5-1} = -1.2$ gal/day
$Q_3(1.1, 13.85)$	$\frac{13.85-14}{1.1-1} = -1.5$ gal/day	$Q_3(0.9, 14.86)$	$\frac{14.86-14}{0.9-1} = -1.4$ gal/day

Thus, it appears that the instantaneous rate of consumption at $t = 1$ is about -1.45 gal/day.

At $P(4, 6)$:

Q	Slope of $PQ = \frac{\Delta A}{\Delta t}$	Q	Slope of $PQ = \frac{\Delta A}{\Delta t}$
$Q_1(5, 3.9)$	$\frac{3.9-6}{5-4} = -2.1$ gal/day	$Q_1(3, 10)$	$\frac{10-6}{3-4} = -4$ gal/day
$Q_2(4.5, 4.8)$	$\frac{4.8-6}{4.5-4} = -2.4$ gal/day	$Q_2(3.5, 7.8)$	$\frac{7.8-6}{3.5-4} = -3.6$ gal/day
$Q_3(4.1, 5.7)$	$\frac{5.7-6}{4.1-4} = -3$ gal/day	$Q_3(3.9, 6.3)$	$\frac{6.3-6}{3.9-4} = -3$ gal/day

Thus, it appears that the instantaneous rate of consumption at $t = 1$ is -3 gal/day.

At $P(8, 1)$:

Q	Slope of $PQ = \frac{\Delta A}{\Delta t}$	Q	Slope of $PQ = \frac{\Delta A}{\Delta t}$
$Q_1(9, 0.5)$	$\frac{0.5-1}{9-8} = -0.5$ gal/day	$Q_1(7, 1.4)$	$\frac{1.4-1}{7-8} = -0.6$ gal/day
$Q_2(8.5, 0.7)$	$\frac{0.7-1}{8.5-8} = -0.6$ gal/day	$Q_2(7.5, 1.3)$	$\frac{1.3-1}{7.5-8} = -0.6$ gal/day
$Q_3(8.1, 0.95)$	$\frac{0.95-1}{8.1-8} = -0.5$ gal/day	$Q_3(7.9, 1.04)$	$\frac{1.04-1}{7.9-8} = -0.6$ gal/day

Thus, it appears that the instantaneous rate of consumption at $t = 1$ is -0.55 gal/day.

- (c) It appears that the curve (the consumption) is decreasing the fastest at
- $t = 3.5$
- . Thus for
- $P(3.5, 7.8)$

Q	Slope of $PQ = \frac{\Delta A}{\Delta t}$	Q	Slope of $PQ = \frac{\Delta s}{\Delta t}$
$Q_1(4.5, 4.8)$	$\frac{4.8-7.8}{4.5-3.5} = -3$ gal/day	$Q_1(2.5, 11.2)$	$\frac{11.2-7.8}{2.5-3.5} = -3.4$ gal/day
$Q_2(4, 6)$	$\frac{6-7.8}{4-3.5} = -3.6$ gal/day	$Q_2(3, 10)$	$\frac{10-7.8}{3-3.5} = -4.4$ gal/day
$Q_3(3.6, 7.4)$	$\frac{7.4-7.8}{3.6-3.5} = -4$ gal/day	$Q_3(3.4, 8.2)$	$\frac{8.2-7.8}{3.4-3.5} = -4$ gal/day

Thus, it appears that the rate of consumption at $t = 3.5$ is about -4 gal/day.

2.2 LIMIT OF A FUNCTION AND LIMIT LAWS

- Does not exist. As x approaches 1 from the right, $g(x)$ approaches 0. As x approaches 1 from the left, $g(x)$ approaches 1. There is no single number L that all the values $g(x)$ get arbitrarily close to as $x \rightarrow 1$.

- (c) Does not exist. As t approaches 0 from the left, $f(t)$ approaches -1 . As t approaches 0 from the right, $f(t)$ approaches 1. There is no single number L that $f(t)$ gets arbitrarily close to as $t \rightarrow 0$.
- (d) -1
3. (a) True (b) True (c) False
(d) False (e) False (f) True
(g) True
4. (a) False (b) False (c) True
(d) True (e) True
5. $\lim_{x \rightarrow 0} \frac{x}{|x|}$ does not exist because $\frac{x}{|x|} = \frac{x}{x} = 1$ if $x > 0$ and $\frac{x}{|x|} = \frac{x}{-x} = -1$ if $x < 0$. As x approaches 0 from the left, $\frac{x}{|x|}$ approaches -1 . As x approaches 0 from the right, $\frac{x}{|x|}$ approaches 1. There is no single number L that all the function values get arbitrarily close to as $x \rightarrow 0$.
6. As x approaches 1 from the left, the values of $\frac{1}{x-1}$ become increasingly large and negative. As x approaches 1 from the right, the values become increasingly large and positive. There is no number L that all the function values get arbitrarily close to as $x \rightarrow 1$, so $\lim_{x \rightarrow 1} \frac{1}{x-1}$ does not exist.
7. Nothing can be said about $f(x)$ because the existence of a limit as $x \rightarrow x_0$ does not depend on how the function is defined at x_0 . In order for a limit to exist, $f(x)$ must be arbitrarily close to a single real number L when x is close enough to x_0 . That is, the existence of a limit depends on the values of $f(x)$ for x near x_0 , not on the definition of $f(x)$ at x_0 itself.
8. Nothing can be said. In order for $\lim_{x \rightarrow 0} f(x)$ to exist, $f(x)$ must close to a single value for x near 0 regardless of the value $f(0)$ itself.
9. No, the definition does not require that f be defined at $x = 1$ in order for a limiting value to exist there. If $f(1)$ is defined, it can be any real number, so we can conclude nothing about $f(1)$ from $\lim_{x \rightarrow 1} f(x) = 5$.
10. No, because the existence of a limit depends on the values of $f(x)$ when x is near 1, not on $f(1)$ itself. If $\lim_{x \rightarrow 1} f(x)$ exists, its value may be some number other than $f(1) = 5$. We can conclude nothing about $\lim_{x \rightarrow 1} f(x)$, whether it exists or what its value is if it does exist, from knowing the value of $f(1)$ alone.
11. $\lim_{x \rightarrow -3} (x^2 - 13) = (-3)^2 - 13 = 9 - 13 = -4$

85-90. Example CAS commands:

Maple:

```
f := x -> (x^4 - 16)/(x - 2);
x0 := 2;
plot( f(x), x = x0-1..x0+1, color = black,
      title = "Section 2.2, #85(a)" );
limit( f(x), x = x0 );
```

In Exercise 87, note that the standard cube root, $x^{1/3}$, is not defined for $x < 0$ in many CASs. This can be overcome in Maple by entering the function as $f := x \rightarrow (\text{surd}(x+1, 3) - 1)/x$.

Mathematica: (assigned function and values for x_0 and h may vary)

```
Clear[f, x]
f[x_]:= (x^3 - x^2 - 5x - 3)/(x + 1)^2
x0 = -1; h = 0.1;
Plot[f[x], {x, x0 - h, x0 + h}]
Limit[f[x], x -> x0]
```

2.3 THE PRECISE DEFINITION OF A LIMIT

Step 1: $|x - 5| < \delta \Rightarrow -\delta < x - 5 < \delta \Rightarrow -\delta + 5 < x < \delta + 5$

Step 2: $\delta + 5 = 7 \Rightarrow \delta = 2$, or $-\delta + 5 = 1 \Rightarrow \delta = 4$.

The value of δ which assures $|x - 5| < \delta \Rightarrow 1 < x < 7$ is the smaller value, $\delta = 2$.

Step 1: $|x - 2| < \delta \Rightarrow -\delta < x - 2 < \delta \Rightarrow -\delta + 2 < x < \delta + 2$

Step 2: $-\delta + 2 = 1 \Rightarrow \delta = 1$, or $\delta + 2 = 7 \Rightarrow \delta = 5$.

The value of δ which assures $|x - 2| < \delta \Rightarrow 1 < x < 7$ is the smaller value, $\delta = 1$.

Step 1: $|x - (-3)| < \delta \Rightarrow -\delta < x + 3 < \delta \Rightarrow -\delta - 3 < x < \delta - 3$

Step 2: $-\delta - 3 = -7/2 \Rightarrow \delta = 1/2$, or $\delta - 3 = -1/2 \Rightarrow \delta = 5/2$.

The value of δ which assures $|x - (-3)| < \delta \Rightarrow -7/2 < x < -1/2$ is the smaller value, $\delta = 1/2$.

Step 1: $|x - (-3/2)| < \delta \Rightarrow -\delta < x + 3/2 < \delta \Rightarrow -\delta - 3/2 < x < \delta - 3/2$

Step 2: $-\delta - 3/2 = -7/2 \Rightarrow \delta = 2$, or $\delta - 3/2 = -1/2 \Rightarrow \delta = 1$.

The value of δ which assures $|x - (-3/2)| < \delta \Rightarrow -7/2 < x < -1/2$ is the smaller value, $\delta = 1$.

Step 1: $|x - 1/2| < \delta \Rightarrow -\delta < x - 1/2 < \delta \Rightarrow -\delta + 1/2 < x < \delta + 1/2$

Step 2: $-\delta + 1/2 = 4/9 \Rightarrow \delta = 1/18$, or $\delta + 1/2 = 4/7 \Rightarrow \delta = 1/14$.

The value of δ which assures $|x - 1/2| < \delta \Rightarrow 4/9 < x < 4/7$ is the smaller value, $\delta = 1/18$.

6.

Step 1: $|x-3| < \delta \Rightarrow -\delta < x-3 < \delta \Rightarrow -\delta+3 < x < \delta+3$

Step 2: $-\delta+3 = 2.7591 \Rightarrow \delta = 0.2409$, or $\delta+3 = 3.2391 \Rightarrow \delta = 0.2391$.

The value of δ which assures $|x-3| < \delta \Rightarrow 2.7591 < x < 3.2391$ is the smaller value, $\delta = 0.2391$.

7. Step 1: $|x-5| < \delta \Rightarrow -\delta < x-5 < \delta \Rightarrow -\delta+5 < x < \delta+5$
 Step 2: From the graph, $-\delta+5 = 4.9 \Rightarrow \delta = 0.1$, or $\delta+5 = 5.1 \Rightarrow \delta = 0.1$; thus $\delta = 0.1$ in either case.
8. Step 1: $|x-(-3)| < \delta \Rightarrow -\delta < x+3 < \delta \Rightarrow -\delta-3 < x < \delta-3$
 Step 2: From the graph, $-\delta-3 = -3.1 \Rightarrow \delta = 0.1$, or $\delta-3 = -2.9 \Rightarrow \delta = 0.1$; thus $\delta = 0.1$.
9. Step 1: $|x-1| < \delta \Rightarrow -\delta < x-1 < \delta \Rightarrow -\delta+1 < x < \delta+1$
 Step 2: From the graph, $-\delta+1 = \frac{9}{16} \Rightarrow \delta = \frac{7}{16}$, or $\delta+1 = \frac{25}{16} \Rightarrow \delta = \frac{9}{16}$; thus $\delta = \frac{7}{16}$.
10. Step 1: $|x-3| < \delta \Rightarrow -\delta < x-3 < \delta \Rightarrow -\delta+3 < x < \delta+3$
 Step 2: From the graph, $-\delta+3 = 2.61 \Rightarrow \delta = 0.39$, or $\delta+3 = 3.41 \Rightarrow \delta = 0.41$; thus $\delta = 0.39$.
11. Step 1: $|x-2| < \delta \Rightarrow -\delta < x-2 < \delta \Rightarrow -\delta+2 < x < \delta+2$
 Step 2: From the graph, $-\delta+2 = \sqrt{3} \Rightarrow \delta = 2-\sqrt{3} \approx 0.2679$, or $\delta+2 = \sqrt{5} \Rightarrow \delta = \sqrt{5}-2 \approx 0.2361$; thus $\delta = \sqrt{5}-2$.
12. Step 1: $|x-(-1)| < \delta \Rightarrow -\delta < x+1 < \delta \Rightarrow -\delta-1 < x < \delta-1$
 Step 2: From the graph, $-\delta-1 = -\frac{\sqrt{5}}{2} \Rightarrow \delta = \frac{\sqrt{5}-2}{2} \approx 0.118$ or $\delta-1 = -\frac{\sqrt{3}}{2} \Rightarrow \delta = \frac{2-\sqrt{3}}{2} \approx 0.1340$; thus $\delta = \frac{\sqrt{5}-2}{2}$.
13. Step 1: $|x-(-1)| < \delta \Rightarrow -\delta < x+1 < \delta \Rightarrow -\delta-1 < x < \delta-1$
 Step 2: From the graph, $-\delta-1 = -\frac{16}{9} \Rightarrow \delta = \frac{7}{9} \approx 0.77$, or $\delta-1 = -\frac{16}{25} \Rightarrow \frac{9}{25} = 0.36$; thus $\delta = \frac{9}{25} = 0.36$.
14. Step 1: $|x-\frac{1}{2}| < \delta \Rightarrow -\delta < x-\frac{1}{2} < \delta \Rightarrow -\delta+\frac{1}{2} < x < \delta+\frac{1}{2}$
 Step 2: From the graph, $-\delta+\frac{1}{2} = \frac{1}{2.01} \Rightarrow \delta = \frac{1}{2} - \frac{1}{2.01} \approx 0.00248$, or $\delta+\frac{1}{2} = \frac{1}{1.99} \Rightarrow \delta = \frac{1}{1.99} - \frac{1}{2} \approx 0.00251$; thus $\delta = 0.00248$.
15. Step 1: $|(x+1)-5| < 0.01 \Rightarrow |x-4| < 0.01 \Rightarrow -0.01 < x-4 < 0.01 \Rightarrow 3.99 < x < 4.01$
 Step 2: $|x-4| < \delta \Rightarrow -\delta < x-4 < \delta \Rightarrow -\delta+4 < x < \delta+4 \Rightarrow \delta = 0.01$.
16. Step 1: $|(2x-2)-(-6)| < 0.02 \Rightarrow |2x+4| < 0.02 \Rightarrow -0.02 < 2x+4 < 0.02$
 $\Rightarrow -4.02 < 2x < -3.98 \Rightarrow -2.01 < x < -1.99$
 Step 2: $|x-(-2)| < \delta \Rightarrow -\delta < x+2 < \delta \Rightarrow -\delta-2 < x < \delta-2 \Rightarrow \delta = 0.01$.
17. Step 1: $|\sqrt{x+1}-1| < 0.1 \Rightarrow -0.1 < \sqrt{x+1}-1 < 0.1 \Rightarrow 0.9 < \sqrt{x+1} < 1.1 \Rightarrow 0.81 < x+1 < 1.21$
 $\Rightarrow -0.19 < x < 0.21$
 Step 2: $|x-0| < \delta \Rightarrow -\delta < x < \delta$. Then, $-\delta = -0.19 \Rightarrow \delta = 0.19$ or $\delta = 0.21$; thus, $\delta = 0.19$.

18. Step 1: $\left|\sqrt{x} - \frac{1}{2}\right| < 0.1 \Rightarrow -0.1 < \sqrt{x} - \frac{1}{2} < 0.1 \Rightarrow 0.4 < \sqrt{x} < 0.6 \Rightarrow 0.16 < x < 0.36$
 Step 2: $\left|x - \frac{1}{4}\right| < \delta \Rightarrow -\delta < x - \frac{1}{4} < \delta \Rightarrow -\delta + \frac{1}{4} < x < \delta + \frac{1}{4}$.
 Then $-\delta + \frac{1}{4} = 0.16 \Rightarrow \delta = 0.09$ or $\delta + \frac{1}{4} = 0.36 \Rightarrow \delta = 0.11$; thus $\delta = 0.09$.
19. Step 1: $\left|\sqrt{19-x} - 3\right| < 1 \Rightarrow -1 < \sqrt{19-x} - 3 < 1 \Rightarrow 2 < \sqrt{19-x} < 4 \Rightarrow 4 < 19-x < 16$
 $\Rightarrow -4 > x - 19 > -16 \Rightarrow 15 > x > 3$ or $3 < x < 15$
 Step 2: $|x - 10| < \delta \Rightarrow -\delta < x - 10 < \delta \Rightarrow -\delta + 10 < x < \delta + 10$.
 Then $-\delta + 10 = 3 \Rightarrow \delta = 7$, or $\delta + 10 = 15 \Rightarrow \delta = 5$; thus $\delta = 5$.
20. Step 1: $\left|\sqrt{x-7} - 4\right| < 1 \Rightarrow -1 < \sqrt{x-7} - 4 < 1 \Rightarrow 3 < \sqrt{x-7} < 5 \Rightarrow 9 < x-7 < 25 \Rightarrow 16 < x < 32$
 Step 2: $|x - 23| < \delta \Rightarrow -\delta < x - 23 < \delta \Rightarrow -\delta + 23 < x < \delta + 23$.
 Then $-\delta + 23 = 16 \Rightarrow \delta = 7$, or $\delta + 23 = 32 \Rightarrow \delta = 9$; thus $\delta = 7$.
21. Step 1: $\left|\frac{1}{x} - \frac{1}{4}\right| < 0.05 \Rightarrow -0.05 < \frac{1}{x} - \frac{1}{4} < 0.05 \Rightarrow 0.2 < \frac{1}{x} < 0.3 \Rightarrow \frac{10}{2} > x > \frac{10}{3}$ or $\frac{10}{3} < x < 5$.
 Step 2: $|x - 4| < \delta \Rightarrow -\delta < x - 4 < \delta \Rightarrow -\delta + 4 < x < \delta + 4$.
 Then $-\delta + 4 = \frac{10}{3}$ or $\delta = \frac{2}{3}$, or $\delta + 4 = 5$ or $\delta = 1$; thus $\delta = \frac{2}{3}$.
22. Step 1: $|x^2 - 3| < 0.1 \Rightarrow -0.1 < x^2 - 3 < 0.1 \Rightarrow 2.9 < x^2 < 3.1 \Rightarrow \sqrt{2.9} < x < \sqrt{3.1}$
 Step 2: $|x - \sqrt{3}| < \delta \Rightarrow -\delta < x - \sqrt{3} < \delta \Rightarrow -\delta + \sqrt{3} < x < \delta + \sqrt{3}$.
 Then $-\delta + \sqrt{3} = \sqrt{2.9} \Rightarrow \delta = \sqrt{3} - \sqrt{2.9} \approx 0.0291$, or $\delta + \sqrt{3} = \sqrt{3.1} \Rightarrow \delta = \sqrt{3.1} - \sqrt{3} \approx 0.0286$;
 thus $\delta = 0.0286$
23. Step 1: $|x^2 - 4| < 0.5 \Rightarrow -0.5 < x^2 - 4 < 0.5 \Rightarrow 3.5 < x^2 < 4.5 \Rightarrow \sqrt{3.5} < |x| < \sqrt{4.5} \Rightarrow -\sqrt{4.5} < x < -\sqrt{3.5}$,
 for x near -2 .
 Step 2: $|x - (-2)| < \delta \Rightarrow -\delta < x + 2 < \delta \Rightarrow -\delta - 2 < x < \delta - 2$.
 Then $-\delta - 2 = -\sqrt{4.5} \Rightarrow \delta = \sqrt{4.5} - 2 \approx 0.1213$, or $\delta - 2 = -\sqrt{3.5} \Rightarrow \delta = 2 - \sqrt{3.5} \approx 0.1292$;
 thus $\delta = \sqrt{4.5} - 2 \approx 0.12$.
24. Step 1: $\left|\frac{1}{x} - (-1)\right| < 0.1 \Rightarrow -0.1 < \frac{1}{x} + 1 < 0.1 \Rightarrow -\frac{11}{10} < \frac{1}{x} < -\frac{9}{10} \Rightarrow -\frac{10}{11} > x > -\frac{10}{9}$ or $-\frac{10}{9} < x < -\frac{10}{11}$.
 Step 2: $|x - (-1)| < \delta \Rightarrow -\delta < x + 1 < \delta \Rightarrow -\delta - 1 < x < \delta - 1$.
 Then $-\delta - 1 = -\frac{10}{9} \Rightarrow \delta = \frac{1}{9}$, or $\delta - 1 = -\frac{10}{11} \Rightarrow \delta = \frac{1}{11}$; thus $\delta = \frac{1}{11}$.
25. Step 1: $\left|(x^2 - 5) - 11\right| < 1 \Rightarrow |x^2 - 16| < 1 \Rightarrow -1 < x^2 - 16 < 1 \Rightarrow 15 < x^2 < 17 \Rightarrow \sqrt{15} < x < \sqrt{17}$.
 Step 2: $|x - 4| < \delta \Rightarrow -\delta < x - 4 < \delta \Rightarrow -\delta + 4 < x < \delta + 4$.
 Then $-\delta + 4 = \sqrt{15} \Rightarrow \delta = 4 - \sqrt{15} \approx 0.1270$, or $\delta + 4 = \sqrt{17} \Rightarrow \delta = \sqrt{17} - 4 \approx 0.1231$; thus
 $\delta = \sqrt{17} - 4 \approx 0.12$.
26. Step 1: $\left|\frac{120}{x} - 5\right| < 1 \Rightarrow -1 < \frac{120}{x} - 5 < 1 \Rightarrow 4 < \frac{120}{x} < 6 \Rightarrow \frac{1}{4} > \frac{x}{120} > \frac{1}{6} \Rightarrow 30 > x > 20$ or $20 < x < 30$.
 Step 2: $|x - 24| < \delta \Rightarrow -\delta < x - 24 < \delta \Rightarrow -\delta + 24 < x < \delta + 24$.
 Then $-\delta + 24 = 20 \Rightarrow \delta = 4$, or $\delta + 24 = 30 \Rightarrow \delta = 6$; thus $\delta = 4$.
27. Step 1: $|mx - 2m| < 0.03 \Rightarrow -0.03 < mx - 2m < 0.03 \Rightarrow -0.03 + 2m < mx < 0.03 + 2m \Rightarrow 2 - \frac{0.03}{m} < x < 2 + \frac{0.03}{m}$.
 Step 2: $|x - 2| < \delta \Rightarrow -\delta < x - 2 < \delta \Rightarrow -\delta + 2 < x < \delta + 2$.
 Then $-\delta + 2 = 2 - \frac{0.03}{m} \Rightarrow \delta = \frac{0.03}{m}$, or $\delta + 2 = 2 + \frac{0.03}{m} \Rightarrow \delta = \frac{0.03}{m}$. In either case, $\delta = \frac{0.03}{m}$.

28. Step 1: $|mx - 3m| < c \Rightarrow -c < mx - 3m < c \Rightarrow -c + 3m < mx < c + 3m \Rightarrow 3 - \frac{c}{m} < x < 3 + \frac{c}{m}$
 Step 2: $|x - 3| < \delta \Rightarrow -\delta < x - 3 < \delta \Rightarrow -\delta + 3 < x < \delta + 3$.
 Then $-\delta + 3 = 3 - \frac{c}{m} \Rightarrow \delta = \frac{c}{m}$, or $\delta + 3 = 3 + \frac{c}{m} \Rightarrow \delta = \frac{c}{m}$. In either case, $\delta = \frac{c}{m}$.
29. Step 1: $\left| (mx + b) - \left(\frac{m}{2} + b \right) \right| < c \Rightarrow -c < mx - \frac{m}{2} < c \Rightarrow -c + \frac{m}{2} < mx < c + \frac{m}{2} \Rightarrow \frac{1}{2} - \frac{c}{m} < x < \frac{1}{2} + \frac{c}{m}$.
 Step 2: $\left| x - \frac{1}{2} \right| < \delta \Rightarrow -\delta < x - \frac{1}{2} < \delta \Rightarrow -\delta + \frac{1}{2} < x < \delta + \frac{1}{2}$.
 Then $-\delta + \frac{1}{2} = \frac{1}{2} - \frac{c}{m} \Rightarrow \delta = \frac{c}{m}$, or $\delta + \frac{1}{2} = \frac{1}{2} + \frac{c}{m} \Rightarrow \delta = \frac{c}{m}$. In either case, $\delta = \frac{c}{m}$.
30. Step 1: $\left| (mx + b) - (m + b) \right| < 0.05 \Rightarrow -0.05 < mx - m < 0.05 \Rightarrow -0.05 + m < mx < 0.05 + m$
 $\Rightarrow 1 - \frac{0.05}{m} < x < 1 + \frac{0.05}{m}$.
 Step 2: $|x - 1| < \delta \Rightarrow -\delta < x - 1 < \delta \Rightarrow -\delta + 1 < x < \delta + 1$.
 Then $-\delta + 1 = 1 - \frac{0.05}{m} \Rightarrow \delta = \frac{0.05}{m}$, or $\delta + 1 = 1 + \frac{0.05}{m} \Rightarrow \delta = \frac{0.05}{m}$. In either case, $\delta = \frac{0.05}{m}$.
31. $\lim_{x \rightarrow 3} (3 - 2x) = 3 - 2(3) = -3$
 Step 1: $\left| (3 - 2x) - (-3) \right| < 0.02 \Rightarrow -0.02 < 6 - 2x < 0.02 \Rightarrow -6.02 < -2x < -5.98 \Rightarrow 3.01 > x > 2.99$ or
 $2.99 < x < 3.01$.
 Step 2: $0 < |x - 3| < \delta \Rightarrow -\delta < x - 3 < \delta \Rightarrow -\delta + 3 < x < \delta + 3$.
 Then $-\delta + 3 = 2.99 \Rightarrow \delta = 0.01$, or $\delta + 3 = 3.01 \Rightarrow \delta = 0.01$; thus $\delta = 0.01$.
32. $\lim_{x \rightarrow -1} (-3x - 2) = (-3)(-1) - 2 = 1$
 Step 1: $\left| (-3x - 2) - 1 \right| < 0.03 \Rightarrow -0.03 < -3x - 3 < 0.03 \Rightarrow 0.01 > x + 1 > -0.01 \Rightarrow -1.01 < x < -0.99$.
 Step 2: $|x - (-1)| < \delta \Rightarrow -\delta < x + 1 < \delta \Rightarrow -\delta - 1 < x < \delta - 1$.
 Then $-\delta - 1 = -1.01 \Rightarrow \delta = 0.01$, or $\delta - 1 = -0.99 \Rightarrow \delta = 0.01$; thus $\delta = 0.01$.
33. $\lim_{x \rightarrow 2} \frac{x^2 - 4}{x - 2} = \lim_{x \rightarrow 2} \frac{(x+2)(x-2)}{(x-2)} = \lim_{x \rightarrow 2} (x + 2) = 2 + 2 = 4, x \neq 2$
 Step 1: $\left| \left(\frac{x^2 - 4}{x - 2} \right) - 4 \right| < 0.05 \Rightarrow -0.05 < \frac{(x+2)(x-2)}{(x-2)} - 4 < 0.05 \Rightarrow 3.95 < x + 2 < 4.05, x \neq 2$
 $\Rightarrow 1.95 < x < 2.05, x \neq 2$.
 Step 2: $|x - 2| < \delta \Rightarrow -\delta < x - 2 < \delta \Rightarrow -\delta + 2 < x < \delta + 2$.
 Then $-\delta + 2 = 1.95 \Rightarrow \delta = 0.05$, or $\delta + 2 = 2.05 \Rightarrow \delta = 0.05$; thus $\delta = 0.05$.
34. $\lim_{x \rightarrow -5} \frac{x^2 + 6x + 5}{x + 5} = \lim_{x \rightarrow -5} \frac{(x+5)(x+1)}{(x+5)} = \lim_{x \rightarrow -5} (x + 1) = -4, x \neq -5$.
 Step 1: $\left| \left(\frac{x^2 + 6x + 5}{x + 5} \right) - (-4) \right| < 0.05 \Rightarrow -0.05 < \frac{(x+5)(x+1)}{(x+5)} + 4 < 0.05 \Rightarrow -4.05 < x + 1 < -3.95, x \neq -5$
 $\Rightarrow -5.05 < x < -4.95, x \neq -5$.
 Step 2: $|x - (-5)| < \delta \Rightarrow -\delta < x + 5 < \delta \Rightarrow -\delta - 5 < x < \delta - 5$.
 Then $-\delta - 5 = -5.05 \Rightarrow \delta = 0.05$, or $\delta - 5 = -4.95 \Rightarrow \delta = 0.05$; thus $\delta = 0.05$.
35. $\lim_{x \rightarrow -3} \sqrt{1 - 5x} = \sqrt{1 - 5(-3)} = \sqrt{16} = 4$
 Step 1: $\left| \sqrt{1 - 5x} - 4 \right| < 0.5 \Rightarrow -0.5 < \sqrt{1 - 5x} - 4 < 0.5 \Rightarrow 3.5 < \sqrt{1 - 5x} < 4.5 \Rightarrow 12.25 < 1 - 5x < 20.25$
 $\Rightarrow 11.25 < -5x < 19.25 \Rightarrow -3.85 < x < 2.25$.
 Step 2: $|x - (-3)| < \delta \Rightarrow -\delta < x + 3 < \delta \Rightarrow -\delta - 3 < x < \delta - 3$.
 Then $-\delta - 3 = -3.85 \Rightarrow \delta = 0.85$, or $\delta - 3 = -2.25 \Rightarrow \delta = 0.75$; thus $\delta = 0.75$.

36. $\lim_{x \rightarrow 2} \frac{4}{x} = \frac{4}{2} = 2$
 Step 1: $\left| \frac{4}{x} - 2 \right| < 0.4 \Rightarrow -0.4 < \frac{4}{x} - 2 < 0.4 \Rightarrow 1.6 < \frac{4}{x} < 2.4 \Rightarrow \frac{10}{16} > \frac{x}{4} > \frac{10}{24} \Rightarrow \frac{10}{4} > x > \frac{10}{6}$ or $\frac{5}{3} < x < \frac{5}{2}$.
 Step 2: $|x-2| < \delta \Rightarrow -\delta < x-2 < \delta \Rightarrow -\delta+2 < x < \delta+2$.
 Then $-\delta+2 = \frac{5}{3} \Rightarrow \delta = \frac{1}{3}$, or $\delta+2 = \frac{5}{2} \Rightarrow \delta = \frac{1}{2}$; thus $\delta = \frac{1}{3}$.
37. Step 1: $|(9-x)-5| < \epsilon \Rightarrow -\epsilon < 4-x < \epsilon \Rightarrow -\epsilon-4 < -x < \epsilon-4 \Rightarrow \epsilon+4 > x > 4-\epsilon \Rightarrow 4-\epsilon < x < 4+\epsilon$.
 Step 2: $|x-4| < \delta \Rightarrow -\delta < x-4 < \delta \Rightarrow -\delta+4 < x < \delta+4$.
 Then $-\delta+4 = -\epsilon+4 \Rightarrow \delta = \epsilon$, or $\delta+4 = \epsilon+4 \Rightarrow \delta = \epsilon$. Thus choose $\delta = \epsilon$.
38. Step 1: $|(3x-7)-2| < \epsilon \Rightarrow -\epsilon < 3x-9 < \epsilon \Rightarrow 9-\epsilon < 3x < 9+\epsilon \Rightarrow 3-\frac{\epsilon}{3} < x < 3+\frac{\epsilon}{3}$.
 Step 2: $|x-3| < \delta \Rightarrow -\delta < x-3 < \delta \Rightarrow -\delta+3 < x < \delta+3$.
 Then $-\delta+3 = 3-\frac{\epsilon}{3} \Rightarrow \delta = \frac{\epsilon}{3}$, or $\delta+3 = 3+\frac{\epsilon}{3} \Rightarrow \delta = \frac{\epsilon}{3}$. Thus choose $\delta = \frac{\epsilon}{3}$.
39. Step 1: $|\sqrt{x-5}-2| < \epsilon \Rightarrow -\epsilon < \sqrt{x-5}-2 < \epsilon \Rightarrow 2-\epsilon < \sqrt{x-5} < 2+\epsilon \Rightarrow (2-\epsilon)^2 < x-5 < (2+\epsilon)^2$
 $\Rightarrow (2-\epsilon)^2 + 5 < x < (2+\epsilon)^2 + 5$.
 Step 2: $|x-9| < \delta \Rightarrow -\delta < x-9 < \delta \Rightarrow -\delta+9 < x < \delta+9$.
 Then $-\delta+9 = \epsilon^2 - 4\epsilon + 9 \Rightarrow \delta = 4\epsilon - \epsilon^2$, or $\delta+9 = \epsilon^2 + 4\epsilon + 9 \Rightarrow \delta = 4\epsilon + \epsilon^2$. Thus choose the smaller distance, $\delta = 4\epsilon - \epsilon^2$.
40. Step 1: $|\sqrt{4-x}-2| < \epsilon \Rightarrow -\epsilon < \sqrt{4-x}-2 < \epsilon \Rightarrow 2-\epsilon < \sqrt{4-x} < 2+\epsilon \Rightarrow (2-\epsilon)^2 < 4-x < (2+\epsilon)^2$
 $\Rightarrow -(2+\epsilon)^2 < x-4 < -(2-\epsilon)^2 \Rightarrow -(2+\epsilon)^2 + 4 < x < -(2-\epsilon)^2 + 4$.
 Step 2: $|x-0| < \delta \Rightarrow -\delta < x < \delta$.
 Then $-\delta = -(2+\epsilon)^2 + 4 = -\epsilon^2 - 4\epsilon \Rightarrow \delta = 4\epsilon + \epsilon^2$, or $\delta = -(2-\epsilon)^2 + 4 = 4\epsilon - \epsilon^2$. Thus choose the smaller distance, $\delta = 4\epsilon - \epsilon^2$.
41. Step 1: For $x \neq 1$, $|x^2-1| < \epsilon \Rightarrow -\epsilon < x^2-1 < \epsilon \Rightarrow 1-\epsilon < x^2 < 1+\epsilon \Rightarrow \sqrt{1-\epsilon} < |x| < \sqrt{1+\epsilon}$
 $\Rightarrow \sqrt{1-\epsilon} < x < \sqrt{1+\epsilon}$ near $x=1$.
 Step 2: $|x-1| < \delta \Rightarrow -\delta < x-1 < \delta \Rightarrow -\delta+1 < x < \delta+1$.
 Then $-\delta+1 = \sqrt{1-\epsilon} \Rightarrow \delta = 1-\sqrt{1-\epsilon}$, or $\delta+1 = \sqrt{1+\epsilon} \Rightarrow \delta = \sqrt{1+\epsilon}-1$. Choose
 $\delta = \min\{1-\sqrt{1-\epsilon}, \sqrt{1+\epsilon}-1\}$, that is, the smaller of the two distances.
42. Step 1: For $x \neq -2$, $|x^2-4| < \epsilon \Rightarrow -\epsilon < x^2-4 < \epsilon \Rightarrow 4-\epsilon < x^2 < 4+\epsilon \Rightarrow \sqrt{4-\epsilon} < |x| < \sqrt{4+\epsilon} \Rightarrow -\sqrt{4+\epsilon} < x < -\sqrt{4-\epsilon}$ near $x=-2$.
 Step 2: $|x-(-2)| < \delta \Rightarrow -\delta < x+2 < \delta \Rightarrow -\delta-2 < x < \delta-2$.
 Then $-\delta-2 = -\sqrt{4+\epsilon} \Rightarrow \delta = \sqrt{4+\epsilon}-2$, or $\delta-2 = -\sqrt{4-\epsilon} \Rightarrow \delta = 2-\sqrt{4-\epsilon}$. Choose
 $\delta = \min\{\sqrt{4+\epsilon}-2, 2-\sqrt{4-\epsilon}\}$.
43. Step 1: $\left| \frac{1}{x} - 1 \right| < \epsilon \Rightarrow -\epsilon < \frac{1}{x} - 1 < \epsilon \Rightarrow 1-\epsilon < \frac{1}{x} < 1+\epsilon \Rightarrow \frac{1}{1+\epsilon} < x < \frac{1}{1-\epsilon}$.
 Step 2: $|x-1| < \delta \Rightarrow -\delta < x-1 < \delta \Rightarrow 1-\delta < x < 1+\delta$.
 Then $1-\delta = \frac{1}{1+\epsilon} \Rightarrow \delta = 1 - \frac{1}{1+\epsilon} = \frac{\epsilon}{1+\epsilon}$, or $1+\delta = \frac{1}{1-\epsilon} \Rightarrow \delta = \frac{1}{1-\epsilon} - 1 = \frac{\epsilon}{1-\epsilon}$.
 Choose $\delta = \frac{\epsilon}{1+\epsilon}$, the smaller of the two distances.
44. Step 1: $\left| \frac{1}{x^2} - \frac{1}{3} \right| < \epsilon \Rightarrow -\epsilon < \frac{1}{x^2} - \frac{1}{3} < \epsilon \Rightarrow \frac{1}{3} - \epsilon < \frac{1}{x^2} < \frac{1}{3} + \epsilon \Rightarrow \frac{1-3\epsilon}{3} < \frac{1}{x^2} < \frac{1+3\epsilon}{3}$
 $\Rightarrow \frac{3}{1-3\epsilon} > x^2 > \frac{3}{1+3\epsilon} \Rightarrow \sqrt{\frac{3}{1+3\epsilon}} < |x| < \sqrt{\frac{3}{1-3\epsilon}}$, or $\sqrt{\frac{3}{1+3\epsilon}} < x < \sqrt{\frac{3}{1-3\epsilon}}$ for x near $\sqrt{3}$.

Step 2: $|x - \sqrt{3}| < \delta \Rightarrow -\delta < x - \sqrt{3} < \delta \Rightarrow \sqrt{3} - \delta < x < \sqrt{3} + \delta.$

Then $\sqrt{3} - \delta = \sqrt{\frac{3}{1+3\epsilon}} \Rightarrow \delta = \sqrt{3} - \sqrt{\frac{3}{1+3\epsilon}}$, or $\sqrt{3} + \delta = \sqrt{\frac{3}{1-3\epsilon}} \Rightarrow \delta = \sqrt{\frac{3}{1-3\epsilon}} - \sqrt{3}.$

Choose $\delta = \min\left\{\sqrt{3} - \sqrt{\frac{3}{1+3\epsilon}}, \sqrt{\frac{3}{1-3\epsilon}} - \sqrt{3}\right\}.$

45. Step 1: $\left|\left(\frac{x^2-9}{x+3}\right) - (-6)\right| < \epsilon \Rightarrow -\epsilon < (x-3) + 6 < \epsilon, x \neq -3 \Rightarrow -\epsilon < x+3 < \epsilon \Rightarrow -\epsilon-3 < x < \epsilon-3.$

Step 2: $|x - (-3)| < \delta \Rightarrow -\delta < x+3 < \delta \Rightarrow -\delta-3 < x < \delta-3.$

Then $-\delta-3 = -\epsilon-3 \Rightarrow \delta = \epsilon$, or $\delta-3 = \epsilon-3 \Rightarrow \delta = \epsilon$. Choose $\delta = \epsilon$.

46. Step 1: $\left|\left(\frac{x^2-1}{x-1}\right) - 2\right| < \epsilon \Rightarrow -\epsilon < (x+1) - 2 < \epsilon, x \neq 1 \Rightarrow 1-\epsilon < x < 1+\epsilon.$

Step 2: $|x-1| < \delta \Rightarrow -\delta < x-1 < \delta \Rightarrow 1-\delta < x < 1+\delta.$

Then $1-\delta = 1-\epsilon \Rightarrow \delta = \epsilon$, or $1+\delta = 1+\epsilon \Rightarrow \delta = \epsilon$. Choose $\delta = \epsilon$.

47. Step 1: $x < 1: |(4-2x) - 2| < \epsilon \Rightarrow 0 < 2-2x < \epsilon$ since $x < 1$. Thus, $1 - \frac{\epsilon}{2} < x < 0$;

$x \geq 1: |(6x-4) - 2| < \epsilon \Rightarrow 0 \leq 6x-6 < \epsilon$ since $x \geq 1$. Thus, $1 \leq x < 1 + \frac{\epsilon}{6}.$

Step 2: $|x-1| < \delta \Rightarrow -\delta < x-1 < \delta \Rightarrow 1-\delta < x < 1+\delta.$

Then $1-\delta = 1 - \frac{\epsilon}{2} \Rightarrow \delta = \frac{\epsilon}{2}$, or $1+\delta = 1 + \frac{\epsilon}{6} \Rightarrow \delta = \frac{\epsilon}{6}$. Choose $\delta = \frac{\epsilon}{6}$.

48. Step 1: $x < 0: |2x-0| < \epsilon \Rightarrow -\epsilon < 2x < 0 \Rightarrow -\frac{\epsilon}{2} < x < 0$;

$x \geq 0: \left|\frac{x}{2} - 0\right| < \epsilon \Rightarrow 0 \leq x < 2\epsilon.$

Step 2: $|x-0| < \delta \Rightarrow -\delta < x < \delta.$

Then $-\delta = -\frac{\epsilon}{2} \Rightarrow \delta = \frac{\epsilon}{2}$, or $\delta = 2\epsilon \Rightarrow \delta = 2\epsilon$. Choose $\delta = \frac{\epsilon}{2}$.

49. By the figure, $-x \leq x \sin \frac{1}{x} \leq x$ for all $x > 0$ and $-x \geq x \sin \frac{1}{x} \geq x$ for $x < 0$. Since $\lim_{x \rightarrow 0} (-x) = \lim_{x \rightarrow 0} x = 0$, then by the sandwich theorem, in either case, $\lim_{x \rightarrow 0} x \sin \frac{1}{x} = 0$.

50. By the figure, $-x^2 \leq x^2 \sin \frac{1}{x} \leq x^2$ for all x except possibly at $x = 0$. Since $\lim_{x \rightarrow 0} (-x^2) = \lim_{x \rightarrow 0} x^2 = 0$, then by the sandwich theorem, $\lim_{x \rightarrow 0} x^2 \sin \frac{1}{x} = 0$.

51. As x approaches the value 0, the values of $g(x)$ approach k . Thus for every number $\epsilon > 0$, there exists a $\delta > 0$ such that $0 < |x-0| < \delta \Rightarrow |g(x) - k| < \epsilon$.

52. Write $x = h + c$. Then $0 < |x-c| < \delta \Leftrightarrow -\delta < x-c < \delta, x \neq c \Leftrightarrow -\delta < (h+c) - c < \delta, h+c \neq c \Leftrightarrow -\delta < h < \delta, h \neq 0 \Leftrightarrow 0 < |h-0| < \delta.$

Thus, $\lim_{x \rightarrow c} f(x) = L \Leftrightarrow$ for any $\epsilon > 0$, there exists $\delta > 0$ such that $|f(x) - L| < \epsilon$ whenever $0 < |x-c| < \delta \Leftrightarrow$

$|f(h+c) - L| < \epsilon$ whenever $0 < |h-0| < \delta \Leftrightarrow \lim_{h \rightarrow 0} f(h+c) = L.$

53. Let $f(x) = x^2$. The function values do get closer to -1 as x approaches 0, but $\lim_{x \rightarrow 0} f(x) = 0$, not -1 . The function $f(x) = x^2$ never gets arbitrarily close to -1 for x near 0.

54. Let $f(x) = \sin x$, $L = \frac{1}{2}$, and $x_0 = 0$. There exists a value of x (namely $x = \frac{\pi}{6}$) for which $|\sin x - \frac{1}{2}| < \epsilon$ for any given $\epsilon > 0$. However, $\lim_{x \rightarrow 0} \sin x = 0$, not $\frac{1}{2}$. The wrong statement does not require x to be arbitrarily close to x_0 . As another example, let $g(x) = \sin \frac{1}{x}$, $L = \frac{1}{2}$, and $x_0 = 0$. We can choose infinitely many values of x near 0 such that $\sin \frac{1}{x} = \frac{1}{2}$ as you can see from the accompanying figure. However, $\lim_{x \rightarrow 0} \sin \frac{1}{x}$ fails to exist. The wrong statement does not require all values of x arbitrarily close to $x_0 = 0$ to lie within $\epsilon > 0$ of $L = \frac{1}{2}$. Again you can see from the figure that there are also infinitely many values of x near 0 such that $\sin \frac{1}{x} = 0$. If we choose $\epsilon < \frac{1}{4}$ we cannot satisfy the inequality $|\sin \frac{1}{x} - \frac{1}{2}| < \epsilon$ for all values of x sufficiently near $x_0 = 0$.

55. $|A - 9| \leq 0.01 \Rightarrow -0.01 \leq \pi \left(\frac{x}{2}\right)^2 - 9 \leq 0.01 \Rightarrow 8.99 \leq \frac{\pi x^2}{4} \leq 9.01 \Rightarrow \frac{4}{\pi}(8.99) \leq x^2 \leq \frac{4}{\pi}(9.01)$
 $\Rightarrow 2\sqrt{\frac{8.99}{\pi}} \leq x \leq 2\sqrt{\frac{9.01}{\pi}}$ or $3.384 \leq x \leq 3.387$. To be safe, the left endpoint was rounded up and the right endpoint was rounded down.
56. $V = RI \Rightarrow \frac{V}{R} = I \Rightarrow \left|\frac{V}{R} - 5\right| \leq 0.1 \Rightarrow -0.1 \leq \frac{120}{R} - 5 \leq 0.1 \Rightarrow 4.9 \leq \frac{120}{R} \leq 5.1 \Rightarrow \frac{10}{49} \geq \frac{R}{120} \geq \frac{10}{51}$
 $\Rightarrow \frac{(120)(10)}{51} \leq R \leq \frac{(120)(10)}{49} \Rightarrow 23.53 \leq R \leq 24.48$.
 To be safe, the left endpoint was rounded up and the right endpoint was rounded down.
57. (a) $-\delta < x - 1 < 0 \Rightarrow 1 - \delta < x < 1 \Rightarrow f(x) = x$. Then $|f(x) - 2| = |x - 2| = 2 - x > 2 - 1 = 1$. That is, $|f(x) - 2| \geq 1 \geq \frac{1}{2}$ no matter how small δ is taken when $1 - \delta < x < 1 \Rightarrow \lim_{x \rightarrow 1} f(x) \neq 2$.
- (b) $0 < x - 1 < \delta \Rightarrow 1 < x < 1 + \delta \Rightarrow f(x) = x + 1$. Then $|f(x) - 1| = |(x + 1) - 1| = |x| = x > 1$. That is, $|f(x) - 1| \geq 1$ no matter how small δ is taken when $1 < x < 1 + \delta \Rightarrow \lim_{x \rightarrow 1} f(x) \neq 1$.
- (c) $-\delta < x - 1 < 0 \Rightarrow 1 - \delta < x < 1 \Rightarrow f(x) = x$. Then $|f(x) - 1.5| = |x - 1.5| = 1.5 - x > 1.5 - 1 = 0.5$. Also, $0 < x - 1 < \delta \Rightarrow 1 < x < 1 + \delta \Rightarrow f(x) = x + 1$. Then $|f(x) - 1.5| = |(x + 1) - 1.5| = |x - 0.5| = x - 0.5 > 1 - 0.5 = 0.5$. Thus, no matter how small δ is taken, there exists a value of x such that $-\delta < x - 1 < \delta$ but $|f(x) - 1.5| \geq \frac{1}{2} \Rightarrow \lim_{x \rightarrow 1} f(x) \neq 1.5$.
58. (a) For $2 < x < 2 + \delta \Rightarrow h(x) = 2 \Rightarrow |h(x) - 4| = 2$. Thus for $\epsilon < 2$, $|h(x) - 4| \geq \epsilon$ whenever $2 < x < 2 + \delta$ no matter how small we choose $\delta > 0 \Rightarrow \lim_{x \rightarrow 2} h(x) \neq 4$.
- (b) For $2 < x < 2 + \delta \Rightarrow h(x) = 2 \Rightarrow |h(x) - 3| = 1$. Thus for $\epsilon < 1$, $|h(x) - 3| \geq \epsilon$ whenever $2 < x < 2 + \delta$ no matter how small we choose $\delta > 0 \Rightarrow \lim_{x \rightarrow 2} h(x) \neq 3$.
- (c) For $2 - \delta < x < 2 \Rightarrow h(x) = x^2$ so $|h(x) - 2| = |x^2 - 2|$. No matter how small $\delta > 0$ is chosen, x^2 is close to 4 when x is near 2 and to the left on the real line $\Rightarrow |x^2 - 2|$ will be close to 2. Thus if $\epsilon < 1$, $|h(x) - 2| \geq \epsilon$ whenever $2 - \delta < x < 2$ no matter how small we choose $\delta > 0 \Rightarrow \lim_{x \rightarrow 2} h(x) \neq 2$.

59. (a) For $3 - \delta < x < 3 \Rightarrow f(x) > 4.8 \Rightarrow |f(x) - 4| \geq 0.8$. Thus for $\epsilon < 0.8$, $|f(x) - 4| \geq \epsilon$ whenever $3 - \delta < x < 3$ no matter how small we choose $\delta > 0 \Rightarrow \lim_{x \rightarrow 3} f(x) \neq 4$.
- (b) For $3 < x < 3 + \delta \Rightarrow f(x) < 3 \Rightarrow |f(x) - 4.8| \geq 1.8$. Thus for $\epsilon < 1.8$, $|f(x) - 4.8| \geq \epsilon$ whenever $3 < x < 3 + \delta$ no matter how small we choose $\delta > 0 \Rightarrow \lim_{x \rightarrow 3} f(x) \neq 4.8$.
- (c) For $3 - \delta < x < 3 \Rightarrow f(x) > 4.8 \Rightarrow |f(x) - 3| \geq 1.8$. Again, for $\epsilon < 1.8$, $|f(x) - 3| \geq \epsilon$ whenever $3 - \delta < x < 3$ no matter how small we choose $\delta > 0 \Rightarrow \lim_{x \rightarrow 3} f(x) \neq 3$.
60. (a) No matter how small we choose $\delta > 0$, for x near -1 satisfying $-1 - \delta < x < -1 + \delta$, the values of $g(x)$ are near $1 \Rightarrow |g(x) - 2|$ is near 1 . Then, for $\epsilon = \frac{1}{2}$ we have $|g(x) - 2| \geq \frac{1}{2}$ for some x satisfying $-1 - \delta < x < -1 + \delta$, or $0 < |x + 1| < \delta \Rightarrow \lim_{x \rightarrow -1} g(x) \neq 2$.
- (b) Yes, $\lim_{x \rightarrow -1} g(x) = 1$ because from the graph we can find a $\delta > 0$ such that $|g(x) - 1| < \epsilon$ if $0 < |x - (-1)| < \delta$.

             color=black, linestyle=[1,3,3], title=head ));
end do;
```

43. Yes. If $\lim_{x \rightarrow a^+} f(x) = L = \lim_{x \rightarrow a^-} f(x)$, then $\lim_{x \rightarrow a} f(x) = L$. If $\lim_{x \rightarrow a^+} f(x) \neq \lim_{x \rightarrow a^-} f(x)$, then $\lim_{x \rightarrow a} f(x)$ does not exist.

44. Since $\lim_{x \rightarrow c} f(x) = L$ if and only if $\lim_{x \rightarrow c^+} f(x) = L$ and $\lim_{x \rightarrow c^-} f(x) = L$, then $\lim_{x \rightarrow c} f(x)$ can be found by calculating $\lim_{x \rightarrow c^+} f(x)$.
45. If f is an odd function of x , then $f(-x) = -f(x)$. Given $\lim_{x \rightarrow 0^+} f(x) = 3$, then $\lim_{x \rightarrow 0^-} f(x) = -3$.
46. If f is an even function of x , then $f(-x) = f(x)$. Given $\lim_{x \rightarrow 2^-} f(x) = 7$ then $\lim_{x \rightarrow -2^+} f(x) = 7$. However, nothing can be said about $\lim_{x \rightarrow -2^-} f(x)$ because we don't know $\lim_{x \rightarrow 2^+} f(x)$.
47. $I = (5, 5 + \delta) \Rightarrow 5 < x < 5 + \delta$. Also, $\sqrt{x-5} < \epsilon \Rightarrow x-5 < \epsilon^2 \Rightarrow x < 5 + \epsilon^2$. Choose $\delta = \epsilon^2 \Rightarrow \lim_{x \rightarrow 5^+} \sqrt{x-5} = 0$.
48. $I = (4 - \delta, 4) \Rightarrow 4 - \delta < x < 4$. Also, $\sqrt{4-x} < \epsilon \Rightarrow 4-x < \epsilon^2 \Rightarrow x > 4 - \epsilon^2$. Choose $\delta = \epsilon^2 \Rightarrow \lim_{x \rightarrow 4^-} \sqrt{4-x} = 0$.
49. As $x \rightarrow 0^-$ the number x is always negative. Thus, $\left| \frac{x}{|x|} - (-1) \right| < \epsilon \Rightarrow \left| \frac{x}{-x} + 1 \right| < \epsilon \Rightarrow 0 < \epsilon$ which is always true independent of the value of x . Hence we can choose any $\delta > 0$ with $-\delta < x < 0 \Rightarrow \lim_{x \rightarrow 0^-} \frac{x}{|x|} = -1$.
50. Since $x \rightarrow 2^+$ we have $x > 2$ and $|x-2| = x-2$. Then, $\left| \frac{x-2}{|x-2|} - 1 \right| = \left| \frac{x-2}{x-2} - 1 \right| < \epsilon \Rightarrow 0 < \epsilon$ which is always true so long as $x > 2$. Hence we can choose any $\delta > 0$, and thus $2 < x < 2 + \delta \Rightarrow \left| \frac{x-2}{|x-2|} - 1 \right| < \epsilon$. Thus, $\lim_{x \rightarrow 2^+} \frac{x-2}{|x-2|} = 1$.
51. (a) $\lim_{x \rightarrow 400^+} \lfloor x \rfloor = 400$. Just observe that if $400 < x < 401$, then $\lfloor x \rfloor = 400$. Thus if we choose $\delta = 1$, we have for any number $\epsilon > 0$ that $400 < x < 400 + \delta \Rightarrow \left| \lfloor x \rfloor - 400 \right| = |400 - 400| = 0 < \epsilon$.
- (b) $\lim_{x \rightarrow 400^-} \lfloor x \rfloor = 399$. Just observe that if $399 < x < 400$ then $\lfloor x \rfloor = 399$. Thus if we choose $\delta = 1$, we have for any number $\epsilon > 0$ that $400 - \delta < x < 400 \Rightarrow \left| \lfloor x \rfloor - 399 \right| = |399 - 399| = 0 < \epsilon$.
- (c) Since $\lim_{x \rightarrow 400^+} \lfloor x \rfloor \neq \lim_{x \rightarrow 400^-} \lfloor x \rfloor$ we conclude that $\lim_{x \rightarrow 400} \lfloor x \rfloor$ does not exist.
52. (a) $\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} \sqrt{x} = \sqrt{0} = 0$; $|\sqrt{x} - 0| < \epsilon \Rightarrow -\epsilon < \sqrt{x} < \epsilon \Rightarrow 0 < x < \epsilon^2$ for x positive. Choose $\delta = \epsilon^2 \Rightarrow \lim_{x \rightarrow 0^+} f(x) = 0$.
- (b) $\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} x^2 \sin\left(\frac{1}{x}\right) = 0$ by the sandwich theorem since $-x^2 \leq x^2 \sin\left(\frac{1}{x}\right) \leq x^2$ for all $x \neq 0$. Since $|x^2 - 0| = |-x^2 - 0| = x^2 < \epsilon$ whenever $|x| < \sqrt{\epsilon}$, we choose $\delta = \sqrt{\epsilon}$ and obtain $\left| x^2 \sin\left(\frac{1}{x}\right) - 0 \right| < \epsilon$ if $-\delta < x < 0$.
- (c) The function f has limit 0 at $x_0 = 0$ since both the right-hand and left-hand limits exist and equal 0.

42. $g(x) = \frac{x^2-16}{x^2-3x-4} = \frac{(x+4)(x-4)}{(x-4)(x+1)} = \frac{x+4}{x+1}, x \neq 4 \Rightarrow g(4) = \lim_{x \rightarrow 4} \left(\frac{x+4}{x+1}\right) = \frac{8}{5}$
43. As defined, $\lim_{x \rightarrow 3^-} f(x) = (3)^2 - 1 = 8$ and $\lim_{x \rightarrow 3^+} (2a)(3) = 6a$. For $f(x)$ to be continuous we must have $6a = 8 \Rightarrow a = \frac{4}{3}$.
44. As defined, $\lim_{x \rightarrow -2^-} g(x) = -2$ and $\lim_{x \rightarrow -2^+} g(x) = b(-2)^2 = 4b$. For $g(x)$ to be continuous we must have $4b = -2 \Rightarrow b = -\frac{1}{2}$.
45. As defined, $\lim_{x \rightarrow 2^-} f(x) = 12$ and $\lim_{x \rightarrow 2^+} f(x) = a^2(2) - 2a = 2a^2 - 2a$. For $f(x)$ to be continuous we must have $12 = 2a^2 - 2a \Rightarrow a = 3$ or $a = -2$.
46. As defined, $\lim_{x \rightarrow 0^-} g(x) = \frac{0-b}{b+1} = \frac{-b}{b+1}$ and $\lim_{x \rightarrow 0^+} g(x) = (0)^2 + b = b$. For $g(x)$ to be continuous we must have $\frac{-b}{b+1} = b \Rightarrow b = 0$ or $b = -2$.
47. As defined, $\lim_{x \rightarrow -1^-} f(x) = -2$ and $\lim_{x \rightarrow -1^+} f(x) = a(-1) + b = -a + b$, and $\lim_{x \rightarrow 1^-} f(x) = a(1) + b = a + b$ and $\lim_{x \rightarrow 1^+} f(x) = 3$. For $f(x)$ to be continuous we must have $-2 = -a + b$ and $a + b = 3 \Rightarrow a = \frac{5}{2}$ and $b = \frac{1}{2}$.
48. As defined, $\lim_{x \rightarrow 0^-} g(x) = a(0) + 2b = 2b$ and $\lim_{x \rightarrow 0^+} g(x) = (0)^2 + 3a - b = 3a - b$, and $\lim_{x \rightarrow 2^-} g(x) = (2)^2 + 3a - b = 4 + 3a - b$ and $\lim_{x \rightarrow 2^+} g(x) = 3(2) - 5 = 1$. For $g(x)$ to be continuous we must have $2b = 3a - b$ and $4 + 3a - b = 1 \Rightarrow a = -\frac{3}{2}$ and $b = -\frac{3}{2}$.

49. The function can be extended: $f(0) \approx 2.3$.

50. The function cannot be extended to be continuous at $x = 0$. If $f(0) \approx 2.3$, it will be continuous from the right. Or if $f(0) \approx -2.3$, it will be continuous from the left.

51. The function cannot be extended to be continuous at $x = 0$. If $f(0) = 1$, it will be continuous from the right. Or if $f(0) = -1$, it will be continuous from the left.

52. The function can be extended: $f(0) \approx 7.39$.

53. $f(x)$ is continuous on $[0, 1]$ and $f(0) < 0$, $f(1) > 0 \Rightarrow$ by the Intermediate Value Theorem $f(x)$ takes on every value between $f(0)$ and $f(1) \Rightarrow$ the equation $f(x) = 0$ has at least one solution between $x = 0$ and $x = 1$.

54. $\cos x = x \Rightarrow (\cos x) - x = 0$. If $x = -\frac{\pi}{2}$, $\cos\left(-\frac{\pi}{2}\right) - \left(-\frac{\pi}{2}\right) > 0$. If $x = \frac{\pi}{2}$, $\cos\left(\frac{\pi}{2}\right) - \frac{\pi}{2} < 0$. Thus $\cos x - x = 0$ for some x between $-\frac{\pi}{2}$ and $\frac{\pi}{2}$ according to the Intermediate Value Theorem, since the function $\cos x - x$ is continuous.

55. Let $f(x) = x^3 - 15x + 1$, which is continuous on $[-4, 4]$. Then $f(-4) = -3$, $f(-1) = 15$, $f(1) = -13$, and $f(4) = 5$. By the Intermediate Value Theorem, $f(x) = 0$ for some x in each of the intervals $-4 < x < -1$, $-1 < x < 1$, and $1 < x < 4$. That is, $x^3 - 15x + 1 = 0$ has three solutions in $[-4, 4]$. Since a polynomial of degree 3 can have at most 3 solutions, these are the only solutions.

56. Without loss of generality, assume that $a < b$. Then $F(x) = (x-a)^2(x-b)^2 + x$ is continuous for all values of x , so it is continuous on the interval $[a, b]$. Moreover $F(a) = a$ and $F(b) = b$. By the Intermediate Value Theorem, since $a < \frac{a+b}{2} < b$, there is a number c between a and b such that $F(x) = \frac{a+b}{2}$.

57. Answers may vary. Note that f is continuous for every value of x .
- (a) $f(0) = 10$, $f(1) = 1^3 - 8(1) + 10 = 3$. Since $3 < \pi < 10$, by the Intermediate Value Theorem, there exists a c so that $0 < c < 1$ and $f(c) = \pi$.
- (b) $f(0) = 10$, $f(-4) = (-4)^3 - 8(-4) + 10 = -22$. Since $-22 < -\sqrt{3} < 10$, by the Intermediate Value Theorem, there exists a c so that $-4 < c < 0$ and $f(c) = -\sqrt{3}$.
- (c) $f(0) = 10$, $f(1000) = (1000)^3 - 8(1000) + 10 = 999,992,010$. Since $10 < 5,000,000 < 999,992,010$, by the Intermediate Value Theorem, there exists a c so that $0 < c < 1000$ and $f(c) = 5,000,000$.
58. All five statements ask for the same information because of the intermediate value property of continuous functions.
- (a) A root of $f(x) = x^3 - 3x - 1$ is a point c where $f(c) = 0$.
- (b) The point where $y = x^3$ crosses $y = 3x + 1$ have the same y -coordinate, or $y = x^3 = 3x + 1 \Rightarrow f(x) = x^3 - 3x - 1 = 0$.
- (c) $x^3 - 3x = 1 \Rightarrow x^3 - 3x - 1 = 0$. The solutions to the equation are the roots of $f(x) = x^3 - 3x - 1$.
- (d) The points where $y = x^3 - 3x$ crosses $y = 1$ have common y -coordinates, or $y = x^3 - 3x = 1 \Rightarrow f(x) = x^3 - 3x - 1 = 0$.
- (e) The solutions of $x^3 - 3x - 1 = 0$ are those points where $f(x) = x^3 - 3x - 1$ has value 0.
59. Answers may vary. For example, $f(x) = \frac{\sin(x-2)}{x-2}$ is discontinuous at $x = 2$ because it is not defined there. However, the discontinuity can be removed because f has a limit (namely 1) as $x \rightarrow 2$.
60. Answers may vary. For example, $g(x) = \frac{1}{x+1}$ has a discontinuity at $x = -1$ because $\lim_{x \rightarrow -1} g(x)$ does not exist.
- $$\left(\lim_{x \rightarrow -1^-} g(x) = -\infty \text{ and } \lim_{x \rightarrow -1^+} g(x) = +\infty. \right)$$
61. (a) Suppose x_0 is rational $\Rightarrow f(x_0) = 1$. Choose $\epsilon = \frac{1}{2}$. For any $\delta > 0$ there is an irrational number x (actually infinitely many) in the interval $(x_0 - \delta, x_0 + \delta) \Rightarrow f(x) = 0$. Then $0 < |x - x_0| < \delta$ but $|f(x) - f(x_0)| = 1 > \frac{1}{2} = \epsilon$, so $\lim_{x \rightarrow x_0} f(x)$ fails to exist $\Rightarrow f$ is discontinuous at x_0 rational.
- On the other hand, x_0 irrational $\Rightarrow f(x_0) = 0$ and there is a rational number x in $(x_0 - \delta, x_0 + \delta) \Rightarrow f(x) = 1$. Again $\lim_{x \rightarrow x_0} f(x)$ fails to exist $\Rightarrow f$ is discontinuous at x_0 irrational. That is, f is discontinuous at every point.
- (b) f is neither right-continuous nor left-continuous at any point x_0 because in every interval $(x_0 - \delta, x_0)$ or $(x_0, x_0 + \delta)$ there exist both rational and irrational real numbers. Thus neither limits $\lim_{x \rightarrow x_0^-} f(x)$ and $\lim_{x \rightarrow x_0^+} f(x)$ exist by the same arguments used in part (a).
62. Yes. Both $f(x) = x$ and $g(x) = x - \frac{1}{2}$ are continuous on $[0, 1]$. However $\frac{f(x)}{g(x)}$ is undefined at $x = \frac{1}{2}$ since $g\left(\frac{1}{2}\right) = 0 \Rightarrow \frac{f(x)}{g(x)}$ is discontinuous at $x = \frac{1}{2}$.
63. No. For instance, if $f(x) = 0$, $g(x) = \lceil x \rceil$, then $h(x) = 0(\lceil x \rceil) = 0$ is continuous at $x = 0$ and $g(x)$ is not.
64. Let $f(x) = \frac{1}{x-1}$ and $g(x) = x+1$. Both functions are continuous at $x = 0$. The composition $f \circ g = f(g(x)) = \frac{1}{(x+1)-1} = \frac{1}{x}$ is discontinuous at $x = 0$, since it is not defined there. Theorem 10 requires that $f(x)$ be continuous at $g(0)$, which is not the case here since $g(0) = 1$ and f is undefined at 1.

65. Yes, because of the Intermediate Value Theorem. If $f(a)$ and $f(b)$ did have different signs then f would have to equal zero at some point between a and b since f is continuous on $[a, b]$.
66. Let $f(x)$ be the new position of point x and let $d(x) = f(x) - x$. The displacement function d is negative if x is the left-hand point of the rubber band and positive if x is the right-hand point of the rubber band. By the Intermediate Value Theorem, $d(x) = 0$ for some point in between. That is, $f(x) = x$ for some point x , which is then in its original position.
67. If $f(0) = 0$ or $f(1) = 1$, we are done (i.e., $c = 0$ or $c = 1$ in those cases). Then let $f(0) = a > 0$ and $f(1) = b < 1$ because $0 \leq f(x) \leq 1$. Define $g(x) = f(x) - x \Rightarrow g$ is continuous on $[0, 1]$. Moreover, $g(0) = f(0) - 0 = a > 0$ and $g(1) = f(1) - 1 = b - 1 < 0 \Rightarrow$ by the Intermediate Value Theorem there is a number c in $(0, 1)$ such that $g(c) = 0 \Rightarrow f(c) - c = 0$ or $f(c) = c$.
68. Let $\epsilon = \frac{|f(c)|}{2} > 0$. Since f is continuous at $x = c$ there is a $\delta > 0$ such that $|x - c| < \delta \Rightarrow |f(x) - f(c)| < \epsilon \Rightarrow f(c) - \epsilon < f(x) < f(c) + \epsilon$.
 If $f(c) > 0$, then $\epsilon = \frac{1}{2}f(c) \Rightarrow \frac{1}{2}f(c) < f(x) < \frac{3}{2}f(c) \Rightarrow f(x) > 0$ on the interval $(c - \delta, c + \delta)$.
 If $f(c) < 0$, then $\epsilon = -\frac{1}{2}f(c) \Rightarrow \frac{3}{2}f(c) < f(x) < \frac{1}{2}f(c) \Rightarrow f(x) < 0$ on the interval $(c - \delta, c + \delta)$.

Thus, $f(x)$ is continuous at $x = c \Leftrightarrow \lim_{x \rightarrow c} f(x) = f(c) \Leftrightarrow \lim_{h \rightarrow 0} f(c+h) = f(c)$.

70. By Exercise 67, it suffices to show that $\lim_{h \rightarrow 0} \sin(c+h) = \sin c$ and $\lim_{h \rightarrow 0} \cos(c+h) = \cos c$.

Now $\lim_{h \rightarrow 0} \sin(c+h) = \lim_{h \rightarrow 0} [(\sin c)(\cos h) + (\cos c)(\sin h)] = (\sin c) \left(\lim_{h \rightarrow 0} \cos h \right) + (\cos c) \left(\lim_{h \rightarrow 0} \sin h \right)$.

By Example 11 Section 2.2, $\lim_{h \rightarrow 0} \cos h = 1$ and $\lim_{h \rightarrow 0} \sin h = 0$. So $\lim_{h \rightarrow 0} \sin(c+h) = \sin c$ and thus $f(x) = \sin x$ is continuous at $x = c$. Similarly,

$\lim_{h \rightarrow 0} \cos(c+h) = \lim_{h \rightarrow 0} [(\cos c)(\cos h) - (\sin c)(\sin h)] = (\cos c) \left(\lim_{h \rightarrow 0} \cos h \right) - (\sin c) \left(\lim_{h \rightarrow 0} \sin h \right) = \cos c$. Thus, $g(x) = \cos x$ is continuous at $x = c$.

- (b) We say that $f(x)$ approaches minus infinity as x approaches x_0 from the right, and write $\lim_{x \rightarrow x_0^+} f(x) = -\infty$, if for every positive number B (or negative number $-B$) there exists a corresponding number $\delta > 0$ such that for all x , $x_0 < x < x_0 + \delta \Rightarrow f(x) < -B$.
- (c) We say that $f(x)$ approaches minus infinity as x approaches x_0 from the left, and write $\lim_{x \rightarrow x_0^-} f(x) = -\infty$, if for every positive number B (or negative number $-B$) there exists a corresponding number $\delta > 0$ such that for all x , $x_0 - \delta < x < x_0 \Rightarrow f(x) < -B$.

94. For $B > 0$, $\frac{1}{x} > B > 0 \Leftrightarrow x < \frac{1}{B}$. Choose $\delta = \frac{1}{B}$. Then $0 < x < \delta \Rightarrow 0 < x < \frac{1}{B} \Rightarrow \frac{1}{x} > B$ so that $\lim_{x \rightarrow 0^+} \frac{1}{x} = \infty$.

95. For $B > 0$, $\frac{1}{x} < -B < 0 \Leftrightarrow -\frac{1}{x} > B > 0 \Leftrightarrow -x < \frac{1}{B} \Leftrightarrow -\frac{1}{B} < x$. Choose $\delta = \frac{1}{B}$. Then $-\delta < x < 0 \Rightarrow -\frac{1}{B} < x < 0 \Rightarrow \frac{1}{x} < -B$ so that $\lim_{x \rightarrow 0^-} \frac{1}{x} = -\infty$.

96. For $B > 0$, $\frac{1}{x-2} < -B \Leftrightarrow -\frac{1}{x-2} > B \Leftrightarrow -(x-2) < \frac{1}{B} \Leftrightarrow x-2 > -\frac{1}{B} \Leftrightarrow x > 2 - \frac{1}{B}$. Choose $\delta = \frac{1}{B}$. Then $2 - \delta < x < 2 \Rightarrow -\delta < x-2 < 0 \Rightarrow -\frac{1}{B} < x-2 < 0 \Rightarrow \frac{1}{x-2} < -B < 0$ so that $\lim_{x \rightarrow 2^-} \frac{1}{x-2} = -\infty$.

97. For $B > 0$, $\frac{1}{x-2} > B > 0 \Leftrightarrow 0 < x-2 < \frac{1}{B}$. Choose $\delta = \frac{1}{B}$. Then $2 < x < 2 + \delta \Rightarrow 0 < x-2 < \delta \Rightarrow 0 < x-2 < \frac{1}{B} \Rightarrow \frac{1}{x-2} > B > 0$ so that $\lim_{x \rightarrow 2^+} \frac{1}{x-2} = \infty$.

98. For $B > 0$ and $0 < x < 1$, $\frac{1}{1-x^2} > B \Leftrightarrow 1-x^2 < \frac{1}{B} \Leftrightarrow (1-x)(1+x) < \frac{1}{B}$. Now $\frac{1+x}{2} < 1$ since $x < 1$. Choose $\delta < \frac{1}{2B}$. Then $1-\delta < x < 1 \Rightarrow -\delta < x-1 < 0 \Rightarrow 1-x < \delta < \frac{1}{2B} \Rightarrow (1-x)(1+x) < \frac{1}{B} \left(\frac{1+x}{2}\right) < \frac{1}{B} \Rightarrow \frac{1}{1-x^2} > B$ for $0 < x < 1$ and x near 1 $\Rightarrow \lim_{x \rightarrow 1^-} \frac{1}{1-x^2} = \infty$.

100. $y = \frac{x^2+1}{x-1} = x + 1 + \frac{2}{x-1}$

101. $y = \frac{x^2-4}{x-1} = x+1 - \frac{3}{x-1}$

102. $y = \frac{x^2-1}{2x+4} = \frac{1}{2}x - 1 + \frac{3}{2x+4}$

103. $y = \frac{x^2-1}{x} = x - \frac{1}{x}$

104. $y = \frac{x^3+1}{x^2} = x + \frac{1}{x^2}$

CHAPTER 2 PRACTICE EXERCISES

1. At $x = -1$: $\lim_{x \rightarrow -1^-} f(x) = \lim_{x \rightarrow -1^+} f(x) = 1$
 $\Rightarrow \lim_{x \rightarrow -1} f(x) = 1 = f(-1)$
 $\Rightarrow f$ is continuous at $x = -1$.

- At $x = 0$: $\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) = 0$
 $\Rightarrow \lim_{x \rightarrow 0} f(x) = 0$.

But $f(0) = 1 \neq \lim_{x \rightarrow 0} f(x)$

$\Rightarrow f$ is discontinuous at $x = 0$.

If we define $f(0) = 0$, then the discontinuity at $x = 0$ is removable.

- At $x = 1$: $\lim_{x \rightarrow 1^-} f(x) = -1$ and $\lim_{x \rightarrow 1^+} f(x) = 1$

$\Rightarrow \lim_{x \rightarrow 1} f(x)$ does not exist

$\Rightarrow f$ is discontinuous at $x = 1$.

2. At $x = -1$: $\lim_{x \rightarrow -1^-} f(x) = 0$ and $\lim_{x \rightarrow -1^+} f(x) = -1$
 $\Rightarrow \lim_{x \rightarrow -1} f(x)$ does not exist
 $\Rightarrow f$ is discontinuous at $x = -1$.

- At $x = 0$: $\lim_{x \rightarrow 0^-} f(x) = -\infty$ and $\lim_{x \rightarrow 0^+} f(x) = \infty$
 $\Rightarrow \lim_{x \rightarrow 0} f(x)$ does not exist
 $\Rightarrow f$ is discontinuous at $x = 0$.

- At $x = 1$: $\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^+} f(x) = 1 \Rightarrow \lim_{x \rightarrow 1} f(x) = 1$.
 But $f(1) = 0 \neq \lim_{x \rightarrow 1} f(x)$
 $\Rightarrow f$ is discontinuous at $x = 1$.
 If we define $f(1) = 1$, then the discontinuity at $x = 1$ is removable.

3. (a) $\lim_{t \rightarrow t_0} (3f(t)) = 3 \lim_{t \rightarrow t_0} f(t) = 3(-7) = -21$
 (b) $\lim_{t \rightarrow t_0} (f(t))^2 = \left(\lim_{t \rightarrow t_0} f(t) \right)^2 = (-7)^2 = 49$
 (c) $\lim_{t \rightarrow t_0} (f(t) \cdot g(t)) = \lim_{t \rightarrow t_0} f(t) \cdot \lim_{t \rightarrow t_0} g(t) = (-7)(0) = 0$
 (d) $\lim_{t \rightarrow t_0} \frac{f(t)}{g(t)-7} = \frac{\lim_{t \rightarrow t_0} f(t)}{\lim_{t \rightarrow t_0} (g(t)-7)} = \frac{\lim_{t \rightarrow t_0} f(t)}{\lim_{t \rightarrow t_0} g(t) - \lim_{t \rightarrow t_0} 7} = \frac{-7}{0-7} = 1$
 (e) $\lim_{t \rightarrow t_0} \cos(g(t)) = \cos\left(\lim_{t \rightarrow t_0} g(t)\right) = \cos 0 = 1$
 (f) $\lim_{t \rightarrow t_0} |f(t)| = \left| \lim_{t \rightarrow t_0} f(t) \right| = |-7| = 7$
 (g) $\lim_{t \rightarrow t_0} (f(t) + g(t)) = \lim_{t \rightarrow t_0} f(t) + \lim_{t \rightarrow t_0} g(t) = -7 + 0 = -7$
 (h) $\lim_{t \rightarrow t_0} \left(\frac{1}{f(t)} \right) = \frac{1}{\lim_{t \rightarrow t_0} f(t)} = \frac{1}{-7} = -\frac{1}{7}$

4. (a) $\lim_{x \rightarrow 0} -g(x) = -\lim_{x \rightarrow 0} g(x) = -\sqrt{2}$
 (b) $\lim_{x \rightarrow 0} (g(x) \cdot f(x)) = \lim_{x \rightarrow 0} g(x) \cdot \lim_{x \rightarrow 0} f(x) = (\sqrt{2})\left(\frac{1}{2}\right) = \frac{\sqrt{2}}{2}$
 (c) $\lim_{x \rightarrow 0} (f(x) + g(x)) = \lim_{x \rightarrow 0} f(x) + \lim_{x \rightarrow 0} g(x) = \frac{1}{2} + \sqrt{2}$
 (d) $\lim_{x \rightarrow 0} \frac{1}{f(x)} = \frac{1}{\lim_{x \rightarrow 0} f(x)} = \frac{1}{\frac{1}{2}} = 2$
 (e) $\lim_{x \rightarrow 0} (x + f(x)) = \lim_{x \rightarrow 0} x + \lim_{x \rightarrow 0} f(x) = 0 + \frac{1}{2} = \frac{1}{2}$
 (f) $\lim_{x \rightarrow 0} \frac{f(x) \cdot \cos x}{x-1} = \frac{\lim_{x \rightarrow 0} f(x) \cdot \lim_{x \rightarrow 0} \cos x}{\lim_{x \rightarrow 0} x - \lim_{x \rightarrow 0} 1} = \frac{\left(\frac{1}{2}\right)(1)}{0-1} = -\frac{1}{2}$

5. Since $\lim_{x \rightarrow 0} x = 0$ we must have that $\lim_{x \rightarrow 0} (4 - g(x)) = 0$. Otherwise, if $\lim_{x \rightarrow 0} (4 - g(x))$ is a finite positive number, we would have $\lim_{x \rightarrow 0^-} \left[\frac{4-g(x)}{x} \right] = -\infty$ and $\lim_{x \rightarrow 0^+} \left[\frac{4-g(x)}{x} \right] = \infty$ so the limit could not equal 1 as $x \rightarrow 0$. Similar reasoning holds if $\lim_{x \rightarrow 0} (4 - g(x))$ is a finite negative number. We conclude that $\lim_{x \rightarrow 0} g(x) = 4$.

6. $2 = \lim_{x \rightarrow -4} \left[x \lim_{x \rightarrow 0} g(x) \right] = \lim_{x \rightarrow -4} x \cdot \lim_{x \rightarrow -4} \left[\lim_{x \rightarrow 0} g(x) \right] = -4 \lim_{x \rightarrow -4} \left[\lim_{x \rightarrow 0} g(x) \right] = -4 \lim_{x \rightarrow 0} g(x)$ (since $\lim_{x \rightarrow 0} g(x)$ is a constant) $\Rightarrow \lim_{x \rightarrow 0} g(x) = \frac{2}{-4} = -\frac{1}{2}$.
7. (a) $\lim_{x \rightarrow c} f(x) = \lim_{x \rightarrow c} x^{1/3} = c^{1/3} = f(c)$ for every real number $c \Rightarrow f$ is continuous on $(-\infty, \infty)$.
 (b) $\lim_{x \rightarrow c} g(x) = \lim_{x \rightarrow c} x^{3/4} = c^{3/4} = g(c)$ for every nonnegative real number $c \Rightarrow g$ is continuous on $[0, \infty)$.
 (c) $\lim_{x \rightarrow c} h(x) = \lim_{x \rightarrow c} x^{-2/3} = \frac{1}{c^{2/3}} = h(c)$ for every nonzero real number $c \Rightarrow h$ is continuous on $(-\infty, 0)$ and $(0, \infty)$.
 (d) $\lim_{x \rightarrow c} k(x) = \lim_{x \rightarrow c} x^{-1/6} = \frac{1}{c^{1/6}} = k(c)$ for every positive real number $c \Rightarrow k$ is continuous on $(0, \infty)$.
8. (a) $\bigcup_{n \in I} \left(\left(n - \frac{1}{2} \right) \pi, \left(n + \frac{1}{2} \right) \pi \right)$, where I = the set of all integers.
 (b) $\bigcup_{n \in I} (n\pi, (n+1)\pi)$, where I = the set of all integers.
 (c) $(-\infty, \pi) \cup (\pi, \infty)$
 (d) $(-\infty, 0) \cup (0, \infty)$
9. (a) $\lim_{x \rightarrow 0} \frac{x^2 - 4x + 4}{x^3 + 5x^2 - 14x} = \lim_{x \rightarrow 0} \frac{(x-2)(x-2)}{x(x+7)(x-2)} = \lim_{x \rightarrow 0} \frac{x-2}{x(x+7)}$, $x \neq 2$; the limit does not exist because $\lim_{x \rightarrow 0^-} \frac{x-2}{x(x+7)} = \infty$ and $\lim_{x \rightarrow 0^+} \frac{x-2}{x(x+7)} = -\infty$
 (b) $\lim_{x \rightarrow 2} \frac{x^2 - 4x + 4}{x^3 + 5x^2 - 14x} = \lim_{x \rightarrow 2} \frac{(x-2)(x-2)}{x(x+7)(x-2)} = \lim_{x \rightarrow 2} \frac{x-2}{x(x+7)}$, $x \neq 2$, and $\lim_{x \rightarrow 2} \frac{x-2}{x(x+7)} = \frac{0}{2(9)} = 0$
10. (a) $\lim_{x \rightarrow 0} \frac{x^2 + x}{x^5 + 2x^4 + x^3} = \lim_{x \rightarrow 0} \frac{x(x+1)}{x^3(x^2 + 2x + 1)} = \lim_{x \rightarrow 0} \frac{x+1}{x^2(x+1)(x+1)} = \lim_{x \rightarrow 0} \frac{1}{x^2(x+1)}$, $x \neq 0$ and $x \neq -1$.
 Now $\lim_{x \rightarrow 0^-} \frac{1}{x^2(x+1)} = \infty$ and $\lim_{x \rightarrow 0^+} \frac{1}{x^2(x+1)} = \infty \Rightarrow \lim_{x \rightarrow 0} \frac{x^2 + x}{x^5 + 2x^4 + x^3} = \infty$.
 (b) $\lim_{x \rightarrow -1} \frac{x^2 + x}{x^5 + 2x^4 + x^3} = \lim_{x \rightarrow -1} \frac{x(x+1)}{x^3(x^2 + 2x + 1)} = \lim_{x \rightarrow -1} \frac{1}{x^2(x+1)}$, $x \neq 0$ and $x \neq -1$. The limit does not exist because $\lim_{x \rightarrow -1^-} \frac{1}{x^2(x+1)} = -\infty$ and $\lim_{x \rightarrow -1^+} \frac{1}{x^2(x+1)} = \infty$.
11. $\lim_{x \rightarrow 1} \frac{1 - \sqrt{x}}{1 - x} = \lim_{x \rightarrow 1} \frac{1 - \sqrt{x}}{(1 - \sqrt{x})(1 + \sqrt{x})} = \lim_{x \rightarrow 1} \frac{1}{1 + \sqrt{x}} = \frac{1}{2}$
12. $\lim_{x \rightarrow a} \frac{x^2 - a^2}{x^4 - a^4} = \lim_{x \rightarrow a} \frac{(x^2 - a^2)}{(x^2 + a^2)(x^2 - a^2)} = \lim_{x \rightarrow a} \frac{1}{x^2 + a^2} = \frac{1}{2a^2}$
13. $\lim_{h \rightarrow 0} \frac{(x+h)^2 - x^2}{h} = \lim_{h \rightarrow 0} \frac{(x^2 + 2hx + h^2) - x^2}{h} = \lim_{h \rightarrow 0} (2x + h) = 2x$
14. $\lim_{x \rightarrow 0} \frac{(x+h)^2 - x^2}{h} = \lim_{x \rightarrow 0} \frac{(x^2 + 2hx + h^2) - x^2}{h} = \lim_{x \rightarrow 0} (2x + h) = h$
15. $\lim_{x \rightarrow 0} \frac{\frac{1}{2+x} - \frac{1}{2}}{x} = \lim_{x \rightarrow 0} \frac{2 - (2+x)}{2x(2+x)} = \lim_{x \rightarrow 0} \frac{-1}{4+2x} = -\frac{1}{4}$
16. $\lim_{x \rightarrow 0} \frac{(2+x)^3 - 8}{x} = \lim_{x \rightarrow 0} \frac{(x^3 + 6x^2 + 12x + 8) - 8}{x} = \lim_{x \rightarrow 0} (x^2 + 6x + 12) = 12$

17. $\lim_{x \rightarrow 1} \frac{x^{1/3}-1}{\sqrt{x}-1} = \lim_{x \rightarrow 1} \frac{(x^{1/3}-1) \cdot (x^{2/3}+x^{1/3}+1)(\sqrt{x}+1)}{(\sqrt{x}-1)(x^{2/3}+x^{1/3}+1)} = \lim_{x \rightarrow 1} \frac{(x-1)(\sqrt{x}+1)}{(x-1)(x^{2/3}+x^{1/3}+1)} = \lim_{x \rightarrow 1} \frac{\sqrt{x}+1}{x^{2/3}+x^{1/3}+1} = \frac{1+1}{1+1+1} = \frac{2}{3}$
18. $\lim_{x \rightarrow 64} \frac{x^{2/3}-16}{\sqrt{x}-8} = \lim_{x \rightarrow 64} \frac{(x^{1/3}-4)(x^{1/3}+4)}{\sqrt{x}-8} = \lim_{x \rightarrow 64} \frac{(x^{1/3}-4)(x^{1/3}+4) \cdot (x^{2/3}+4x^{1/3}+16)(\sqrt{x}+8)}{(\sqrt{x}-8)(x^{2/3}+4x^{1/3}+16)}$

22. $\lim_{x \rightarrow \pi} \cos^2(x - \tan x) = \cos^2(\pi - \tan \pi) = \cos^2(\pi) = (-1)^2 = 1$
23. $\lim_{x \rightarrow 0} \frac{8x}{3 \sin x - x} = \lim_{x \rightarrow 0} \frac{8}{3 \frac{\sin x}{x} - 1} = \frac{8}{3(1) - 1} = 4$

 $= \lim_{x \rightarrow 0} \frac{-4 \sin x \cos^2 x}{\cos 2x + 1} = \frac{-4(0)(1)^2}{1+1} = 0$
25. Let $x = t - 3 \Rightarrow \lim_{t \rightarrow 3^+} \ln(t - 3) = \lim_{x \rightarrow 0^+} \ln x = -\infty$
26. $\lim_{t \rightarrow 1} t^2 \ln(2 - \sqrt{t}) = \ln 1 = 0$
27. $-1 \leq \cos\left(\frac{\pi}{\theta}\right) \leq 1 \Rightarrow e^{-1} \leq e^{\cos(\pi/\theta)} \leq e^1 \Rightarrow \sqrt{\theta}e^{-1} \leq \sqrt{\theta}e^{\cos(\pi/\theta)} \leq \sqrt{\theta}e \Rightarrow \lim_{\theta \rightarrow 0^+} \sqrt{\theta}e^{\cos(\pi/\theta)} = 0$ by the Sandwich Theorem
28. $\lim_{z \rightarrow 0^+} \frac{2e^{1/z}}{e^{1/z} + 1} = \lim_{z \rightarrow 0^+} \frac{2}{1 + e^{1/z}} = \frac{2}{1+0} = 2$
29. $\lim_{x \rightarrow 0^+} [4g(x)]^{1/3} = 2 \Rightarrow \left[\lim_{x \rightarrow 0^+} 4g(x) \right]^{1/3} = 2 \Rightarrow \lim_{x \rightarrow 0^+} 4g(x) = 8$, since $2^3 = 8$. Then $\lim_{x \rightarrow 0^+} g(x) = 2$.
30. $\lim_{x \rightarrow \sqrt{5}} \frac{1}{x+g(x)} = 2 \Rightarrow \lim_{x \rightarrow \sqrt{5}} (x+g(x)) = \frac{1}{2} \Rightarrow \sqrt{5} + \lim_{x \rightarrow \sqrt{5}} g(x) = \frac{1}{2} \Rightarrow \lim_{x \rightarrow \sqrt{5}} g(x) = \frac{1}{2} - \sqrt{5}$
31. $\lim_{x \rightarrow 1} \frac{3x^2+1}{g(x)} = \infty \Rightarrow \lim_{x \rightarrow 1} g(x) = 0$ since $\lim_{x \rightarrow 1} (3x^2 + 1) = 4$
32. $\lim_{x \rightarrow -2} \frac{5-x^2}{\sqrt{g(x)}} = 0 \Rightarrow \lim_{x \rightarrow -2} g(x) = \infty$ since $\lim_{x \rightarrow -2} (5-x^2) = 1$

33. At $x = -1$: $\lim_{x \rightarrow -1^-} f(x) = \lim_{x \rightarrow -1^-} \frac{x(x^2-1)}{|x^2-1|}$
 $= \lim_{x \rightarrow -1^-} \frac{x(x^2-1)}{x^2-1} = \lim_{x \rightarrow -1^-} x = -1$, and
 $\lim_{x \rightarrow -1^+} f(x) = \lim_{x \rightarrow -1^+} \frac{x(x^2-1)}{|x^2-1|} = \lim_{x \rightarrow -1^+} \frac{x(x^2-1)}{-(x^2-1)}$
 $= \lim_{x \rightarrow -1^+} (-x) = -(-1) = 1$. Since $\lim_{x \rightarrow -1^-} f(x) \neq \lim_{x \rightarrow -1^+} f(x) \Rightarrow \lim_{x \rightarrow -1} f(x)$ does not exist, the function f cannot be extended to a continuous function at $x = -1$.

At $x = 1$: $\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^-} \frac{x(x^2-1)}{|x^2-1|} = \lim_{x \rightarrow 1^-} \frac{x(x^2-1)}{-(x^2-1)} = \lim_{x \rightarrow 1^-} (-x) = -1$, and $\lim_{x \rightarrow 1^+} f(x) = \lim_{x \rightarrow 1^+} \frac{x(x^2-1)}{|x^2-1|}$
 $= \lim_{x \rightarrow 1^+} \frac{x(x^2-1)}{x^2-1} = \lim_{x \rightarrow 1^+} x = 1$.

Again $\lim_{x \rightarrow 1} f(x)$ does not exist so f cannot be extended to a continuous function at $x = 1$ either.

34. The discontinuity at $x = 0$ of $f(x) = \sin\left(\frac{1}{x}\right)$ is nonremovable because $\lim_{x \rightarrow 0} \sin\frac{1}{x}$ does not exist.

35. Yes, f does have a continuous extension at $a = 1$:
 define $f(1) = \lim_{x \rightarrow 1} \frac{x-1}{x-\sqrt{x}} = \frac{4}{3}$.

36. Yes, g does have a continuous extension at $a = \frac{\pi}{2}$:
 $g\left(\frac{\pi}{2}\right) = \lim_{\theta \rightarrow \frac{\pi}{2}} \frac{5 \cos \theta}{4\theta - 2\pi} = -\frac{5}{4}$.

37. From the graph we see that $\lim_{t \rightarrow 0^-} h(t) \neq \lim_{t \rightarrow 0^+} h(t)$
 so h cannot be extended to a continuous function at $a = 0$.

38. From the graph we see that $\lim_{x \rightarrow 0^-} k(x) \neq \lim_{x \rightarrow 0^+} k(x)$
so k cannot be extended to a continuous function at $a = 0$.

$$44. \lim_{x \rightarrow \infty} \frac{1}{x^2-7x+1} = \lim_{x \rightarrow \infty} \frac{\frac{1}{x^2}}{1-\frac{7}{x}+\frac{1}{x^2}} = \frac{0}{1-0+0} = 0$$

$$45. \lim_{x \rightarrow -\infty} \frac{x^2-7x}{x+1} = \lim_{x \rightarrow -\infty} \frac{x-7}{1+\frac{1}{x}} = -\infty$$

$$46. \lim_{x \rightarrow \infty} \frac{x^4+x^3}{12x^3+128} = \lim_{x \rightarrow -\infty} \frac{x+1}{12+\frac{128}{x^3}} = \infty$$

$$47. \lim_{x \rightarrow \infty} \frac{\sin x}{[x]} \leq \lim_{x \rightarrow \infty} \frac{1}{[x]} = 0 \text{ since } [x] \rightarrow \infty \text{ as } x \rightarrow \infty \Rightarrow \lim_{x \rightarrow \infty} \frac{\sin x}{[x]} = 0.$$

$$48. \lim_{\theta \rightarrow \infty} \frac{\cos \theta - 1}{\theta} \leq \lim_{\theta \rightarrow \infty} \frac{2}{\theta} = 0 \Rightarrow \lim_{\theta \rightarrow \infty} \frac{\cos \theta - 1}{\theta} = 0.$$

$$49. \lim_{x \rightarrow \infty} \frac{x + \sin x + 2\sqrt{x}}{x + \sin x} = \lim_{x \rightarrow \infty} \frac{1 + \frac{\sin x}{x} + \frac{2}{\sqrt{x}}}{1 + \frac{\sin x}{x}} = \frac{1+0+0}{1+0} = 1$$

$$50. \lim_{x \rightarrow \infty} \frac{x^{2/3} + x^{-1}}{x^{2/3} + \cos^2 x} = \lim_{x \rightarrow \infty} \left(\frac{1 + x^{-5/3}}{1 + \frac{\cos^2 x}{x^{2/3}}} \right) = \frac{1+0}{1+0} = 1$$

$$51. \lim_{x \rightarrow \infty} e^{1/x} \cos\left(\frac{1}{x}\right) = e^0 \cdot \cos(0) = 1 \cdot 1 = 1$$

$$52. \lim_{x \rightarrow \infty} \ln\left(1 + \frac{1}{t}\right) = \ln 1 = 0$$

$$53. \lim_{x \rightarrow -\infty} \tan^{-1} x = -\frac{\pi}{2}$$

54. $\lim_{t \rightarrow -\infty} e^{3t} \sin^{-1}\left(\frac{1}{t}\right) = 0 \cdot \sin^{-1}(0) = 0 \cdot 0 = 0$

55. (a) $y = \frac{x^2+4}{x-3}$ is undefined at $x = 3$: $\lim_{x \rightarrow 3^-} \frac{x^2+4}{x-3} = -\infty$ and $\lim_{x \rightarrow 3^+} \frac{x^2+4}{x-3} = +\infty$, thus $x = 3$ is a vertical asymptote.

(b) $y = \frac{x^2-x-2}{x^2-2x+1}$ is undefined at $x = 1$: $\lim_{x \rightarrow 1^-} \frac{x^2-x-2}{x^2-2x+1} = -\infty$ and $\lim_{x \rightarrow 1^+} \frac{x^2-x-2}{x^2-2x+1} = -\infty$, thus $x = 1$ is a vertical asymptote.

(c) $y = \frac{x^2+x-6}{x^2+2x-8}$ is undefined at $x = 2$ and -4 : $\lim_{x \rightarrow 2} \frac{x^2+x-6}{x^2+2x-8} = \lim_{x \rightarrow 2} \frac{x+3}{x+4} = \frac{5}{6}$; $\lim_{x \rightarrow -4^-} \frac{x^2+x-6}{x^2+2x-8} = \lim_{x \rightarrow -4^-} \frac{x+3}{x+4} = \infty$
 $\lim_{x \rightarrow -4^+} \frac{x^2+x-6}{x^2+2x-8} = \lim_{x \rightarrow -4^+} \frac{x+3}{x+4} = -\infty$. Thus $x = -4$ is a vertical asymptote.

56. (a) $y = \frac{1-x^2}{x^2+1}$: $\lim_{x \rightarrow \infty} \frac{1-x^2}{x^2+1} = \lim_{x \rightarrow \infty} \frac{\frac{1}{x^2}-1}{1+\frac{1}{x^2}} = \frac{-1}{1} = -1$ and $\lim_{x \rightarrow -\infty} \frac{1-x^2}{x^2+1} = \lim_{x \rightarrow -\infty} \frac{\frac{1}{x^2}-1}{1+\frac{1}{x^2}} = \frac{-1}{1} = -1$, thus $y = -1$ is a horizontal asymptote.

(b) $y = \frac{\sqrt{x+4}}{\sqrt{x+4}}$: $\lim_{x \rightarrow \infty} \frac{\sqrt{x+4}}{\sqrt{x+4}} = \lim_{x \rightarrow \infty} \frac{1+\frac{4}{x}}{\sqrt{1+\frac{4}{x}}} = \frac{1+0}{\sqrt{1+0}} = 1$, thus $y = 1$ is a horizontal asymptote.

(c) $y = \frac{\sqrt{x^2+4}}{x}$: $\lim_{x \rightarrow \infty} \frac{\sqrt{x^2+4}}{x} = \lim_{x \rightarrow \infty} \frac{\sqrt{1+\frac{4}{x^2}}}{1} = \frac{\sqrt{1+0}}{1} = 1$ and $\lim_{x \rightarrow -\infty} \frac{\sqrt{x^2+4}}{x} = \lim_{x \rightarrow -\infty} \frac{\sqrt{1+\frac{4}{x^2}}}{\frac{x}{x^2}}$
 $= \lim_{x \rightarrow -\infty} \frac{\sqrt{1+\frac{4}{x^2}}}{\frac{1}{-x}} = \lim_{x \rightarrow -\infty} \frac{\sqrt{1+\frac{4}{x^2}}}{-1} = \frac{\sqrt{1+0}}{-1} = -1$,

thus $y = 1$ and $y = -1$ are horizontal asymptotes.

(d) $y = \frac{\sqrt{x^2+9}}{\sqrt{9x^2+1}}$: $\lim_{x \rightarrow \infty} \frac{\sqrt{x^2+9}}{\sqrt{9x^2+1}} = \lim_{x \rightarrow \infty} \sqrt{\frac{1+\frac{9}{x^2}}{9+\frac{1}{x^2}}} = \sqrt{\frac{1+0}{9+0}} = \frac{1}{3}$ and $\lim_{x \rightarrow -\infty} \frac{\sqrt{x^2+9}}{\sqrt{9x^2+1}} = \lim_{x \rightarrow -\infty} \sqrt{\frac{1+\frac{9}{x^2}}{9+\frac{1}{x^2}}} = \sqrt{\frac{1+0}{9+0}} = \frac{1}{3}$,
 thus $y = \frac{1}{3}$ is a horizontal asymptote.

CHAPTER 2 ADDITIONAL AND ADVANCED EXERCISES

1. (a)

x	0.1	0.01	0.001	0.0001	0.00001
x^x	0.7943	0.9550	0.9931	0.9991	0.9999

Apparently, $\lim_{x \rightarrow 0^+} x^x = 1$

(b)

2. (a)

x	10	100	1000
$\left(\frac{1}{x}\right)^{1/(\ln x)}$	0.3679	0.3679	0.3679

 Apparently, $\lim_{x \rightarrow \infty} \left(\frac{1}{x}\right)^{1/(\ln x)} = 0.3678 = \frac{1}{e}$

3. $\lim_{v \rightarrow c^-} L = \lim_{v \rightarrow c^-} L_0 \sqrt{1 - \frac{v^2}{c^2}} = L_0 \sqrt{1 - \frac{\lim_{v \rightarrow c^-} v^2}{c^2}} = L_0 \sqrt{1 - \frac{c^2}{c^2}} = 0$

The left-hand limit was needed because the function L is undefined if $v > c$ (the rocket cannot move faster than the speed of light).

4. (a) $\left| \frac{\sqrt{x}}{2} - 1 \right| < 0.2 \Rightarrow -0.2 < \frac{\sqrt{x}}{2} - 1 < 0.2 \Rightarrow 0.8 < \frac{\sqrt{x}}{2} < 1.2 \Rightarrow 1.6 < \sqrt{x} < 2.4 \Rightarrow 2.56 < x < 5.76$.

(b) $\left| \frac{\sqrt{x}}{2} - 1 \right| < 0.1 \Rightarrow -0.1 < \frac{\sqrt{x}}{2} - 1 < 0.1 \Rightarrow 0.9 < \frac{\sqrt{x}}{2} < 1.1 \Rightarrow 1.8 < \sqrt{x} < 2.2 \Rightarrow 3.24 < x < 4.84$.

5. $|10 + (t - 70) \times 10^{-4} - 10| < 0.0005 \Rightarrow |(t - 70) \times 10^{-4}| < 0.0005 \Rightarrow -0.0005 < (t - 70) \times 10^{-4} < 0.0005 \Rightarrow -5 < t - 70 < 5 \Rightarrow 65^\circ < t < 75^\circ \Rightarrow$ Within 5° F.

6. We want to know in what interval to hold values of h to make V satisfy the inequality $|V - 1000| = |36\pi h - 1000| \leq 10$. To find out, we solve the inequality:

$$|36\pi h - 1000| \leq 10 \Rightarrow -10 \leq 36\pi h - 1000 \leq 10 \Rightarrow 990 \leq 36\pi h \leq 1010 \Rightarrow \frac{990}{36\pi} \leq h \leq \frac{1010}{36\pi} \Rightarrow 8.8 \leq h \leq 8.9$$

where 8.8 was rounded up, to be safe, and 8.9 was rounded down, to be safe.

The interval in which we should hold h is about $8.9 - 8.8 = 0.1$ cm wide (1 mm). With stripes 1 mm wide, we can expect to measure a liter of water with an accuracy of 1%, which is more than enough accuracy for cooking.

7. Show $\lim_{x \rightarrow 1} f(x) = \lim_{x \rightarrow 1} (x^2 - 7) = -6 = f(1)$.

Step 1: $|(x^2 - 7) + 6| < \epsilon \Rightarrow -\epsilon < x^2 - 1 < \epsilon \Rightarrow 1 - \epsilon < x^2 < 1 + \epsilon \Rightarrow \sqrt{1 - \epsilon} < x < \sqrt{1 + \epsilon}$.

Step 2: $|x - 1| < \delta \Rightarrow -\delta < x - 1 < \delta \Rightarrow -\delta + 1 < x < \delta + 1$.

Then $-\delta + 1 = \sqrt{1 - \epsilon}$ or $\delta + 1 = \sqrt{1 + \epsilon}$. Choose $\delta = \min\{1 - \sqrt{1 - \epsilon}, \sqrt{1 + \epsilon} - 1\}$, then $0 < |x - 1| < \delta \Rightarrow$

$|(x^2 - 7) - (-6)| < \epsilon$ and $\lim_{x \rightarrow 1} f(x) = -6$. By the continuity text, $f(x)$ is continuous at $x = 1$.

8. Show $\lim_{x \rightarrow \frac{1}{4}} g(x) = \lim_{x \rightarrow \frac{1}{4}} \frac{1}{2x} = 2 = g\left(\frac{1}{4}\right)$.

Step 1: $\left| \frac{1}{2x} - 2 \right| < \epsilon \Rightarrow -\epsilon < \frac{1}{2x} - 2 < \epsilon \Rightarrow 2 - \epsilon < \frac{1}{2x} < 2 + \epsilon \Rightarrow \frac{1}{4 - 2\epsilon} > x > \frac{1}{4 + 2\epsilon}$.

Step 2: $\left|x - \frac{1}{4}\right| < \delta \Rightarrow -\delta < x - \frac{1}{4} < \delta \Rightarrow -\delta + \frac{1}{4} < x < \delta + \frac{1}{4}$.

Then $-\delta + \frac{1}{4} = \frac{1}{4+2\epsilon} \Rightarrow \delta = \frac{1}{4} - \frac{1}{4+2\epsilon} = \frac{\epsilon}{4(2-\epsilon)}$, or $\delta + \frac{1}{4} = \frac{1}{4-2\epsilon} \Rightarrow \delta = \frac{1}{4-2\epsilon} - \frac{1}{4} = \frac{\epsilon}{4(2+\epsilon)}$.

Choose $\delta = \frac{\epsilon}{4(2+\epsilon)}$, the smaller of the two values. Then $0 < \left|x - \frac{1}{4}\right| < \delta \Rightarrow \left|\frac{1}{2x} - 2\right| < \epsilon$ and $\lim_{x \rightarrow \frac{1}{4}} \frac{1}{2x} = 2$.

By the continuity test, $g(x)$ is continuous at $x = \frac{1}{4}$.

9. Show $\lim_{x \rightarrow 2} h(x) = \lim_{x \rightarrow 2} \sqrt{2x-3} = 1 = h(2)$.

Step 1: $\left|\sqrt{2x-3} - 1\right| < \epsilon \Rightarrow -\epsilon < \sqrt{2x-3} - 1 < \epsilon \Rightarrow 1 - \epsilon < \sqrt{2x-3} < 1 + \epsilon \Rightarrow \frac{(1-\epsilon)^2+3}{2} < x < \frac{(1+\epsilon)^2+3}{2}$.

Step 2: $|x - 2| < \delta \Rightarrow -\delta < x - 2 < \delta$ or $-\delta + 2 < x < \delta + 2$.

Then $-\delta + 2 = \frac{(1-\epsilon)^2+3}{2} \Rightarrow \delta = 2 - \frac{(1-\epsilon)^2+3}{2} = \frac{1-(1-\epsilon)^2}{2} = \epsilon - \frac{\epsilon^2}{2}$, or $\delta + 2 = \frac{(1+\epsilon)^2+3}{2} \Rightarrow \delta = \frac{(1+\epsilon)^2+3}{2} - 2 = \frac{(1+\epsilon)^2-1}{2} = \epsilon + \frac{\epsilon^2}{2}$. Choose $\delta = \epsilon - \frac{\epsilon^2}{2}$, the smaller of the two values. Then, $0 < |x - 2| < \delta \Rightarrow \left|\sqrt{2x-3} - 1\right| < \epsilon$,

so $\lim_{x \rightarrow 2} \sqrt{2x-3} = 1$. By the continuity test, $h(x)$ is continuous at $x = 2$.

10. Show $\lim_{x \rightarrow 5} F(x) = \lim_{x \rightarrow 5} \sqrt{9-x} = 2 = F(5)$.

Step 1: $\left|\sqrt{9-x} - 2\right| < \epsilon \Rightarrow -\epsilon < \sqrt{9-x} - 2 < \epsilon \Rightarrow 9 - (2-\epsilon)^2 > x > 9 - (2+\epsilon)^2$.

Step 2: $0 < |x - 5| < \delta \Rightarrow -\delta < x - 5 < \delta \Rightarrow -\delta + 5 < x < \delta + 5$.

Then $-\delta + 5 = 9 - (2+\epsilon)^2 \Rightarrow \delta = (2+\epsilon)^2 - 4 = \epsilon^2 + 2\epsilon$, or $\delta + 5 = 9 - (2-\epsilon)^2 \Rightarrow \delta = 4 - (2-\epsilon)^2 = \epsilon^2 - 2\epsilon$.

Choose $\delta = \epsilon^2 - 2\epsilon$, the smaller of the two values. Then, $0 < |x - 5| < \delta \Rightarrow \left|\sqrt{9-x} - 2\right| < \epsilon$, so $\lim_{x \rightarrow 5} \sqrt{9-x} = 2$.

By the continuity test, $F(x)$ is continuous at $x = 5$.

11. Suppose L_1 and L_2 are two different limits. Without loss of generality assume $L_2 > L_1$. Let $\epsilon = \frac{1}{3}(L_2 - L_1)$. Since

$\lim_{x \rightarrow x_0} f(x) = L_1$ there is a $\delta_1 > 0$ such that $0 < |x - x_0| < \delta_1 \Rightarrow |f(x) - L_1| < \epsilon \Rightarrow -\epsilon < f(x) - L_1 < \epsilon$

$\Rightarrow -\frac{1}{3}(L_2 - L_1) + L_1 < f(x) < \frac{1}{3}(L_2 - L_1) + L_1 \Rightarrow 4L_1 - L_2 < 3f(x) < 2L_1 + L_2$. Likewise, $\lim_{x \rightarrow x_0} f(x) = L_2$ so

there is a δ_2

such that $0 < |x - x_0| < \delta_2 \Rightarrow |f(x) - L_2| < \epsilon \Rightarrow -\epsilon < f(x) - L_2 < \epsilon \Rightarrow -\frac{1}{3}(L_2 - L_1) + L_2 < f(x) < \frac{1}{3}(L_2 - L_1) + L_2$

$\Rightarrow 2L_2 + L_1 < 3f(x) < 4L_2 - L_1 \Rightarrow L_1 - 4L_2 < -3f(x) < -2L_2 - L_1$. If $\delta = \min\{\delta_1, \delta_2\}$ both inequalities must

hold for $0 < |x - x_0| < \delta$: $\left. \begin{array}{l} 4L_1 - L_2 < 3f(x) < 2L_1 + L_2 \\ L_1 - 4L_2 < -3f(x) < -2L_2 - L_1 \end{array} \right\} \Rightarrow 5(L_1 - L_2) < 0 < L_1 - L_2$. That is, $L_1 - L_2 < 0$ and

$L_1 - L_2 > 0$, a contradiction.

12. Suppose $\lim_{x \rightarrow c} f(x) = L$. If $k = 0$, then $\lim_{x \rightarrow c} kf(x) = \lim_{x \rightarrow c} 0 = 0 = 0 \cdot \lim_{x \rightarrow c} f(x)$ and we are done. If $k \neq 0$, then given

any $\epsilon > 0$, there is a $\delta > 0$ so that $0 < |x - c| < \delta \Rightarrow |f(x) - L| < \frac{\epsilon}{|k|} \Rightarrow |k||f(x) - L| < \epsilon \Rightarrow |k(f(x) - L)| < \epsilon$

$\Rightarrow |(kf(x)) - (kL)| < \epsilon$. Thus $\lim_{x \rightarrow c} kf(x) = kL = k \left(\lim_{x \rightarrow c} f(x) \right)$.

13. (a) Since $x \rightarrow 0^+$, $0 < x^3 < x < 1 \Rightarrow (x^3 - x) \rightarrow 0^- \Rightarrow \lim_{x \rightarrow 0^+} f(x^3 - x) = \lim_{y \rightarrow 0^-} f(y) = B$ where $y = x^3 - x$.

(b) Since $x \rightarrow 0^-$, $-1 < x < x^3 < 0 \Rightarrow (x^3 - x) \rightarrow 0^+ \Rightarrow \lim_{x \rightarrow 0^-} f(x^3 - x) = \lim_{y \rightarrow 0^+} f(y) = A$ where $y = x^3 - x$.

(c) Since $x \rightarrow 0^+$, $0 < x^4 < x^2 < 1 \Rightarrow (x^2 - x^4) \rightarrow 0^+ \Rightarrow \lim_{x \rightarrow 0^+} f(x^2 - x^4) = \lim_{y \rightarrow 0^+} f(y) = A$ where $y = x^2 - x^4$.

(d) Since $x \rightarrow 0^-$, $-1 < x < 0 \Rightarrow 0 < x^4 < x^2 < 1 \Rightarrow (x^2 - x^4) \rightarrow 0^+ \Rightarrow \lim_{x \rightarrow 0^-} f(x^2 - x^4) = A$ as in part (c).

14. (a) True, because if $\lim_{x \rightarrow a} (f(x) + g(x))$ exists then $\lim_{x \rightarrow a} (f(x) + g(x)) - \lim_{x \rightarrow a} f(x) = \lim_{x \rightarrow a} [(f(x) + g(x)) - f(x)] = \lim_{x \rightarrow a} g(x)$ exists, contrary to assumption.
- (b) False; for example take $f(x) = \frac{1}{x}$ and $g(x) = -\frac{1}{x}$. Then neither $\lim_{x \rightarrow 0} f(x)$ nor $\lim_{x \rightarrow 0} g(x)$ exists, but $\lim_{x \rightarrow 0} (f(x) + g(x)) = \lim_{x \rightarrow 0} \left(\frac{1}{x} - \frac{1}{x}\right) = \lim_{x \rightarrow 0} 0 = 0$ exists.
- (c) True, because $g(x) = |x|$ is continuous $\Rightarrow g(f(x)) = |f(x)|$ is continuous (it is the composite of continuous functions).
- (d) False; for example let $f(x) = \begin{cases} -1, & x \leq 0 \\ 1, & x > 0 \end{cases} \Rightarrow f(x)$ is discontinuous at $x = 0$. However $|f(x)| = 1$ is continuous at $x = 0$.

15. Show $\lim_{x \rightarrow -1} f(x) = \lim_{x \rightarrow -1} \frac{x^2 - 1}{x + 1} = \lim_{x \rightarrow -1} \frac{(x + 1)(x - 1)}{(x + 1)} = -2, x \neq -1$.

Define the continuous extension of $f(x)$ as $F(x) = \begin{cases} \frac{x^2 - 1}{x + 1}, & x \neq -1 \\ -2, & x = -1 \end{cases}$. We now prove the limit of $f(x)$ as $x \rightarrow -1$

exists and has the correct value.

Step 1: $\left| \frac{x^2 - 1}{x + 1} - (-2) \right| < \epsilon \Rightarrow -\epsilon < \frac{(x + 1)(x - 1)}{(x + 1)} + 2 < \epsilon \Rightarrow -\epsilon < (x - 1) + 2 < \epsilon, x \neq -1 \Rightarrow -\epsilon - 1 < x < \epsilon - 1$.

Step 2: $|x - (-1)| < \delta \Rightarrow -\delta < x + 1 < \delta \Rightarrow -\delta - 1 < x < \delta - 1$.

Then $-\delta - 1 = -\epsilon - 1 \Rightarrow \delta = \epsilon$, or $\delta - 1 = \epsilon - 1 \Rightarrow \delta = \epsilon$. Choose $\delta = \epsilon$. Then $0 < |x - (-1)| < \delta$

$\Rightarrow \left| \frac{x^2 - 1}{x + 1} - (-2) \right| < \epsilon \Rightarrow \lim_{x \rightarrow -1} F(x) = -2$. Since the conditions of the continuity test are met by $F(x)$, then $f(x)$ has a continuous extension to $F(x)$ at $x = -1$.

16. Show $\lim_{x \rightarrow 3} g(x) = \lim_{x \rightarrow 3} \frac{x^2 - 2x - 3}{2x - 6} = \lim_{x \rightarrow 3} \frac{(x - 3)(x + 1)}{2(x - 3)} = 2, x \neq 3$.

Define the continuous extension of $g(x)$ as $G(x) = \begin{cases} \frac{x^2 - 2x - 3}{2x - 6}, & x \neq 3 \\ 2, & x = 3 \end{cases}$. We now prove the limit of $g(x)$ as $x \rightarrow 3$

exists and has the correct value.

Step 1: $\left| \frac{x^2 - 2x - 3}{2x - 6} - 2 \right| < \epsilon \Rightarrow -\epsilon < \frac{(x - 3)(x + 1)}{2(x - 3)} - 2 < \epsilon \Rightarrow -\epsilon < \frac{x + 1}{2} - 2 < \epsilon, x \neq 3 \Rightarrow 3 - 2\epsilon < x < 3 + 2\epsilon$.

Step 2: $|x - 3| < \delta \Rightarrow -\delta < x - 3 < \delta \Rightarrow 3 - \delta < x < \delta + 3$.

Then, $3 - \delta = 3 - 2\epsilon \Rightarrow \delta = 2\epsilon$, or $\delta + 3 = 3 + 2\epsilon \Rightarrow \delta = 2\epsilon$. Choose $\delta = 2\epsilon$. Then $0 < |x - 3| < \delta$

$\Rightarrow \left| \frac{x^2 - 2x - 3}{2x - 6} - 2 \right| < \epsilon \Rightarrow \lim_{x \rightarrow 3} \frac{(x - 3)(x + 1)}{2(x - 3)} = 2$. Since the conditions of the continuity test hold for $G(x)$, $g(x)$ can be continuously extended to $G(x)$ at $x = 3$.

17. (a) Let $\epsilon > 0$ be given. If x is rational, then $f(x) = x \Rightarrow |f(x) - 0| = |x - 0| < \epsilon \Leftrightarrow |x - 0| < \epsilon$; i.e., choose $\delta = \epsilon$. Then $|x - 0| < \delta \Rightarrow |f(x) - 0| < \epsilon$ for x rational. If x is irrational, then $f(x) = 0 \Rightarrow |f(x) - 0| < \epsilon \Leftrightarrow 0 < \epsilon$ which is true no matter how close irrational x is to 0, so again we can choose $\delta = \epsilon$. In either case, given $\epsilon > 0$ there is a $\delta = \epsilon > 0$ such that $0 < |x - 0| < \delta \Rightarrow |f(x) - 0| < \epsilon$. Therefore, f is continuous at $x = 0$.
- (b) Choose $x = c > 0$. Then within any interval $(c - \delta, c + \delta)$ there are both rational and irrational numbers. If c is rational, pick $\epsilon = \frac{c}{2}$. No matter how small we choose $\delta > 0$ there is an irrational number x in $(c - \delta, c + \delta) \Rightarrow |f(x) - f(c)| = |0 - c| = c > \frac{c}{2} = \epsilon$. That is, f is not continuous at any rational $c > 0$. On the other hand, suppose c is irrational $\Rightarrow f(c) = 0$. Again pick $\epsilon = \frac{c}{2}$. No matter how small we choose $\delta > 0$ there is a rational number x in $(c - \delta, c + \delta)$ with $|x - c| < \frac{c}{2} = \epsilon \Leftrightarrow \frac{c}{2} < x < \frac{3c}{2}$. Then $|f(x) - f(c)| = |x - 0| = |x| > \frac{c}{2} = \epsilon \Rightarrow f$ is not continuous at any irrational $c > 0$.
- If $x = c < 0$, repeat the argument picking $\epsilon = \frac{|c|}{2} = \frac{-c}{2}$. Therefore f fails to be continuous at any nonzero value $x = c$.

18. (a) Let $c = \frac{m}{n}$ be a rational number in $[0, 1]$ reduced to lowest terms $\Rightarrow f(c) = \frac{1}{n}$. Pick $\epsilon = \frac{1}{2n}$. No matter how small $\delta > 0$ is taken, there is an irrational number x in the interval $(c - \delta, c + \delta) \Rightarrow |f(x) - f(c)| = \left|0 - \frac{1}{n}\right| = \frac{1}{n} > \frac{1}{2n} = \epsilon$. Therefore f is discontinuous at $x = c$, a rational number.
- (b) Now suppose c is an irrational number $\Rightarrow f(c) = 0$. Let $\epsilon > 0$ be given. Notice that $\frac{1}{2}$ is the only rational number reduced to lowest terms with denominator 2 and belonging to $[0, 1]$; $\frac{1}{3}$ and $\frac{2}{3}$ the only rationals with denominator 3 belonging to $[0, 1]$; $\frac{1}{4}$ and $\frac{3}{4}$ with denominator 4 in $[0, 1]$; $\frac{1}{5}, \frac{2}{5}, \frac{3}{5}$ and $\frac{4}{5}$ with denominator 5 in $[0, 1]$; etc. In general, choose N so that $\frac{1}{N} < \epsilon \Rightarrow$ there exist only finitely many rationals in $[0, 1]$ having

denominator $\leq N$, say r_1, r_2, \dots, r_p . Let $\delta = \min \{|c - r_i| : i = 1, \dots, p\}$. Then the interval $(c - \delta, c + \delta)$ contains no rational numbers with denominator $\leq N$. Thus, $0 < |x - c| < \delta \Rightarrow |f(x) - f(c)| = |f(x) - 0| = |f(x)| \leq \frac{1}{N} < \epsilon \Rightarrow f$ is continuous at $x = c$ irrational.

- (c) The graph looks like the markings on a typical ruler when the points $(x, f(x))$ on the graph of $f(x)$ are connected to the x -axis with vertical lines.

19. Yes. Let R be the radius of the equator (earth) and suppose at a fixed instant of time we label noon as the zero point, 0, on the equator $\Rightarrow 0 + \pi R$ represents the midnight point (at the same exact time). Suppose x_1 is a point on the equator “just after” noon $\Rightarrow x_1 + \pi R$ is simultaneously “just after” midnight. It seems reasonable that the temperature T at a point just after noon is hotter than it would be at the diametrically opposite point just after midnight: That is, $T(x_1) - T(x_1 + \pi R) > 0$. At exactly the same moment in time pick x_2 to be a point just before midnight $\Rightarrow x_2 + \pi R$ is just before noon. Then $T(x_2) - T(x_2 + \pi R) < 0$. Assuming the temperature function T is continuous along the equator (which is reasonable), the Intermediate Value Theorem says there is a point c between 0 (noon) and πR (simultaneously midnight) such that $T(c) - T(c + \pi R) = 0$; i.e., there is always a pair of antipodal points on the earth’s equator where the temperatures are the same.

20.
$$\lim_{x \rightarrow c} f(x)g(x) = \lim_{x \rightarrow c} \frac{1}{4} \left[(f(x) + g(x))^2 - (f(x) - g(x))^2 \right] = \frac{1}{4} \left[\left(\lim_{x \rightarrow c} (f(x) + g(x)) \right)^2 - \left(\lim_{x \rightarrow c} (f(x) - g(x)) \right)^2 \right]$$

$$= \frac{1}{4} (3^2 - (-1)^2) = 2.$$

21. (a) At $x = 0$: $\lim_{a \rightarrow 0} r_+(a) = \lim_{a \rightarrow 0} \frac{-1 + \sqrt{1+a}}{a} = \lim_{a \rightarrow 0} \left(\frac{-1 + \sqrt{1+a}}{a} \right) \left(\frac{-1 - \sqrt{1+a}}{-1 - \sqrt{1+a}} \right) = \lim_{a \rightarrow 0} \frac{1 - (1+a)}{a(-1 - \sqrt{1+a})} = \frac{-1}{-1 - \sqrt{1+0}} = \frac{1}{2}$
 At $x = -1$: $\lim_{a \rightarrow -1^+} r_+(a) = \lim_{a \rightarrow -1^+} \frac{1 - (1+a)}{a(-1 - \sqrt{1+a})} = \lim_{a \rightarrow -1} \frac{-a}{a(-1 - \sqrt{1+a})} = \frac{-1}{-1 - \sqrt{0}} = 1$

(b) At $x = 0$: $\lim_{a \rightarrow 0^-} r_-(a) = \lim_{a \rightarrow 0^-} \frac{-1 - \sqrt{1+a}}{a} = \lim_{a \rightarrow 0^-} \left(\frac{-1 - \sqrt{1+a}}{a} \right) \left(\frac{-1 + \sqrt{1+a}}{-1 + \sqrt{1+a}} \right) = \lim_{a \rightarrow 0^-} \frac{1 - (1+a)}{a(-1 + \sqrt{1+a})} = \lim_{a \rightarrow 0^-} \frac{-a}{a(-1 + \sqrt{1+a})}$
 $= \lim_{a \rightarrow 0^-} \frac{-1}{-1 + \sqrt{1+a}} = \infty$ (because the denominator is always negative); $\lim_{a \rightarrow 0^+} r_-(a)$
 $= \lim_{a \rightarrow 0^+} \frac{-1}{-1 + \sqrt{1+a}} = -\infty$ (because the denominator is always positive).

Therefore, $\lim_{a \rightarrow 0} r_-(a)$ does not exist.

At $x = -1$: $\lim_{a \rightarrow -1^+} r_-(a) = \lim_{a \rightarrow -1^+} \frac{-1 - \sqrt{1+a}}{a} = \lim_{a \rightarrow -1^+} \frac{-1}{-1 + \sqrt{1+a}} = 1$

(c)

(d)

22. $f(x) = x + 2 \cos x \Rightarrow f(0) = 0 + 2 \cos 0 = 2 > 0$ and $f(-\pi) = -\pi + 2 \cos(-\pi) = -\pi - 2 < 0$. Since $f(x)$ is continuous on $[-\pi, 0]$, by the Intermediate Value Theorem, $f(x)$ must take on every value between $[-\pi - 2, 2]$. Thus there is some number c in $[-\pi, 0]$ such that $f(c) = 0$; i.e., c is a solution to $x + 2 \cos x = 0$.

23. (a) The function f is bounded on D if $f(x) \geq M$ and $f(x) \leq N$ for all x in D . This means $M \leq f(x) \leq N$ for all x in D . Choose B to be $\max\{|M|, |N|\}$. Then $|f(x)| \leq B$. On the other hand, if $|f(x)| \leq B$, then $-B \leq f(x) \leq B \Rightarrow f(x) \geq -B$ and $f(x) \leq B \Rightarrow f(x)$ is bounded on D with $N = B$ an upper bound and $M = -B$ a lower bound.

(b) Assume $f(x) \leq N$ for all x and that $L > N$. Let $\epsilon = \frac{L-N}{2}$. Since $\lim_{x \rightarrow x_0} f(x) = L$ there is a $\delta > 0$ such that $0 < |x - x_0| < \delta \Rightarrow |f(x) - L| < \epsilon \Leftrightarrow L - \epsilon < f(x) < L + \epsilon \Leftrightarrow L - \frac{L-N}{2} < f(x) < L + \frac{L-N}{2} \Leftrightarrow \frac{L+N}{2} < f(x) < \frac{3L-N}{2}$. But $L > N \Rightarrow \frac{L+N}{2} > N \Rightarrow N < f(x)$ contrary to the boundedness assumption $f(x) \leq N$. This contradiction proves $L \leq N$.

(c) Assume $M \leq f(x)$ for all x and that $L < M$. Let $\epsilon = \frac{M-L}{2}$. As in part (b), $0 < |x - x_0| < \delta \Rightarrow L - \frac{M-L}{2} < f(x) < L + \frac{M-L}{2} \Leftrightarrow \frac{3L-M}{2} < f(x) < \frac{M+L}{2} < M$, a contradiction.

24. (a) If $a \geq b$, then $a - b \geq 0 \Rightarrow |a - b| = a - b \Rightarrow \max \{a, b\} = \frac{a+b}{2} + \frac{|a-b|}{2} = \frac{a+b}{2} + \frac{a-b}{2} = \frac{2a}{2} = a$.
 If $a \leq b$, then $a - b \leq 0 \Rightarrow |a - b| = -(a - b) = b - a \Rightarrow \max \{a, b\} = \frac{a+b}{2} + \frac{|a-b|}{2} = \frac{a+b}{2} + \frac{b-a}{2} = \frac{2b}{2} = b$.
- (b) Let $\min \{a, b\} = \frac{a+b}{2} - \frac{|a-b|}{2}$.

$$25. \lim_{x \rightarrow 0} \frac{\sin(1 - \cos x)}{x} = \lim_{x \rightarrow 0} \frac{\sin(1 - \cos x)}{1 - \cos x} \cdot \frac{1 - \cos x}{x} \cdot \frac{1 + \cos x}{1 + \cos x} = \lim_{x \rightarrow 0} \frac{\sin(1 - \cos x)}{1 - \cos x} \cdot \lim_{x \rightarrow 0} \frac{1 - \cos^2 x}{x(1 + \cos x)}$$

$$= 1 \cdot \lim_{x \rightarrow 0} \frac{\sin^2 x}{x(1 + \cos x)} = \lim_{x \rightarrow 0} \frac{\sin x}{x} \cdot \frac{\sin x}{1 + \cos x} = 1 \cdot \left(\frac{0}{2}\right) = 0.$$

$$26. \lim_{x \rightarrow 0^+} \frac{\sin x}{\sin \sqrt{x}} = \lim_{x \rightarrow 0^+} \frac{\sin x}{x} \cdot \frac{\sqrt{x}}{\sin \sqrt{x}} \cdot \frac{x}{\sqrt{x}} = 1 \cdot \lim_{x \rightarrow 0^+} \frac{1}{\left(\frac{\sin \sqrt{x}}{\sqrt{x}}\right)} \cdot \lim_{x \rightarrow 0^+} \sqrt{x} = 1 \cdot 1 \cdot 0 = 0.$$

$$27. \lim_{x \rightarrow 0} \frac{\sin(\sin x)}{x} = \lim_{x \rightarrow 0} \frac{\sin(\sin x)}{\sin x} \cdot \frac{\sin x}{x} = \lim_{x \rightarrow 0} \frac{\sin(\sin x)}{\sin x} \cdot \lim_{x \rightarrow 0} \frac{\sin x}{x} = 1 \cdot 1 = 1.$$

$$28. \lim_{x \rightarrow 0} \frac{\sin(x^2 + x)}{x} = \lim_{x \rightarrow 0} \frac{\sin(x^2 + x)}{x^2 + x} \cdot (x + 1) = \lim_{x \rightarrow 0} \frac{\sin(x^2 + x)}{x^2 + x} \cdot \lim_{x \rightarrow 0} (x + 1) = 1 \cdot 1 = 1.$$

$$29. \lim_{x \rightarrow 2} \frac{\sin(x^2 - 4)}{x - 2} = \lim_{x \rightarrow 2} \frac{\sin(x^2 - 4)}{x^2 - 4} \cdot (x + 2) = \lim_{x \rightarrow 2} \frac{\sin(x^2 - 4)}{x^2 - 4} \cdot \lim_{x \rightarrow 2} (x + 2) = 1 \cdot 4 = 4.$$

$$30. \lim_{x \rightarrow 9} \frac{\sin(\sqrt{x} - 3)}{x - 9} = \lim_{x \rightarrow 9} \frac{\sin(\sqrt{x} - 3)}{\sqrt{x} - 3} \cdot \frac{1}{\sqrt{x} + 3} = \lim_{x \rightarrow 9} \frac{\sin(\sqrt{x} - 3)}{\sqrt{x} - 3} \cdot \lim_{x \rightarrow 9} \frac{1}{\sqrt{x} + 3} = 1 \cdot \frac{1}{6} = \frac{1}{6}.$$

31. Since the highest power of x in the numerator is 1 more than the highest power of x in the denominator, there is an oblique asymptote. $y = \frac{2x^{3/2} + 2x - 3}{\sqrt{x} + 1} = 2x - \frac{3}{\sqrt{x} + 1}$, thus the oblique asymptote is $y = 2x$.

32. As $x \rightarrow \pm\infty$, $\frac{1}{x} \rightarrow 0 \Rightarrow \sin\left(\frac{1}{x}\right) \rightarrow 0 \Rightarrow 1 + \sin\left(\frac{1}{x}\right) \rightarrow 1$, thus as $x \rightarrow \pm\infty$, $y = x + x \sin\left(\frac{1}{x}\right) = x\left(1 + \sin\left(\frac{1}{x}\right)\right) \rightarrow x$; thus the oblique asymptote is $y = x$.

33. As $x \rightarrow \pm\infty$, $x^2 + 1 \rightarrow x^2 \Rightarrow \sqrt{x^2 + 1} \rightarrow \sqrt{x^2}$; as $x \rightarrow -\infty$, $\sqrt{x^2} = -x$, and as $x \rightarrow +\infty$, $\sqrt{x^2} = x$; thus the oblique asymptotes are $y = x$ and $y = -x$.

34. As $x \rightarrow \pm\infty$, $x + 2 \rightarrow x \Rightarrow \sqrt{x^2 + 2x} = \sqrt{x(x + 2)} \rightarrow \sqrt{x^2}$; as $x \rightarrow -\infty$, $\sqrt{x^2} = -x$, and as $x \rightarrow +\infty$, $\sqrt{x^2} = x$; asymptotes are $y = x$ and $y = -x$.

 $\lim_{h \rightarrow 0} (3x^2 + 3xh + h^2 - 3) = 3x^2 - 3; 3x^2 - 3 = 0 \Rightarrow x = -1$ or $x = 1$. Then $f(-1) = 2$ and $f(1) = -2 \Rightarrow (-1, 2)$ and $(1, -2)$ are the points on the graph where a horizontal tangent exists.

 $\Rightarrow x(x-2) = 0 \Rightarrow x = 0$ or $x = 2$. If $x = 0$, then $y = -1$ and $m = -1 \Rightarrow y = -1 - (x-0) = -(x+1)$. If $x = 2$, then $y = 1$ and $m = -1 \Rightarrow y = 1 - (x-2) = -(x-3)$.
28. $\frac{1}{4} = m = \lim_{h \rightarrow 0} \frac{\sqrt{x+h} - \sqrt{x}}{h} = \lim_{h \rightarrow 0} \frac{\sqrt{x+h} - \sqrt{x}}{h} \cdot \frac{\sqrt{x+h} + \sqrt{x}}{\sqrt{x+h} + \sqrt{x}} = \lim_{h \rightarrow 0} \frac{(x+h) - x}{h(\sqrt{x+h} + \sqrt{x})} = \lim_{h \rightarrow 0} \frac{h}{h(\sqrt{x+h} + \sqrt{x})} = \frac{1}{2\sqrt{x}}$.
 Thus, $\frac{1}{4} = \frac{1}{2\sqrt{x}} \Rightarrow \sqrt{x} = 2 \Rightarrow x = 4 \Rightarrow y = 2$. The tangent line is $y = 2 + \frac{1}{4}(x-4) = \frac{x}{4} + 1$.

27. Note that as x increases, the slope of the tangent line to the curve is first negative, then zero (when $x = 0$), then positive \Rightarrow the slope is always increasing which matches (b).

28. Note that the slope of the tangent line is never negative. For x negative, $f_2'(x)$ is positive but decreasing as x increases. When $x = 0$, the slope of the tangent line to x is 0. For $x > 0$, $f_2'(x)$ is positive and increasing. This graph matches (a).

29. $f_3(x)$ is an oscillating function like the cosine. Everywhere that the graph of f_3 has a horizontal tangent we expect f'_3 to be zero, and (d) matches this condition.

30. The graph matches with (c).

31. (a) f' is not defined at $x = 0, 1, 4$. At these points, the left-hand and right-hand derivatives do not agree. For example, $\lim_{x \rightarrow 0^-} \frac{f(x)-f(0)}{x-0} = \text{slope of line joining } (-4, 0) \text{ and } (0, 2) = \frac{1}{2}$ but $\lim_{x \rightarrow 0^+} \frac{f(x)-f(0)}{x-0} = \text{slope of line joining } (0, 2) \text{ and } (1, -2) = -4$. Since these values are not equal, $f'(0) = \lim_{x \rightarrow 0} \frac{f(x)-f(0)}{x-0}$ does not exist.

(d) $y = \frac{x^4}{4}$ is increasing on $0 < x < \infty$ and decreasing on $-\infty < x < 0$

53. $y' = \lim_{h \rightarrow 0} \frac{(2(x+h)^2 - 13(x+h) + 5) - (2x^2 - 13x + 5)}{h} = \lim_{h \rightarrow 0} \frac{2x^2 + 4xh + 2h^2 - 13x - 13h + 5 - 2x^2 + 13x - 5}{h} = \lim_{h \rightarrow 0} \frac{4xh + 2h^2 - 13h}{h}$
 $= \lim_{h \rightarrow 0} (4x + 2h - 13) = 4x - 13$, slope at x . The slope is -1 when $4x - 13 = -1 \Rightarrow 4x = 12 \Rightarrow x = 3$
 $\Rightarrow y = 2 \cdot 3^2 - 13 \cdot 3 + 5 = -16$. Thus the tangent line is $y + 16 = (-1)(x - 3) \Rightarrow y = -x - 13$ and the point of tangency is $(3, -16)$.

54. For the curve $y = \sqrt{x}$, we have $y' = \lim_{h \rightarrow 0} \frac{(\sqrt{x+h} - \sqrt{x})}{h} \cdot \frac{(\sqrt{x+h} + \sqrt{x})}{(\sqrt{x+h} + \sqrt{x})} = \lim_{h \rightarrow 0} \frac{(x+h) - x}{(\sqrt{x+h} + \sqrt{x})h} = \lim_{h \rightarrow 0} \frac{1}{\sqrt{x+h} + \sqrt{x}} = \frac{1}{2\sqrt{x}}$.

Suppose (a, \sqrt{a}) is the point of tangency of such a line and $(-1, 0)$ is the point on the line where it crosses the x -axis. Then the slope of the line is $\frac{\sqrt{a} - 0}{a - (-1)} = \frac{\sqrt{a}}{a + 1}$ which must also equal $\frac{1}{2\sqrt{a}}$; using the derivative formula at $x = a \Rightarrow \frac{\sqrt{a}}{a + 1} = \frac{1}{2\sqrt{a}} \Rightarrow 2a = a + 1 \Rightarrow a = 1$. Thus such a line does exist: its point of tangency is $(1, 1)$, its slope is $\frac{1}{2\sqrt{a}} = \frac{1}{2}$; and an equation of the line is $y - 1 = \frac{1}{2}(x - 1) \Rightarrow y = \frac{1}{2}x + \frac{1}{2}$.

57. Yes, $\lim_{t \rightarrow 0} \frac{g(t)}{h(t)}$ can exist but it need not equal zero. For example, let $g(t) = mt$ and $h(t) = t$. Then $g(0) = h(0) = 0$, but $\lim_{t \rightarrow 0} \frac{g(t)}{h(t)} = \lim_{t \rightarrow 0} \frac{mt}{t} = \lim_{t \rightarrow 0} m = m$, which need not be zero.

58. (a) Suppose $|f(x)| \leq x^2$ for $-1 \leq x \leq 1$. Then $|f(0)| \leq 0^2 \Rightarrow f(0) = 0$. Then $f'(0) = \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h}$
 $= \lim_{h \rightarrow 0} \frac{f(h) - 0}{h} = \lim_{h \rightarrow 0} \frac{f(h)}{h}$. For $|h| \leq 1, -h^2 \leq f(h) \leq h^2 \Rightarrow -h \leq \frac{f(h)}{h} \leq h \Rightarrow f'(0) = \lim_{h \rightarrow 0} \frac{f(h)}{h} = 0$ by the

Sandwich Theorem for limits.

(b) Note that for $x \neq 0$,

$|f(x)| = |x^2 \sin \frac{1}{x}| = |x^2| |\sin \frac{1}{x}| \leq |x^2| \cdot 1 = x^2$ (since $-1 \leq \sin x \leq 1$). By part (a), f is differentiable at $x = 0$ and $f'(0) = 0$.

59. The graphs are shown below for $h = 1, 0.5, 0.1$. The function $y = \frac{1}{2\sqrt{x}}$ is the derivative of the function $y = \sqrt{x}$ so that $\frac{1}{2\sqrt{x}} = \lim_{h \rightarrow 0} \frac{\sqrt{x+h} - \sqrt{x}}{h}$. The graphs reveal that $y = \frac{\sqrt{x+h} - \sqrt{x}}{h}$ gets closer to $y = \frac{1}{2\sqrt{x}}$ as h gets smaller and smaller.

60. The graphs are shown below for $h = 2, 1, 0.5$. The function $y = 3x^2$ is the derivative of the function $y = x^3$ so that $3x^2 = \lim_{h \rightarrow 0} \frac{(x+h)^3 - x^3}{h}$. The graphs reveal that $y = \frac{(x+h)^3 - x^3}{h}$ gets closer to $y = 3x^2$ as h gets smaller and smaller.

61. The graphs are the same. So we know that for $f(x) = |x|$, we have $f'(x) = \frac{|x|}{x}$.

and $w'' = e^z \cdot (z^3+2z^2-z) + (3z^2+4z-1) \cdot e^z = e^z(z^3+5z^2+3z-1)$
53. $u(0) = 5, u'(0) = -3, v(0) = -1, v'(0) = 2$
(a) $\frac{d}{dx}(uv) = uv' + vu' \Rightarrow \frac{d}{dx}(uv)\Big|_{x=0} = u(0)v'(0) + v(0)u'(0) = 5 \cdot 2 + (-1)(-3) = 13$
(b) $\frac{d}{dx}\left(\frac{u}{v}\right) = \frac{vu' - uv'}{v^2} \Rightarrow \frac{d}{dx}\left(\frac{u}{v}\right)\Big|_{x=0} = \frac{v(0)u'(0) - u(0)v'(0)}{(v(0))^2} = \frac{(-1)(-3) - (5)(2)}{(-1)^2} = -7$
(c) $\frac{d}{dx}\left(\frac{v}{u}\right) = \frac{uv' - vu'}{u^2} \Rightarrow \frac{d}{dx}\left(\frac{v}{u}\right)\Big|_{x=0} = \frac{u(0)v'(0) - v(0)u'(0)}{(u(0))^2} = \frac{(5)(2) - (-1)(-3)}{(5)^2} = \frac{7}{25}$
(d) $\frac{d}{dx}(7v - 2u) = 7v' - 2u' \Rightarrow \frac{d}{dx}(7v - 2u)\Big|_{x=0} = 7v'(0) - 2u'(0) = 7 \cdot 2 - 2(-3) = 20$
54. $u(1) = 2, u'(1) = 0, v(1) = 5, v'(1) = -1$
(a) $\frac{d}{dx}(uv)\Big|_{x=1} = u(1)v'(1) + v(1)u'(1) = 2 \cdot (-1) + 5 \cdot 0 = -2$
(b) $\frac{d}{dx}\left(\frac{u}{v}\right)\Big|_{x=1} = \frac{v(1)u'(1) - u(1)v'(1)}{(v(1))^2} = \frac{5 \cdot 0 - 2 \cdot (-1)}{(5)^2} = \frac{2}{25}$
(c) $\frac{d}{dx}\left(\frac{v}{u}\right)\Big|_{x=1} = \frac{u(1)v'(1) - v(1)u'(1)}{(u(1))^2} = \frac{2 \cdot (-1) - 5 \cdot 0}{(2)^2} = -\frac{1}{2}$
(d) $\frac{d}{dx}(7v - 2u)\Big|_{x=1} = 7v'(1) - 2u'(1) = 7 \cdot (-1) - 2 \cdot 0 = -7$
55. $y = x^3 - 4x + 1$. Note that (2, 1) is on the curve: $1 = 2^3 - 4(2) + 1$
(a) Slope of the tangent at (x, y) is $y' = 3x^2 - 4 \Rightarrow$ slope of the tangent at (2, 1) is $y'(2) = 3(2)^2 - 4 = 8$. Thus the slope of the line perpendicular to the tangent at (2, 1) is $-\frac{1}{8} \Rightarrow$ the equation of the line perpendicular to the tangent line at (2, 1) is $y - 1 = -\frac{1}{8}(x - 2)$ or $y = -\frac{x}{8} + \frac{5}{4}$.
(b) The slope of the curve at x is $m = 3x^2 - 4$ and the smallest value for m is -4 when $x = 0$ and $y = 1$.
(c) We want the slope of the curve to be 8 $\Rightarrow y' = 8 \Rightarrow 3x^2 - 4 = 8 \Rightarrow 3x^2 = 12 \Rightarrow x^2 = 4 \Rightarrow x = \pm 2$. When $x = 2, y = 1$ and the tangent line has equation $y - 1 = 8(x - 2)$ or $y = 8x - 15$; When $x = -2, y = (-2)^3 - 4(-2) + 1 = 1$, and the tangent line has equation $y - 1 = 8(x + 2)$ or $y = 8x + 17$.

56. (a) $y = x^3 - 3x - 2 \Rightarrow y' = 3x^2 - 3$. For the tangent to be horizontal, we need $m = y' = 0 \Rightarrow 0 = 3x^2 - 3$
 $\Rightarrow 3x^2 = 3 \Rightarrow x = \pm 1$. When $x = -1$, $y = 0 \Rightarrow$ the tangent line has equation $y = 0$. The line perpendicular to this line at $(-1, 0)$ is $x = -1$. When $x = 1$, $y = -4 \Rightarrow$ the tangent line has equation $y = -4$. The line perpendicular to this line at $(1, -4)$ is $x = 1$.
- (b) The smallest value of y' is -3 , and this occurs when $x = 0$ and $y = -2$. The tangent to the curve at $(0, -2)$ has slope $-3 \Rightarrow$ the line perpendicular to the tangent at $(0, -2)$ has slope $\frac{1}{3} \Rightarrow y + 2 = \frac{1}{3}(x - 0)$ or $y = \frac{1}{3}x - 2$ is an equation of the perpendicular line.
57. $y = \frac{4x}{x^2 + 1} \Rightarrow \frac{dy}{dx} = \frac{(x^2 + 1)(4) - (4x)(2x)}{(x^2 + 1)^2} = \frac{4x^2 + 4 - 8x^2}{(x^2 + 1)^2} = \frac{4(-x^2 + 1)}{(x^2 + 1)^2}$. When $x = 0$, $y = 0$ and $y' = \frac{4(0+1)}{1} = 4$, so the tangent to the curve at $(0, 0)$ is the line $y = 4x$. When $x = 1$, $y = 2 \Rightarrow y' = 0$, so the tangent to the curve at $(1, 2)$ is the line $y = 2$.
58. $y = \frac{8}{x^2 + 4} \Rightarrow y' = \frac{(x^2 + 4)(0) - 8(2x)}{(x^2 + 4)^2} = \frac{-16x}{(x^2 + 4)^2}$. When $x = 2$, $y = 1$ and $y' = \frac{-16(2)}{(2^2 + 4)^2} = -\frac{1}{2}$, so the tangent line to the curve at $(2, 1)$ has the equation $y - 1 = -\frac{1}{2}(x - 2)$, or $y = -\frac{x}{2} + 2$.
59. $y = ax^2 + bx + c$ passes through $(0, 0) \Rightarrow 0 = a(0) + b(0) + c \Rightarrow c = 0$; $y = ax^2 + bx$ passes through $(1, 2) \Rightarrow 2 = a + b$; $y' = 2ax + b$ and since the curve is tangent to $y = x$ at the origin, its slope is 1 at $x = 0 \Rightarrow y' = 1$ when $x = 0 \Rightarrow 1 = 2a(0) + b \Rightarrow b = 1$. Then $a + b = 2 \Rightarrow a = 1$. In summary $a = b = 1$ and $c = 0$ so the curve is $y = x^2 + x$.
60. $y = cx - x^2$ passes through $(1, 0) \Rightarrow 0 = c(1) - 1 \Rightarrow c = 1 \Rightarrow$ the curve is $y = x - x^2$. For this curve, $y' = 1 - 2x$ and $x = 1 \Rightarrow y' = -1$. Since $y = x - x^2$ and $y = x^2 + ax + b$ have common tangents at $x = 1$, $y = x^2 + ax + b$ must also have slope -1 at $x = 1$. Thus $y' = 2x + a \Rightarrow -1 = 2 \cdot 1 + a \Rightarrow a = -3 \Rightarrow y = x^2 - 3x + b$. Since this last curve passes through $(1, 0)$, we have $0 = 1 - 3 + b \Rightarrow b = 2$. In summary, $a = -3$, $b = 2$ and $c = 1$ so the curves are $y = x^2 - 3x + 2$ and $y = x - x^2$.
61. $y = 8x + 5 \Rightarrow m = 8$; $f(x) = 3x^2 - 4x \Rightarrow f'(x) = 6x - 4$; $6x - 4 = 8 \Rightarrow x = 2 \Rightarrow f(2) = 3(2)^2 - 4(2) = 4 \Rightarrow (2, 4)$
62. $8x - 2y = 1 \Rightarrow y = 4x - \frac{1}{2} \Rightarrow m = 4$; $g(x) = \frac{1}{3}x^3 - \frac{3}{2}x^2 + 1 \Rightarrow g'(x) = x^2 - 3x$; $x^2 - 3x = 4 \Rightarrow x = 4$ or $x = -1$
 $\Rightarrow g(4) = \frac{1}{3}(4)^3 - \frac{3}{2}(4)^2 + 1 = -\frac{5}{3}$, $g(-1) = \frac{1}{3}(-1)^3 - \frac{3}{2}(-1)^2 + 1 = -\frac{5}{6} \Rightarrow (4, -\frac{5}{3})$ or $(-1, -\frac{5}{6})$
63. $y = 2x + 3 \Rightarrow m = 2 \Rightarrow m_{\perp} = -\frac{1}{2}$; $y = \frac{x}{x-2} \Rightarrow y' = \frac{(x-2)(1) - x(1)}{(x-2)^2} = \frac{-2}{(x-2)^2}$; $\frac{-2}{(x-2)^2} = -\frac{1}{2} \Rightarrow 4 = (x-2)^2$
 $\Rightarrow \pm 2 = x - 2 \Rightarrow x = 4$ or $x = 0 \Rightarrow$ if $x = 4$, $y = \frac{4}{4-2} = 2$, and if $x = 0$, $y = \frac{0}{0-2} = 0 \Rightarrow (4, 2)$ or $(0, 0)$.
64. $m = \frac{y-8}{x-3}$; $f(x) = x^2 \Rightarrow f'(x) = 2x$; $m = f'(x) \Rightarrow \frac{y-8}{x-3} = 2x \Rightarrow \frac{x^2-8}{x-3} = 2x \Rightarrow x^2 - 8 = 2x^2 - 6x \Rightarrow x^2 - 6x + 8 = 0$
 $\Rightarrow x = 4$ or $x = 2 \Rightarrow f(4) = 4^2 = 16$, $f(2) = 2^2 = 4 \Rightarrow (4, 16)$ or $(2, 4)$.
65. (a) $y = x^3 - x \Rightarrow y' = 3x^2 - 1$. When $x = -1$, $y = 0$ and $y' = 2 \Rightarrow$ the tangent line to the curve at $(-1, 0)$ is $y = 2(x + 1)$ or $y = 2x + 2$.

(b)

(c) $\left. \begin{matrix} y = x^3 - x \\ y = 2x + 2 \end{matrix} \right\} \Rightarrow x^3 - x = 2x + 2 \Rightarrow x^3 - 3x - 2 = (x - 2)(x + 1)^2 = 0 \Rightarrow x = 2 \text{ or } x = -1$. Since $y = 2(2) + 2 = 6$; the other intersection point is $(2, 6)$

66. (a) $y = x^3 - 6x^2 + 5x \Rightarrow y' = 3x^2 - 12x + 5$. When $x = 0$, $y = 0$ and $y' = 5 \Rightarrow$ the tangent line to the curve at $(0, 0)$ is $y = 5x$.

(b)

(c) $\left. \begin{matrix} y = x^3 - 6x^2 + 5x \\ y = 5x \end{matrix} \right\} \Rightarrow x^3 - 6x^2 + 5x = 5x \Rightarrow x^3 - 6x^2 = 0 \Rightarrow x^2(x - 6) = 0 \Rightarrow x = 0 \text{ or } x = 6$. Since $y = 5(6) = 30$, the other intersection point is $(6, 30)$.

67. $\lim_{x \rightarrow 1} \frac{x^{50} - 1}{x - 1} = 50x^{49} \Big|_{x=1} = 50(1)^{49} = 50$

68. $\lim_{x \rightarrow -1} \frac{x^{2/9} - 1}{x + 1} = \frac{2}{9} x^{-7/9} \Big|_{x=-1} = \frac{2}{9(-1)^{7/9}} = -\frac{2}{9}$

69. $g'(x) = \begin{cases} 2x - 3 & x > 0 \\ a & x < 0 \end{cases}$, since g is differentiable at $x = 0 \Rightarrow \lim_{x \rightarrow 0^+} (2x - 3) = -3$ and $\lim_{x \rightarrow 0^-} a = a \Rightarrow a = -3$

70. $f'(x) = \begin{cases} a & x > -1 \\ 2bx & x < -1 \end{cases}$, since f is differentiable at $x = -1 \Rightarrow \lim_{x \rightarrow -1^+} a = a$ and $\lim_{x \rightarrow -1^-} (2bx) = -2b \Rightarrow a = -2b$, and since f is continuous at $x = -1 \Rightarrow \lim_{x \rightarrow -1^+} (ax + b) = -a + b$ and $\lim_{x \rightarrow -1^-} (bx^2 - 3) = b - 3 \Rightarrow -a + b = b - 3 \Rightarrow a = 3 \Rightarrow 3 = -2b \Rightarrow b = -\frac{3}{2}$.

71. $P(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_2 x^2 + a_1 x + a_0 \Rightarrow P'(x) = n a_n x^{n-1} + (n-1) a_{n-1} x^{n-2} + \dots + 2 a_2 x + a_1$

72. $R = M^2 \left(\frac{C}{2} - \frac{M}{3} \right) = \frac{C}{2} M^2 - \frac{1}{3} M^3$, where C is a constant $\Rightarrow \frac{dR}{dM} = CM - M^2$

73. Let c be a constant $\Rightarrow \frac{dc}{dx} = 0 \Rightarrow \frac{d}{dx}(u \cdot c) = u \cdot \frac{dc}{dx} + c \cdot \frac{du}{dx} = u \cdot 0 + c \frac{du}{dx} = c \frac{du}{dx}$. Thus when one of the functions is a constant, the Product Rule is just the Constant Multiple Rule \Rightarrow the Constant Multiple Rule is a special case of the Product Rule.

74. (a) We use the Quotient rule to derive the Reciprocal Rule (with $u = 1$): $\frac{d}{dx}\left(\frac{1}{v}\right) = \frac{v \cdot 0 - 1 \cdot \frac{dv}{dx}}{v^2} = \frac{-1 \cdot \frac{dv}{dx}}{v^2} = -\frac{1}{v^2} \cdot \frac{dv}{dx}$.

(b) Now, using the Reciprocal Rule and the Product Rule, we'll derive the Quotient Rule:

$$\frac{d}{dx}\left(\frac{u}{v}\right) = \frac{d}{dx}\left(u \cdot \frac{1}{v}\right) = u \cdot \frac{d}{dx}\left(\frac{1}{v}\right) + \frac{1}{v} \cdot \frac{du}{dx} \quad (\text{Product Rule}) = u \cdot \left(\frac{-1}{v^2}\right) \frac{dv}{dx} + \frac{1}{v} \frac{du}{dx} \quad (\text{Reciprocal Rule})$$

$$\Rightarrow \frac{d}{dx}\left(\frac{u}{v}\right) = \frac{-u \frac{dv}{dx} + v \frac{du}{dx}}{v^2} = \frac{v \frac{du}{dx} - u \frac{dv}{dx}}{v^2}, \quad \text{the Quotient Rule.}$$

75. (a) $\frac{d}{dx}(uvw) = \frac{d}{dx}((uv) \cdot w) = (uv) \frac{dw}{dx} + w \cdot \frac{d}{dx}(uv) = uv \frac{dw}{dx} + w \left(u \frac{dv}{dx} + v \frac{du}{dx}\right) = uv \frac{dw}{dx} + wu \frac{dv}{dx} + wv \frac{du}{dx}$
 $= uvw' + uv'w + u'vw$

(b) $\frac{d}{dx}(u_1 u_2 u_3 u_4) = \frac{d}{dx}((u_1 u_2 u_3) u_4) = (u_1 u_2 u_3) \frac{du_4}{dx} + u_4 \frac{d}{dx}(u_1 u_2 u_3)$
 $\Rightarrow \frac{d}{dx}(u_1 u_2 u_3 u_4) = u_1 u_2 u_3 \frac{du_4}{dx} + u_4 \left(u_1 u_2 \frac{du_3}{dx} + u_3 u_1 \frac{du_2}{dx} + u_3 u_2 \frac{du_1}{dx}\right)$ (using (a) above)

$$\Rightarrow \frac{d}{dx}(u_1 u_2 u_3 u_4) = u_1 u_2 u_3 \frac{du_4}{dx} + u_1 u_2 u_4 \frac{du_3}{dx} + u_1 u_3 u_4 \frac{du_2}{dx} + u_2 u_3 u_4 \frac{du_1}{dx}$$

$$= u_1 u_2 u_3 u_4' + u_1 u_2 u_3' u_4 + u_1 u_2' u_3 u_4 + u_1' u_2 u_3 u_4$$

(c) Generalizing (a) and (b) above, $\frac{d}{dx}(u_1 \cdots u_n) = u_1 u_2 \cdots u_{n-1} u_n' + u_1 u_2 \cdots u_{n-2} u_{n-1}' u_n + \cdots + u_1' u_2 \cdots u_n$

76. $\frac{d}{dx}(x^{-m}) = \frac{d}{dx}\left(\frac{1}{x^m}\right) = \frac{x^m \cdot 0 - 1(m \cdot x^{m-1})}{(x^m)^2} = \frac{-m \cdot x^{m-1}}{x^{2m}} = -m \cdot x^{m-1-2m} = -m \cdot x^{-m-1}$

77. $P = \frac{nRT}{V-nb} - \frac{an^2}{V^2}$. We are holding T constant, and a, b, n, R are also constant so their derivatives are zero

$$\Rightarrow \frac{dP}{dV} = \frac{(V-nb) \cdot 0 - (nRT)(1)}{(V-nb)^2} - \frac{V^2(0) - (an^2)(2V)}{(V^2)^2} = \frac{-nRT}{(V-nb)^2} + \frac{2an^2}{V^3}$$

78. $A(q) = \frac{km}{q} + cm + \frac{hq}{2} = (km)q^{-1} + cm + \left(\frac{h}{2}\right)q \Rightarrow \frac{dA}{dq} = -(km)q^{-2} + \left(\frac{h}{2}\right) = -\frac{km}{q^2} + \frac{h}{2} \Rightarrow \frac{d^2A}{dq^2} = 2(km)q^{-3} = \frac{2km}{q^3}$

3.4 THE DERIVATIVE AS A RATE OF CHANGE

1. $s = t^2 - 3t + 2, 0 \leq t \leq 2$

(a) displacement $= \Delta s = s(2) - s(0) = 0 \text{ m} - 2 \text{ m} = -2 \text{ m}$, $v_{av} = \frac{\Delta s}{\Delta t} = \frac{-2}{2} = -1 \text{ m/sec}$

(b) $v = \frac{ds}{dt} = 2t - 3 \Rightarrow |v(0)| = |-3| = 3 \text{ m/sec}$ and $|v(2)| = 1 \text{ m/sec}$; $a = \frac{d^2s}{dt^2} = 2 \Rightarrow a(0) = 2 \text{ m/sec}^2$ and $a(2) = 2 \text{ m/sec}^2$

(c) $v = 0 \Rightarrow 2t - 3 = 0 \Rightarrow t = \frac{3}{2}$. v is negative in the interval $0 < t < \frac{3}{2}$ and v is positive when $\frac{3}{2} < t < 2 \Rightarrow$ the body changes direction at $t = \frac{3}{2}$.

2. $s = 6t - t^2, 0 \leq t \leq 6$

(b) $v = \frac{ds}{dt} = 6 - 2t \Rightarrow |v(0)| = |6| = 6 \text{ m/sec}$ and $|v(6)| = |-6| = 6 \text{ m/sec}$; $a = \frac{d^2s}{dt^2} = -2 \Rightarrow a(0) = -2 \text{ m/sec}^2$ and $a(6) = -2 \text{ m/sec}^2$

(c) $v = 0 \Rightarrow 6 - 2t = 0 \Rightarrow t = 3$. v is positive in the interval $0 < t < 3$ and v is negative when $3 < t < 6 \Rightarrow$ the body changes direction at $t = 3$.

3. $s = -t^3 + 3t^2 - 3t, 0 \leq t \leq 3$

 $\Rightarrow a(0) = 6$ m/sec² and $a(3) = -12$ m/sec²
- (c) $v = 0 \Rightarrow -3t^2 + 6t - 3 = 0 \Rightarrow t^2 - 2t + 1 = 0 \Rightarrow (t-1)^2 = 0 \Rightarrow t = 1$. For all other values of t in the interval the velocity v is negative (the graph of $v = -3t^2 + 6t - 3$ is a parabola with vertex at $t = 1$ which opens downward \Rightarrow the body never changes direction).
4. $s = \frac{t^4}{4} - t^3 + t^2, 0 \leq t \leq 3$

- (b) $v = t^3 - 3t^2 + 2t \Rightarrow |v(0)| = 0$ m/sec and $|v(3)| = 6$ m/sec; $a = 3t^2 - 6t + 2 \Rightarrow a(0) = 2$ m/sec² and $a(3) = 11$ m/sec²
- (c) $v = 0 \Rightarrow t^3 - 3t^2 + 2t = 0 \Rightarrow t(t-2)(t-1) = 0 \Rightarrow t = 0, 1, 2 \Rightarrow v = t(t-2)(t-1)$ is positive in the interval for $0 < t < 1$ and v is negative for $1 < t < 2$ and v is positive for $2 < t < 3 \Rightarrow$ the body changes direction at $t = 1$ and at $t = 2$.
5. $s = \frac{25}{t^2} - \frac{5}{t}, 1 \leq t \leq 5$

- (c) $v = 0 \Rightarrow \frac{-50+5t}{t^3} = 0 \Rightarrow -50 + 5t = 0 \Rightarrow t = 10 \Rightarrow$ the body does not change direction in the interval
6. $s = \frac{25}{t+5}, -4 \leq t \leq 0$
- (a) $\Delta s = s(0) - s(-4) = -20$ m, $v_{av} = \frac{-20}{4} = -5$ m/sec
- (b) $v = \frac{-25}{(t+5)^2} \Rightarrow |v(-4)| = 25$ m/sec and $|v(0)| = 1$ m/sec; $a = \frac{50}{(t+5)^3} \Rightarrow a(-4) = 50$ m/sec² and $a(0) = \frac{2}{5}$ m/sec²
- (c) $v = 0 \Rightarrow \frac{-25}{(t+5)^2} = 0 \Rightarrow v$ is never 0 \Rightarrow the body never changes direction
7. $s = t^3 - 6t^2 + 9t$ and let the positive direction be to the right on the s -axis.
- (a) $v = 3t^2 - 12t + 9$ so that $v = 0 \Rightarrow t^2 - 4t + 3 = (t-3)(t-1) = 0 \Rightarrow t = 1$ or 3 ; $a = 6t - 12 \Rightarrow a(1) = -6$ m/sec² and $a(3) = 6$ m/sec². Thus the body is motionless but being accelerated left when $t = 1$, and motionless but being accelerated right when $t = 3$.
- (b) $a = 0 \Rightarrow 6t - 12 = 0 \Rightarrow t = 2$ with speed $|v(2)| = |12 - 24 + 9| = 3$ m/sec
- (c) The body moves to the right or forward on $0 \leq t < 1$, and to the left or backward on $1 < t < 2$. The positions are $s(0) = 0$, $s(1) = 4$ and $s(2) = 2 \Rightarrow$ total distance $= |s(1) - s(0)| + |s(2) - s(1)| = |4| + |-2| = 6$ m.

- (c) velocity increasing $\Rightarrow a > 0 \Rightarrow 2t - 4 > 0 \Rightarrow t > 2$; velocity decreasing $\Rightarrow a < 0 \Rightarrow 2t - 4 < 0 \Rightarrow 0 \leq t < 2$
9. $s_m = 1.86t^2 \Rightarrow v_m = 3.72t$ and solving $3.72t = 27.8 \Rightarrow t \approx 7.5$ sec on Mars; $s_j = 11.44t^2 \Rightarrow v_j = 22.88t$ and solving $22.88t = 27.8 \Rightarrow t \approx 1.2$ sec on Jupiter.

10. (a) $v(t) = s'(t) = 24 - 1.6t$ m/sec, and $a(t) = v'(t) = s''(t) = -1.6$ m/sec²
 (b) Solve $v(t) = 0 \Rightarrow 24 - 1.6t = 0 \Rightarrow t = 15$ sec
 (c) $s(15) = 24(15) - .8(15)^2 = 180$ m
 (d) Solve $s(t) = 90 \Rightarrow 24t - .8t^2 = 90 \Rightarrow t = \frac{30 \pm 15\sqrt{2}}{2} \approx 4.39$ sec going up and 25.6 sec going down
 (e) Twice the time it took to reach its highest point or 30 sec

11. $s = 15t - \frac{1}{2}g_s t^2 \Rightarrow v = 15 - g_s t$ so that $v = 0 \Rightarrow 15 - g_s t = 0 \Rightarrow g_s = \frac{15}{t}$. Therefore $g_s = \frac{15}{20} = \frac{3}{4} = 0.75$ m/sec²

12. Solving $s_m = 832t - 2.6t^2 = 0 \Rightarrow t(832 - 2.6t) = 0 \Rightarrow t = 0$ or $320 \Rightarrow 320$ sec on the moon;
 solving $s_e = 832t - 16t^2 = 0 \Rightarrow t(832 - 16t) = 0 \Rightarrow t = 0$ or $52 \Rightarrow 52$ sec on the earth. Also, $v_m = 832 - 5.2t = 0 \Rightarrow t = 160$ and $s_m(160) = 66,560$ ft, the height it reaches above the moon's surface; $v_e = 832 - 32t = 0 \Rightarrow t = 26$ and $s_e(26) = 10,816$ ft, the height it reaches above the earth's surface.

13. (a) $s = 179 - 16t^2 \Rightarrow v = -32t \Rightarrow \text{speed} = |v| = 32t$ ft/sec and $a = -32$ ft/sec²
 (b) $s = 0 \Rightarrow 179 - 16t^2 = 0 \Rightarrow t = \sqrt{\frac{179}{16}} \approx 3.3$ sec
 (c) When $t = \sqrt{\frac{179}{16}}$, $v = -32\sqrt{\frac{179}{16}} = -8\sqrt{179} \approx -107.0$ ft/sec

14. (a) $\lim_{\theta \rightarrow \frac{\pi}{2}} v = \lim_{\theta \rightarrow \frac{\pi}{2}} 9.8(\sin \theta)t = 9.8t$ so we expect $v = 9.8t$ m/sec in free fall
 (b) $a = \frac{dv}{dt} = 9.8$ m/sec²

 (f) Greatest acceleration happens 2 sec after launch
 (g) From $t = 2$ to $t = 10.8$ sec; during this period, $a = \frac{v(10.8) - v(2)}{10.8 - 2} \approx -32$ ft/sec²

18. (a) Forward: $0 \leq t < 1$ and $5 < t < 7$; Backward: $1 < t < 5$; Speeds up: $1 < t < 2$ and $5 < t < 6$; Slows down: $0 \leq t < 1$, $3 < t < 5$, and $6 < t < 7$
 (b) Positive: $3 < t < 6$; negative: $0 \leq t < 2$ and $6 < t < 7$; zero: $2 < t < 3$ and $7 < t < 9$
 (c) $t = 0$ and $2 \leq t \leq 3$
 (d) $7 \leq t \leq 9$

19. $s = 490t^2 \Rightarrow v = 980t \Rightarrow a = 980$
 (a) Solving $160 = 490t^2 \Rightarrow t = \frac{4}{7}$ sec. The average velocity was $\frac{s(4/7)-s(0)}{4/7} = 280$ cm/sec.
 (b) At the 160 cm mark the balls are falling at $v(4/7) = 560$ cm/sec. The acceleration at the 160 cm mark was 980 cm/sec².
 (c) The light was flashing at a rate of $\frac{17}{4/7} = 29.75$ flashes per second.

21. $C =$ position, $A =$ velocity, and $B =$ acceleration. Neither A nor C can be the derivative of B because B 's derivative is constant. Graph C cannot be the derivative of A either, because A has some negative slopes while C has only positive values. So, C (being the derivative of neither A nor B) must be the graph of position. Curve C has both positive and negative slopes, so its derivative, the velocity, must be A and not B . That leaves B for acceleration.

22. $C =$ position, $B =$ velocity, and $A =$ acceleration. Curve C cannot be the derivative of either A or B because C has only negative values while both A and B have some positive slopes. So, C represents position. Curve C has no positive slopes, so its derivative, the velocity, must be B . That leaves A for acceleration. Indeed, A is negative where B has negative slopes and positive where B has positive slopes.

23. (a) $c(100) = 11,000 \Rightarrow c_{av} = \frac{11,000}{100} = \110
 (b) $c(x) = 2000 + 100x - .1x^2 \Rightarrow c'(x) = 100 - .2x$. Marginal cost = $c'(x) \Rightarrow$ the marginal cost of producing 100 machines is $c'(100) = \$80$
 (c) The cost of producing the 101st machine is $c(101) - c(100) = 100 - \frac{201}{10} = \79.90

24. (a) $r(x) = 20000\left(1 - \frac{1}{x}\right) \Rightarrow r'(x) = \frac{20000}{x^2}$, which is marginal revenue. $r'(100) = \frac{20000}{100^2} = \2 .
 (b) $r'(101) = \$1.96$.
 (c) $\lim_{x \rightarrow \infty} r'(x) = \lim_{x \rightarrow \infty} \frac{20000}{x^2} = 0$. The increase in revenue as the number of items increases without bound will approach zero.

25. $b(t) = 10^6 + 10^4 t - 10^3 t^2 \Rightarrow b'(t) = 10^4 - (2)(10^3 t) = 10^3(10 - 2t)$

- (a) $b'(0) = 10^4$ bacteria/hr (b) $b'(5) = 0$ bacteria/hr
 (c) $b'(10) = -10^4$ bacteria/hr

26. $S'(w) = \frac{1}{120} \sqrt{\frac{180}{w}} = \frac{1}{\sqrt{80w}}$; S increases more rapidly at lower weights where the derivative is greater.

27. (a) $y = 6\left(1 - \frac{t}{12}\right)^2 = 6\left(1 - \frac{t}{6} + \frac{t^2}{144}\right) \Rightarrow \frac{dy}{dt} = \frac{t}{12} - 1$

- (b) The largest value of $\frac{dy}{dt}$ is 0 m/h when $t = 12$ and the fluid level is falling the slowest at that time.
 The smallest value of $\frac{dy}{dt}$ is -1 m/h, when $t = 0$, and the fluid level is falling the fastest at that time.

- (c) In this situation, $\frac{dy}{dt} \leq 0 \Rightarrow$ the graph of y is always decreasing. As $\frac{dy}{dt}$ increases in value, the slope of the graph of y increases from -1 to 0 over the interval $0 \leq t \leq 12$.

28. $Q(t) = 200(30 - t)^2 = 200(900 - 60t + t^2) \Rightarrow Q'(t) = 200(-60 + 2t) \Rightarrow Q'(10) = -8,000$ gallons/min is the rate the water is running at the end of 10 min. Then $\frac{Q(10) - Q(0)}{10} = -10,000$ gallons/min is the average rate the water flows during the first 10 min. The negative signs indicate water is leaving the tank.

29. $s'(v) = 1.1 + 0.108v$; $s'(35) = 4.88$, $s'(70) = 8.66$. The units of ds/dv are ft/mph; ds/dv gives, roughly, the number of additional feet required to stop the car if its speed increases by 1 mph.

30. (a) $V = \frac{4}{3}\pi r^3 \Rightarrow \frac{dV}{dr} = 4\pi r^2 \Rightarrow \left.\frac{dV}{dr}\right|_{r=2} = 4\pi(2)^2 = 16\pi$ ft³/ft

- (b) When $r = 2$, $\frac{dV}{dr} = 16\pi$ so that when r changes by 1 unit, we expect V to change by approximately 16π .
 Therefore when r changes by 0.2 units V changes by approximately $(16\pi)(0.2) = 3.2\pi \approx 10.05$ ft³.
 Note that $V(2.2) - V(2) \approx 11.09$ ft³.

31. $200 \text{ km/hr} = 55\frac{5}{9} \text{ m/sec} = \frac{500}{9} \text{ m/sec}$, and $D = \frac{10}{9}t^2 \Rightarrow V = \frac{20}{9}t$. Thus $V = \frac{500}{9} \Rightarrow \frac{20}{9}t = \frac{500}{9} \Rightarrow t = 25 \text{ sec}$. When $t = 25$, $D = \frac{10}{9}(25)^2 = \frac{6250}{9} \text{ m}$

32. $s = v_0 t - 16t^2 \Rightarrow v = v_0 - 32t$; $v = 0 \Rightarrow t = \frac{v_0}{32}$; $1900 = v_0 t - 16t^2$ so that $t = \frac{v_0}{32} \Rightarrow 1900 = \frac{v_0^2}{32} - \frac{v_0^2}{64} \Rightarrow v_0 = \sqrt{(64)(1900)} = 80\sqrt{19}$ ft/sec and, finally, $\frac{80\sqrt{19} \text{ ft}}{\text{sec}} \cdot \frac{60 \text{ sec}}{1 \text{ min}} \cdot \frac{60 \text{ min}}{1 \text{ hr}} \cdot \frac{1 \text{ mi}}{5280 \text{ ft}} \approx 238 \text{ mph}$.

- (e) The body is moving fastest at 7 units/sec when $t = 0$ and $t = 4$; it is moving slowest and stationary at $t = \frac{6 \pm \sqrt{15}}{3}$

36. $y = \tan x \Rightarrow y' = \sec^2 x \Rightarrow$ slope of tangent at $x = -\frac{\pi}{3}$ is $\sec^2\left(-\frac{\pi}{3}\right) = 4$; slope of tangent at $x = 0$ is $\sec^2(0) = 1$; and slope of tangent at $x = \frac{\pi}{3}$ is $\sec^2\left(\frac{\pi}{3}\right) = 4$. The tangent at $\left(-\frac{\pi}{3}, \tan\left(-\frac{\pi}{3}\right)\right) = \left(-\frac{\pi}{3}, -\sqrt{3}\right)$ is $y + \sqrt{3} = 4\left(x + \frac{\pi}{3}\right)$; the tangent at $(0, 0)$ is $y = x$; and the tangent at $\left(\frac{\pi}{3}, \tan\left(\frac{\pi}{3}\right)\right) = \left(\frac{\pi}{3}, \sqrt{3}\right)$ is $y - \sqrt{3} = 4\left(x - \frac{\pi}{3}\right)$.

37. $y = \sec x \Rightarrow y' = \sec x \tan x \Rightarrow$ slope of tangent at $x = -\frac{\pi}{3}$ is $\sec\left(-\frac{\pi}{3}\right) \tan\left(-\frac{\pi}{3}\right) = -2\sqrt{3}$; slope of tangent at $x = \frac{\pi}{4}$ is $\sec\left(\frac{\pi}{4}\right) \tan\left(\frac{\pi}{4}\right) = \sqrt{2}$. The tangent at the point $\left(-\frac{\pi}{3}, \sec\left(-\frac{\pi}{3}\right)\right) = \left(-\frac{\pi}{3}, 2\right)$ is $y - 2 = -2\sqrt{3}\left(x + \frac{\pi}{3}\right)$; the tangent at the point $\left(\frac{\pi}{4}, \sec\left(\frac{\pi}{4}\right)\right) = \left(\frac{\pi}{4}, \sqrt{2}\right)$ is $y - \sqrt{2} = \sqrt{2}\left(x - \frac{\pi}{4}\right)$.

38. $y = 1 + \cos x \Rightarrow y' = -\sin x \Rightarrow$ slope of tangent at $x = -\frac{\pi}{3}$ is $-\sin\left(-\frac{\pi}{3}\right) = \frac{\sqrt{3}}{2}$; slope of tangent at $x = \frac{3\pi}{2}$ is $-\sin\left(\frac{3\pi}{2}\right) = 1$. The tangent at the point $\left(-\frac{\pi}{3}, 1 + \cos\left(-\frac{\pi}{3}\right)\right) = \left(-\frac{\pi}{3}, \frac{3}{2}\right)$ is $y - \frac{3}{2} = \frac{\sqrt{3}}{2}\left(x + \frac{\pi}{3}\right)$; the tangent at the point $\left(\frac{3\pi}{2}, 1 + \cos\left(\frac{3\pi}{2}\right)\right) = \left(\frac{3\pi}{2}, 1\right)$ is $y - 1 = x - \frac{3\pi}{2}$.

39. Yes, $y = x + \sin x \Rightarrow y' = 1 + \cos x$; horizontal tangent occurs where $1 + \cos x = 0 \Rightarrow \cos x = -1 \Rightarrow x = \pi$
40. No, $y = 2x + \sin x \Rightarrow y' = 2 + \cos x$; horizontal tangent occurs where $2 + \cos x = 0 \Rightarrow \cos x = -2$. But there are no x -values for which $\cos x = -2$.
41. No, $y = x \cot x \Rightarrow y' = 1 + \csc^2 x$; horizontal tangent occurs where $1 + \csc^2 x = 0 \Rightarrow \csc^2 x = -1$. But there are no x -values for which $\csc^2 x = -1$.
42. Yes, $y = x + 2 \cos x \Rightarrow y' = 1 - 2 \sin x$; horizontal tangent occurs where $1 - 2 \sin x = 0 \Rightarrow 1 = 2 \sin x \Rightarrow \frac{1}{2} = \sin x \Rightarrow x = \frac{\pi}{6}$ or $x = \frac{5\pi}{6}$

43. We want all points on the curve where the tangent line has slope 2. Thus, $y = \tan x \Rightarrow y' = \sec^2 x$ so that $y' = 2 \Rightarrow \sec^2 x = 2 \Rightarrow \sec x = \pm \sqrt{2} \Rightarrow x = \pm \frac{\pi}{4}$. Then the tangent line at $\left(\frac{\pi}{4}, 1\right)$ has equation $y - 1 = 2\left(x - \frac{\pi}{4}\right)$; the tangent line at $\left(-\frac{\pi}{4}, -1\right)$ has equation $y + 1 = 2\left(x + \frac{\pi}{4}\right)$.

44. We want all points on the curve $y = \cot x$ where the tangent line has slope -1 . Thus $y = \cot x \Rightarrow y' = -\csc^2 x$ so that $y' = -1 \Rightarrow -\csc^2 x = -1 \Rightarrow \csc^2 x = 1 \Rightarrow \csc x = \pm 1 \Rightarrow x = \frac{\pi}{2}$. The tangent line at $(\frac{\pi}{2}, 0)$ is $y = -x + \frac{\pi}{2}$.

45. $y = 4 + \cot x - 2 \csc x \Rightarrow y' = -\csc^2 x + 2 \csc x \cot x = -\left(\frac{1}{\sin x}\right)\left(\frac{1-2\cos x}{\sin x}\right)$
 (a) When $x = \frac{\pi}{2}$, then $y' = -1$; the tangent line is $y = -x + \frac{\pi}{2} + 2$.
 (b) To find the location of the horizontal tangent set $y' = 0 \Rightarrow 1 - 2 \cos x = 0 \Rightarrow x = \frac{\pi}{3}$ radians. When $x = \frac{\pi}{3}$, then $y = 4 - \sqrt{3}$ is the horizontal tangent.
46. $y = 1 + \sqrt{2} \csc x + \cot x \Rightarrow y' = -\sqrt{2} \csc x \cot x - \csc^2 x = -\left(\frac{1}{\sin x}\right)\left(\frac{\sqrt{2} \cos x + 1}{\sin x}\right)$
 (a) If $x = \frac{\pi}{4}$, then $y' = -4$; the tangent line is $y = -4x + \pi + 4$.
 (b) To find the location of the horizontal tangent set $y' = 0 \Rightarrow \sqrt{2} \cos x + 1 = 0 \Rightarrow x = \frac{3\pi}{4}$ radians. When $x = \frac{3\pi}{4}$, then $y = 2$ is the horizontal tangent.
47. $\lim_{x \rightarrow 2} \sin\left(\frac{1}{x} - \frac{1}{2}\right) = \sin\left(\frac{1}{2} - \frac{1}{2}\right) = \sin 0 = 0$
48. $\lim_{x \rightarrow -\frac{\pi}{6}} \sqrt{1 + \cos(\pi \csc x)} = \sqrt{1 + \cos(\pi \csc(-\frac{\pi}{6}))} = \sqrt{1 + \cos(\pi \cdot (-2))} = \sqrt{2}$
49. $\lim_{\theta \rightarrow \frac{\pi}{6}} \frac{\sin \theta - \frac{1}{2}}{\theta - \frac{\pi}{6}} = \frac{d}{d\theta}(\sin \theta) \Big|_{\theta = \frac{\pi}{6}} = \cos \theta \Big|_{\theta = \frac{\pi}{6}} = \cos\left(\frac{\pi}{6}\right) = \frac{\sqrt{3}}{2}$
50. $\lim_{\theta \rightarrow \frac{\pi}{4}} \frac{\tan \theta - 1}{\theta - \frac{\pi}{4}} = \frac{d}{d\theta}(\tan \theta) \Big|_{\theta = \frac{\pi}{4}} = \sec^2 \theta \Big|_{\theta = \frac{\pi}{4}} = \sec^2\left(\frac{\pi}{4}\right) = 2$
51. $\lim_{x \rightarrow 0} \sec\left[e^x + \pi \tan\left(\frac{\pi}{4 \sec x}\right) - 1\right] = \sec\left[1 + \pi \tan\left(\frac{\pi}{4 \sec 0}\right) - 1\right] = \sec\left[\pi \tan\left(\frac{\pi}{4}\right)\right] = \sec(\pi) = -1$
52. $\lim_{x \rightarrow 0} \sin\left(\frac{\pi + \tan x}{\tan x - 2 \sec x}\right) = \sin\left(\frac{\pi + \tan 0}{\tan 0 - 2 \sec 0}\right) = \sin\left(-\frac{\pi}{2}\right) = -1$
53. $\lim_{t \rightarrow 0} \tan\left(1 - \frac{\sin t}{t}\right) = \tan\left(1 - \lim_{t \rightarrow 0} \frac{\sin t}{t}\right) = \tan(1 - 1) = 0$
54. $\lim_{\theta \rightarrow 0} \cos\left(\frac{\pi \theta}{\sin \theta}\right) = \cos\left(\pi \lim_{\theta \rightarrow 0} \frac{\theta}{\sin \theta}\right) = \cos\left(\pi \cdot \frac{1}{\lim_{\theta \rightarrow 0} \frac{\sin \theta}{\theta}}\right) = \cos\left(\pi \cdot \frac{1}{1}\right) = -1$

55. $s = 2 - 2 \sin t \Rightarrow v = \frac{ds}{dt} = -2 \cos t \Rightarrow a = \frac{dv}{dt} = 2 \sin t \Rightarrow j = \frac{da}{dt} = 2 \cos t$. Therefore, velocity $= v\left(\frac{\pi}{4}\right) = -\sqrt{2}$ m/sec; speed $= \left|v\left(\frac{\pi}{4}\right)\right| = \sqrt{2}$ m/sec; acceleration $= a\left(\frac{\pi}{4}\right) = \sqrt{2}$ m/sec²; jerk $= j\left(\frac{\pi}{4}\right) = \sqrt{2}$ m/sec³.

56. $s = \sin t + \cos t \Rightarrow v = \frac{ds}{dt} = \cos t - \sin t \Rightarrow a = \frac{dv}{dt} = -\sin t - \cos t \Rightarrow j = \frac{da}{dt} = -\cos t + \sin t$. Therefore velocity $= v\left(\frac{\pi}{4}\right) = 0$ m/sec; speed $= \left|v\left(\frac{\pi}{4}\right)\right| = 0$ m/sec; acceleration $= a\left(\frac{\pi}{4}\right) = -\sqrt{2}$ m/sec²; jerk $= j\left(\frac{\pi}{4}\right) = 0$ m/sec³.

57. $\lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \frac{\sin^2 3x}{x^2} = \lim_{x \rightarrow 0} 9 \left(\frac{\sin 3x}{3x}\right) \left(\frac{\sin 3x}{3x}\right) = 9$ so that f is continuous at $x = 0 \Rightarrow \lim_{x \rightarrow 0} f(x) = f(0) \Rightarrow 9 = c$.

58. $\lim_{x \rightarrow 0^-} g(x) = \lim_{x \rightarrow 0^-} (x + b) = b$ and $\lim_{x \rightarrow 0^+} g(x) = \lim_{x \rightarrow 0^+} \cos x = 1$ so that g is continuous at $x = 0 \Rightarrow \lim_{x \rightarrow 0^-} g(x) = \lim_{x \rightarrow 0^+} g(x) \Rightarrow b = 1$. Now g is not differentiable at $x = 0$: At $x = 0$, the left-hand derivative is $\frac{d}{dx}(x + b)|_{x=0} = 1$, but the right-hand derivative is $\frac{d}{dx}(\cos x)|_{x=0} = -\sin 0 = 0$. The left- and right-hand derivatives can never agree at $x = 0$, so g is not differentiable at $x = 0$ for any value of b (including $b = 1$).

59. $\frac{d^{999}}{dx^{999}}(\cos x) = \sin x$ because $\frac{d^4}{dx^4}(\cos x) = \cos x \Rightarrow$ the derivative of $\cos x$ any number of times that is a multiple of 4 is $\cos x$. Thus, dividing 999 by 4 gives $999 = 249 \cdot 4 + 3 \Rightarrow \frac{d^{999}}{dx^{999}}(\cos x) = \frac{d^3}{dx^3} \left[\frac{d^{249 \cdot 4}}{dx^{249 \cdot 4}}(\cos x) \right] = \frac{d^3}{dx^3}(\cos x) = \sin x$.

60. (a) $y = \sec x = \frac{1}{\cos x} \Rightarrow \frac{dy}{dx} = \frac{(\cos x)(0) - (1)(-\sin x)}{(\cos x)^2} = \frac{\sin x}{\cos^2 x} = \left(\frac{1}{\cos x}\right) \left(\frac{\sin x}{\cos x}\right) = \sec x \tan x \Rightarrow \frac{d}{dx}(\sec x) = \sec x \tan x$

(b) $y = \csc x = \frac{1}{\sin x} \Rightarrow \frac{dy}{dx} = \frac{(\sin x)(0) - (1)(\cos x)}{(\sin x)^2} = \frac{-\cos x}{\sin^2 x} = \left(\frac{-1}{\sin x}\right) \left(\frac{\cos x}{\sin x}\right) = -\csc x \cot x \Rightarrow \frac{d}{dx}(\csc x) = -\csc x \cot x$

(c) $y = \cot x = \frac{\cos x}{\sin x} \Rightarrow \frac{dy}{dx} = \frac{(\sin x)(-\sin x) - (\cos x)(\cos x)}{(\sin x)^2} = \frac{-\sin^2 x - \cos^2 x}{\sin^2 x} = \frac{-1}{\sin^2 x} = -\csc^2 x \Rightarrow \frac{d}{dx}(\cot x) = -\csc^2 x$

61. (a) $t = 0 \rightarrow x = 10 \cos(0) = 10$ cm; $t = \frac{\pi}{3} \rightarrow x = 10 \cos\left(\frac{\pi}{3}\right) = 5$ cm; $t = \frac{3\pi}{4} \rightarrow x = 10 \cos\left(\frac{3\pi}{4}\right) = -5\sqrt{2}$ cm

(b) $t = 0 \rightarrow v = -10 \sin(0) = 0$ cm/sec; $t = \frac{\pi}{3} \rightarrow v = -10 \sin\left(\frac{\pi}{3}\right) = -5\sqrt{3}$ cm/sec; $t = \frac{3\pi}{4} \rightarrow v = -10 \sin\left(\frac{3\pi}{4}\right) = -5\sqrt{2}$ cm/sec

62. (a) $t = 0 \rightarrow x = 3 \cos(0) + 4 \sin(0) = 3$ ft; $t = \frac{\pi}{2} \rightarrow x = 3 \cos\left(\frac{\pi}{2}\right) + 4 \sin\left(\frac{\pi}{2}\right) = 4$ ft;
 $t = \pi \rightarrow x = 3 \cos(\pi) + 4 \sin(\pi) = -3$ ft

(b) $t = 0 \rightarrow v = -3 \sin(0) + 4 \cos(0) = 4$ ft/sec; $t = \frac{\pi}{2} \rightarrow v = -3 \sin\left(\frac{\pi}{2}\right) + 4 \cos\left(\frac{\pi}{2}\right) = -3$ ft/sec;
 $t = \pi \rightarrow v = -3 \sin(\pi) + 4 \cos(\pi) = -4$ ft/sec

As h takes on the values of 1, 0.5, 0.3 and 0.1 the corresponding dashed curves of $y = \frac{\sin(x+h) - \sin x}{h}$ get closer and closer to the black curve $y = \cos x$ because $\frac{d}{dx}(\sin x) = \lim_{h \rightarrow 0} \frac{\sin(x+h) - \sin x}{h} = \cos x$. The same is true as h takes on the values of $-1, -0.5, -0.3$ and -0.1 .

64.

As h takes on the values of 1, 0.5, 0.3, and 0.1 the corresponding dashed curves of $y = \frac{\cos(x+h) - \cos x}{h}$ get closer and closer to the black curve $y = -\sin x$ because $\frac{d}{dx}(\cos x) = \lim_{h \rightarrow 0} \frac{\cos(x+h) - \cos x}{h} = -\sin x$. The same is true as h takes on the values of $-1, -0.5, -0.3,$ and -0.1 .

65. (a)

The dashed curves of $y = \frac{\sin(x+h) - \sin(x-h)}{2h}$ are closer to the black curve $y = \cos x$ than the corresponding dashed curves in Exercise 63 illustrating that the centered difference quotient is a better approximation of the derivative of this function.

(b)

The dashed curves of $y = \frac{\cos(x+h) - \cos(x-h)}{2h}$ are closer to the black curve $y = -\sin x$ than the corresponding dashed curves in Exercise 64 illustrating that the centered difference quotient is a better approximation of the derivative of this function.

66. $\lim_{h \rightarrow 0} \frac{|0+h| - |0-h|}{2h} = \lim_{x \rightarrow 0} \frac{|h| - |-h|}{2h} = \lim_{h \rightarrow 0} 0 = 0 \Rightarrow$ the limits of the centered difference quotient exists even though the derivative of $f(x) = |x|$ does not exist at $x = 0$.

67. $y = \tan x \Rightarrow y' = \sec^2 x$, so the smallest value $y' = \sec^2 x$ takes on is $y' = 1$ when $x = 0$; y' has no maximum value since $\sec^2 x$ has no largest value on $(-\frac{\pi}{2}, \frac{\pi}{2})$; y' is never negative since $\sec^2 x \geq 1$.

68. $y = \cot x \Rightarrow y' = -\csc^2 x$ so y' has no smallest value since $-\csc^2 x$ has no minimum value on $(0, \pi)$; the largest value of y' is -1 , when $x = \frac{\pi}{2}$; the slope is never positive since the largest value $y' = -\csc^2 x$ takes on is -1 .

69. $y = \frac{\sin x}{x}$ appears to cross the y -axis at $y = 1$, since $\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$; $y = \frac{\sin 2x}{x}$ appears to cross the y -axis at $y = 2$, since $\lim_{x \rightarrow 0} \frac{\sin 2x}{x} = 2$; $y = \frac{\sin 4x}{x}$ appears to cross the y -axis at $y = 4$, since $\lim_{x \rightarrow 0} \frac{\sin 4x}{x} = 4$.

However, none of these graphs actually cross the y -axis since $x = 0$ is not in the domain of the functions. Also, $\lim_{x \rightarrow 0} \frac{\sin 5x}{x} = 5$, $\lim_{x \rightarrow 0} \frac{\sin(-3x)}{x} = -3$, and $\lim_{x \rightarrow 0} \frac{\sin kx}{x} = k \Rightarrow$ the graphs of $y = \frac{\sin 5x}{x}$, $y = \frac{\sin(-3x)}{x}$, and $y = \frac{\sin kx}{x}$ approach 5, -3, and k , respectively, as $x \rightarrow 0$. However, the graphs do not actually cross the y -axis.

2. $f(u) = 2u^3 \Rightarrow f'(u) = 6u^2 \Rightarrow f'(g(x)) = 6(8x-1)^2; g(x) = 8x-1 \Rightarrow g'(x) = 8;$
therefore $\frac{dy}{dx} = f'(g(x))g'(x) = 6(8x-1)^2 \cdot 8 = 48(8x-1)^2$
3. $f(u) = \sin u \Rightarrow f'(u) = \cos u \Rightarrow f'(g(x)) = \cos(3x+1); g(x) = 3x+1 \Rightarrow g'(x) = 3;$
therefore $\frac{dy}{dx} = f'(g(x))g'(x) = (\cos(3x+1))(3) = 3 \cos(3x+1)$
4. $f(u) = \cos u \Rightarrow f'(u) = -\sin u \Rightarrow f'(g(x)) = -\sin(e^{-x}); g(x) = e^{-x} \Rightarrow g'(x) = -e^{-x};$ therefore,

$$96. \quad (a) \quad y = \sin 2x \Rightarrow y' = 2 \cos 2x \Rightarrow y'(0) = 2 \cos(0) = 2 \Rightarrow \text{tangent to } y = \sin 2x \text{ at the origin is } y = 2x; \\ y = -\sin\left(\frac{x}{2}\right) \Rightarrow y' = -\frac{1}{2} \cos\left(\frac{x}{2}\right) \Rightarrow y'(0) = -\frac{1}{2} \cos 0 = -\frac{1}{2} \Rightarrow \text{tangent to } y = -\sin\left(\frac{x}{2}\right) \text{ at the origin is} \\ y = -\frac{1}{2}x. \text{ The tangents are perpendicular to each other at the origin since the product of their slopes is } -1.$$

- (b) $y = \sin(mx) \Rightarrow y' = m \cos(mx) \Rightarrow y'(0) = m \cos 0 = m$; $y = -\sin\left(\frac{x}{m}\right) \Rightarrow y' = -\frac{1}{m} \cos\left(\frac{x}{m}\right) \Rightarrow y'(0) = -\frac{1}{m} \cos(0) = -\frac{1}{m}$. Since $m \cdot \left(-\frac{1}{m}\right) = -1$, the tangent lines are perpendicular at the origin.
- (c) $y = \sin(mx) \Rightarrow y' = m \cos(mx)$. The largest value $\cos(mx)$ can attain is 1 at $x = 0 \Rightarrow$ the largest value y' can attain is $|m|$ because $|y'| = |m \cos(mx)| = |m| |\cos mx| \leq |m| \cdot 1 = |m|$. Also, $y = -\sin\left(\frac{x}{m}\right) \Rightarrow y' = -\frac{1}{m} \cos\left(\frac{x}{m}\right) \Rightarrow |y'| = \left|-\frac{1}{m} \cos\left(\frac{x}{m}\right)\right| \leq \left|\frac{1}{m}\right| \left|\cos\left(\frac{x}{m}\right)\right| \leq \frac{1}{|m|} \Rightarrow$ the largest value y' can attain is $\left|\frac{1}{m}\right|$.
- (d) $y = \sin(mx) \Rightarrow y' = m \cos(mx) \Rightarrow y'(0) = m \Rightarrow$ slope of curve at the origin is m . Also, $\sin(mx)$ completes m periods on $[0, 2\pi]$. Therefore the slope of the curve $y = \sin(mx)$ at the origin is the same as the number of periods it completes on $[0, 2\pi]$. In particular, for large m , we can think of “compressing” the graph of $y = \sin x$ horizontally which gives more periods completed on $[0, 2\pi]$, but also increases the slope of the graph at the origin.
97. $s = A \cos(2\pi bt) \Rightarrow v = \frac{ds}{dt} = -A \sin(2\pi bt)(2\pi b) = -2\pi b A \sin(2\pi bt)$. If we replace b with $2b$ to double the frequency, the velocity formula gives $v = -4\pi b A \sin(4\pi bt) \Rightarrow$ doubling the frequency causes the velocity to double. Also $v = -2\pi b A \sin(2\pi bt) \Rightarrow a = \frac{dv}{dt} = -4\pi^2 b^2 A \cos(2\pi bt)$. If we replace b with $2b$ in the acceleration formula, we get $a = -16\pi^2 b^2 A \cos(4\pi bt) \Rightarrow$ doubling the frequency causes the acceleration to quadruple. Finally, $a = -4\pi^2 b^2 A \cos(2\pi bt) \Rightarrow j = \frac{da}{dt} = 8\pi^3 b^3 A \sin(2\pi bt)$. If we replace b with $2b$ in the jerk formula, we get $j = 64\pi^3 b^3 A \sin(4\pi bt) \Rightarrow$ doubling the frequency multiplies the jerk by a factor of 8.
98. (a) $y = 37 \sin\left[\frac{2\pi}{365}(x-101)\right] + 25 \Rightarrow y' = 37 \cos\left[\frac{2\pi}{365}(x-101)\right] \left(\frac{2\pi}{365}\right) = \frac{74\pi}{365} \cos\left[\frac{2\pi}{365}(x-101)\right]$. The temperature is increasing the fastest when y' is as large as possible. The largest value of $\cos\left[\frac{2\pi}{365}(x-101)\right]$ is 1 and occurs when $\frac{2\pi}{365}(x-101) = 0 \Rightarrow x = 101 \Rightarrow$ on day 101 of the year (\sim April 11), the temperature is increasing the fastest.
- (b) $y'(101) = \frac{74\pi}{365} \cos\left[\frac{2\pi}{365}(101-101)\right] = \frac{74\pi}{365} \cos(0) = \frac{74\pi}{365} \approx 0.64^\circ \text{ F/day}$
99. $s = (1+4t)^{1/2} \Rightarrow v = \frac{ds}{dt} = \frac{1}{2}(1+4t)^{-1/2}(4) = 2(1+4t)^{-1/2} \Rightarrow v(6) = 2(1+4 \cdot 6)^{-1/2} = \frac{2}{5} \text{ m/sec}$; $v = 2(1+4t)^{-1/2} \Rightarrow a = \frac{dv}{dt} = -\frac{1}{2} \cdot 2(1+4t)^{-3/2}(4) = -4(1+4t)^{-3/2} \Rightarrow a(6) = -4(1+4 \cdot 6)^{-3/2} = -\frac{4}{125} \text{ m/sec}^2$
100. We need to show $a = \frac{dv}{dt}$ is constant: $a = \frac{dv}{dt} = \frac{dv}{ds} \cdot \frac{ds}{dt}$ and $\frac{dv}{ds} = \frac{d}{ds}(k\sqrt{s}) = \frac{k}{2\sqrt{s}} \Rightarrow a = \frac{dv}{ds} \cdot \frac{ds}{dt} = \frac{dv}{ds} \cdot v = \frac{k}{2\sqrt{s}} \cdot k\sqrt{s} = \frac{k^2}{2}$ which is a constant.
101. v proportional to $\frac{1}{\sqrt{s}} \Rightarrow v = \frac{k}{\sqrt{s}}$ for some constant $k \Rightarrow \frac{dv}{ds} = -\frac{k}{2s^{3/2}}$. Thus, $a = \frac{dv}{dt} = \frac{dv}{ds} \cdot \frac{ds}{dt} = \frac{dv}{ds} \cdot v = -\frac{k}{2s^{3/2}} \cdot \frac{k}{\sqrt{s}} = -\frac{k^2}{2} \left(\frac{1}{s^2}\right) \Rightarrow$ acceleration is a constant times $\frac{1}{s^2}$ so a is inversely proportional to s^2 .
102. Let $\frac{dx}{dt} = f(x)$. Then, $a = \frac{dv}{dt} = \frac{dv}{dx} \cdot \frac{dx}{dt} = \frac{dv}{dx} \cdot f(x) = \frac{d}{dx}\left(\frac{dx}{dt}\right) \cdot f(x) = \frac{d}{dx}(f(x)) \cdot f(x) = f'(x)f(x)$, as required.
103. $T = 2\pi\sqrt{\frac{L}{g}} \Rightarrow \frac{dT}{dL} = 2\pi \cdot \frac{1}{2\sqrt{\frac{L}{g}}} \cdot \frac{1}{g} = \frac{\pi}{g\sqrt{\frac{L}{g}}} = \frac{\pi}{\sqrt{gL}}$. Therefore, $\frac{dT}{du} = \frac{dT}{dL} \cdot \frac{dL}{du} = \frac{\pi}{\sqrt{gL}} \cdot kL = \frac{\pi k\sqrt{L}}{\sqrt{g}} = \frac{1}{2} \cdot 2\pi k\sqrt{\frac{L}{g}} = \frac{kT}{2}$, as required.
104. No. The chain rule says that when g is differentiable at 0 and f is differentiable at $g(0)$, then $f \circ g$ is differentiable at 0. But the chain rule says nothing about what happens when g is not differentiable at 0 so there is no contradiction.

105. As $h \rightarrow 0$, the graph of $y = \frac{\sin 2(x+h) - \sin 2x}{h}$ approaches the graph of $y = 2 \cos 2x$ because $\lim_{h \rightarrow 0} \frac{\sin 2(x+h) - \sin 2x}{h} = \frac{d}{dx}(\sin 2x) = 2 \cos 2x$.

106. As $h \rightarrow 0$, the graph of $y = \frac{\cos[(x+h)^2] - \cos(x^2)}{h}$ approaches the graph of $y = -2x \sin(x^2)$ because $\lim_{h \rightarrow 0} \frac{\cos[(x+h)^2] - \cos(x^2)}{h} = \frac{d}{dx}[\cos(x^2)] = -2x \sin(x^2)$.

107. From the power rule, with $y = x^{1/4}$, we get $\frac{dy}{dx} = \frac{1}{4}x^{-3/4}$. From the chain rule, $y = \sqrt{\sqrt{x}}$
 $\Rightarrow \frac{dy}{dx} = \frac{1}{2\sqrt{x\sqrt{x}}} \cdot \frac{d}{dx}(\sqrt{x}) = \frac{1}{2\sqrt{x\sqrt{x}}} \cdot \frac{1}{2\sqrt{x}} = \frac{1}{4}x^{-3/4}$, in agreement.

108. From the power rule, with $y = x^{3/4}$, we get $\frac{dy}{dx} = \frac{3}{4}x^{-1/4}$. From the chain rule, $y = \sqrt{x\sqrt{x}}$
 $\Rightarrow \frac{dy}{dx} = \frac{1}{2\sqrt{x\sqrt{x}}} \cdot \frac{d}{dx}(x\sqrt{x})$
 $\Rightarrow \frac{dy}{dx} = \frac{1}{2\sqrt{x\sqrt{x}}} \cdot \left(x \cdot \frac{1}{2\sqrt{x}} + \sqrt{x}\right) = \frac{1}{2\sqrt{x\sqrt{x}}} \cdot \left(\frac{3}{2}\sqrt{x}\right) = \frac{3\sqrt{x}}{4\sqrt{x\sqrt{x}}} = \frac{3\sqrt{x}}{4\sqrt{x}\sqrt{\sqrt{x}}} = \frac{3}{4}x^{-1/4}$, in agreement.

42. $xy + 2x - y = 0 \Rightarrow x \frac{dy}{dx} + y + 2 - \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = \frac{y+2}{1-x}$; the slope of the line $2x + y = 0$ is -2 . In order to be parallel, the normal lines must also have slope of -2 . Since a normal is perpendicular to a tangent, the slope of the tangent is $\frac{1}{2}$. Therefore, $\frac{y+2}{1-x} = \frac{1}{2} \Rightarrow 2y + 4 = 1 - x \Rightarrow x = -3 - 2y$.  $\Rightarrow x^{3/2}(x^{3/2} - 6\sqrt{3}) = 0 \Rightarrow$ or $x^{3/2} = 0$ or $x^{3/2} = 6\sqrt{3} \Rightarrow x = 0$ or $x = \sqrt[3]{108} = 3\sqrt[3]{4}$. Since the equation $x^3 + y^3 - 9xy = 0$ is symmetric in x and y , the graph is symmetric about the line $y = x$. That is, if (a, b) is a point on the folium, then so is (b, a) . Moreover, if $y'|_{(a,b)} = m$, then $y'|_{(b,a)} = \frac{1}{m}$. Thus, if the folium has a horizontal tangent at (a, b) , it has a vertical tangent at (b, a) so one might expect that with a horizontal tangent at $x = \sqrt[3]{54}$ and a vertical tangent at $x = 3\sqrt[3]{4}$, the points of tangency are $(\sqrt[3]{54}, 3\sqrt[3]{4})$ and $(3\sqrt[3]{4}, \sqrt[3]{54})$, respectively. One can check that these points do satisfy the equation $x^3 + y^3 - 9xy = 0$.

47. $x^2 + 2xy - 3y^2 = 0 \Rightarrow 2x + 2xy' + 2y - 6yy' = 0 \Rightarrow y'(2x - 6y) = -2x - 2y \Rightarrow y' = \frac{x+y}{3y-x} \Rightarrow$ the slope of the tangent line $m = y' \Big|_{(1,1)} = \frac{x+y}{3y-x} \Big|_{(1,1)} = 1 \Rightarrow$ the equation of the normal line at $(1, 1)$ is $y - 1 = -1(x - 1) \Rightarrow y = -x + 2$. To find where the normal line intersects the curve we substitute into its equation:
 $x^2 + 2x(2 - x) - 3(2 - x)^2 = 0 \Rightarrow x^2 + 4x - 2x^2 - 3(4 - 4x + x^2) = 0 \Rightarrow -4x^2 + 16x - 12 = 0 \Rightarrow x^2 - 4x + 3 = 0$
 $\Rightarrow (x - 3)(x - 1) = 0 \Rightarrow x = 3$ and $y = -x + 2 = -1$. Therefore, the normal to the curve at $(1, 1)$ intersects the curve at the point $(3, -1)$. Note that it also intersects the curve at $(1, 1)$.
48. Let p and q be integers with $q > 0$ and suppose that $y = \sqrt[q]{x^p} = x^{p/q}$. Then $y^q = x^p$. Since p and q are integers and assuming y is a differentiable function of x , $\frac{d}{dx}(y^q) = \frac{d}{dx}(x^p) \Rightarrow qy^{q-1} \frac{dy}{dx} = px^{p-1} \Rightarrow \frac{dy}{dx} = \frac{px^{p-1}}{qy^{q-1}} = \frac{p}{q} \cdot \frac{x^{p-1}}{y^{q-1}} = \frac{p}{q} \cdot \frac{x^{p-1}}{(x^{p/q})^{q-1}} = \frac{p}{q} \cdot \frac{x^{p-1}}{x^{p-p/q}} = \frac{p}{q} \cdot x^{p-1-(p-p/q)} = \frac{p}{q} \cdot x^{(p/q)-1}$
49. $y^2 = x \Rightarrow \frac{dy}{dx} = \frac{1}{2y}$. If a normal is drawn from $(a, 0)$ to (x_1, y_1) on the curve its slope satisfies $\frac{y_1 - 0}{x_1 - a} = -2y_1$
 $\Rightarrow y_1 = -2y_1(x_1 - a)$ or $a = x_1 + \frac{1}{2}$. Since $x_1 \geq 0$ on the curve, we must have that $a \geq \frac{1}{2}$. By symmetry, the two points on the parabola are $(x_1, \sqrt{x_1})$ and $(x_1, -\sqrt{x_1})$. For the normal to be perpendicular, $\left(\frac{\sqrt{x_1}}{x_1 - a}\right)\left(\frac{\sqrt{x_1}}{a - x_1}\right) = -1$
 $\Rightarrow \frac{x_1}{(a - x_1)^2} = 1 \Rightarrow x_1 = (a - x_1)^2 \Rightarrow x_1 = \left(x_1 + \frac{1}{2} - x_1\right)^2 \Rightarrow x_1 = \frac{1}{4}$ and $y_1 = \pm \frac{1}{2}$. Therefore, $\left(\frac{1}{4}, \pm \frac{1}{2}\right)$ and $a = \frac{3}{4}$.
50. $2x^2 + 3y^2 = 5 \Rightarrow 4x + 6yy' = 0 \Rightarrow y' = -\frac{2x}{3y} \Rightarrow y' \Big|_{(1,1)} = -\frac{2x}{3y} \Big|_{(1,1)} = -\frac{2}{3}$ and $y' \Big|_{(1,-1)} = -\frac{2x}{3y} \Big|_{(1,-1)} = -\frac{2}{3}$; also,
 $y^2 = x^3 \Rightarrow 2yy' = 3x^2 \Rightarrow y' = \frac{3x^2}{2y} \Rightarrow y' \Big|_{(1,1)} = \frac{3x^2}{2y} \Big|_{(1,1)} = \frac{3}{2}$ and $y' \Big|_{(1,-1)} = \frac{3x^2}{2y} \Big|_{(1,-1)} = -\frac{3}{2}$. Therefore the tangents to the curves are perpendicular at $(1, 1)$ and $(1, -1)$ (i.e., the curves are orthogonal at these two points of intersection).

 At $\left(\frac{1}{4}, -\frac{\sqrt{3}}{2}\right)$: $m_1 = \frac{dy}{dx} = -\frac{1}{2(-\sqrt{3}/2)} = \frac{1}{\sqrt{3}}$ and $m_2 = \frac{dy}{dx} = \frac{3}{2(-\sqrt{3}/2)} = -\frac{3}{\sqrt{3}} \Rightarrow m_1 \cdot m_2 = \left(\frac{1}{\sqrt{3}}\right)\left(-\frac{3}{\sqrt{3}}\right) = -1$

52. $y = -\frac{1}{3}x + b$, $y^2 = x^3 \Rightarrow \frac{dy}{dx} = -\frac{1}{3}$ and $2y \frac{dy}{dx} = 3x^2 \Rightarrow \frac{dy}{dx} = \frac{3x^2}{2y} \Rightarrow \left(-\frac{1}{3}\right)\left(\frac{3x^2}{2y}\right) = -1 \Rightarrow \frac{x^2}{2} = y \Rightarrow \left(\frac{x^2}{2}\right)^2 = x^3$
 $\Rightarrow \frac{x^4}{4} = x^3 \Rightarrow x^4 - 4x^3 = 0 \Rightarrow x^3(x-4) = 0 \Rightarrow x = 0$ or $x = 4$. If $x = 0 \Rightarrow y = \frac{(0)^2}{2} = 0$ and $\left(-\frac{1}{3}\right)\left(\frac{3x^2}{2y}\right) = -1$ is
indeterminate at $(0, 0)$. If $x = 4 \Rightarrow y = \frac{(4)^2}{2} = 8$. At $(4, 8)$, $y = -\frac{1}{3}x + b \Rightarrow 8 = -\frac{1}{3}(4) + b \Rightarrow b = \frac{28}{3}$.

53. $xy^3 + x^2y = 6 \Rightarrow x\left(3y^2 \frac{dy}{dx}\right) + y^3 + x^2 \frac{dy}{dx} + 2xy = 0 \Rightarrow \frac{dy}{dx}(3xy^2 + x^2) = -y^3 - 2xy \Rightarrow \frac{dy}{dx} = \frac{-y^3 - 2xy}{3xy^2 + x^2} = -\frac{y^3 + 2xy}{3xy^2 + x^2}$;
also, $xy^3 + x^2y = 6 \Rightarrow x(3y^2) + y^3 \frac{dx}{dy} + x^2 + y(2x \frac{dx}{dy}) = 0 \Rightarrow \frac{dx}{dy}(y^3 + 2xy) = -3xy^2 - x^2 \Rightarrow \frac{dx}{dy} = -\frac{3xy^2 + x^2}{y^3 + 2xy}$;
thus $\frac{dx}{dy}$ appears to equal $\frac{1}{\frac{dy}{dx}}$. The two different treatments view the graphs as functions symmetric across the
line $y = x$, so their slopes are reciprocals of one another at the corresponding points (a, b) and (b, a) .

54. $x^3 + y^2 = \sin^2 y \Rightarrow 3x^2 + 2y \frac{dy}{dx} = (2 \sin y)(\cos y) \frac{dy}{dx} \Rightarrow \frac{dy}{dx}(2y - 2 \sin y \cos y) = -3x^2 \Rightarrow \frac{dy}{dx} = \frac{-3x^2}{2y - 2 \sin y \cos y}$
 $= \frac{3x^2}{2 \sin y \cos y - 2y}$; also, $x^3 + y^2 = \sin^2 y \Rightarrow 3x^2 \frac{dx}{dy} + 2y = 2 \sin y \cos y \Rightarrow \frac{dx}{dy} = \frac{2 \sin y \cos y - 2y}{3x^2}$; thus $\frac{dx}{dy}$ appears to
equal $\frac{1}{\frac{dy}{dx}}$. The two different treatments view the graphs as functions symmetric across the line $y = x$ so their
slopes are reciprocals of one another at the corresponding points (a, b) and (b, a) .

55. $y = \sin^{-1} x \Rightarrow x = \sin y \Rightarrow \frac{d}{dx}(x) = \frac{d}{dx} \sin y \Rightarrow 1 = \cos y \frac{dy}{dx} = \frac{dy}{dx} = \frac{1}{\cos y}$. Since $\sin^2 y + \cos^2 y = 1$,
 $\cos y = \sqrt{1 - \sin^2 y} = \sqrt{1 - x^2}$. Therefore, $\frac{dy}{dx} = \frac{d}{dx} \sin^{-1} x = \frac{1}{\sqrt{1-x^2}}$.

56. (a) $\frac{d}{dx}(\sin^{-1} x)^2 = 2 \sin^{-1} x \frac{d}{dx} \sin^{-1} x = \frac{2 \sin^{-1} x}{\sqrt{1-x^2}}$

(b) $\frac{d}{dx} \sin^{-1}\left(\frac{1}{x}\right) = \frac{1}{\sqrt{1-\left(\frac{1}{x}\right)^2}} \frac{d}{dx}\left(\frac{1}{x}\right) = \frac{1}{\sqrt{1-\frac{1}{x^2}}}\left(-\frac{1}{x^2}\right) = -\frac{1}{x^2 \sqrt{1-\frac{1}{x^2}}}$ or $-\frac{1}{|x|\sqrt{x^2-1}}$

98. $\lim_{n \rightarrow \infty} \left(1 + \frac{x}{n} \right)^n = \lim_{n \rightarrow \infty} \left[\left(1 + \frac{1}{(n/x)} \right)^{(n/x)} \right]^x = e^x$ for any $x > 0$.
99. The derivative of x^n at $x = 0$ is given by $\lim_{h \rightarrow 0} \frac{(0+h)^n}{h} = \lim_{h \rightarrow 0} h^{n-1}$. For $n \geq 2$, $n-1 \geq 1$, so $\lim_{h \rightarrow 0} h^{n-1} = 0$.

100. Suppose $n = 1$. Then $\frac{d}{dx} \ln x = \frac{1}{x} = (-1)^0 \cdot \frac{0!}{x^1}$ and so the base case is established. Now if the statement holds for $n = k$ we have that, for $n = k + 1$, the following holds:

$$\frac{d^n}{dx^n} (\ln x) = \frac{d^{k+1}}{dx^{k+1}} (\ln x) = \frac{d}{dx} \left(\frac{d^k}{dx^k} (\ln x) \right) = \frac{d}{dx} \left((-1)^{k-1} \frac{(k-1)!}{x^k} \right) = (-1)^{k-1} (k-1)! \cdot (-k) x^{-k-1} = \frac{(-1)^k k!}{x^{k+1}} = \frac{(-1)^{n-1} (n-1)!}{x^n}$$

Thus by mathematical induction the result is established for all $n \geq 1$.

43. The angle α is the large angle between the wall and the right end of the blackboard minus the small angle between the left end of the blackboard and the wall $\Rightarrow \alpha = \cot^{-1} \left(\frac{x}{15} \right) - \cot^{-1} \left(\frac{x}{3} \right)$.

44. $65^\circ + (90^\circ - \beta) + (90^\circ - \alpha) = 180^\circ \Rightarrow \alpha = 65^\circ - \beta = 65^\circ - \tan^{-1} \left(\frac{21}{50} \right) \approx 65^\circ - 22.78^\circ \approx 42.22^\circ$

45. Take each square as a unit square. From the diagram we have the following: the smallest angle α has a tangent of 1 $\Rightarrow \alpha = \tan^{-1} 1$; the middle angle β has a tangent of 2 $\Rightarrow \beta = \tan^{-1} 2$; and the largest angle γ has a tangent of 3 $\Rightarrow \gamma = \tan^{-1} 3$. The sum of these three angles is $\pi \Rightarrow \alpha + \beta + \gamma = \pi \Rightarrow \tan^{-1} 1 + \tan^{-1} 2 + \tan^{-1} 3 = \pi$.

46. (a) From the symmetry of the diagram, we see that $\pi - \sec^{-1} x$ is the vertical distance from the graph of $y = \sec^{-1} x$ to the line $y = \pi$ and this distance is the same as the height of $y = \sec^{-1} x$ above the x -axis at $-x$; i.e., $\pi - \sec^{-1} x = \sec^{-1}(-x)$.

(b) $\cos^{-1}(-x) = \pi - \cos^{-1} x$, where $-1 \leq x \leq 1 \Rightarrow \cos^{-1} \left(-\frac{1}{x} \right) = \pi - \cos^{-1} \left(\frac{1}{x} \right)$, where $x \geq 1$ or $x \leq -1$

55. The functions f and g have the same derivative (for $x \geq 0$), namely $\frac{1}{\sqrt{x(x+1)}}$. The functions therefore differ by a constant. To identify the constant we can set x equal to 0 in the equation $f(x) = g(x) + C$, obtaining $\sin^{-1}(-1) = 2 \tan^{-1}(0) + C \Rightarrow -\frac{\pi}{2} = 0 + C \Rightarrow C = -\frac{\pi}{2}$. For $x \geq 0$, we have $\sin^{-1}\left(\frac{x-1}{x+1}\right) = 2 \tan^{-1} \sqrt{x} - \frac{\pi}{2}$.

56. The functions f and g have the same derivative for $x > 0$, namely $\frac{-1}{1+x^2}$. The functions therefore differ by a constant for $x > 0$. To identify the constant we can set x equal to 1 in the equation $f(x) = g(x) + C$, obtaining $\sin^{-1}\left(\frac{1}{\sqrt{2}}\right) = \tan^{-1} 1 + C \Rightarrow \frac{\pi}{4} = \frac{\pi}{4} + C \Rightarrow C = 0$. For $x > 0$, we have $\sin^{-1} \frac{1}{\sqrt{x^2+1}} = \tan^{-1} \frac{1}{x}$.

There is an inflection point at $x = 0$ where $f'' = 0$ and f' has a local maximum value.

36. Let $P(x, y)$ represent a point on the curve $y = x^2$ and θ the angle of inclination of a line containing P and the origin. Consequently, $\tan \theta = \frac{y}{x} \Rightarrow \tan \theta = \frac{x^2}{x} = x \Rightarrow \sec^2 \theta \frac{d\theta}{dt} = \frac{dx}{dt} \Rightarrow \frac{d\theta}{dt} = \cos^2 \theta \frac{dx}{dt}$.  $\Rightarrow \sec^2 \theta \frac{d\theta}{dt} = \frac{1}{132} \frac{ds}{dt} \Rightarrow \frac{d\theta}{dt} = \frac{\cos^2 \theta}{132} \frac{ds}{dt}$; $\frac{ds}{dt} = -264$ and $\theta = 0 \Rightarrow \frac{d\theta}{dt} = -2$ rad/sec. A half second later the car has traveled 132 ft right of the perpendicular $\Rightarrow |\theta| = \frac{\pi}{4}$, $\cos^2 \theta = \frac{1}{2}$, and $\frac{ds}{dt} = 264$ (since s increases)
 $\Rightarrow \frac{d\theta}{dt} = \left(\frac{1}{2}\right) \frac{1}{132} (264) = 1$ rad/sec.

39. Let $s = 16t^2$ represent the distance the ball has fallen, h the distance between the ball and the ground, and l the distance between the shadow and the point directly beneath the ball. Accordingly, $s + h = 50$ and since the triangle LOQ and triangle PRQ are similar we have $l = \frac{30h}{50-h} \Rightarrow h = 50 - 16t^2$
 and $l = \frac{30(50-16t^2)}{50-(50-16t^2)} = \frac{1500}{16t^2} - 30 \Rightarrow \frac{dl}{dt} = -\frac{1500}{8t^3}$
 $\Rightarrow \frac{dl}{dt} \Big|_{t=\frac{1}{2}} = -1500$ ft/sec.

40. When x represents the length of the shadow, then $\tan \theta = \frac{80}{x} \Rightarrow \sec^2 \theta \frac{d\theta}{dt} = -\frac{80}{x^2} \frac{dx}{dt} \Rightarrow \frac{dx}{dt} = \frac{-x^2 \sec^2 \theta}{80} \frac{d\theta}{dt}$.

Therefore, $x = 60$ and $s = 30\sqrt{13} \Rightarrow \frac{d\theta_1}{dt} = -\frac{90}{(30\sqrt{13})(60)} \cdot \left(\frac{-32}{\sqrt{13}}\right) = \frac{8}{65}$ rad/sec; $\cos \theta_2 = \frac{90}{s} \Rightarrow -\sin \theta_2 \frac{d\theta_2}{dt} = -\frac{90}{s^2} \cdot \frac{ds}{dt} \Rightarrow \frac{d\theta_2}{dt} = \frac{90}{s^2 \sin \theta_2} \cdot \frac{ds}{dt} = \frac{90}{s \cdot k} \cdot \frac{ds}{dt}$. Therefore, $x = 60$ and $s = 30\sqrt{13} \Rightarrow \frac{d\theta_2}{dt} = \frac{90}{(30\sqrt{13})(60)} \cdot \left(\frac{-32}{\sqrt{13}}\right) = -\frac{8}{65}$ rad/sec.

When $a = 5$, $\frac{da}{dt} = 14$, $b = 3$, and $\frac{db}{dt} = 21$, then $\frac{dD}{dt} = \frac{413}{2D}$ where $D = 7$. The ships are moving $\frac{dD}{dt} = 29.5$ knots apart.

 (b) $\left(\frac{.08\pi}{4\pi}\right)(100\%) = 2\%$
52. $C = 2\pi r$ and $dC = 2$ in. $\Rightarrow dC = 2\pi dr \Rightarrow dr = \frac{1}{\pi} \Rightarrow$ the diameter grew about $\frac{2}{\pi}$ in.; $A = \pi r^2$
 $\Rightarrow dA = 2\pi r dr = 2\pi(5)\left(\frac{1}{\pi}\right) = 10$ in.²
53. The volume of a cylinder is $V = \pi r^2 h$. When h is held fixed, we have $\frac{dV}{dr} = 2\pi r h$, and so $dV = 2\pi r h dr$. For $h = 30$ in., $r = 6$ in., and $dr = 0.5$ in., the volume of the material in the shell is approximately $dV = 2\pi r h dr = 2\pi(6)(30)(0.5) = 180\pi \approx 565.5$ in.³.
54. Let $\theta =$ angle of elevation and $h =$ height of building. Then $h = 30 \tan \theta$, so $dh = 30 \sec^2 \theta d\theta$. We want $|dh| < 0.04h$, which gives: $|30 \sec^2 \theta d\theta| < 0.04|30 \tan \theta| \Rightarrow \frac{1}{\cos^2 \theta} |d\theta| < \frac{0.04 \sin \theta}{\cos \theta} \Rightarrow |d\theta| < 0.04 \sin \theta \cos \theta$
 $\Rightarrow |d\theta| < 0.04 \sin \frac{5\pi}{12} \cos \frac{5\pi}{12} = 0.01$ radian. The angle should be measured with an error of less than 0.01 radian (or approximately 0.57 degrees), which is a percentage error of approximately 0.76%.
55. The percentage error in the radius is $\frac{\left(\frac{dr}{dt}\right)}{r} \times 100 \leq 2\%$.
 (a) Since $C = 2\pi r \Rightarrow \frac{dC}{dt} = 2\pi \frac{dr}{dt}$. The percentage error in calculating the circle's circumference is $\frac{\left(\frac{dC}{dt}\right)}{C} \times 100$
 $= \frac{\left(2\pi \frac{dr}{dt}\right)}{2\pi r} \times 100 = \frac{\left(\frac{dr}{dt}\right)}{r} \times 100 \leq 2\%$.

(b) Since $A = \pi r^2 \Rightarrow \frac{dA}{dt} = 2\pi r \frac{dr}{dt}$. The percentage error in calculating the circle's area is given by $\frac{(\frac{dA}{dt})}{A} \times 100 = \frac{(2\pi r \frac{dr}{dt})}{\pi r^2} \times 100 = 2 \frac{(\frac{dr}{dt})}{r} \times 100 \leq 2(2\%) = 4\%$.

56. The percentage error in the edge of the cube is $\frac{(\frac{dx}{dt})}{x} \times 100 \leq 0.5\%$.

(a) Since $S = 6x^2 \Rightarrow \frac{dS}{dt} = 12x \frac{dx}{dt}$. The percentage error in the cube's surface area is $\frac{(\frac{dS}{dt})}{S} \times 100 = \frac{(12x \frac{dx}{dt})}{6x^2} \times 100 = 2 \frac{(\frac{dx}{dt})}{x} \times 100 \leq 2(0.5\%) = 1\%$

(b) Since $V = x^3 \Rightarrow \frac{dV}{dt} = 3x^2 \frac{dx}{dt}$. The percentage error in the cube's volume is $\frac{(\frac{dV}{dt})}{V} \times 100 = \frac{(3x^2 \frac{dx}{dt})}{x^3} \times 100 = 3 \frac{(\frac{dx}{dt})}{x} \times 100 \leq 3(0.5\%) = 1.5\%$

57. $V = \pi h^3 \Rightarrow dV = 3\pi h^2 dh$; recall that $\Delta V \approx dV$. Then $|\Delta V| \leq (1\%)(V) = \frac{(1)(\pi h^3)}{100} \Rightarrow |dV| \leq \frac{(1)(\pi h^3)}{100} \Rightarrow |3\pi h^2 dh| \leq \frac{(1)(\pi h^3)}{100} \Rightarrow |dh| \leq \frac{1}{300} h = \left(\frac{1}{3}\right)\% h$. Therefore the greatest tolerated error in the measurement of h is $\frac{1}{3}\%$.

58. (a) Let D_i represent the interior diameter. Then $V = \pi r^2 h = \pi \left(\frac{D_i}{2}\right)^2 h = \frac{\pi D_i^2 h}{4}$ and $h = 10 \Rightarrow V = \frac{5\pi D_i^2}{2} \Rightarrow dV = 5\pi D_i dD_i$. Recall that $\Delta V \approx dV$. We want $|\Delta V| \leq (1\%)(V) \Rightarrow |dV| \leq \left(\frac{1}{100}\right) \left(\frac{5\pi D_i^2}{2}\right) = \frac{\pi D_i^2}{40} \Rightarrow 5\pi D_i dD_i \leq \frac{\pi D_i^2}{40} \Rightarrow \frac{dD_i}{D_i} \leq \frac{1}{200}$. The inside diameter must be measured to within 0.5%.

(b) Let D_e represent the exterior diameter, h the height and S the area of the painted surface. $S = \pi D_e h \Rightarrow dS = \pi h dD_e \Rightarrow \frac{dS}{S} = \frac{dD_e}{D_e}$. Thus for small changes in exterior diameter, the approximate percentage change in the exterior diameter is equal to the approximate percentage change in the area painted, and to estimate the amount of paint required to within 5%, the tank's exterior diameter must be measured to within 5%.

59. Given $D = 100$ cm, $dD = 1$ cm, $V = \frac{4}{3}\pi \left(\frac{D}{2}\right)^3 = \frac{\pi D^3}{6} \Rightarrow dV = \frac{\pi}{2} D^2 dD = \frac{\pi}{2} (100)^2 (1) = \frac{10^4 \pi}{2}$. Then $\frac{dV}{V} (100\%) = \left[\frac{10^4 \pi}{2}\right] \left(\frac{10^2 \pi}{6}\right) = \left[\frac{10^6 \pi}{6}\right] \pi = 3\% \frac{10^4 \pi}{6}$

60. $V = \frac{4}{3}\pi r^3 = \frac{4}{3}\pi \left(\frac{D}{2}\right)^3 = \frac{\pi D^3}{6} \Rightarrow dV = \frac{\pi D^2}{2} dD$; recall that $\Delta V \approx dV$. Then $|\Delta V| \leq (3\%)V = \left(\frac{3}{100}\right) \left(\frac{\pi D^3}{6}\right) = \frac{\pi D^3}{200} \Rightarrow |dV| \leq \frac{\pi D^3}{200} \Rightarrow \left|\frac{\pi D^2}{2} dD\right| \leq \frac{\pi D^3}{200} \Rightarrow |dD| \leq \frac{D}{100} = (1\%)D \Rightarrow$ the allowable percentage error in measuring the diameter is 1%.

61. $W = a + \frac{b}{g} = a + bg^{-1} \Rightarrow dW = -bg^{-2} dg = -\frac{b dg}{g^2} \Rightarrow \frac{dW_{\text{moon}}}{dW_{\text{earth}}} = \frac{\left(-\frac{b dg}{(5.2)^2}\right)}{\left(-\frac{b dg}{(32)^2}\right)} = \left(\frac{32}{5.2}\right)^2 = 37.87$, so a change of gravity on the moon has about 38 times the effect that a change of the same magnitude has on Earth.

62. $C'(t) = \frac{4-8t^3}{(1+t^3)^2} + 0.06e^{-0.06t}$, where t is measured in hours. When the time changes from 20 min to 30 min, t in hours changes from $\frac{1}{3}$ to $\frac{1}{2}$, so the differential estimate for the change in C is $C'(\frac{1}{3}) \cdot (\frac{1}{2} - \frac{1}{3}) = \frac{1}{6} C'(\frac{1}{3}) \approx 0.584$ mg/mL.

63. The relative change in V is estimated by $\frac{dV/dr}{V} \Delta r = \frac{4kr^3}{kr^4} \Delta r = \frac{4\Delta r}{r}$. If the radius increases by 10%, r changes to $1.1r$ and $\Delta r = 0.1r$. The approximate relative increase in V is thus $\frac{4(0.1r)}{r} = 0.4$ or 40%.

64. (a) $T = 2\pi \left(\frac{L}{g}\right)^{1/2} \Rightarrow dT = 2\pi\sqrt{L} \left(-\frac{1}{2}g^{-3/2}\right) dg = -\pi\sqrt{L}g^{-3/2} dg$
 (b) If g increases, then $dg > 0 \Rightarrow dT < 0$. The period T decreases and the clock ticks more frequently. Both the pendulum speed and clock speed increase.
 (c) $0.001 = -\pi\sqrt{100}(980^{-3/2}) dg \Rightarrow dg \approx -0.977$ cm/sec² \Rightarrow the new $g \approx 979$ cm/sec²

65. (a) i. $Q(a) = f(a)$ implies that $b_0 = f(a)$.
 ii. Since $Q'(x) = b_1 + 2b_2(x-a)$, $Q'(a) = f'(a)$ implies that $b_1 = f'(a)$.
 iii. Since $Q''(x) = 2b_2$, $Q''(a) = f''(a)$ implies that $b_2 = \frac{f''(a)}{2}$.

In summary, $b_0 = f(a)$, $b_1 = f'(a)$, and $b_2 = \frac{f''(a)}{2}$.

(b) $f(x) = (1-x)^{-1}$; $f'(x) = -1(1-x)^{-2}(-1) = (1-x)^{-2}$; $f''(x) = -2(1-x)^{-3}(-1) = 2(1-x)^{-3}$ Since $f(0) = 1$, $f'(0) = 1$, and $f''(0) = 2$, the coefficients are $b_0 = 1$, $b_1 = 1$, $b_2 = \frac{2}{2} = 1$. The quadratic approximation is $Q(x) = 1 + x + x^2$.

(c) As one zooms in, the two graphs quickly become indistinguishable. They appear to be identical.

(d) $g(x) = x^{-1}$; $g'(x) = -1x^{-2}$; $g''(x) = 2x^{-3}$
 Since $g(1) = 1$, $g'(1) = -1$, and $g''(1) = 2$, the coefficients are $b_0 = 1$, $b_1 = -1$, $b_2 = \frac{2}{2} = 1$. The quadratic approximation is $Q(x) = 1 - (x-1) + (x-1)^2$.

As one zooms in, the two graphs quickly become indistinguishable. They appear to be identical.

(e) $h(x) = (1+x)^{1/2}$; $h'(x) = \frac{1}{2}(1+x)^{-1/2}$; $h''(x) = -\frac{1}{4}(1+x)^{-3/2}$
 Since $h(0) = 1$, $h'(0) = \frac{1}{2}$, and $h''(0) = -\frac{1}{4}$, the coefficients are $b_0 = 1$, $b_1 = \frac{1}{2}$, $b_2 = \frac{-\frac{1}{4}}{2} = -\frac{1}{8}$. The quadratic approximation is $Q(x) = 1 + \frac{x}{2} - \frac{x^2}{8}$.

As one zooms in, the two graphs quickly become indistinguishable. They appear to be identical.

(f) The linearization of any differentiable function $u(x)$ at $x = a$ is $L(x) = u(a) + u'(a)(x - a) = b_0 + b_1(x - a)$, where b_0 and b_1 are the coefficients of the constant and linear terms of the quadratic approximation. Thus, the linearization for $f(x)$ at $x = 0$ is $1 + x$; the linearization for $g(x)$ at $x = 1$ is $1 - (x - 1)$ or $2 - x$; and the linearization for $h(x)$ at $x = 0$ is $1 + \frac{x}{2}$.

66. $E(x) = f(x) - g(x) \Rightarrow E(x) = f(x) - m(x - a) - c$. Then $E(a) = 0 \Rightarrow f(a) - m(a - a) - c = 0 \Rightarrow c = f(a)$. Next we calculate m : $\lim_{x \rightarrow a} \frac{E(x)}{x - a} = 0 \Rightarrow \lim_{x \rightarrow a} \frac{f(x) - m(x - a) - c}{x - a} = 0 \Rightarrow \lim_{x \rightarrow a} \left[\frac{f(x) - f(a)}{x - a} - m \right] = 0$ (since $c = f(a)$) $\Rightarrow f'(a) - m = 0 \Rightarrow m = f'(a)$. Therefore, $g(x) = m(x - a) + c = f'(a)(x - a) + f(a)$ is the linear approximation, as claimed.

67. (a) $f(x) = 2^x \Rightarrow f'(x) = 2^x \ln 2$; $L(x) = (2^0 \ln 2)x + 2^0 = x \ln 2 + 1 \approx 0.69x + 1$

68. (a) $f(x) = \log_3 x \Rightarrow f'(x) = \frac{1}{x \ln 3}$, and $f(3) = \frac{\ln 3}{\ln 3} \Rightarrow L(x) = \frac{1}{3 \ln 3}(x - 3) + \frac{\ln 3}{\ln 3} = \frac{x}{3 \ln 3} - \frac{1}{\ln 3} + 1$

(a) $\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} \sin 2x = 0$ and $\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} mx = 0 \Rightarrow \lim_{x \rightarrow 0} f(x) = 0$, independent of m ; since $f(0) = 0 = \lim_{x \rightarrow 0} f(x)$ it follows that f is continuous at $x = 0$ for all values of m .
- (b) $\lim_{x \rightarrow 0^-} f'(x) = \lim_{x \rightarrow 0^-} (\sin 2x)' = \lim_{x \rightarrow 0^-} 2 \cos 2x = 2$ and $\lim_{x \rightarrow 0^+} f'(x) = \lim_{x \rightarrow 0^+} (mx)' = \lim_{x \rightarrow 0^+} m = m \Rightarrow f$ is differentiable at $x = 0$ provided that $\lim_{x \rightarrow 0^-} f'(x) = \lim_{x \rightarrow 0^+} f'(x) \Rightarrow m = 2$.

99. $y = \frac{x}{2} + \frac{1}{2x-4} = \frac{1}{2}x + (2x-4)^{-1} \Rightarrow \frac{dy}{dx} = \frac{1}{2} - 2(2x-4)^{-2}$; the slope of the tangent is $-\frac{3}{2} \Rightarrow -\frac{3}{2} = \frac{1}{2} - 2(2x-4)^{-2} \Rightarrow -2 = -2(2x-4)^{-2} \Rightarrow 1 = \frac{1}{(2x-4)^2} \Rightarrow (2x-4)^2 = 1 \Rightarrow 4x^2 - 16x + 16 = 1 \Rightarrow 4x^2 - 16x + 15 = 0 \Rightarrow (2x-5)(2x-3) = 0 \Rightarrow x = \frac{5}{2}$ or $x = \frac{3}{2} \Rightarrow (\frac{5}{2}, \frac{5}{9})$ and $(\frac{3}{2}, -\frac{1}{4})$ are points on the curve where the slope is $-\frac{3}{2}$.

100. $y = x - e^{-x}$; $\frac{dy}{dx} = 1 + e^{-x} = 2 \Rightarrow e^{-x} = 1 \Rightarrow x = 0 \Rightarrow y = 0 - e^0 = -1$. Therefore, the curve has a tangent with a slope of 2 at the point $(0, -1)$.

101. $y = 2x^3 - 3x^2 - 12x + 20 \Rightarrow \frac{dy}{dx} = 6x^2 - 6x - 12$; the tangent is parallel to the x -axis when $\frac{dy}{dx} = 0 \Rightarrow 6x^2 - 6x - 12 = 0 \Rightarrow x^2 - x - 2 = 0 \Rightarrow (x-2)(x+1) = 0 \Rightarrow x = 2$ or $x = -1 \Rightarrow (2, 0)$ and $(-1, 27)$ are points on the curve where the tangent is parallel to the x -axis.

102. $y = x^3 \Rightarrow \frac{dy}{dx} = 3x^2 \Rightarrow \frac{dy}{dx} \Big|_{(-2, -8)} = 12$; an equation of the tangent line at $(-2, -8)$ is $y + 8 = 12(x + 2) \Rightarrow y = 12x + 16$; x -intercept: $0 = 12x + 16 \Rightarrow x = -\frac{4}{3} \Rightarrow (-\frac{4}{3}, 0)$; y -intercept: $y = 12(0) + 16 = 16 \Rightarrow (0, 16)$

103. $y = 2x^3 - 3x^2 - 12x + 20 \Rightarrow \frac{dy}{dx} = 6x^2 - 6x - 12$

- (a) The tangent is perpendicular to the line $y = 1 - \frac{x}{24}$ when $\frac{dy}{dx} = -\left(\frac{1}{-\frac{1}{24}}\right) = 24$; $6x^2 - 6x - 12 = 24 \Rightarrow x^2 - x - 2 = 4 \Rightarrow x^2 - x - 6 = 0 \Rightarrow (x-3)(x+2) = 0 \Rightarrow x = -2$ or $x = 3 \Rightarrow (-2, 16)$ and $(3, 11)$ are points where the tangent is perpendicular to $y = 1 - \frac{x}{24}$.
- (b) The tangent is parallel to the line $y = \sqrt{2} - 12x$ when $\frac{dy}{dx} = -12 \Rightarrow 6x^2 - 6x - 12 = -12 \Rightarrow x^2 - x = 0 \Rightarrow x(x-1) = 0 \Rightarrow x = 0$ or $x = 1 \Rightarrow (0, 20)$ and $(1, 7)$ are points where the tangent is parallel to $y = \sqrt{2} - 12x$.

104. $y = \frac{\pi \sin x}{x} \Rightarrow \frac{dy}{dx} = \frac{x(\pi \cos x) - (\pi \sin x)(1)}{x^2} \Rightarrow m_1 = \frac{dy}{dx}\bigg|_{x=\pi} = \frac{-\pi^2}{\pi^2} = -1$ and $m_2 = \frac{dy}{dx}\bigg|_{x=-\pi} = \frac{\pi^2}{\pi^2} = 1$. Since $m_1 = -\frac{1}{m_2}$

the tangents intersect at right angles.

105. $y = \tan x, -\frac{\pi}{2} < x < \frac{\pi}{2} \Rightarrow \frac{dy}{dx} = \sec^2 x$; now the slope of $y = -\frac{x}{2}$ is $-\frac{1}{2} \Rightarrow$ the normal line is parallel to $y = -\frac{x}{2}$ when $\frac{dy}{dx} = 2$. Thus, $\sec^2 x = 2 \Rightarrow \frac{1}{\cos^2 x} = 2 \Rightarrow \cos^2 x = \frac{1}{2} \Rightarrow \cos x = \frac{\pm 1}{\sqrt{2}} \Rightarrow x = -\frac{\pi}{4}$ and $x = \frac{\pi}{4}$ for $-\frac{\pi}{2} < x < \frac{\pi}{2} \Rightarrow (-\frac{\pi}{4}, -1)$ and $(\frac{\pi}{4}, 1)$ are points where the normal is parallel to $y = -\frac{x}{2}$.

106. $y = 1 + \cos x \Rightarrow \frac{dy}{dx} = -\sin x \Rightarrow \frac{dy}{dx}\bigg|_{(\frac{\pi}{2}, 1)} = -1$
 \Rightarrow the tangent at $(\frac{\pi}{2}, 1)$ is the line $y - 1 = -(x - \frac{\pi}{2})$
 $\Rightarrow y = -x + \frac{\pi}{2} + 1$; the normal at $(\frac{\pi}{2}, 1)$ is $y - 1 = (1)(x - \frac{\pi}{2}) \Rightarrow y = x - \frac{\pi}{2} + 1$

107. $y = x^2 + C \Rightarrow \frac{dy}{dx} = 2x$ and $y = x \Rightarrow \frac{dy}{dx} = 1$; the parabola is tangent to $y = x$ when $2x = 1 \Rightarrow x = \frac{1}{2} \Rightarrow y = \frac{1}{2}$; thus, $\frac{1}{2} = (\frac{1}{2})^2 + C \Rightarrow C = \frac{1}{4}$

108. $y = x^3 \Rightarrow \frac{dy}{dx} = 3x^2 \Rightarrow \frac{dy}{dx}\bigg|_{x=a} = 3a^2 \Rightarrow$ the tangent line at (a, a^3) is $y - a^3 = 3a^2(x - a)$. The tangent line intersects $y = x^3$ when $x^3 - a^3 = 3a^2(x - a) \Rightarrow (x - a)(x^2 + xa + a^2) = 3a^2(x - a) \Rightarrow (x - a)(x^2 + xa - 2a^2) = 0 \Rightarrow (x - a)^2(x + 2a) = 0 \Rightarrow x = a$ or $x = -2a$. Now $\frac{dy}{dx}\bigg|_{x=-2a} = 3(-2a)^2 = 12a^2 = 4(3a^2)$, so the slope at $x = -2a$ is 4 times as large as the slope at (a, a^3) where $x = a$.

109. The line through $(0, 3)$ and $(5, -2)$ has slope $m = \frac{3 - (-2)}{0 - 5} = -1 \Rightarrow$ the line through $(0, 3)$ and $(5, -2)$ is $y = -x + 3$; $y = \frac{c}{x+1} \Rightarrow \frac{dy}{dx} = \frac{-c}{(x+1)^2}$, so the curve is tangent to $y = -x + 3 \Rightarrow \frac{dy}{dx} = -1 = \frac{-c}{(x+1)^2} \Rightarrow (x+1)^2 = c, x \neq -1$. Moreover, $y = \frac{c}{x+1}$ intersects $y = -x + 3 \Rightarrow \frac{c}{x+1} = -x + 3, x \neq -1 \Rightarrow c = (x+1)(-x+3), x \neq -1$. Thus $c = c \Rightarrow (x+1)^2 = (x+1)(-x+3) \Rightarrow (x+1)[x+1 - (-x+3)] = 0, x \neq -1 \Rightarrow (x+1)(2x-2) = 0 \Rightarrow x = 1$ (since $x \neq -1$) $\Rightarrow c = 4$.

110. Let $(b, \pm\sqrt{a^2 - b^2})$ be a point on the circle $x^2 + y^2 = a^2$. Then $x^2 + y^2 = a^2 \Rightarrow 2x + 2y \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = -\frac{x}{y} \Rightarrow \frac{dy}{dx}\bigg|_{x=a} = \frac{-b}{\pm\sqrt{a^2 - b^2}} \Rightarrow$ normal line through $(b, \pm\sqrt{a^2 - b^2})$ has slope $\frac{\pm\sqrt{a^2 - b^2}}{b} \Rightarrow$ normal line is $y - (\pm\sqrt{a^2 - b^2}) = \frac{\pm\sqrt{a^2 - b^2}}{b}(x - b) \Rightarrow y \mp \sqrt{a^2 - b^2} = \frac{\pm\sqrt{a^2 - b^2}}{b}x \mp \sqrt{a^2 - b^2} \Rightarrow y = \pm \frac{\sqrt{a^2 - b^2}}{b}x$ which passes through the origin.

111. $x^2 + 2y^2 = 9 \Rightarrow 2x + 4y \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = -\frac{x}{2y} \Rightarrow \frac{dy}{dx}\bigg|_{(1, 2)} = -\frac{1}{4} \Rightarrow$ the tangent line is $y - 2 = -\frac{1}{4}(x - 1) = -\frac{1}{4}x + \frac{9}{4}$ and the normal line is $y = 2 + 4(x - 1) = 4x - 2$.

112. $e^x + y^2 = 2 \Rightarrow \frac{d}{dx}(e^x + y^2) = \frac{d}{dx}(2) \Rightarrow e^x + 2y \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = -\frac{e^x}{2y} \Rightarrow m_{\tan} = \frac{dy}{dx}\Big|_{(0,1)} = -\frac{e^0}{2(1)} = -\frac{1}{2};$

$m_{\perp} = -\frac{1}{m_{\tan}} = 2; \text{ tangent line: } y - 1 = -\frac{1}{2}(x - 0) \Rightarrow y = 1 - \frac{x}{2}; \text{ normal line: } y - 1 = 2(x - 0) \Rightarrow y = 2x + 1$

113. $xy + 2x - 5y = 2 \Rightarrow \left(x \frac{dy}{dx} + y\right) + 2 - 5 \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx}(x - 5) = -y - 2 \Rightarrow \frac{dy}{dx} = \frac{-y - 2}{x - 5} \Rightarrow \frac{dy}{dx}\Big|_{(3,2)} = 2 \Rightarrow \text{the tangent line is } y = 2 + 2(x - 3) = 2x - 4 \text{ and the normal line is } y = 2 + \frac{-1}{2}(x - 3) = -\frac{1}{2}x + \frac{7}{2}.$

114. $(y - x)^2 = 2x + 4 \Rightarrow 2(y - x)\left(\frac{dy}{dx} - 1\right) = 2 \Rightarrow (y - x) \frac{dy}{dx} = 1 + (y - x) \Rightarrow \frac{dy}{dx} = \frac{1 + y - x}{y - x} \Rightarrow \frac{dy}{dx}\Big|_{(6,2)} = \frac{3}{4} \Rightarrow \text{the tangent line is } y = 2 + \frac{3}{4}(x - 6) = \frac{3}{4}x - \frac{5}{2} \text{ and the normal line is } y = 2 - \frac{4}{3}(x - 6) = -\frac{4}{3}x + 10.$

115. $x + \sqrt{xy} = 6 \Rightarrow 1 + \frac{1}{2\sqrt{xy}}\left(x \frac{dy}{dx} + y\right) = 0 \Rightarrow x \frac{dy}{dx} + y = -2\sqrt{xy} \Rightarrow \frac{dy}{dx} = \frac{-2\sqrt{xy} - y}{x} \Rightarrow \frac{dy}{dx}\Big|_{(4,1)} = \frac{-5}{4} \Rightarrow \text{the tangent line is } y = 1 - \frac{5}{4}(x - 4) = -\frac{5}{4}x + 6 \text{ and the normal line is } y = 1 + \frac{4}{5}(x - 4) = \frac{4}{5}x - \frac{11}{5}.$

116. $x^{3/2} + 2y^{3/2} = 17 \Rightarrow \frac{3}{2}x^{1/2} + 3y^{1/2} \cdot \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = \frac{-x^{1/2}}{2y^{1/2}} \Rightarrow \frac{dy}{dx}\Big|_{(1,4)} = -\frac{1}{4} \Rightarrow \text{the tangent line is } y = 4 - \frac{1}{4}(x - 1) = -\frac{1}{4}x + \frac{17}{4} \text{ and the normal line is } y = 4 + 4(x - 1) = 4x.$

117. $x^3y^3 + y^2 = x + y \Rightarrow \left[x^3\left(3y^2 \frac{dy}{dx}\right) + y^3(3x^2)\right] + 2y \frac{dy}{dx} = 1 + \frac{dy}{dx} \Rightarrow 3x^3y^2 \frac{dy}{dx} + 2y \frac{dy}{dx} - \frac{dy}{dx} = 1 - 3x^2y^3$
 $\Rightarrow \frac{dy}{dx}(3x^3y^2 + 2y - 1) = 1 - 3x^2y^3 \Rightarrow \frac{dy}{dx} = \frac{1 - 3x^2y^3}{3x^3y^2 + 2y - 1} \Rightarrow \frac{dy}{dx}\Big|_{(1,1)} = -\frac{2}{4}, \text{ but } \frac{dy}{dx}\Big|_{(1,-1)} \text{ is undefined. Therefore, the curve has slope } -\frac{1}{2} \text{ at } (1, 1) \text{ but the slope is undefined at } (1, -1).$

118. $y = \sin(x - \sin x) \Rightarrow \frac{dy}{dx} = [\cos(x - \sin x)](1 - \cos x); y = 0 \Rightarrow \sin(x - \sin x) = 0 \Rightarrow x - \sin x = k\pi, k = -2, -1, 0, 1, 2$
 (for our interval) $\Rightarrow \cos(x - \sin x) = \cos(k\pi) = \pm 1$. Therefore, $\frac{dy}{dx} = 0$ and $y = 0$ when $1 - \cos x = 0$ and $x = k\pi$.
 For $-2\pi \leq x \leq 2\pi$, these equations hold when $k = -2, 0, \text{ and } 2$ (since $\cos(-\pi) = \cos \pi = -1$.) Thus the curve has horizontal tangents at the x -axis for the x -values $-2\pi, 0, \text{ and } 2\pi$ (which are even integer multiples of π) \Rightarrow the curve has an infinite number of horizontal tangents.

119. $B = \text{graph of } f, A = \text{graph of } f'$. Curve B cannot be the derivative of A because A has only negative slopes while some of B 's values are positive.

120. $A = \text{graph of } f, B = \text{graph of } f'$. Curve A cannot be the derivative of B because B has only negative slopes while A has positive values for $x > 0$.

 (a) h constant $\Rightarrow \frac{dh}{dt} = 0 \Rightarrow \frac{dS}{dt} = \frac{\pi r^2 \frac{dr}{dt}}{\sqrt{r^2 + h^2}} + \pi \sqrt{r^2 + h^2} \frac{dr}{dt} = \left[\pi \sqrt{r^2 + h^2} + \frac{\pi r^2}{\sqrt{r^2 + h^2}}\right] \frac{dr}{dt}$
 (b) r constant $\Rightarrow \frac{dr}{dt} = 0 \Rightarrow \frac{dS}{dt} = \frac{\pi r h}{\sqrt{r^2 + h^2}} \frac{dh}{dt}$
 (c) In general, $\frac{dS}{dt} = \left[\pi \sqrt{r^2 + h^2} + \frac{\pi r^2}{\sqrt{r^2 + h^2}}\right] \frac{dr}{dt} + \frac{\pi r h}{\sqrt{r^2 + h^2}} \frac{dh}{dt}$
143. $A = \pi r^2 \Rightarrow \frac{dA}{dt} = 2\pi r \frac{dr}{dt}$; so $r = 10$ and $\frac{dr}{dt} = -\frac{2}{\pi}$ m/sec $\Rightarrow \frac{dA}{dt} = (2\pi)(10)\left(-\frac{2}{\pi}\right) = -40$ m²/sec
144. $V = s^3 \Rightarrow \frac{dV}{dt} = 3s^2 \cdot \frac{ds}{dt} \Rightarrow \frac{ds}{dt} = \frac{1}{3s^2} \frac{dV}{dt}$; so $s = 20$ and $\frac{dV}{dt} = 1200$ cm³/min $\Rightarrow \frac{ds}{dt} = \frac{1}{30(20)^2} (1200) = 1$ cm/min
145. $\frac{dR_1}{dt} = -1$ ohm/sec, $\frac{dR_2}{dt} = 0.5$ ohm/sec; and $\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2} \Rightarrow \frac{-1}{R^2} \frac{dR}{dt} = \frac{-1}{R_1^2} \frac{dR_1}{dt} - \frac{1}{R_2^2} \frac{dR_2}{dt}$. Also, $R_1 = 75$ ohms and $R_2 = 50$ ohms $\Rightarrow \frac{1}{R} = \frac{1}{75} + \frac{1}{50} \Rightarrow R = 30$ ohms. Therefore, from the derivative equation,
 $\frac{-1}{(30)^2} \frac{dR}{dt} = \frac{-1}{(75)^2} (-1) - \frac{1}{(50)^2} (0.5) = \left(\frac{1}{5625} - \frac{1}{5000}\right) \Rightarrow \frac{dR}{dt} = (-900) \left(\frac{5000 - 5625}{5625 \cdot 5000}\right) = \frac{9(625)}{50(5625)} = \frac{1}{50} = 0.02$ ohm/sec.
146. $\frac{dR}{dt} = 3$ ohms/sec and $\frac{dX}{dt} = -2$ ohms/sec; $Z = \sqrt{R^2 + X^2} \Rightarrow \frac{dZ}{dt} = \frac{R \frac{dR}{dt} + X \frac{dX}{dt}}{\sqrt{R^2 + X^2}}$ so that $R = 10$ ohms and $X = 20$ ohms $\Rightarrow \frac{dZ}{dt} = \frac{(10)(3) + (20)(-2)}{\sqrt{10^2 + 20^2}} = \frac{-1}{\sqrt{5}} \approx -0.45$ ohm/sec.

147. Given $\frac{dx}{dt} = 10$ m/sec and $\frac{dy}{dt} = 5$ m/sec, let D be the distance from the origin $\Rightarrow D^2 = x^2 + y^2$
 $\Rightarrow 2D \frac{dD}{dt} = 2x \frac{dx}{dt} + 2y \frac{dy}{dt} \Rightarrow D \frac{dD}{dt} = x \frac{dx}{dt} + y \frac{dy}{dt}$. When $(x, y) = (3, -4)$, $D = \sqrt{3^2 + (-4)^2} = 5$ and
 $5 \frac{dD}{dt} = (3)(10) + (-4)(5) \Rightarrow \frac{dD}{dt} = \frac{10}{5} = 2$. Therefore, the particle is moving away from the origin at 2 m/sec
 (because the distance D is increasing).

148. Let D be the distance from the origin. We are given that $\frac{dD}{dt} = 11$ units/sec. Then $D^2 = x^2 + y^2 = x^2 + (x^{3/2})^2$
 $= x^2 + x^3 \Rightarrow 2D \frac{dD}{dt} = 2x \frac{dx}{dt} + 3x^2 \frac{dx}{dt} = x(2 + 3x) \frac{dx}{dt}$; $x = 3 \Rightarrow D = \sqrt{3^2 + 3^3} = 6$ and substitution in the derivative
 equation gives $(2)(6)(11) = (3)(2 + 9) \frac{dx}{dt} \Rightarrow \frac{dx}{dt} = 4$ units/sec.

149. (a) From the diagram we have $\frac{10}{h} = \frac{4}{r} \Rightarrow r = \frac{2}{5} h$.

(b) $V = \frac{1}{3} \pi r^2 h = \frac{1}{3} \pi \left(\frac{2}{5} h\right)^2 h = \frac{4\pi h^3}{75} \Rightarrow \frac{dV}{dt} = \frac{4\pi h^2}{25} \frac{dh}{dt}$, so $\frac{dV}{dt} = -5$ and $h = 6 \Rightarrow \frac{dh}{dt} = -\frac{125}{144\pi}$ ft/min.

150. From the sketch in the text, $s = r\theta \Rightarrow \frac{ds}{dt} = r \frac{d\theta}{dt} + \theta \frac{dr}{dt}$. Also $r = 1.2$ is constant $\Rightarrow \frac{dr}{dt} = 0 \Rightarrow \frac{ds}{dt} = r \frac{d\theta}{dt} = (1.2) \frac{d\theta}{dt}$.
 Therefore, $\frac{ds}{dt} = 6$ ft/sec and $r = 1.2$ ft $\Rightarrow \frac{d\theta}{dt} = 5$ rad/sec

151. (a) From the sketch in the text, $\frac{d\theta}{dt} = -0.6$ rad/sec and $x = \tan \theta$. Also $x = \tan \theta \Rightarrow \frac{dx}{dt} = \sec^2 \theta \frac{d\theta}{dt}$; at point A ,
 $x = 0 \Rightarrow \theta = 0 \Rightarrow \frac{dx}{dt} = (\sec^2 0)(-0.6) = -0.6$. Therefore the speed of the light is $0.6 = \frac{3}{5}$ km/sec when it
 reaches point A .

(b) $\frac{(3/5) \text{ rad}}{\text{sec}} \cdot \frac{1 \text{ rev}}{2\pi \text{ rad}} \cdot \frac{60 \text{ sec}}{\text{min}} = \frac{18}{\pi}$ revs/min

152. From the figure, $\frac{a}{r} = \frac{b}{BC} \Rightarrow \frac{a}{r} = \frac{b}{\sqrt{b^2 - r^2}}$. We are given
 that r is constant. Differentiation gives,

$\frac{1}{r} \cdot \frac{da}{dt} = \frac{(\sqrt{b^2 - r^2}) \left(\frac{db}{dt}\right) - (b) \left(\frac{b}{\sqrt{b^2 - r^2}}\right) \left(\frac{db}{dt}\right)}{b^2 - r^2}$. Then, $b = 2r$ and

$$\frac{db}{dt} = -0.3r \Rightarrow \frac{da}{dt} = r \left[\frac{\sqrt{(2r)^2 - r^2} (-0.3r) - (2r) \left(\frac{2r(-0.3r)}{\sqrt{(2r)^2 - r^2}}\right)}{(2r)^2 - r^2} \right]$$

$= \frac{\sqrt{3r^2} (-0.3r) + \frac{4r^2(0.3r)}{\sqrt{3r^2}}}{3r} = \frac{(3r^2)(-0.3r) + (4r^2)(0.3r)}{3\sqrt{3r^2}} = \frac{0.3r}{3\sqrt{3}} = \frac{r}{10\sqrt{3}}$ m/sec. Since $\frac{da}{dt}$ is positive, the distance OA is
 increasing when $OB = 2r$, and B is moving toward O at the rate of $0.3r$ m/sec.

153. (a) If $f(x) = \tan x$ and $x = -\frac{\pi}{4}$, then $f'(x) = \sec^2 x$,
 $f\left(-\frac{\pi}{4}\right) = -1$ and $f'\left(-\frac{\pi}{4}\right) = 2$. The linearization of
 $f(x)$ is $L(x) = 2\left(x + \frac{\pi}{4}\right) + (-1) = 2x + \frac{\pi-2}{2}$.

- (b) if $f(x) = \sec x$ and $x = -\frac{\pi}{4}$, then $f'(x) = \sec x \tan x$,
 $f\left(-\frac{\pi}{4}\right) = \sqrt{2}$ and $f'\left(-\frac{\pi}{4}\right) = -\sqrt{2}$. The linearization of
 $f(x)$ is $L(x) = -\sqrt{2}\left(x + \frac{\pi}{4}\right) + \sqrt{2} = -\sqrt{2}x + \frac{\sqrt{2}(4-\pi)}{4}$.

154. $f(x) = \frac{1}{1+\tan x} \Rightarrow f'(x) = \frac{-\sec^2 x}{(1+\tan x)^2}$. The linearization at $x = 0$ is $L(x) = f'(0)(x-0) + f(0) = 1-x$.
155. $f(x) = \sqrt{x+1} + \sin x - 0.5 = (x+1)^{1/2} + \sin x - 0.5 \Rightarrow f'(x) = \left(\frac{1}{2}\right)(x+1)^{-1/2} + \cos x$
 $\Rightarrow L(x) = f'(0)(x-0) + f(0) = 1.5(x-0) + 0.5 \Rightarrow L(x) = 1.5x + 0.5$, the linearization of $f(x)$.
156. $f(x) = \frac{2}{1-x} + \sqrt{1+x} - 3.1 = 2(1-x)^{-1} + (x+1)^{1/2} - 3.1 \Rightarrow f'(x) = -2(1-x)^{-2}(-1) + \left(\frac{1}{2}\right)(x+1)^{-1/2}$
 $= \frac{2}{(1-x)^2} + \frac{1}{2\sqrt{1+x}} \Rightarrow L(x) = f'(0)(x-0) + f(0) = 2.5x - 0.1$, the linearization of $f(x)$.
157. $S = \pi r \sqrt{r^2 + h^2}$, r constant $\Rightarrow dS = \pi r \cdot \frac{1}{2}(r^2 + h^2)^{-1/2} 2h dh = \frac{\pi r h}{\sqrt{r^2 + h^2}} dh$. Height changes from
 h_0 to $h_0 + dh \Rightarrow dS = \frac{\pi r h_0 (dh)}{\sqrt{r^2 + h_0^2}}$
158. (a) $S = 6r^2 \Rightarrow dS = 12r dr$. We want $|dS| \leq (2\%) S \Rightarrow |12r dr| \leq \frac{12r^2}{100} \Rightarrow |dr| \leq \frac{r}{100}$. The measurement of the
edge r must have an error less than 1%.
- (b) When $V = r^3$, then $dV = 3r^2 dr$. The accuracy of the volume is $\left(\frac{dV}{V}\right)(100\%) = \left(\frac{3r^2 dr}{r^3}\right)(100\%)$
 $= \left(\frac{3}{r}\right)(dr)(100\%) = \left(\frac{3}{r}\right)\left(\frac{r}{100}\right)(100\%) = 3\%$
159. $C = 2\pi r \Rightarrow r = \frac{C}{2\pi}$, $S = 4\pi r^2 = \frac{C^2}{\pi}$, and $V = \frac{4}{3}\pi r^3 = \frac{C^3}{6\pi^2}$. It also follows that $dr = \frac{1}{2\pi} dC$, $dS = \frac{2C}{\pi} dC$ and
 $dV = \frac{C^2}{2\pi^2} dC$. Recall that $C = 10$ cm and $dC = 0.4$ cm.
- (a) $dr = \frac{0.4}{2\pi} = \frac{0.2}{\pi}$ cm $\Rightarrow \left(\frac{dr}{r}\right)(100\%) = \left(\frac{0.2}{\pi}\right)\left(\frac{2\pi}{10}\right)(100\%) = (0.4)(100\%) = 4\%$
- (b) $dS = \frac{20}{\pi}(0.4) = \frac{8}{\pi}$ cm $\Rightarrow \left(\frac{dS}{S}\right)(100\%) = \left(\frac{8}{\pi}\right)\left(\frac{\pi}{100}\right)(100\%) = 8\%$
- (c) $dV = \frac{10^2}{2\pi^2}(0.4) = \frac{20}{\pi^2}$ cm $\Rightarrow \left(\frac{dV}{V}\right)(100\%) = \left(\frac{20}{\pi^2}\right)\left(\frac{6\pi^2}{1000}\right)(100\%) = 12\%$
160. Similar triangles yield $\frac{35}{h} = \frac{15}{6} \Rightarrow h = 14$ ft. The same triangles imply that $\frac{20+a}{h} = \frac{a}{6} \Rightarrow h = 120a^{-1} + 6$
 $\Rightarrow dh = -120a^{-2} da = -\frac{120}{a^2} da = \left(-\frac{120}{a^2}\right)\left(\pm\frac{1}{12}\right) = \left(-\frac{120}{15^2}\right)\left(\pm\frac{1}{12}\right) = \pm\frac{2}{45} \approx \pm 0.0444$ ft $= \pm 0.53$ inches.

CHAPTER 3 ADDITIONAL AND ADVANCED EXERCISES

1. (a) $\sin 2\theta = 2 \sin \theta \cos \theta \Rightarrow \frac{d}{d\theta}(\sin 2\theta) = \frac{d}{d\theta}(2 \sin \theta \cos \theta) \Rightarrow 2 \cos 2\theta = 2[(\sin \theta)(-\sin \theta) + (\cos \theta)(\cos \theta)]$
 $\Rightarrow \cos 2\theta = \cos^2 \theta - \sin^2 \theta$
- (b) $\cos 2\theta = \cos^2 \theta - \sin^2 \theta \Rightarrow \frac{d}{d\theta}(\cos 2\theta) = \frac{d}{d\theta}(\cos^2 \theta - \sin^2 \theta)$
 $\Rightarrow -2 \sin 2\theta = (2 \cos \theta)(-\sin \theta) - (2 \sin \theta)(\cos \theta)$
 $\Rightarrow \sin 2\theta = \cos \theta \sin \theta + \sin \theta \cos \theta \Rightarrow \sin 2\theta = 2 \sin \theta \cos \theta$
2. The derivative of $\sin(x+a) = \sin x \cos a + \cos x \sin a$ with respect to x is $\cos(x+a) = \cos x \cos a - \sin x \sin a$, which is also an identity. This principle does not apply to the equation $x^2 - 2x - 8 = 0$, since $x^2 - 2x - 8 = 0$ is not an identity: it holds for 2 values of x (-2 and 4), but not for all x .
3. (a) $f(x) = \cos x \Rightarrow f'(x) = -\sin x \Rightarrow f''(x) = -\cos x$, and $g(x) = a + bx + cx^2 \Rightarrow g'(x) = b + 2cx \Rightarrow g''(x) = 2c$; also, $f(0) = g(0) \Rightarrow \cos(0) = a \Rightarrow a = 1$; $f'(0) = g'(0) \Rightarrow -\sin(0) = b \Rightarrow b = 0$; $f''(0) = g''(0) \Rightarrow -\cos(0) = 2c \Rightarrow c = -\frac{1}{2}$. Therefore, $g(x) = 1 - \frac{1}{2}x^2$.
- (b) $f(x) = \sin(x+a) \Rightarrow f'(x) = \cos(x+a)$, and $g(x) = b \sin x + c \cos x \Rightarrow g'(x) = b \cos x - c \sin x$; also $f(0) = g(0) \Rightarrow \sin(a) = b \sin(0) + c \cos(0) \Rightarrow c = \sin a$; $f'(0) = g'(0) \Rightarrow \cos(a) = b \cos(0) - c \sin(0) \Rightarrow b = \cos a$. Therefore, $g(x) = \sin x \cos a + \cos x \sin a$.
- (c) When $f(x) = \cos x$, $f'''(x) = \sin x$ and $f^{(4)}(x) = \cos x$; when $g(x) = 1 - \frac{1}{2}x^2$, $g'''(x) = 0$ and $g^{(4)}(x) = 0$. Thus $f'''(0) = 0 = g'''(0)$ so the third derivatives agree at $x = 0$. However, the fourth derivatives do not agree since $f^{(4)}(0) = 1$ but $g^{(4)}(0) = 0$. In case (b), when $f(x) = \sin(x+a)$ and $g(x) = \sin x \cos a + \cos x \sin a$, notice that $f(x) = g(x)$ for all x , not just $x = 0$. Since this is an identity, we have $f^{(n)}(x) = g^{(n)}(x)$ for any x and any positive integer n .
4. (a) $y = \sin x \Rightarrow y' = \cos x \Rightarrow y'' = -\sin x \Rightarrow y'' + y = -\sin x + \sin x = 0$; $y = \cos x \Rightarrow y' = -\sin x \Rightarrow y'' = -\cos x \Rightarrow y'' + y = -\cos x + \cos x = 0$; $y = a \cos x + b \sin x \Rightarrow y' = -a \sin x + b \cos x \Rightarrow y'' = -a \cos x - b \sin x \Rightarrow y'' + y = (-a \cos x - b \sin x) + (a \cos x + b \sin x) = 0$
- (b) $y = \sin(2x) \Rightarrow y' = 2 \cos(2x) \Rightarrow y'' = -4 \sin(2x) \Rightarrow y'' + 4y = -4 \sin(2x) + 4 \sin(2x) = 0$. Similarly, $y = \cos(2x)$ and $y = a \cos(2x) + b \sin(2x)$ satisfy the differential equation $y'' + 4y = 0$. In general, $y = \cos(mx)$, $y = \sin(mx)$ and $y = a \cos(mx) + b \sin(mx)$ satisfy the differential equation $y'' + m^2 y = 0$.
5. If the circle $(x-h)^2 + (y-k)^2 = a^2$ and $y = x^2 + 1$ are tangent at $(1, 2)$, then the slope of this tangent is $m = 2x|_{(1,2)} = 2$ and the tangent line is $y = 2x$. The line containing (h, k) and $(1, 2)$ is perpendicular to $y = 2x \Rightarrow \frac{k-2}{h-1} = -\frac{1}{2} \Rightarrow h = 5 - 2k \Rightarrow$ the location of the center is $(5 - 2k, k)$. Also, $(x-h)^2 + (y-k)^2 = a^2 \Rightarrow x-h + (y-k)y' = 0 \Rightarrow 1 + (y')^2 + (y-k)y'' = 0 \Rightarrow y'' = \frac{1+(y')^2}{k-y}$. At the point $(1, 2)$ we know $y' = 2$ from the tangent line and that $y'' = 2$ from the parabola. Since the second derivatives are equal at $(1, 2)$ we obtain $2 = \frac{1+(2)^2}{k-2} \Rightarrow k = \frac{9}{2}$. Then $h = 5 - 2k = -4 \Rightarrow$ the circle is $(x+4)^2 + (y-\frac{9}{2})^2 = a^2$. Since $(1, 2)$ lies on the circle we have that $a = \frac{5\sqrt{5}}{2}$.
6. The total revenue is the number of people times the price of the fare: $r(x) = xp = x\left(3 - \frac{x}{40}\right)^2$, where $0 \leq x \leq 60$. The marginal revenue is $\frac{dr}{dx} = \left(3 - \frac{x}{40}\right)^2 + 2x\left(3 - \frac{x}{40}\right)\left(-\frac{1}{40}\right) \Rightarrow \frac{dr}{dx} = \left(3 - \frac{x}{40}\right)\left[\left(3 - \frac{x}{40}\right) - \frac{2x}{40}\right] = 3\left(3 - \frac{x}{40}\right)\left(1 - \frac{x}{40}\right)$. Then $\frac{dr}{dx} = 0 \Rightarrow x = 40$ (since $x = 120$ does not belong to the domain). When 40 people are on the bus the marginal revenue is zero and the fare is $p(40) = \left(3 - \frac{x}{40}\right)^2 \Big|_{(x=40)} = \4.00 .

7. (a) $y = uv \Rightarrow \frac{dy}{dt} = \frac{du}{dt}v + u\frac{dv}{dt} = (0.04u)v + u(0.05v) = 0.09uv = 0.09y \Rightarrow$ the rate of growth of the total production is 9% per year.
 (b) If $\frac{du}{dt} = -0.02u$ and $\frac{dv}{dt} = 0.03v$, then $\frac{dy}{dt} = (-0.02u)v + (0.03v)u = 0.01uv = 0.01y$, increasing at 1% per year.

8. When $x^2 + y^2 = 225$, then $y' = -\frac{x}{y}$. The tangent line to the balloon at $(12, -9)$ is $y + 9 = \frac{4}{3}(x - 12)$
 $\Rightarrow y = \frac{4}{3}x - 25$. The top of the gondola is $15 + 8 = 23$ ft below the center of the balloon. The intersection of $y = -23$ and $y = \frac{4}{3}x - 25$ is at the far right edge of the gondola $\Rightarrow -23 = \frac{4}{3}x - 25 \Rightarrow x = \frac{3}{2}$. Thus the gondola is $2x = 3$ ft wide.

9. Answers will vary. Here is one possibility.

10. $s(t) = 10 \cos\left(t + \frac{\pi}{4}\right) \Rightarrow v(t) = \frac{ds}{dt} = -10 \sin\left(t + \frac{\pi}{4}\right) \Rightarrow a(t) = \frac{dv}{dt} = \frac{d^2s}{dt^2} = -10 \cos\left(t + \frac{\pi}{4}\right)$
 (a) $s(0) = 10 \cos\left(\frac{\pi}{4}\right) = \frac{10}{\sqrt{2}}$
 (b) Left: -10 , Right: 10
 (c) Solving $10 \cos\left(t + \frac{\pi}{4}\right) = -10 \Rightarrow \cos\left(t + \frac{\pi}{4}\right) = -1 \Rightarrow t = \frac{3\pi}{4}$ when the particle is farthest to the left. Solving $10 \cos\left(t + \frac{\pi}{4}\right) = 10 \Rightarrow \cos\left(t + \frac{\pi}{4}\right) = 1 \Rightarrow t = -\frac{\pi}{4}$, but $t \geq 0 \Rightarrow t = 2\pi + \frac{-\pi}{4} = \frac{7\pi}{4}$ when the particle is farthest to the right. Thus, $v\left(\frac{3\pi}{4}\right) = 0$, $v\left(\frac{7\pi}{4}\right) = 0$, $a\left(\frac{3\pi}{4}\right) = 10$, and $a\left(\frac{7\pi}{4}\right) = -10$.
 (d) Solving $10 \cos\left(t + \frac{\pi}{4}\right) = 0 \Rightarrow t = \frac{\pi}{4} \Rightarrow v\left(\frac{\pi}{4}\right) = -10$, $\left|v\left(\frac{\pi}{4}\right)\right| = 10$ and $a\left(\frac{\pi}{4}\right) = 0$.
11. (a) $s(t) = 64t - 16t^2 \Rightarrow v(t) = \frac{ds}{dt} = 64 - 32t = 32(2 - t)$. The maximum height is reached when $v(t) = 0 \Rightarrow t = 2$ sec. The velocity when it leaves the hand is $v(0) = 64$ ft/sec.
 (b) $s(t) = 64t - 2.6t^2 \Rightarrow v(t) = \frac{ds}{dt} = 64 - 5.2t$. The maximum height is reached when $v(t) = 0 \Rightarrow t \approx 12.31$ sec. The maximum height is about $s(12.31) = 393.85$ ft.
12. $s_1 = 3t^3 - 12t^2 + 18t + 5$ and $s_2 = -t^3 + 9t^2 - 12t \Rightarrow v_1 = 9t^2 - 24t + 18$ and $v_2 = -3t^2 + 18t - 12$; $v_1 = v_2 \Rightarrow 9t^2 - 24t + 18 = -3t^2 + 18t - 12 \Rightarrow 2t^2 - 7t + 5 = 0 \Rightarrow (t - 1)(2t - 5) = 0 \Rightarrow t = 1$ sec and $t = 2.5$ sec.
13. $m(v^2 - v_0^2) = k(x_0^2 - x^2) \Rightarrow m\left(2v\frac{dv}{dt}\right) = k\left(-2x\frac{dx}{dt}\right) \Rightarrow m\frac{dv}{dt} = k\left(-\frac{2x}{2v}\right)\frac{dx}{dt} \Rightarrow m\frac{dv}{dt} = -kx\left(\frac{1}{v}\right)\frac{dx}{dt}$. Then substituting $\frac{dx}{dt} = v \Rightarrow m\frac{dv}{dt} = -kx$, as claimed.
14. (a) $x = At^2 + Bt + C$ on $[t_1, t_2] \Rightarrow v = \frac{dx}{dt} = 2At + B \Rightarrow v\left(\frac{t_1+t_2}{2}\right) = 2A\left(\frac{t_1+t_2}{2}\right) + B = A(t_1 + t_2) + B$ is the instantaneous velocity at the midpoint. The average velocity over the time interval is $v_{av} = \frac{\Delta x}{\Delta t} = \frac{(At_2^2 + Bt_2 + C) - (At_1^2 + Bt_1 + C)}{t_2 - t_1} = \frac{(t_2 - t_1)[A(t_2 + t_1) + B]}{t_2 - t_1} = A(t_2 + t_1) + B$.

- (b) On the graph of the parabola $x = At^2 + Bt + C$, the slope of the curve at the midpoint of the interval $[t_1, t_2]$ is the same as the average slope of the curve over the interval.
15. (a) To be continuous at $x = \pi$ requires that $\lim_{x \rightarrow \pi^-} \sin x = \lim_{x \rightarrow \pi^+} (mx + b) \Rightarrow 0 = m\pi + b \Rightarrow m = -\frac{b}{\pi}$;
- (b) If $y' = \begin{cases} \cos x, & x < \pi \\ m, & x \geq \pi \end{cases}$ is differentiable at $x = \pi$, then $\lim_{x \rightarrow \pi^-} \cos x = m \Rightarrow m = -1$ and $b = \pi$.
16. $f(x)$ is continuous at 0 because $\lim_{x \rightarrow 0} \frac{1 - \cos x}{x} = 0 = f(0)$. $f'(0) = \lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0} \frac{1 - \cos x - 0}{x}$
 $= \lim_{x \rightarrow 0} \left(\frac{1 - \cos x}{x^2} \right) \left(\frac{1 + \cos x}{1 + \cos x} \right) = \lim_{x \rightarrow 0} \left(\frac{\sin x}{x} \right)^2 \left(\frac{1}{1 + \cos x} \right) = \frac{1}{2}$. Therefore $f'(0)$ exists with value $\frac{1}{2}$.
17. (a) For all a, b and for all $x \neq 2$, f is differentiable at x . Next, f differentiable at $x = 2 \Rightarrow f$ continuous at $x = 2 \Rightarrow \lim_{x \rightarrow 2^-} f(x) = f(2) \Rightarrow 2a = 4a - 2b + 3 \Rightarrow 2a - 2b + 3 = 0$. Also, f differentiable at $x \neq 2$
 $\Rightarrow f'(x) = \begin{cases} a, & x < 2 \\ 2ax - b, & x > 2 \end{cases}$. In order that $f'(2)$ exist we must have $a = 2a(2) - b \Rightarrow a = 4a - b \Rightarrow 3a = b$.
Then $2a - 2b + 3 = 0$ and $3a = b \Rightarrow a = \frac{3}{4}$ and $b = \frac{9}{4}$.
- (b) For $x < 2$, the graph of f is a straight line having a slope of $\frac{3}{4}$ and passing through the origin; for $x \geq 2$, the graph of f is a parabola. At $x = 2$, the value of the y -coordinate on the parabola is $\frac{3}{2}$ which matches the y -coordinate of the point on the straight line at $x = 2$. In addition, the slope of the parabola at the match up point is $\frac{3}{4}$ which is equal to the slope of the straight line. Therefore, since the graph is differentiable at the match up point, the graph is smooth there.
18. (a) For any a, b and for any $x \neq -1$, g is differentiable at x . Next, g differentiable at $x = -1 \Rightarrow g$ continuous at $x = -1 \Rightarrow \lim_{x \rightarrow -1^+} g(x) = g(-1) \Rightarrow -a - 1 + 2b = -a + b \Rightarrow b = 1$. Also, g differentiable at $x \neq -1$
 $\Rightarrow g'(x) = \begin{cases} a, & x < -1 \\ 3ax^2 + 1, & x > -1 \end{cases}$. In order that $g'(-1)$ exist we must have $a = 3a(-1)^2 + 1 \Rightarrow a = 3a + 1 \Rightarrow a = -\frac{1}{2}$.
- (b) For $x \leq -1$, the graph of g is a straight line having a slope of $-\frac{1}{2}$ and a y -intercept of 1. For $x > -1$, the graph of g is a cubic. At $x = -1$, the value of the y -coordinate on the cubic is $\frac{3}{2}$ which matches the y -coordinate of the point on the straight line at $x = -1$. In addition, the slope of the cubic at the match up point is $-\frac{1}{2}$ which is equal to the slope of the straight line. Therefore, since the graph is differentiable at the match up point, the graph is smooth there.
19. f odd $\Rightarrow f(-x) = -f(x) \Rightarrow \frac{d}{dx}(f(-x)) = \frac{d}{dx}(-f(x)) \Rightarrow f'(-x)(-1) = -f'(x) \Rightarrow f'(-x) = f'(x) \Rightarrow f'$ is even.
20. f even $\Rightarrow f(-x) = f(x) \Rightarrow \frac{d}{dx}(f(-x)) = \frac{d}{dx}(f(x)) \Rightarrow f'(-x)(-1) = f'(x) \Rightarrow f'(-x) = -f'(x) \Rightarrow f'$ is odd.
21. Let $h(x) = (fg)(x) = f(x)g(x) \Rightarrow h'(x) = \lim_{x \rightarrow x_0} \frac{h(x) - h(x_0)}{x - x_0} = \lim_{x \rightarrow x_0} \frac{f(x)g(x) - f(x_0)g(x_0)}{x - x_0} =$
 $\lim_{x \rightarrow x_0} \frac{f(x)g(x) - f(x)g(x_0) + f(x)g(x_0) - f(x_0)g(x_0)}{x - x_0} = \lim_{x \rightarrow x_0} \left[f(x) \left[\frac{g(x) - g(x_0)}{x - x_0} \right] \right] + \lim_{x \rightarrow x_0} \left[g(x_0) \left[\frac{f(x) - f(x_0)}{x - x_0} \right] \right]$
 $= f(x_0) \lim_{x \rightarrow x_0} \left[\frac{g(x) - g(x_0)}{x - x_0} \right] + g(x_0) f'(x_0) = 0 \cdot \lim_{x \rightarrow x_0} \left[\frac{g(x) - g(x_0)}{x - x_0} \right] + g(x_0) f'(x_0) = g(x_0) f'(x_0)$, if g is continuous at x_0 . Therefore $(fg)(x)$ is differentiable at x_0 if $f(x_0) = 0$, and $(fg)'(x_0) = g(x_0) f'(x_0)$.

22. From Exercise 21 we have that fg is differentiable at 0 if f is differentiable at 0, $f(0) = 0$ and g is continuous at 0.
- (a) If $f(x) = \sin x$ and $g(x) = |x|$, then $|x| \sin x$ is differentiable because $f'(0) = \cos(0) = 1$, $f(0) = \sin(0) = 0$ and $g(x) = |x|$ is continuous at $x = 0$.
- (b) If $f(x) = \sin x$ and $g(x) = x^{2/3}$, then $x^{2/3} \sin x$ is differentiable because $f'(0) = \cos(0) = 1$, $f(0) = \sin(0) = 0$ and $g(x) = x^{2/3}$ is continuous at $x = 0$.
- (c) If $f(x) = 1 - \cos x$ and $g(x) = \sqrt[3]{x}$, then $\sqrt[3]{x}(1 - \cos x)$ is differentiable because $f'(0) = \sin(0) = 0$, $f(0) = 1 - \cos(0) = 0$ and $g(x) = x^{1/3}$ is continuous at $x = 0$.
- (d) If $f(x) = x$ and $g(x) = x \sin\left(\frac{1}{x}\right)$, then $x^2 \sin\left(\frac{1}{x}\right)$ is differentiable because $f'(0) = 1$, $f(0) = 0$ and

$$\lim_{x \rightarrow 0} x \sin\left(\frac{1}{x}\right) = \lim_{x \rightarrow 0} \frac{\sin\left(\frac{1}{x}\right)}{\frac{1}{x}} = \lim_{x \rightarrow \infty} \frac{\sin t}{t} = 0 \text{ (so } g \text{ is continuous at } x = 0 \text{)}.$$

23. If $f(x) = x$ and $g(x) = x \sin\left(\frac{1}{x}\right)$, then $x^2 \sin\left(\frac{1}{x}\right)$ is differentiable at $x = 0$ because $f'(0) = 1$, $f(0) = 0$ and

$$\lim_{x \rightarrow 0} x \sin\left(\frac{1}{x}\right) = \lim_{x \rightarrow 0} \frac{\sin\left(\frac{1}{x}\right)}{\frac{1}{x}} = \lim_{t \rightarrow \infty} \frac{\sin t}{t} = 0 \text{ (so } g \text{ is continuous at } x = 0 \text{)}. \text{ In fact, from Exercise 21,}$$

$$h'(0) = g(0)f'(0) = 0. \text{ However, for } x \neq 0, h'(x) = \left[x^2 \cos\left(\frac{1}{x}\right)\right] \left(-\frac{1}{x^2}\right) + 2x \sin\left(\frac{1}{x}\right). \text{ But}$$

$$\lim_{x \rightarrow 0} h'(x) = \lim_{x \rightarrow 0} \left[-\cos\left(\frac{1}{x}\right) + 2x \sin\left(\frac{1}{x}\right)\right] \text{ does not exist because } \cos\left(\frac{1}{x}\right) \text{ has no limit as } x \rightarrow 0. \text{ Therefore, the derivative is not continuous at } x = 0 \text{ because it has no limit there.}$$

24. From the given conditions we have $f(x+h) = f(x)f(h)$, $f(h) - 1 = hg(h)$ and $\lim_{h \rightarrow 0} g(h) = 1$. Therefore,

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \rightarrow 0} \frac{f(x)f(h) - f(x)}{h} = \lim_{h \rightarrow 0} f(x) \left[\frac{f(h) - 1}{h} \right] = f(x) \left[\lim_{h \rightarrow 0} g(h) \right] = f(x) \cdot 1 = f(x) \\ \Rightarrow f'(x) = f(x) \text{ and } f'(x) \text{ exists at every value of } x.$$

25. Step 1: The formula holds for $n = 2$ (a single product) since $y = u_1 u_2 \Rightarrow \frac{dy}{dx} = \frac{du_1}{dx} u_2 + u_1 \frac{du_2}{dx}$.

Step 2: Assume the formula holds for $n = k$:

$$y = u_1 u_2 \cdots u_k \Rightarrow \frac{dy}{dx} = \frac{du_1}{dx} u_2 u_3 \cdots u_k + u_1 \frac{du_2}{dx} u_3 \cdots u_k + \cdots + u_1 u_2 \cdots u_{k-1} \frac{du_k}{dx}.$$

$$\text{If } y = u_1 u_2 \cdots u_k u_{k+1} = (u_1 u_2 \cdots u_k) u_{k+1}, \text{ then } \frac{dy}{dx} = \frac{d(u_1 u_2 \cdots u_k)}{dx} u_{k+1} + u_1 u_2 \cdots u_k \frac{du_{k+1}}{dx}$$

$$= \left(\frac{du_1}{dx} u_2 u_3 \cdots u_k + u_1 \frac{du_2}{dx} u_3 \cdots u_k + \cdots + u_1 u_2 \cdots u_{k-1} \frac{du_k}{dx} \right) u_{k+1} + u_1 u_2 \cdots u_k \frac{du_{k+1}}{dx}$$

$$= \frac{du_1}{dx} u_2 u_3 \cdots u_{k+1} + u_1 \frac{du_2}{dx} u_3 \cdots u_{k+1} + \cdots + u_1 u_2 \cdots u_{k-1} \frac{du_k}{dx} u_{k+1} + u_1 u_2 \cdots u_k \frac{du_{k+1}}{dx}.$$

Thus the original formula holds for $n = (k + 1)$ whenever it holds for $n = k$.

26. Recall $\binom{m}{k} = \frac{m!}{k!(m-k)!}$. Then $\binom{m}{1} = \frac{m!}{1!(m-1)!} = m$ and $\binom{m}{k} + \binom{m}{k+1} = \frac{m!}{k!(m-k)!} + \frac{m!}{(k+1)!(m-k-1)!} = \frac{m!(k+1)+m!(m-k)}{(k+1)!(m-k)!}$
 $= \frac{m!(m+1)}{(k+1)!(m-k)!} = \frac{(m+1)!}{(k+1)!(m-k-1)!} = \binom{m+1}{k+1}$. Now, we prove Leibniz's rule by mathematical induction.

Step 1: If $n = 1$, then $\frac{d(uv)}{dx} = u \frac{dv}{dx} + v \frac{du}{dx}$. Assume that the statement is true for $n = k$, that is:

$$\frac{d^k(uv)}{dx^k} = \frac{d^k u}{dx^k} v + k \frac{d^{k-1} u}{dx^{k-1}} \frac{dv}{dx} + \binom{k}{2} \frac{d^{k-2} u}{dx^{k-2}} \frac{d^2 v}{dx^2} + \cdots + \binom{k}{k-1} \frac{du}{dx} \frac{d^{k-1} v}{dx^{k-1}} + u \frac{d^k v}{dx^k}.$$

Step 2: If $n = k + 1$, then $\frac{d^{k+1}(uv)}{dx^{k+1}} = \frac{d}{dx} \left(\frac{d^k(uv)}{dx^k} \right) = \left[\frac{d^{k+1} u}{dx^{k+1}} v + \frac{d^k u}{dx^k} \frac{dv}{dx} \right] + \left[k \frac{d^k u}{dx^k} \frac{dv}{dx} + k \frac{d^{k+1} u}{dx^{k+1}} \frac{d^2 v}{dx^2} \right]$

$$+ \left[\binom{k}{2} \frac{d^{k-1} u}{dx^{k-1}} \frac{d^2 v}{dx^2} + \binom{k}{2} \frac{d^{k-2} u}{dx^{k-2}} \frac{d^3 v}{dx^3} \right] + \cdots + \left[\binom{k}{k-1} \frac{d^2 u}{dx^2} \frac{d^{k-1} v}{dx^{k-1}} + \binom{k}{k-1} \frac{du}{dx} \frac{d^k v}{dx^k} \right]$$

$$+ \left[\frac{du}{dx} \frac{d^k v}{dx^k} + u \frac{d^{k+1} v}{dx^{k+1}} \right] = \frac{d^{k+1} u}{dx^{k+1}} v + (k+1) \frac{d^k u}{dx^k} \frac{dv}{dx} + \left[\binom{k}{1} + \binom{k}{2} \right] \frac{d^{k-1} u}{dx^{k-1}} \frac{d^2 v}{dx^2} + \cdots$$

$$\begin{aligned}
& + \left[\binom{k}{k-1} + \binom{k}{k} \right] \frac{du}{dx} \frac{d^k v}{dx^k} + u \frac{d^{k+1} v}{dx^{k+1}} = \frac{d^{k+1} u}{dx^{k+1}} v + (k+1) \frac{d^k u}{dx^k} \frac{dv}{dx} + \binom{k+1}{2} \frac{d^{k-1} u}{dx^{k-1}} \frac{d^2 v}{dx^2} + \dots \\
& + \binom{k+1}{k} \frac{du}{dx} \frac{d^k v}{dx^k} + u \frac{d^{k+1} v}{dx^{k+1}}.
\end{aligned}$$

Therefore the formula (c) holds for $n = (k+1)$ whenever it holds for $n = k$.

27. (a) $T^2 = \frac{4\pi^2 L}{g} \Rightarrow L = \frac{T^2 g}{4\pi^2} \Rightarrow L = \frac{(1 \text{ sec}^2)(32.2 \text{ ft/sec}^2)}{4\pi^2} \Rightarrow L \approx 0.8156 \text{ ft}$
- (b) $T^2 = \frac{4\pi^2 L}{g} \Rightarrow T = \frac{2\pi}{\sqrt{g}} \sqrt{L}$; $dT = \frac{2\pi}{\sqrt{g}} \cdot \frac{1}{2\sqrt{L}} dL = \frac{\pi}{\sqrt{Lg}} dL$; $dT = \frac{\pi}{\sqrt{(0.8156 \text{ ft})(32.2 \text{ ft/sec}^2)}} (0.01 \text{ ft}) \approx 0.00613 \text{ sec}$.
- (c) Since there are 86,400 sec in a day, we have we have $(0.00613 \text{ sec})(86,400 \text{ sec/day}) \approx 529.6 \text{ sec/day}$, or 8.83 min/day; the clock will lose about 8.83 min/day.
28. $v = s^3 \Rightarrow \frac{dv}{dt} = 3s^2 \frac{ds}{dt} = -k(6s^2) \Rightarrow \frac{ds}{dt} = -2k$. If s_0 = the initial length of the cube's side, then $s_1 = s_0 - 2k$
 $\Rightarrow 2k = s_0 - s_1$. Let t = the time it will take the ice cube to melt. Now, $t = \frac{s_0}{2k} = \frac{s_0}{s_0 - s_1} = \frac{(v_0)^{1/3}}{(v_0)^{1/3} - (\frac{3}{4}v_0)^{1/3}}$
 $= \frac{1}{1 - (\frac{3}{4})^{1/3}} \approx 11 \text{ hr}$.

CHAPTER 4 APPLICATIONS OF DERIVATIVES

4.1 EXTREME VALUES OF FUNCTIONS

1. An absolute minimum at $x = c_2$, an absolute maximum at $x = b$. Theorem 1 guarantees the existence of such extreme values because h is continuous on $[a, b]$.
2. An absolute minimum at $x = b$, an absolute maximum at $x = c$. Theorem 1 guarantees the existence of such extreme values because f is continuous on $[a, b]$.
3. No absolute minimum. An absolute maximum at $x = c$. Since the function's domain is an open interval, the function does not satisfy the hypotheses of Theorem 1 and need not have absolute extreme values.
4. No absolute extrema. The function is neither continuous nor defined on a closed interval, so it need not fulfill the conclusions of Theorem 1.
5. An absolute minimum at $x = a$ and an absolute maximum at $x = c$. Note that $y = g(x)$ is not continuous but still has extrema. When the hypothesis of Theorem 1 is satisfied then extrema are guaranteed, but when the hypothesis is not satisfied, absolute extrema may or may not occur.
6. Absolute minimum at $x = c$ and an absolute maximum at $x = a$. Note that $y = g(x)$ is not continuous but still has absolute extrema. When the hypothesis of Theorem 1 is satisfied then extrema are guaranteed, but when the hypothesis is not satisfied, absolute extrema may or may not occur.
7. Local minimum at $(-1, 0)$, local maximum at $(1, 0)$.
8. Minima at $(-2, 0)$ and $(2, 0)$, maximum at $(0, 2)$.
9. Maximum at $(0, 5)$. Note that there is no minimum since the endpoint $(2, 0)$ is excluded from the graph.
10. Local maximum at $(-3, 0)$, local minimum at $(2, 0)$, maximum at $(1, 2)$, minimum at $(0, -1)$.
11. Graph (c), since this is the only graph that has positive slope at c .
12. Graph (b), since this is the only graph that represents a differentiable function at a and b and has negative slope at c .
13. Graph (d), since this is the only graph representing a function that is differentiable at b but not at a .
14. Graph (a), since this is the only graph that represents a function that is not differentiable at a or b .
15. f has an absolute min at $x = 0$ but does not have an absolute max. Since the interval on which f is defined, $-1 < x < 2$, is an open interval, we do not meet the conditions of Theorem 1.

16. f has an absolute max at $x = 0$ but does not have an absolute min. Since the interval on which f is defined, $-1 < x < 1$, is an open interval, we do not meet the conditions of Theorem 1.

17. f has an absolute max at $x = 2$ but does not have an absolute min. Since the function is not continuous at $x = 1$, we do not meet the conditions of Theorem 1.

18. f has an absolute max at $x = 4$ but does not have an absolute min. Since the function is not continuous at $x = 0$, we do not meet the conditions of Theorem 1.

19. f has an absolute max at $x = \frac{\pi}{2}$ and an absolute min at $x = \frac{3\pi}{2}$. Since the interval on which f is defined, $0 < x < 2\pi$, is an open interval we do not meet the conditions of Theorem 1.

20. f has an absolute max at $x = 0$ and an absolute min at $x = \frac{\pi}{2}$ and $x = -1$ but does not have an absolute maximum. Since f is defined on a union of half-open intervals, we do not meet the conditions of Theorem 1.

21. $f(x) = \frac{2}{3}x - 5 \Rightarrow f'(x) = \frac{2}{3} \Rightarrow$ no critical points;
 $f(-2) = -\frac{19}{3}$, $f(3) = -3 \Rightarrow$ the absolute maximum is -3 at $x = 3$ and the absolute minimum is $-\frac{19}{3}$ at $x = -2$

22. $f(x) = -x - 4 \Rightarrow f'(x) = -1 \Rightarrow$ no critical points;
 $f(-4) = 0, f(1) = -5 \Rightarrow$ the absolute maximum is 0
 at $x = -4$ and the absolute minimum is -5 at $x = 1$

23. $f(x) = x^2 - 1 \Rightarrow f'(x) = 2x \Rightarrow$ a critical point at
 $x = 0; f(-1) = 0, f(0) = -1, f(2) = 3 \Rightarrow$ the absolute
 maximum is 3 at $x = 2$ and the absolute minimum is
 -1 at $x = 0$

24. $f(x) = 4 - x^3 \Rightarrow f'(x) = -3x^2 \Rightarrow$ a critical point at
 $x = 0; f(-2) = 12, f(0) = 4, f(1) = 3 \Rightarrow$ the absolute
 maximum is 12 at $x = -2$ and the absolute
 minimum is 3 at $x = 1$

25. $F(x) = -\frac{1}{x^2} = -x^{-2} \Rightarrow F'(x) = 2x^{-3} = \frac{2}{x^3}$, however
 $x = 0$ is not a critical point since 0 is not in the domain;
 $F(0.5) = -4, F(2) = -0.25 \Rightarrow$ the absolute maximum
 is -0.25 at $x = 2$ and the absolute minimum is -4 at
 $x = 0.5$

26. $F(x) = -\frac{1}{x} = -x^{-1} \Rightarrow F'(x) = x^{-2} = \frac{1}{x^2}$, however
 $x = 0$ is not a critical point since 0 is not in the
 domain; $F(-2) = \frac{1}{2}, F(-1) = 1 \Rightarrow$ the absolute
 maximum is 1 at $x = -1$ and the absolute minimum
 is $\frac{1}{2}$ at $x = -2$

27. $h(x) = \sqrt[3]{x} = x^{1/3} \Rightarrow h'(x) = \frac{1}{3}x^{-2/3} \Rightarrow$ a critical point at $x = 0$; $h(-1) = -1$, $h(0) = 0$, $h(8) = 2 \Rightarrow$ the absolute maximum is 2 at $x = 8$ and the absolute minimum is -1 at $x = -1$

28. $h(x) = -3x^{2/3} \Rightarrow h'(x) = -2x^{-1/3} \Rightarrow$ a critical point at $x = 0$; $h(-1) = -3$, $h(0) = 0$, $h(1) = -3 \Rightarrow$ the absolute maximum is 0 at $x = 0$ and the absolute minimum is -3 at $x = 1$ and $x = -1$

29. $g(x) = \sqrt{4-x^2} = (4-x^2)^{1/2}$
 $\Rightarrow g'(x) = \frac{1}{2}(4-x^2)^{-1/2}(-2x) = \frac{-x}{\sqrt{4-x^2}} \Rightarrow$ critical points at $x = -2$ and $x = 0$, but not at $x = 2$ because 2 is not in the domain;
 $g(-2) = 0$, $g(0) = 2$, $g(1) = \sqrt{3} \Rightarrow$ the absolute maximum is 2 at $x = 0$ and the absolute minimum is 0 at $x = -2$

30. $g(x) = -\sqrt{5-x^2} = -(5-x^2)^{1/2}$
 $\Rightarrow g'(x) = -\left(\frac{1}{2}\right)(5-x^2)^{-1/2}(-2x) = \frac{x}{\sqrt{5-x^2}}$
 \Rightarrow critical points at $x = -\sqrt{5}$ and $x = 0$, but not at $x = \sqrt{5}$ because $\sqrt{5}$ is not in the domain;
 $f(-\sqrt{5}) = 0$, $f(0) = -\sqrt{5}$
 \Rightarrow the absolute maximum is 0 at $x = -\sqrt{5}$ and the absolute minimum is $-\sqrt{5}$ at $x = 0$

31. $f(\theta) = \sin \theta \Rightarrow f'(\theta) = \cos \theta \Rightarrow \theta = \frac{\pi}{2}$ is a critical point, but $\theta = \frac{-\pi}{2}$ is not a critical point because $\frac{-\pi}{2}$ is not interior to the domain; $f\left(\frac{-\pi}{2}\right) = -1$, $f\left(\frac{\pi}{2}\right) = 1$, $f\left(\frac{5\pi}{6}\right) = \frac{1}{2} \Rightarrow$ the absolute maximum is 1 at $\theta = \frac{\pi}{2}$ and the absolute minimum is -1 at $\theta = \frac{-\pi}{2}$

32. $f(\theta) = \tan \theta \Rightarrow f'(\theta) = \sec^2 \theta \Rightarrow f$ has no critical points in $\left(\frac{-\pi}{3}, \frac{\pi}{4}\right)$. The extreme values therefore occur at the endpoints: $f\left(\frac{-\pi}{3}\right) = -\sqrt{3}$ and $f\left(\frac{\pi}{4}\right) = 1$
 \Rightarrow the absolute maximum is 1 at $\theta = \frac{\pi}{4}$ and the absolute minimum is $-\sqrt{3}$ at $\theta = \frac{-\pi}{3}$

33. $g(x) = \csc x \Rightarrow g'(x) = -(\csc x)(\cot x) \Rightarrow$ a critical point at $x = \frac{\pi}{2}; g(\frac{\pi}{3}) = \frac{2}{\sqrt{3}}, g(\frac{\pi}{2}) = 1, g(\frac{2\pi}{3}) = \frac{2}{\sqrt{3}} \Rightarrow$ the absolute maximum is $\frac{2}{\sqrt{3}}$ at $x = \frac{\pi}{3}$ and $x = \frac{2\pi}{3}$, and the absolute minimum is 1 at $x = \frac{\pi}{2}$

34. $g(x) = \sec x \Rightarrow g'(x) = (\sec x)(\tan x) \Rightarrow$ a critical point at $x = 0; g(-\frac{\pi}{3}) = 2, g(0) = 1, g(\frac{\pi}{6}) = \frac{2}{\sqrt{3}} \Rightarrow$ the absolute maximum is 2 at $x = -\frac{\pi}{3}$ and the absolute minimum is 1 at $x = 0$

35. $f(t) = 2 - |t| = 2 - \sqrt{t^2} = 2 - (t^2)^{1/2} \Rightarrow f'(t) = -\frac{1}{2}(t^2)^{-1/2}(2t) = -\frac{t}{\sqrt{t^2}} = -\frac{t}{|t|} \Rightarrow$ a critical point at $t = 0; f(-1) = 1, f(0) = 2, f(3) = -1 \Rightarrow$ the absolute maximum is 2 at $t = 0$ and the absolute minimum is -1 at $t = 3$

36. $f(t) = |t - 5| = \sqrt{(t - 5)^2} = ((t - 5)^2)^{1/2} \Rightarrow f'(t) = \frac{1}{2}((t - 5)^2)^{-1/2}(2(t - 5)) = \frac{t - 5}{\sqrt{(t - 5)^2}} = \frac{t - 5}{|t - 5|} \Rightarrow$ a critical point at $t = 5; f(4) = 1, f(5) = 0, f(7) = 2 \Rightarrow$ the absolute maximum is 2 at $t = 7$ and the absolute minimum is 0 at $t = 5$

37. $g(x) = xe^{-x} \Rightarrow g'(x) = e^{-x} - xe^{-x} \Rightarrow$ a critical point at $x = 1; g(-1) = -e$, and $g(1) = \frac{1}{e} \Rightarrow$ the absolute maximum is $\frac{1}{e}$ at $x = 1$ and the absolute minimum is $-e$ at $x = -1$

38. The first derivative $h'(x) = \frac{1}{x+1}$ has no zeros, so we need only consider the endpoints, $h(0) = \ln 1; h(3) = \ln 4$
Maximum value is $\ln 4$ at $x = 3$;
Minimum value is $\ln 1$ at $x = 0$.

45. $y = x^2 - 6x + 7 \Rightarrow y' = 2x - 6 \Rightarrow 2x - 6 = 0 \Rightarrow x = 3$. The critical point is $x = 3$.

46. $f(x) = 6x^2 - x^3 \Rightarrow f'(x) = 12x - 3x^2 \Rightarrow 12x - 3x^2 = 0 \Rightarrow 3x(4 - x) = 0 \Rightarrow x = 0$ or $x = 4$. The critical points are $x = 0$ and $x = 4$.

47. $f(x) = x(4 - x)^3 \Rightarrow f'(x) = x[3(4 - x)^2(-1)] + (4 - x)^3 = (4 - x)^2[-3x + (4 - x)] = (4 - x)^2(4 - 4x) = 4(4 - x)^2(1 - x) \Rightarrow 4(4 - x)^2(1 - x) = 0 \Rightarrow x = 1$ or $x = 4$. The critical points are $x = 1$ and $x = 4$.

The critical points are $x = 1, x = 2,$ and $x = 3$.

The domain of the function is $(-\infty, 0) \cup (0, \infty)$, thus $x = 0$ is not the domain, so the only critical point is $x = 1$.

50. $f(x) = \frac{x^2}{x-2} \Rightarrow f'(x) = \frac{(x-2)2x-x^2(1)}{(x-2)^2} = \frac{x^2-4x}{(x-2)^2} \Rightarrow \frac{x^2-4x}{(x-2)^2} = 0 \Rightarrow x^2 - 4x = 0 \Rightarrow x = 0$ or $x = 4$; $\frac{x^2-4x}{(x-2)^2}$ is undefined $\Rightarrow (x-2)^2 = 0 \Rightarrow x = 2$. The domain of the function is $(-\infty, 2) \cup (2, \infty)$, thus $x = 2$ is not the domain, so the only critical points are $x = 0$ and $x = 4$

51. $y = x^2 - 32\sqrt{x} \Rightarrow y' = 2x - \frac{16}{\sqrt{x}} = \frac{2x^{3/2}-16}{\sqrt{x}} \Rightarrow \frac{2x^{3/2}-16}{\sqrt{x}} = 0 \Rightarrow 2x^{3/2} - 16 = 0 \Rightarrow x = 4$; $\frac{2x^{3/2}-16}{\sqrt{x}}$ is undefined $\Rightarrow \sqrt{x} = 0 \Rightarrow x = 0$. The critical points are $x = 0$, $x = 1$, and $x = 2$.

53. Minimum value is 1 at $x = 2$.

54. To find the exact values, note that $y' = 3x^2 - 2$, which is zero when $x = \pm\sqrt{\frac{2}{3}}$. Local maximum at $(-\sqrt{\frac{2}{3}}, 4 + \frac{4\sqrt{6}}{9}) \approx (-0.816, 5.089)$; local minimum at $(\sqrt{\frac{2}{3}}, 4 - \frac{4\sqrt{6}}{9}) \approx (0.816, 2.911)$

55. To find the exact values, note that $y' = 3x^2 + 2x - 8 = (3x-4)(x+2)$, which is zero when $x = -2$ or $x = \frac{4}{3}$. Local maximum at $(-2, 17)$; local minimum at $(\frac{4}{3}, -\frac{41}{27})$

56. Note that $y' = 5x^2(x-5)(x-3)$, which is zero at $x = 0$, $x = 3$, and $x = 5$. Local maximum at $(3, 108)$; local minimum at $(5, 0)$; $(0, 0)$ is neither a maximum nor a minimum.

57. Minimum value is 0 when $x = -1$ or $x = 1$.

58. Note that $y' = \frac{\sqrt{x}-2}{\sqrt{x}}$, which is zero at $x = 4$ and is undefined when $x = 0$. Local maximum at $(0, 0)$; absolute minimum at $(4, -4)$

59. The actual graph of the function has asymptotes at $x = \pm 1$, so there are no extrema near these values. (This is an example of grapher failure.) There is a local minimum at $(0, 1)$.

60. Maximum value is 2 at $x = 1$;
minimum value is 0 at $x = -1$ and $x = 3$.

61. Maximum value is $\frac{1}{2}$ at $x = 1$;

62. Maximum value is $\frac{1}{2}$ at $x = 0$;
minimum value is $-\frac{1}{2}$ at $x = -2$.

63. $y = e^x + e^{-x} \Rightarrow y' = e^x - e^{-x} = e^x - \frac{1}{e^x} = \frac{e^{2x} - 1}{e^x}$,
which is 0 at $x = 0$; an absolute minimum value is 2 at $x = 0$.

64. $y = e^x - e^{-x} \Rightarrow y' = e^x - (-e^{-x}) = e^x + \frac{1}{e^x} = \frac{e^{2x} + 1}{e^x}$,
which is never zero; there are no extreme values.

65. $y = x \ln x \Rightarrow y' = x \cdot \frac{1}{x} + (1) \cdot \ln x = 1 + \ln x$, which is
zero at $x = e^{-1}$; an absolute minimum value is $-\frac{1}{e}$ at
 $x = \frac{1}{e}$

66. $y = x^2 \ln x \Rightarrow y' = x^2 \cdot \frac{1}{x} + 2x \cdot \ln x = x(1 + 2 \ln x)$,
which is zero at $x = e^{-1/2}$; an absolute minimum
value is $-\frac{1}{2e}$ at $x = \frac{1}{\sqrt{e}}$

67. $y = \cos^{-1}(x^2) \Rightarrow y' = \frac{-1}{\sqrt{1-(x^2)^2}} \cdot (2x) = \frac{-2x}{\sqrt{1-x^4}}$, which is zero at $x = 0$; an absolute maximum value is $\frac{\pi}{2}$ at $x = 0$; an absolute minimum value is 0 at $x = 1$ and $x = -1$.

68. $y = \sin^{-1}(e^x) \Rightarrow y' = \frac{1}{\sqrt{1-(e^x)^2}} \cdot (e^x) = \frac{e^x}{\sqrt{1-e^{2x}}}$, which is never zero; an absolute maximum value is $\frac{\pi}{2}$ at $x = 0$.

76. We begin by determining whether $f'(x)$ is defined at $x = 1$, where $f(x) = \begin{cases} -\frac{1}{4}x^2 - \frac{1}{2}x + \frac{15}{4}, & x \leq 1 \\ x^3 - 6x^2 + 8x, & x > 1 \end{cases}$

Clearly, $f'(x) = -\frac{1}{2}x - \frac{1}{2}$ if $x < 1$, and $\lim_{h \rightarrow 0^-} f'(1+h) = -1$. Also, $f'(x) = 3x^2 - 12x + 8$ if $x > 1$, and

$\lim_{h \rightarrow 0^+} f'(1+h) = -1$. Since f is continuous at $x = 1$, we have that $f'(1) = -1$.

$$\text{Thus, } f'(x) = \begin{cases} -\frac{1}{2}x - \frac{1}{2}, & x \leq 1 \\ 3x^2 - 12x + 8, & x > 1 \end{cases}$$

Note that $-\frac{1}{2}x - \frac{1}{2} = 0$ when $x = -1$, and $3x^2 - 12x + 8 = 0$ when $x = \frac{12 \pm \sqrt{12^2 - 4(3)(8)}}{2(3)} = \frac{12 \pm \sqrt{48}}{6} = 2 \pm \frac{2\sqrt{3}}{3}$.

But $2 - \frac{2\sqrt{3}}{3} \approx 0.845 < 1$, so the critical points occur at $x = -1$ and $x = 2 + \frac{2\sqrt{3}}{3} \approx 3.155$.

crit.pt.	derivative	extremum	value
$x = -1$	0	local max	4
$x \approx 3.155$	0	local min	≈ -3.079

77. (a) No, since $f'(x) = \frac{2}{3}(x-2)^{-1/3}$, which is undefined at $x = 2$.
 (b) The derivative is defined and nonzero for all $x \neq 2$. Also, $f(2) = 0$ and $f(x) > 0$ for all $x \neq 2$.
 (c) No, $f(x)$ need not have a global maximum because its domain is all real numbers. Any restriction of f to a closed interval of the form $[a, b]$ would have both a maximum value and minimum value on the interval.
 (d) The answers are the same as (a) and (b) with 2 replaced by a .

78. Note that $f(x) = \begin{cases} -x^3 + 9x, & x \leq -3 \text{ or } 0 \leq x < 3 \\ x^3 - 9x, & -3 < x < 0 \text{ or } x \geq 3 \end{cases}$. Therefore, $f'(x) = \begin{cases} -3x^2 + 9, & x < -3 \text{ or } 0 < x < 3 \\ 3x^2 - 9, & -3 < x < 0 \text{ or } x > 3 \end{cases}$.
- (a) No, since the left- and right-hand derivatives at $x = 0$, are -9 and 9 , respectively.
 (b) No, since the left- and right-hand derivatives at $x = 3$, are -18 and 18 , respectively.
 (c) No, since the left- and right-hand derivatives at $x = -3$, are 18 and -18 , respectively.
 (d) The critical points occur when $f'(x) = 0$ (at $x = \pm\sqrt{3}$) and when $f'(x)$ is undefined (at $x = 0$ and $x = \pm 3$).
 The minimum value is 0 at $x = -3$, at $x = 0$, and at $x = 3$; local maxima occur at $(-\sqrt{3}, 6\sqrt{3})$ and $(\sqrt{3}, 6\sqrt{3})$.

79. Yes, since $f(x) = |x| = \sqrt{x^2} = (x^2)^{1/2} \Rightarrow f'(x) = \frac{1}{2}(x^2)^{-1/2}(2x) = \frac{x}{(x^2)^{1/2}} = \frac{x}{|x|}$ is not defined at $x = 0$. Thus it is not required that f' be zero at a local extreme point since f' may be undefined there.
80. If $f(c)$ is a local maximum value of f , then $f(x) \leq f(c)$ for all x in some open interval (a, b) containing c . Since f is even, $f(-x) = f(x) \leq f(c) = f(-c)$ for all $-x$ in the open interval $(-b, -a)$ containing $-c$. That is, f assumes a local maximum at the point $-c$. This is also clear from the graph of f because the graph of an even function is symmetric about the y -axis.
81. If $g(c)$ is a local minimum value of g , then $g(x) \geq g(c)$ for all x in some open interval (a, b) containing c . Since g is odd, $g(-x) = -g(x) \leq -g(c) = g(-c)$ for all $-x$ in the open interval $(-b, -a)$ containing $-c$. That is, g assumes a local maximum at the point $-c$. This is also clear from the graph of g because the graph of an odd function is symmetric about the origin.
82. If there are no boundary points or critical points the function will have no extreme values in its domain. Such functions do indeed exist, for example $f(x) = x$ for $-\infty < x < \infty$. (Any other linear function $f(x) = mx + b$ with $m \neq 0$ will do as well.)

83. (a) $V(x) = 160x - 52x^2 + 4x^3$
 $V'(x) = 160 - 104x + 12x^2 = 4(x-2)(3x-20)$
 The only critical point in the interval $(0, 5)$ is at $x = 2$. The maximum value of $V(x)$ is 144 at $x = 2$.
 (b) The largest possible volume of the box is 144 cubic units, and it occurs when $x = 2$ units.

84. (a) $f'(x) = 3ax^2 + 2bx + c$ is a quadratic, so it can have 0, 1, or 2 zeros, which would be the critical points of f .
 The function $f(x) = x^3 - 3x$ has two critical points at $x = -1$ and $x = 1$. The function $f(x) = x^3 - 1$ has one critical point at $x = 0$. The function $f(x) = x^3 + x$ has no critical points.

- (b) The function can have either two local extreme values or no extreme values. (If there is only one critical point, the cubic function has no extreme values.)

85. $s = -\frac{1}{2}gt^2 + v_0t + s_0 \Rightarrow \frac{ds}{dt} = -gt + v_0 = 0 \Rightarrow t = \frac{v_0}{g}$. Now $s(t) = s_0 \Leftrightarrow t\left(-\frac{gt}{2} + v_0\right) = 0 \Leftrightarrow t = 0$ or $t = \frac{2v_0}{g}$.
 Thus $s\left(\frac{v_0}{g}\right) = -\frac{1}{2}g\left(\frac{v_0}{g}\right)^2 + v_0\left(\frac{v_0}{g}\right) + s_0 = \frac{v_0^2}{2g} + s_0 > s_0$ is the maximum height over the interval $0 \leq t \leq \frac{2v_0}{g}$.

86. $\frac{dl}{dt} = -2\sin t + 2\cos t$, solving $\frac{dl}{dt} = 0 \Rightarrow \tan t = 1 \Rightarrow t = \frac{\pi}{4} + n\pi$ where n is a nonnegative integer (in this exercise t is never negative) \Rightarrow the peak current is $2\sqrt{2}$ amps.

87. Maximum value is 11 at $x = 5$; minimum value is 5 on the interval $[-3, 2]$; local maximum at $(-5, 9)$

88. Maximum value is 4 on the interval $[5, 7]$; minimum value is -4 on the interval $[-2, 1]$.

89. Maximum value is 5 on the interval $[3, \infty)$;
 minimum value is -5 on the interval $(-\infty, -2]$.

90. Minimum value is 4 on the interval $[-1, 3]$

91-98. Example CAS commands:

Maple:

```
with(student):
f := x -> x^4 - 8*x^2 + 4*x + 2;
domain := x = -20/25..64/25;
plot( f(x), domain, color=black, title="Section 4.1 #91(a)");
Df := D(f);
plot( Df(x), domain, color=black, title="Section 4.1 #91(b)");
StatPt := fsolve( Df(x)=0, domain );
SingPt := NULL;
EndPt := op(rhs(domain));
Pts := evalf([EndPt, StatPt, SingPt]);
Values := [seq( f(x), x=Pts )];
```

Maximum value is 2.7608 and occurs at $x=2.56$ (right endpoint).

Minimum value is -6.2680 and occurs at $x=1.86081$ (singular point).

Mathematica: (functions may vary) (see Section 2.5 re. RealsOnly):

```
<<Miscellaneous `RealOnly`
Clear[f,x]
a = -1; b = 10/3;
f[x_] = 2 + 2x - 3 x^(2/3)
f'[x]
Plot[{f[x], f'[x]}, {x, a, b}]
NSolve[f'[x]==0, x]
{f[a], f[0], f[x]/.%, f[b]}/N
```

In more complicated expressions, NSolve may not yield results. In this case, an approximate solution (say 1.1 here) is observed from the graph and the following command is used:

```
FindRoot[f'[x]==0, {x, 1.1}]
```

4.2 THE MEAN VALUE THEOREM

- When $f(x) = x^2 + 2x - 1$ for $0 \leq x \leq 1$, then $\frac{f(1)-f(0)}{1-0} = f'(c) \Rightarrow 3 = 2c + 2 \Rightarrow c = \frac{1}{2}$.
- When $f(x) = x^{2/3}$ for $0 \leq x \leq 1$, then $\frac{f(1)-f(0)}{1-0} = f'(c) \Rightarrow 1 = \left(\frac{2}{3}\right)c^{-1/3} \Rightarrow c = \frac{8}{27}$.
- When $f(x) = x + \frac{1}{x}$ for $\frac{1}{2} \leq x \leq 2$, then $\frac{f(2)-f(1/2)}{2-1/2} = f'(c) \Rightarrow 0 = 1 - \frac{1}{c^2} \Rightarrow c = 1$.
- When $f(x) = \sqrt{x-1}$ for $1 \leq x \leq 3$, then $\frac{f(3)-f(1)}{3-1} = f'(c) \Rightarrow \frac{\sqrt{2}}{2} = \frac{1}{2\sqrt{c-1}} \Rightarrow c = \frac{3}{2}$.
- When $f(x) = \sin^{-1}(x)$ for $-1 \leq x \leq 1$, then $f'(c) = \frac{f(1)-f(-1)}{1-(-1)} \Rightarrow \frac{1}{\sqrt{1-c^2}} = \frac{\frac{\pi}{2} - (-\frac{\pi}{2})}{2} \Rightarrow \sqrt{1-c^2} = \frac{2}{\pi} \Rightarrow 1-c^2 = \frac{4}{\pi^2} \Rightarrow c^2 = 1 - \frac{4}{\pi^2} \Rightarrow c = \pm\sqrt{1 - \frac{4}{\pi^2}} \approx \pm 0.771$
- When $f(x) = \ln(x-1)$ for $2 \leq x \leq 4$, then $f'(c) = \frac{f(4)-f(2)}{4-2} \Rightarrow \frac{1}{c-1} = \frac{\ln 3 - \ln 1}{2} \Rightarrow c-1 = \frac{2}{\ln 3} \Rightarrow c = 1 + \frac{2}{\ln 3} \approx 2.820$
- When $f(x) = x^3 - x^2$ for $-1 \leq x \leq 2$, then $\frac{f(2)-f(-1)}{2-(-1)} = f'(c) \Rightarrow 2 = 3c^2 - 2c \Rightarrow c = \frac{1 \pm \sqrt{7}}{3}$.
 $\frac{1+\sqrt{7}}{3} \approx 1.22$ and $\frac{1-\sqrt{7}}{3} \approx -0.549$ are both in the interval $-1 \leq x \leq 2$.
- When $g(x) = \begin{cases} x^3 & -2 \leq x \leq 0 \\ x^2 & 0 < x \leq 2 \end{cases}$, then $\frac{g(2)-g(-2)}{2-(-2)} = g'(c) \Rightarrow 3 = g'(c)$. If $-2 \leq x < 0$, then $g'(x) = 3x^2 \Rightarrow 3 = g'(c) \Rightarrow 3c^2 = 3 \Rightarrow c = \pm 1$. Only $c = -1$ is in the interval. If $0 < x \leq 2$, then $g'(x) = 2x \Rightarrow 3 = g'(c) \Rightarrow 2c = 3 \Rightarrow c = \frac{3}{2}$.
- Does not; $f(x)$ is not differentiable at $x = 0$ in $(-1, 8)$.
- Does; $f(x)$ is continuous for every point of $[0, 1]$ and differentiable for every point in $(0, 1)$.
- Does; $f(x)$ is continuous for every point of $[0, 1]$ and differentiable for every point in $(0, 1)$.
- Does not; $f(x)$ is not continuous at $x = 0$ because $\lim_{x \rightarrow 0^-} f(x) = 1 \neq 0 = f(0)$.
- Does not; f is not differentiable at $x = -1$ in $(-2, 0)$.
- Does; $f(x)$ is continuous for every point of $[0, 3]$ and differentiable for every point in $(0, 3)$.
- Since $f(x)$ is not continuous on $0 \leq x \leq 1$, Rolle's Theorem does not apply: $\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^-} x = 1 \neq 0 = f(1)$.
- Since $f(x)$ must be continuous at $x = 0$ and $x = 1$ we have $\lim_{x \rightarrow 0^+} f(x) = a = f(0) \Rightarrow a = 3$ and $\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^+} f(x) \Rightarrow -1 + 3 + a = m + b \Rightarrow 5 = m + b$. Since $f(x)$ must also be differentiable at $x = 1$ we have $\lim_{x \rightarrow 1^-} f'(x) = \lim_{x \rightarrow 1^+} f'(x) \Rightarrow -2x + 3|_{x=1} = m|_{x=1} \Rightarrow 1 = m$. Therefore, $a = 3$, $m = 1$ and $b = 4$.

17. (a)

(b) Let r_1 and r_2 be zeros of the polynomial $P(x) = x^n + a_{n-1}x^{n-1} + \dots + a_1x + a_0$, then $P(r_1) = P(r_2) = 0$. Since polynomials are everywhere continuous and differentiable, by Rolle's Theorem $P'(r) = 0$ for some r between r_1 and r_2 , where $P'(x) = nx^{n-1} + (n-1)a_{n-1}x^{n-2} + \dots + a_1$.

18. With f both differentiable and continuous on $[a, b]$ and $f(r_1) = f(r_2) = f(r_3) = 0$ where r_1, r_2 and r_3 are in $[a, b]$, then by Rolle's Theorem there exists a c_1 between r_1 and r_2 such that $f'(c_1) = 0$ and a c_2 between r_2 and r_3 such that $f'(c_2) = 0$. Since f' is both differentiable and continuous on $[a, b]$, Rolle's Theorem again applies and we have a c_3 between c_1 and c_2 such that $f''(c_3) = 0$. To generalize, if f has $n+1$ zeros in $[a, b]$ and $f^{(n)}$ is continuous on $[a, b]$, then $f^{(n)}$ has at least one zero between a and b .

19. Since f'' exists throughout $[a, b]$ the derivative function f' is continuous there. If f' has more than one zero in $[a, b]$, say $f'(r_1) = f'(r_2) = 0$ for $r_1 \neq r_2$, then by Rolle's Theorem there is a c between r_1 and r_2 such that $f''(c) = 0$, contrary to $f'' > 0$ throughout $[a, b]$. Therefore f' has at most one zero in $[a, b]$. The same argument holds if $f'' < 0$ throughout $[a, b]$.

20. If $f(x)$ is a cubic polynomial with four or more zeros, then by Rolle's Theorem $f'(x)$ has three or more zeros, $f''(x)$ has 2 or more zeros and $f'''(x)$ has at least one zero. This is a contradiction since $f'''(x)$ is a non-zero constant when $f(x)$ is a cubic polynomial.

21. With $f(-2) = 11 > 0$ and $f(-1) = -1 < 0$ we conclude from the Intermediate Value Theorem that $f(x) = x^4 + 3x + 1$ has at least one zero between -2 and -1 . Then $-2 < x < -1 \Rightarrow -8 < x^3 < -1 \Rightarrow -32 < 4x^3 < -4 \Rightarrow -29 < 4x^3 + 3 < -1 \Rightarrow f'(x) < 0$ for $-2 < x < -1 \Rightarrow f(x)$ is decreasing on $[-2, -1] \Rightarrow f(x) = 0$ has exactly one solution in the interval $(-2, -1)$.

22. $f(x) = x^3 + \frac{4}{x^2} + 7 \Rightarrow f'(x) = 3x^2 - \frac{8}{x^3} > 0$ on $(-\infty, 0) \Rightarrow f(x)$ is increasing on $(-\infty, 0)$. Also, $f(x) < 0$ if $x < -2$ and $f(x) > 0$ if $-2 < x < 0 \Rightarrow f(x)$ has exactly one zero in $(-\infty, 0)$.

23. $g(t) = \sqrt{t} + \sqrt{t+1} - 4 \Rightarrow g'(t) = \frac{1}{2\sqrt{t}} - \frac{1}{2\sqrt{t+1}} > 0 \Rightarrow g(t)$ is increasing for t in $(0, \infty)$; $g(3) = \sqrt{3} - 2 < 0$ and $g(15) = \sqrt{15} > 0 \Rightarrow g(t)$ has exactly one zero in $(0, \infty)$.

24. $g(t) = \frac{1}{1-t} + \sqrt{1+t} - 3.1 \Rightarrow g'(t) = \frac{1}{(1-t)^2} + \frac{1}{2\sqrt{1+t}} > 0 \Rightarrow g(t)$ is increasing for t in $(-1, 1)$; $g(-0.99) = -2.5$ and $g(0.99) = 98.3 \Rightarrow g(t)$ has exactly one zero in $(-1, 1)$.

25. $r(\theta) = \theta + \sin^2\left(\frac{\theta}{3}\right) - 8 \Rightarrow r'(\theta) = 1 + \frac{2}{3}\sin\left(\frac{\theta}{3}\right)\cos\left(\frac{\theta}{3}\right) = 1 + \frac{1}{3}\sin\left(\frac{2\theta}{3}\right) > 0$ on $(-\infty, \infty) \Rightarrow r(\theta)$ is increasing on $(-\infty, \infty)$; $r(0) = -8$ and $r(8) = \sin^2\left(\frac{8}{3}\right) > 0 \Rightarrow r(\theta)$ has exactly one zero in $(-\infty, \infty)$.

26. $r(\theta) = 2\theta - \cos^2\theta + \sqrt{2} \Rightarrow r'(\theta) = 2 + 2\sin\theta\cos\theta = 2 + \sin 2\theta > 0$ on $(-\infty, \infty) \Rightarrow r(\theta)$ is increasing on $(-\infty, \infty)$; $r(-2\pi) = -4\pi - \cos(-2\pi) + \sqrt{2} = -4\pi - 1 + \sqrt{2} < 0$ and $r(2\pi) = 4\pi - 1 + \sqrt{2} > 0 \Rightarrow r(\theta)$ has exactly one zero in $(-\infty, \infty)$.

27. $r(\theta) = \sec \theta - \frac{1}{\theta^3} + 5 \Rightarrow r'(\theta) = (\sec \theta)(\tan \theta) + \frac{3}{\theta^4} > 0$ on $(0, \frac{\pi}{2}) \Rightarrow r(\theta)$ is increasing on $(0, \frac{\pi}{2})$; $r(0.1) \approx -994$ and $r(1.57) \approx 1260.5 \Rightarrow r(\theta)$ has exactly one zero in $(0, \frac{\pi}{2})$.
28. $r(\theta) = \tan \theta - \cot \theta - \theta \Rightarrow r'(\theta) = \sec^2 \theta + \csc^2 \theta - 1 = \sec^2 \theta + \cot^2 \theta > 0$ on $(0, \frac{\pi}{2}) \Rightarrow r(\theta)$ is increasing on $(0, \frac{\pi}{2})$; $r(\frac{\pi}{4}) = -\frac{\pi}{4} < 0$ and $r(1.57) \approx 1254.2 \Rightarrow r(\theta)$ has exactly one zero in $(0, \frac{\pi}{2})$.
29. By Corollary 1, $f'(x) = 0$ for all $x \Rightarrow f(x) = C$, where C is a constant. Since $f(-1) = 3$ we have $C = 3 \Rightarrow f(x) = 3$ for all x .
30. $g(x) = 2x + 5 \Rightarrow g'(x) = 2 = f'(x)$ for all x . By Corollary 2, $f(x) = g(x) + C$ for some constant C . Then $f(0) = g(0) + C \Rightarrow 5 = 5 + C \Rightarrow C = 0 \Rightarrow f(x) = g(x) = 2x + 5$ for all x .
31. $g(x) = x^2 \Rightarrow g'(x) = 2x = f'(x)$ for all x . By Corollary 2, $f(x) = g(x) + C$.
- (a) $f(0) = 0 \Rightarrow 0 = g(0) + C = 0 + C \Rightarrow C = 0 \Rightarrow f(x) = x^2 \Rightarrow f(2) = 4$
- (b) $f(1) = 0 \Rightarrow 0 = g(1) + C = 1 + C \Rightarrow C = -1 \Rightarrow f(x) = x^2 - 1 \Rightarrow f(2) = 3$
- (c) $f(-2) = 3 \Rightarrow 3 = g(-2) + C \Rightarrow 3 = 4 + C \Rightarrow C = -1 \Rightarrow f(x) = x^2 - 1 \Rightarrow f(2) = 3$
32. $g(x) = mx \Rightarrow g'(x) = m$, a constant. If $f'(x) = m$, then by Corollary 2, $f(x) = g(x) + b = mx + b$ where b is a constant. Therefore all functions whose derivatives are constant can be graphed as straight lines $y = mx + b$.
33. (a) $y = \frac{x^2}{2} + C$ (b) $y = \frac{x^3}{3} + C$ (c) $y = \frac{x^4}{4} + C$
34. (a) $y = x^2 + C$ (b) $y = x^2 - x + C$ (c) $y = x^3 + x^2 - x + C$
35. (a) $y' = -x^{-2} \Rightarrow y = \frac{1}{x} + C$ (b) $y = x + \frac{1}{x} + C$ (c) $y = 5x - \frac{1}{x} + C$
36. (a) $y' = \frac{1}{2}x^{-1/2} \Rightarrow y = x^{1/2} + C \Rightarrow y = \sqrt{x} + C$ (b) $y = 2\sqrt{x} + C$
(c) $y = 2x^2 - 2\sqrt{x} + C$
37. (a) $y = -\frac{1}{2}\cos 2t + C$ (b) $y = 2\sin \frac{t}{2} + C$
(c) $y = -\frac{1}{2}\cos 2t + 2\sin \frac{t}{2} + C$
38. (a) $y = \tan \theta + C$ (b) $y' = \theta^{1/2} \Rightarrow y = \frac{2}{3}\theta^{3/2} + C$ (c) $y = \frac{2}{3}\theta^{3/2} - \tan \theta + C$
39. $f(x) = x^2 - x + C; 0 = f(0) = 0^2 - 0 + C \Rightarrow C = 0 \Rightarrow f(x) = x^2 - x$
40. $g(x) = -\frac{1}{x} + x^2 + C; 1 = g(-1) = -\frac{1}{-1} + (-1)^2 + C \Rightarrow C = -1 \Rightarrow g(x) = -\frac{1}{x} + x^2 - 1$
41. $f(x) = \frac{e^{2x}}{2} + C; f(0) = \frac{3}{2} \Rightarrow \frac{e^{2(0)}}{2} + C = \frac{3}{2} \Rightarrow C = 1 \Rightarrow f(x) = 1 + \frac{e^{2x}}{2}$
42. $r(t) = \sec t - t + C; 0 = r(0) = \sec(0) - 0 + C \Rightarrow C = -1 \Rightarrow r(t) = \sec t - t - 1$
43. $v = \frac{ds}{dt} = 9.8t + 5 \Rightarrow s = 4.9t^2 + 5t + C$; at $s = 10$ and $t = 0$ we have $C = 10 \Rightarrow s = 4.9t^2 + 5t + 10$

44. $v = \frac{ds}{dt} = 32t - 2 \Rightarrow s = 16t^2 - 2t + C$; at $s = 4$ and $t = \frac{1}{2}$ we have $C = 1 \Rightarrow s = 16t^2 - 2t + 1$
45. $v = \frac{ds}{dt} = \sin(\pi t) \Rightarrow s = -\frac{1}{\pi} \cos(\pi t) + C$; at $s = 0$ and $t = 0$ we have $C = \frac{1}{\pi} \Rightarrow s = \frac{1 - \cos(\pi t)}{\pi}$
46. $v = \frac{ds}{dt} = \frac{2}{\pi} \cos\left(\frac{2t}{\pi}\right) \Rightarrow s = \sin\left(\frac{2t}{\pi}\right) + C$; at $s = 1$ and $t = \pi^2$ we have $C = 1 \Rightarrow s = \sin\left(\frac{2t}{\pi}\right) + 1$
47. $a = \frac{dv}{dt} = e^t \Rightarrow v = e^t + C$; at $v = 20$ and $t = 0$ we have $C = 19 \Rightarrow v = e^t + 19$
 $v = \frac{ds}{dt} = e^t + 19 \Rightarrow s = e^t + 19t + C$; at $s = 5$ and $t = 0$ we have $C = 4 \Rightarrow s = e^t + 19t + 4$
48. $a = 9.8 \Rightarrow v = 9.8t + C_1$; at $v = -3$ and $t = 0$ we have $C_1 = -3 \Rightarrow v = 9.8t - 3 \Rightarrow s = 4.9t^2 - 3t + C_2$; at $s = 0$ and $t = 0$ we have $C_2 = 0 \Rightarrow s = 4.9t^2 - 3t$
49. $a = -4 \sin(2t) \Rightarrow v = 2 \cos(2t) + C_1$; at $v = 2$ and $t = 0$ we have $C_1 = 0 \Rightarrow v = 2 \cos(2t) \Rightarrow s = \sin(2t) + C_2$; at $s = -3$ and $t = 0$ we have $C_2 = -3 \Rightarrow s = \sin(2t) - 3$
50. $a = \frac{9}{\pi^2} \cos\left(\frac{3t}{\pi}\right) \Rightarrow v = \frac{3}{\pi} \sin\left(\frac{3t}{\pi}\right) + C_1$; at $v = 0$ and $t = 0$ we have $C_1 = 0 \Rightarrow v = \frac{3}{\pi} \sin\left(\frac{3t}{\pi}\right) \Rightarrow s = -\cos\left(\frac{3t}{\pi}\right) + C_2$; at $s = -1$ and $t = 0$ we have $C_2 = 0 \Rightarrow s = -\cos\left(\frac{3t}{\pi}\right)$
51. If $T(t)$ is the temperature of the thermometer at time t , then $T(0) = -19^\circ C$ and $T(14) = -100^\circ C$. From the Mean Value Theorem there exists a $0 < t_0 < 14$ such that $\frac{T(14) - T(0)}{14 - 0} = 8.5^\circ C/\text{sec} = T'(t_0)$, the rate at which the temperature was changing at $t = t_0$ as measured by the rising mercury on the thermometer.
52. Because the trucker's average speed was 79.5 mph, by the Mean Value Theorem, the trucker must have been going that speed at least once during the trip.
53. Because its average speed was approximately 7.667 knots, and by the Mean Value Theorem, it must have been going that speed at least once during the trip.
54. The runner's average speed for the marathon was approximately 11.909 mph. Therefore, by the Mean Value Theorem, the runner must have been going that speed at least once during the marathon. Since the initial speed and final speed are both 0 mph and the runner's speed is continuous, by the Intermediate Value Theorem, the runner's speed must have been 11 mph at least twice.
55. Let $d(t)$ represent the distance the automobile traveled in time t . The average speed over $0 \leq t \leq 2$ is $\frac{d(2) - d(0)}{2 - 0}$. The Mean Value Theorem says that for some $0 < t_0 < 2$, $d'(t_0) = \frac{d(2) - d(0)}{2 - 0}$. The value $d'(t_0)$ is the speed of the automobile at time t_0 (which is read on the speedometer).
56. $a(t) = v'(t) = 1.6 \Rightarrow v(t) = 1.6t + C$; at $(0, 0)$ we have $C = 0 \Rightarrow v(t) = 1.6t$. When $t = 30$, then $v(30) = 48$ m/sec.
57. The conclusion of the Mean Value Theorem yields $\frac{\frac{1}{b} - \frac{1}{a}}{b - a} = -\frac{1}{c^2} \Rightarrow c^2 \left(\frac{a - b}{ab}\right) = a - b \Rightarrow c = \sqrt{ab}$.
58. The conclusion of the Mean Value Theorem yields $\frac{b^2 - a^2}{b - a} = 2c \Rightarrow c = \frac{a + b}{2}$.
59. $f'(x) = [\cos x \sin(x + 2) + \sin x \cos(x + 2)] - 2 \sin(x + 1) \cos(x + 1) = \sin(x + x + 2) - \sin 2(x + 1)$
 $= \sin(2x + 2) - \sin(2x + 2) = 0$. Therefore, the function has the constant value $f(0) = -\sin^2 1 \approx -0.7081$

which explains why the graph is a horizontal line.

60. (a) $f(x) = (x+2)(x+1)x(x-1)(x-2) = x^5 - 5x^3 + 4x$ is one possibility.
 (b) Graphing $f(x) = x^5 - 5x^3 + 4x$ and $f'(x) = 5x^4 - 15x^2 + 4$ on $[-3, 3]$ by $[-7, 7]$ we see that each x -intercept of $f'(x)$ lies between a pair of x -intercepts of $f(x)$, as expected by Rolle's Theorem.

- (c) Yes, since \sin is continuous and differentiable on $(-\infty, \infty)$.

61. $f(x)$ must be zero at least once between a and b by the Intermediate Value Theorem. Now suppose that $f(x)$ is zero twice between a and b . Then by the Mean Value Theorem, $f'(x)$ would have to be zero at least once between the two zeros of $f(x)$, but this can't be true since we are given that $f'(x) \neq 0$ on this interval. Therefore, $f(x)$ is zero once and only once between a and b .

62. Consider the function $k(x) = f(x) - g(x)$. $k(x)$ is continuous and differentiable on $[a, b]$, and since $k(a) = f(a) - g(a)$ and $k(b) = f(b) - g(b)$, by the Mean Value Theorem, there must be a point c in (a, b) where $k'(c) = 0$. But since $k'(c) = f'(c) - g'(c)$, this means that $f'(c) = g'(c)$, and c is a point where the graphs of f and g have tangent lines with the same slope, so these lines are either parallel or are the same line.

63. $f'(x) \leq 1$ for $1 \leq x \leq 4 \Rightarrow f(x)$ is differentiable on $1 \leq x \leq 4 \Rightarrow f$ is continuous on $1 \leq x \leq 4 \Rightarrow f$ satisfies the conditions of the Mean Value Theorem $\Rightarrow \frac{f(4) - f(1)}{4 - 1} = f'(c)$ for some c in $1 < x < 4 \Rightarrow f'(c) \leq 1 \Rightarrow \frac{f(4) - f(1)}{3} \leq 1 \Rightarrow f(4) - f(1) \leq 3$

64. $0 < f'(x) < \frac{1}{2}$ for all $x \Rightarrow f'(x)$ exists for all x , thus f is differentiable on $(-1, 1) \Rightarrow f$ is continuous on $[-1, 1] \Rightarrow f$ satisfies the conditions of the Mean Value Theorem $\Rightarrow \frac{f(1) - f(-1)}{1 - (-1)} = f'(c)$ for some c in $[-1, 1] \Rightarrow 0 < \frac{f(1) - f(-1)}{2} < \frac{1}{2} \Rightarrow 0 < f(1) - f(-1) < 1$. Since $f(1) - f(-1) < 1 \Rightarrow f(1) < 1 + f(-1) < 2 + f(-1)$, and since $0 < f(1) - f(-1)$ we have $f(-1) < f(1)$. Together we have $f(-1) < f(1) < 2 + f(-1)$.

65. Let $f(t) = \cos t$ and consider the interval $[0, x]$ where x is a real number. f is continuous on $[0, x]$ and f is differentiable on $(0, x)$ since $f'(t) = -\sin t \Rightarrow f$ satisfies the conditions of the Mean Value Theorem
 $\Rightarrow \frac{f(x)-f(0)}{x-0} = f'(c)$ for some c in $[0, x] \Rightarrow \frac{\cos x-1}{x} = -\sin c$. Since $-1 \leq \sin c \leq 1 \Rightarrow -1 \leq -\sin c \leq 1$
 $\Rightarrow -1 \leq \frac{\cos x-1}{x} \leq 1$. If $x > 0$, $-1 \leq \frac{\cos x-1}{x} \leq 1 \Rightarrow -x \leq \cos x-1 \leq x \Rightarrow |\cos x-1| \leq x = |x|$. If $x < 0$, $-1 \leq \frac{\cos x-1}{x} \leq 1$
 $\Rightarrow -x \geq \cos x-1 \geq x \Rightarrow x \leq \cos x-1 \leq -x \Rightarrow -(-x) \leq \cos x-1 \leq -x \Rightarrow |\cos x-1| \leq -x = |x|$. Thus, in both cases, we have $|\cos x-1| \leq |x|$. If $x = 0$, then $|\cos 0-1| = |1-1| = |0| \leq |0|$, thus $|\cos x-1| \leq |x|$ is true for all x .
66. Let $f(x) = \sin x$ for $a \leq x \leq b$. From the Mean Value Theorem there exists a c between a and b such that
 $\frac{\sin b - \sin a}{b - a} = \cos c \Rightarrow -1 \leq \frac{\sin b - \sin a}{b - a} \leq 1 \Rightarrow \frac{\sin b - \sin a}{b - a} \leq 1 \Rightarrow |\sin b - \sin a| \leq |b - a|$.
67. Yes. By Corollary 2 we have $f(x) = g(x) + c$ since $f'(x) = g'(x)$. If the graphs start at the same point $x = a$, then $f(a) = g(a) \Rightarrow c = 0 \Rightarrow f(x) = g(x)$.
68. Assume f is differentiable and $|f(w) - f(x)| \leq |w - x|$ for all values of w and x . Since f is differentiable, $f'(x)$ exists and $f'(x) = \lim_{w \rightarrow x} \frac{f(w) - f(x)}{w - x}$ using the alternative formula for the derivative. Let $g(x) = |x|$, which is continuous for all x . By Theorem 10 from Chapter 2, $|f'(x)| = \left| \lim_{w \rightarrow x} \frac{f(w) - f(x)}{w - x} \right| = \lim_{w \rightarrow x} \left| \frac{f(w) - f(x)}{w - x} \right|$
 $= \lim_{w \rightarrow x} \frac{|f(w) - f(x)|}{|w - x|}$. Since $|f(w) - f(x)| \leq |w - x|$ for all w and $x \Rightarrow \frac{|f(w) - f(x)|}{|w - x|} \leq 1$ as long as $w \neq x$. By Theorem 5 from Chapter 2, $|f'(x)| = \lim_{w \rightarrow x} \frac{|f(w) - f(x)|}{|w - x|} \leq \lim_{w \rightarrow x} 1 = 1 \Rightarrow |f'(x)| \leq 1 \Rightarrow -1 \leq f'(x) \leq 1$.
69. By the Mean Value Theorem we have $\frac{f(b) - f(a)}{b - a} = f'(c)$ for some point c between a and b . Since $b - a > 0$ and $f(b) < f(a)$, we have $f(b) - f(a) < 0 \Rightarrow f'(c) < 0$.
70. The condition is that f' should be continuous over $[a, b]$. The Mean Value Theorem then guarantees the existence of a point c in (a, b) such that $\frac{f(b) - f(a)}{b - a} = f'(c)$. If f' is continuous, then it has a minimum and maximum value on $[a, b]$, and $\min f' \leq f'(c) \leq \max f'$, as required.
71. $f'(x) = (1 + x^4 \cos x)^{-1} \Rightarrow f''(x) = -(1 + x^4 \cos x)^{-2} (4x^3 \cos x - x^4 \sin x)$
 $= -x^3 (1 + x^4 \cos x)^{-2} (4 \cos x - x \sin x) < 0$ for $0 \leq x \leq 0.1 \Rightarrow f'(x)$ is decreasing when $0 \leq x \leq 0.1$
 $\Rightarrow \min f' \approx 0.9999$ and $\max f' = 1$. Now we have $0.9999 \leq \frac{f(0.1) - 1}{0.1} \leq 1 \Rightarrow 0.09999 \leq f(0.1) - 1 \leq 0.1$
 $\Rightarrow 1.09999 \leq f(0.1) \leq 1.1$.
72. $f'(x) = (1 - x^4)^{-1} \Rightarrow f''(x) = -(1 - x^4)^{-2} (-4x^3) = \frac{4x^3}{(1 - x^4)^2} > 0$ for $0 < x \leq 0.1 \Rightarrow f'(x)$ is increasing when
 $0 \leq x \leq 0.1 \Rightarrow \min f' = 1$ and $\max f' = 1.0001$. Now we have $1 \leq \frac{f(0.1) - 2}{0.1} \leq 1.0001$
 $\Rightarrow 0.1 \leq f(0.1) - 2 \leq 0.10001 \Rightarrow 2.1 \leq f(0.1) \leq 2.10001$.
73. (a) Suppose $x < 1$, then by the Mean Value Theorem $\frac{f(x) - f(1)}{x - 1} < 0 \Rightarrow f(x) > f(1)$. Suppose $x > 1$, then by the Mean Value Theorem $\frac{f(x) - f(1)}{x - 1} > 0 \Rightarrow f(x) > f(1)$. Therefore $f(x) \geq 1$ for all x since $f(1) = 1$.
- (b) Yes. From part (a), $\lim_{x \rightarrow 1^-} \frac{f(x) - f(1)}{x - 1} \leq 0$ and $\lim_{x \rightarrow 1^+} \frac{f(x) - f(1)}{x - 1} \geq 0$. Since $f'(1)$ exists, these two one-sided limits are equal and have the value $f'(1) \Rightarrow f'(1) \leq 0$ and $f'(1) \geq 0 \Rightarrow f'(1) = 0$.

74. From the Mean Value Theorem we have $\frac{f(b)-f(a)}{b-a} = f'(c)$ where c is between a and b . But $f'(c) = 2pc + q = 0$ has only one solution $c = -\frac{q}{2p}$. (Note: $p \neq 0$ since f is a quadratic function.)
75. Proof that $\ln\left(\frac{b}{x}\right) = \ln b - \ln x$: Note that $\frac{d}{dx} \ln\left(\frac{b}{x}\right) = \frac{1}{b/x} \cdot \frac{-b}{x^2} = \frac{-1}{x}$ and $\frac{d}{dx} (\ln b - \ln x) = \frac{-1}{x}$; by Corollary 2 of the Mean Value Theorem there is a constant C so that $\ln\left(\frac{b}{x}\right) = \ln b - \ln x + C$; if $x = b$, then $\ln 1 = \ln b - \ln b + C \Rightarrow C = 0 \Rightarrow \ln\left(\frac{b}{x}\right) = \ln b - \ln x$.
76. (a) $\frac{d}{dx} (\tan^{-1} x + \cot^{-1} x) = \frac{1}{1+x^2} + \frac{-1}{1+x^2} = 0 \Rightarrow$ by Corollary 2 of the Mean Value Theorem that $\tan^{-1} x + \cot^{-1} x = C$ for some constant C ; if $x = 1$, then $\tan^{-1} 1 + \cot^{-1} 1 = \frac{\pi}{4} + \frac{\pi}{4} = \frac{\pi}{2} = C \Rightarrow \tan^{-1} x + \cot^{-1} x = \frac{\pi}{2}$.
- (b) $\frac{d}{dx} (\sec^{-1} x + \csc^{-1} x) = \frac{1}{|x|\sqrt{x^2-1}} + \frac{-1}{|x|\sqrt{x^2-1}} = 0 \Rightarrow$ by Corollary 2 of the Mean Value Theorem that $\sec^{-1} x + \csc^{-1} x = C$ for some constant C ; if $x = \sqrt{2}$, then $\sec^{-1} \sqrt{2} + \csc^{-1} \sqrt{2} = \frac{\pi}{4} + \frac{\pi}{4} = \frac{\pi}{2} = C \Rightarrow \sec^{-1} x + \csc^{-1} x = \frac{\pi}{2}$.

66. $h(\theta) = 5 \sin\left(\frac{\theta}{2}\right) \Rightarrow h'(\theta) = \frac{5}{2} \cos\left(\frac{\theta}{2}\right) \Rightarrow h' = \left[\begin{matrix} + & + & + \\ 0 & & \pi \end{matrix} \right]$, $(0, 0)$ and $(\pi, 5) \Rightarrow$ a local maximum is 5 at $\theta = \pi$, a local minimum is 0 at $\theta = 0$

71. The function $f(x) = x \sin\left(\frac{1}{x}\right)$ has an infinite number of local maxima and minima on its domain, which is $(-\infty, 0) \cup (0, \infty)$. The function $\sin x$ has the following properties: a) it is continuous on $(-\infty, \infty)$; b) it is periodic; and c) its range is $[-1, 1]$. Also, for $a > 0$, the function $\frac{1}{x}$ has a range of $(-\infty, -a] \cup [a, \infty)$ on $\left[-\frac{1}{a}, 0\right) \cup \left(0, \frac{1}{a}\right]$. In particular, if $a = 1$, then $\frac{1}{x} \leq -1$ or $\frac{1}{x} \geq 1$ when x is in $[-1, 0) \cup (0, 1]$. This means $\sin\left(\frac{1}{x}\right)$ takes on the values of 1 and -1 infinitely many times on $[-1, 0) \cup (0, 1]$, namely at $\frac{1}{x} = \pm\frac{\pi}{2}, \pm\frac{3\pi}{2}, \pm\frac{5\pi}{2}, \dots \Rightarrow x = \pm\frac{2}{\pi}, \pm\frac{2}{3\pi}, \pm\frac{2}{5\pi}, \dots$. Thus $\sin\left(\frac{1}{x}\right)$ has infinitely many local maxima and minima in $[-1, 0) \cup (0, 1]$. On the interval $(0, 1]$, $-1 \leq \sin\left(\frac{1}{x}\right) \leq 1$ and since $x > 0$ we have $-x \leq x \sin\left(\frac{1}{x}\right) \leq x$. On the interval $[-1, 0)$, $-1 \leq \sin\left(\frac{1}{x}\right) \leq 1$ and since $x < 0$ we have $-x \geq x \sin\left(\frac{1}{x}\right) \geq x$. Thus $f(x)$ is bounded by the lines $y = x$ and $y = -x$. Since $\sin\left(\frac{1}{x}\right)$ oscillates between 1 and -1 infinitely many times on $[-1, 0) \cup (0, 1]$ then f will oscillate between $y = x$ and $y = -x$ infinitely many times. Thus f has infinitely many local maxima and minima. We can see from the graph (and verify later in Chapter 7) that $\lim_{x \rightarrow \infty} x \sin\left(\frac{1}{x}\right) = 1$ and $\lim_{x \rightarrow -\infty} x \sin\left(\frac{1}{x}\right) = 1$. The graph of f does not have any absolute maxima, but it does have two absolute minima.
72. $f(x) = ax^2 + bx + c = a\left(x^2 + \frac{b}{a}x\right) + c = a\left(x^2 + \frac{b}{a}x + \frac{b^2}{4a^2}\right) - \frac{b^2}{4a} + c = a\left(x + \frac{b}{2a}\right)^2 - \frac{b^2 - 4ac}{4a}$, a parabola whose vertex is at $x = -\frac{b}{2a}$. Thus when $a > 0$, f is increasing on $\left(-\frac{b}{2a}, \infty\right)$ and decreasing on $\left(-\infty, \frac{-b}{2a}\right)$; when $a < 0$, f is increasing on $\left(-\infty, \frac{-b}{2a}\right)$ and decreasing on $\left(\frac{-b}{2a}, \infty\right)$. Also note that $f'(x) = 2ax + b = 2a\left(x + \frac{b}{2a}\right) \Rightarrow$ for $a > 0$, $f' = \text{---} \mid \text{+++}$; for $a < 0$, $f' = \text{+++} \mid \text{---}$.
 $\qquad \qquad \qquad -b/2a \qquad \qquad \qquad -b/2a$
73. $f(x) = ax^2 + bx \Rightarrow f'(x) = 2ax + b$, $f(1) = 2 \Rightarrow a + b = 2$, $f'(1) = 0 \Rightarrow 2a + b = 0 \Rightarrow a = -2, b = 4$
 $\Rightarrow f(x) = -2x^2 + 4x$
74. $f(x) = ax^3 + bx^2 + cx + d \Rightarrow f'(x) = 3ax^2 + 2bx + c$, $f(0) = 0 \Rightarrow d = 0$, $f(1) = -1 \Rightarrow a + b + c + d = -1$,
 $f'(0) = 0 \Rightarrow c = 0$, $f'(1) = 0 \Rightarrow 3a + 2b + c = 0 \Rightarrow a = 2, b = -3, c = 0, d = 0 \Rightarrow f(x) = 2x^3 - 3x^2$
75. (a) $f(x) = \ln(\cos x) \Rightarrow f'(x) = -\frac{\sin x}{\cos x} = -\tan x = 0 \Rightarrow x = 0$; $f'(x) > 0$ for $-\frac{\pi}{4} \leq x < 0$ and $f'(x) < 0$ for $0 < x \leq \frac{\pi}{4} \Rightarrow$ there is a relative maximum at $x = 0$ with $f(0) = \ln(\cos 0) = \ln 1 = 0$;
 $f\left(-\frac{\pi}{4}\right) = \ln\left(\cos\left(-\frac{\pi}{4}\right)\right) = \ln\left(\frac{1}{\sqrt{2}}\right) = -\frac{1}{2}\ln 2$ and $f\left(\frac{\pi}{4}\right) = \ln\left(\cos\left(\frac{\pi}{4}\right)\right) = \ln\frac{1}{\sqrt{2}} = -\frac{1}{2}\ln 2$. Therefore, the absolute minimum occurs at $x = \pm\frac{\pi}{4}$ with $f\left(\pm\frac{\pi}{4}\right) = -\frac{1}{2}\ln 2$ and the absolute maximum occurs at $x = 0$ with $f(0) = 0$.
- (b) $f(x) = \cos(\ln x) \Rightarrow f'(x) = \frac{-\sin(\ln x)}{x} = 0 \Rightarrow x = 1$; $f'(x) > 0$ for $\frac{1}{2} \leq x < 1$ and $f'(x) < 0$ for $1 < x \leq 2$
 \Rightarrow there is a relative maximum at $x = 1$ with $f(1) = \cos(\ln 1) = \cos 0 = 1$;
 $f\left(\frac{1}{2}\right) = \cos\left(\ln\left(\frac{1}{2}\right)\right) = \cos(-\ln 2) = \cos(\ln 2)$ and $f(2) = \cos(\ln 2)$. Therefore, the absolute minimum occurs at $x = \frac{1}{2}$ and $x = 2$ with $f\left(\frac{1}{2}\right) = f(2) = \cos(\ln 2)$, and the absolute maximum occurs at $x = 1$ with $f(1) = 1$.
76. (a) $f(x) = x - \ln x \Rightarrow f'(x) = 1 - \frac{1}{x}$; if $x > 1$, then $f'(x) > 0$ which means that $f(x)$ is increasing
- (b) $f(1) = 1 - \ln 1 = 1 \Rightarrow f(x) = x - \ln x > 0$, if $x > 1$ by part (a) $\Rightarrow x > \ln x$ if $x > 1$

77. $f(x) = e^x - 2x \Rightarrow f'(x) = e^x - 2$; $f'(x) = 0 \Rightarrow e^x = 2 \Rightarrow x = \ln 2$; $f(0) = 1$, the absolute maximum; $f(\ln 2) = 2 - 2 \ln 2 \approx 0.613706$, the absolute minimum; $f(1) = e - 2 \approx 0.71828$, a relative or local maximum since f is increasing on the interval $(\ln 2, 1)$.
78. The function $f(x) = 2e^{\sin(x/2)}$ has a maximum whenever $\sin \frac{x}{2} = 1$ and a minimum whenever $\sin \frac{x}{2} = -1$. Therefore the maximums occur at $x = \pi + 2k(2\pi)$ and the minimums occur at $x = 3\pi + 2k(2\pi)$, where k is any integer. The maximum is $2e \approx 5.43656$ and the minimum is $\frac{2}{e} \approx 0.73576$.
79. $f(x) = x^2 \ln \frac{1}{x} \Rightarrow f'(x) = 2x \ln \frac{1}{x} + x^2 \left(\frac{1}{x} \right) (-x^{-2}) = 2x \ln \frac{1}{x} - x = -x(2 \ln x + 1)$; $f'(x) = 0 \Rightarrow x = 0$ or $\ln x = -\frac{1}{2}$. Since $x = 0$ is not in the domain of f , $x = e^{-1/2} = \frac{1}{\sqrt{e}}$. Also, $f'(x) > 0$ for $0 < x < \frac{1}{\sqrt{e}}$ and $f'(x) < 0$ for $x > \frac{1}{\sqrt{e}}$. Therefore, $f\left(\frac{1}{\sqrt{e}}\right) = \frac{1}{e} \ln \sqrt{e} = \frac{1}{e} \ln e^{1/2} = \frac{1}{2e} \ln e = \frac{1}{2e}$ is the absolute maximum value of f assumed at $x = \frac{1}{\sqrt{e}}$.
80. (a) Let $f(x) = e^x - x - 1 \Rightarrow f'(x) = e^x - 1 \Rightarrow$ a critical point at $x = 0 \Rightarrow f' = \text{---} | \text{+++}$, so f is increasing on $(0, \infty)$; since $f(0) = 0$ it follows that $f(x) = e^x - x - 1 \geq 0$ for $x \geq 0 \Rightarrow e^x \geq x + 1$ for $x \geq 0$.
- (b) Let $f(x) = e^x - \frac{1}{2}x^2 - x - 1 \Rightarrow f'(x) = e^x - x - 1 \geq 0$ for $x \geq 0$ by part (a), so f is increasing on $(0, \infty)$; since $f(0) = 0$ it follows that $f(x) = e^x - \frac{1}{2}x^2 - x - 1 \geq 0$ for $x \geq 0 \Rightarrow e^x \geq \frac{1}{2}x^2 + x + 1$ for $x \geq 0$.
81. Let $x_1 \neq x_2$ be two numbers in the domain of an increasing function f . Then, either $x_1 < x_2$ or $x_1 > x_2$ which implies $f(x_1) < f(x_2)$ or $f(x_1) > f(x_2)$, since $f(x)$ is increasing. In either case, $f(x_1) \neq f(x_2)$ and f is one-to-one. Similar arguments hold if f is decreasing.
82. $f(x)$ is increasing since $x_2 > x_1 \Rightarrow \frac{1}{3}x_2 + \frac{5}{6} > \frac{1}{3}x_1 + \frac{5}{6}$; $\frac{df}{dx} = \frac{1}{3} \Rightarrow \frac{df^{-1}}{dx} = \frac{1}{\left(\frac{1}{3}\right)} = 3$
83. $f(x)$ is increasing since $x_2 > x_1 \Rightarrow 27x_2^3 > 27x_1^3$; $y = 27x^3 \Rightarrow x = \frac{1}{3}y^{1/3} \Rightarrow f^{-1}(x) = \frac{1}{3}x^{1/3}$;
 $\frac{df}{dx} = 81x^2 \Rightarrow \frac{df^{-1}}{dx} = \frac{1}{81x^2} \Big|_{\frac{1}{3}x^{1/3}} = \frac{1}{9x^{2/3}} = \frac{1}{9}x^{-2/3}$
84. $f(x)$ is decreasing since $x_2 > x_1 \Rightarrow 1 - 8x_2^3 < 1 - 8x_1^3$; $y = 1 - 8x^3 \Rightarrow x = \frac{1}{2}(1 - y)^{1/3} \Rightarrow f^{-1}(x) = \frac{1}{2}(1 - x)^{1/3}$;
 $\frac{df}{dx} = -24x^2 \Rightarrow \frac{df^{-1}}{dx} = \frac{1}{-24x^2} \Big|_{\frac{1}{2}(1-x)^{1/3}} = \frac{-1}{6(1-x)^{2/3}} = -\frac{1}{6}(1-x)^{-2/3}$
85. $f(x)$ is decreasing since $x_2 > x_1 \Rightarrow (1 - x_2)^3 < (1 - x_1)^3$; $y = (1 - x)^3 \Rightarrow x = 1 - y^{1/3} \Rightarrow f^{-1}(x) = 1 - x^{1/3}$;
 $\frac{df}{dx} = -3(1 - x)^2 \Rightarrow \frac{df^{-1}}{dx} = \frac{1}{-3(1 - x)^2} \Big|_{1 - x^{1/3}} = \frac{-1}{3x^{2/3}} = -\frac{1}{3}x^{-2/3}$

86. $f(x)$ is increasing since $x_2 > x_1 \Rightarrow x_2^{5/3} > x_1^{5/3}$; $y = x^{5/3} \Rightarrow x = y^{3/5} \Rightarrow f^{-1}(x) = x^{3/5}$;

$$\frac{df}{dx} = \frac{5}{3}x^{2/3} \Rightarrow \frac{df^{-1}}{dx} = \frac{1}{\frac{5}{3}x^{2/3}} \Big|_{x^{3/5}} = \frac{3}{5x^{2/5}} = \frac{3}{5}x^{-2/5}$$

$$y' = -\frac{2x^2 + 5x + 4}{x^3(x-2)^2}; \quad y'' = \frac{6x^3 - 24x^2 + 40x - 24}{x^4(x-2)^3}$$

There are no critical points. The function is increasing on $(-\infty, 0)$ and decreasing on $(0, 2) \cup (2, \infty)$. There is an inflection point at

approximately $x = 1.223$. The function is concave up on $(-\infty, 0) \cup (0, 1.223) \cup (2, \infty)$ and concave down on $(1.223, 2)$. The lines $x = 0$ (the y -axis) and $x = 2$ are vertical asymptotes.

Dividing numerator and denominator by x^3 gives

$y = \frac{(1/x^2) - (1/x^3)}{1 - (2/x)}$ which shows that the x -axis is a horizontal asymptote. The x -intercept is 1.

101. $y = \frac{8}{x^2 + 4}$

The domain is $(-\infty, \infty)$.

$y' = -\frac{16x}{(x^2 + 4)^2}$; $y'' = \frac{16(3x^2 - 4)}{(x^2 + 4)^3}$

There is a critical point at $x = 0$, where the function has a local maximum. The function is increasing on $(-\infty, 0)$ and decreasing on $(0, \infty)$. There are inflection points at $x = -2/\sqrt{3}$ and at $x = 2/\sqrt{3}$. The function is concave up on $(-\infty, -2/\sqrt{3}) \cup (2/\sqrt{3}, \infty)$ and concave down on $(-2/\sqrt{3}, 2/\sqrt{3})$. Dividing numerator and denominator by x^2 gives $y = \frac{8/x^2}{1 + (4/x^2)}$ which shows that the x -axis is a horizontal asymptote. The y -intercept is 2.

102. $y = \frac{4x}{x^2 + 4}$

The domain is $(-\infty, \infty)$.

$y' = -\frac{4(x^2 - 4)}{(x^2 + 4)^2}$; $y'' = \frac{8x(x^2 - 12)}{(x^2 + 4)^3}$

There is a critical point at $x = -2$, where the function has a local minimum, and at $x = 2$, where the function has a local maximum. The function is increasing on $(-2, 2)$ and decreasing on $(-\infty, -2) \cup (2, \infty)$. There are inflection points at $x = -2\sqrt{3}$, $x = 0$, and $x = 2\sqrt{3}$. The function is concave up on $(-2\sqrt{3}, 0) \cup (2\sqrt{3}, \infty)$ and concave down on $(-\infty, -2\sqrt{3}) \cup (0, 2\sqrt{3})$. Dividing numerator and denominator by x^2 gives $y = \frac{4/x}{1 + (4/x^2)}$ which shows that the x -axis is a horizontal asymptote. The x -intercept is 0 and the y -intercept is 0.

107. Graphs printed in color can shift during a press run, so your values may differ somewhat from those given here.

- The body is moving away from the origin when $|\text{displacement}|$ is increasing as t increases, $0 < t < 2$ and $6 < t < 9.5$; the body is moving toward the origin when $|\text{displacement}|$ is decreasing as t increases, $2 < t < 6$ and $9.5 < t < 15$.
- The velocity will be zero when the slope of the tangent line for $y = s(t)$ is horizontal. The velocity is zero when t is approximately 2, 6, or 9.5 sec.
- The acceleration will be zero at those values of t where the curve $y = s(t)$ has points of inflection. The acceleration is zero when t is approximately 4, 7.5, or 12.5.
- The acceleration is positive when the concavity is up, $4 < t < 7.5$ and $12.5 < t < 15$; the acceleration is negative when the concavity is down, $0 < t < 4$ and $7.5 < t < 12.5$.

108. (a) The body is moving away from the origin when $|\text{displacement}|$ is increasing as t increases, $1.5 < t < 4$, $10 < t < 12$ and $13.5 < t < 16$; the body is moving toward the origin when $|\text{displacement}|$ is decreasing as t increases, $0 < t < 1.5$, $4 < t < 10$ and $12 < t < 13.5$.
- (b) The velocity will be zero when the slope of the tangent line for $y = s(t)$ is horizontal. The velocity is zero when t is approximately 0, 4, 12 or 16 sec.
- (c) The acceleration will be zero at those values of t where the curve $y = s(t)$ has points of inflection. The acceleration is zero when t is approximately 1.5, 6, 8, 10.5, or 13.5 sec.
- (d) The acceleration is positive when the concavity is up, $0 < t < 1.5$, $6 < t < 8$ and $10 < t < 13.5$, the acceleration is negative when the concavity is down, $1.5 < t < 6$, $8 < t < 10$ and $13.5 < t < 16$.

109. The marginal cost is $\frac{dc}{dx}$ which changes from decreasing to increasing when its derivative $\frac{d^2c}{dx^2}$ is zero. This is a point of inflection of the cost curve and occurs when the production level x is approximately 60 thousand units.

110. The marginal revenue is $\frac{dy}{dx}$ and it is increasing when its derivative $\frac{d^2y}{dx^2}$ is positive \Rightarrow the curve is concave up $\Rightarrow 0 < t < 2$ and $5 < t < 9$; marginal revenue is decreasing when $\frac{d^2y}{dx^2} < 0 \Rightarrow$ the curve is concave down $\Rightarrow 2 < t < 5$ and $9 < t < 12$.

111. When $y' = (x-1)^2(x-2)$, then $y'' = 2(x-1)(x-2) + (x-1)^2$. The curve falls on $(-\infty, 2)$ and rises on $(2, \infty)$. At $x = 2$ there is a local minimum. There is no local maximum. The curve is concave upward on $(-\infty, 1)$ and $(\frac{5}{3}, \infty)$, and concave downward on $(1, \frac{5}{3})$. At $x = 1$ or $x = \frac{5}{3}$ there are inflection points.

112. When $y' = (x-1)^2(x-2)(x-4)$, then $y'' = 2(x-1)(x-2)(x-4) + (x-1)^2(x-4) + (x-1)^2(x-2)$
 $= (x-1)[2(x^2 - 6x + 8) + (x^2 - 5x + 4) + (x^2 - 3x + 2)] = 2(x-1)(2x^2 - 10x + 11)$. The curve rises on $(-\infty, 2)$ and $(4, \infty)$ and falls on $(2, 4)$. At $x = 2$ there is a local maximum and at $x = 4$ a local minimum. The curve is concave downward on $(-\infty, 1)$ and $(\frac{5-\sqrt{3}}{2}, \frac{5+\sqrt{3}}{2})$ and concave upward on $(1, \frac{5-\sqrt{3}}{2})$ and $(\frac{5+\sqrt{3}}{2}, \infty)$. At $x = 1, \frac{5-\sqrt{3}}{2}$ and $\frac{5+\sqrt{3}}{2}$ there are inflection points.

113. The graph must be concave down for $x > 0$ because $f''(x) = -\frac{1}{x^2} < 0$.

114. The second derivative, being continuous and never zero, cannot change sign. Therefore the graph will always be concave up or concave down so it will have no inflection points and no cusps or corners.

115. The curve will have a point of inflection at $x = 1$ if 1 is a solution of $y'' = 0$; $y = x^3 + bx^2 + cx + d$
 $\Rightarrow y' = 3x^2 + 2bx + c \Rightarrow y'' = 6x + 2b$ and $6(1) + 2b = 0 \Rightarrow b = -3$.

116. (a) $f(x) = ax^2 + bx + c = a(x^2 + \frac{b}{a}x) + c = a(x^2 + \frac{b}{a}x + \frac{b^2}{4a^2}) - \frac{b^2}{4a} + c = a(x + \frac{b}{2a})^2 - \frac{b^2 - 4ac}{4a}$ a parabola whose vertex is at $x = -\frac{b}{2a} \Rightarrow$ the coordinates of the vertex are $(-\frac{b}{2a}, -\frac{b^2 - 4ac}{4a})$

(b) The second derivative, $f''(x) = 2a$, describes concavity \Rightarrow when $a > 0$ the parabola is concave up and when $a < 0$ the parabola is concave down.

117. A quadratic curve never has an inflection point. If $y = ax^2 + bx + c$ where $a \neq 0$, then $y' = 2ax + b$ and $y'' = 2a$. Since $2a$ is a constant, it is not possible for y'' to change signs.

118. A cubic curve always has exactly one inflection point. If $y = ax^3 + bx^2 + cx + d$ where $a \neq 0$, then $y' = 3ax^2 + 2bx + c$ and $y'' = 6ax + 2b$. Since $-\frac{b}{3a}$ is a solution of $y'' = 0$, we have that y'' changes its sign at $x = -\frac{b}{3a}$ and y' exists everywhere (so there is a tangent at $x = -\frac{b}{3a}$). Thus the curve has an inflection point at $x = -\frac{b}{3a}$. There are no other inflection points because y'' changes sign only at this zero.

119. $y'' = (x+1)(x-2)$, when $y'' = 0 \Rightarrow x = -1$ or $x = 2$; $y'' = \begin{matrix} + & + & + \\ - & 1 & - \\ - & - & + \end{matrix} \Rightarrow$ points of inflection at $x = -1$ and $x = 2$

120. $y'' = x^2(x-2)^3(x+3)$, when $y'' = 0 \Rightarrow x = -3, x = 0$ or $x = 2$; $y'' = \begin{matrix} + & + & + \\ - & 3 & - \\ - & - & + \end{matrix} \Rightarrow$ points of inflection at $x = -3$ and $x = 2$

121. $y = ax^3 + bx^2 + cx \Rightarrow y' = 3ax^2 + 2bx + c$ and $y'' = 6ax + 2b$; local maximum at $x = 3$
 $\Rightarrow 3a(3)^2 + 2b(3) + c = 0 \Rightarrow 27a + 6b + c = 0$; local minimum at $x = -1 \Rightarrow 3a(-1)^2 + 2b(-1) + c = 0$
 $\Rightarrow 3a - 2b + c = 0$; point of inflection at $(1, 11) \Rightarrow a(1)^3 + b(1)^2 + c(1) = 11 \Rightarrow a + b + c = 11$ and
 $6a(1) + 2b = 0 \Rightarrow 6a + 2b = 0$. Solving $27a + 6b + c = 0$, $3a - 2b + c = 0$, $a + b + c = 11$, and $6a + 2b = 0$
 $\Rightarrow a = -1$, $b = 3$, and $c = 9 \Rightarrow y = -x^3 + 3x^2 + 9x$

122. $y = \frac{x^2+a}{bx+c} \Rightarrow y' = \frac{bx^2+2cx-ab}{(bx+c)^2}$; local maximum at $x = 3 \Rightarrow \frac{b(3)^2+2c(3)-ab}{(b(3)+c)^2} = 0 \Rightarrow 9b+6c-ab=0$; local
 minimum at $(-1, -2) \Rightarrow \frac{b(-1)^2+2c(-1)-ab}{(b(-1)+c)^2} = 0 \Rightarrow b-2c-ab=0$ and $\frac{(-1)^2+a}{b(-1)+c} = -2 \Rightarrow -a+2b-2c=1$.
 Solving $9b+6c-ab=0$, $b-2c-ab=0$, and $-a+2b-2c=1 \Rightarrow a=3$, $b=1$, and $c=-1 \Rightarrow y = \frac{x^2+3}{x-1}$.

123. If $y = x^5 - 5x^4 - 240$, then $y' = 5x^3(x-4)$ and
 $y'' = 20x^2(x-3)$. The zeros of y' are extrema, and
 there is a point of inflection at $x = 3$.

124. If $y = x^3 - 12x^2$ then $y' = 3x(x-8)$ and $y'' = 6(x-4)$.
 The zeros of y' and y'' are extrema, and points of
 inflection, respectively.

125. If $y = \frac{4}{5}x^5 + 16x^2 - 25$, then $y' = 4x(x^3 + 8)$ and
 $y'' = 16(x^2 + 2)$. The zeros of y' and y'' are extrema,
 and points of inflection, respectively.

126. If $y = \frac{x^4}{4} - \frac{x^3}{3} - 4x^2 + 12x + 20$, then
 $y' = x^3 - x^2 - 8x + 12 = (x+3)(x-2)^2$. So y has a
 local minimum at $x = -3$ as its only extreme value.
 Also $y'' = 3x^2 - 2x - 8 = (3x+4)(x-2)$ and there
 are inflection points at both zeros, $-\frac{4}{3}$ and 2 , of y'' .

127. The graph of f falls where $f' < 0$, rises where $f' > 0$, and has horizontal tangents where $f' = 0$. It has local minima at points where f' changes from negative to positive and local maxima where f' changes from positive to negative. The graph of f is concave down where $f'' < 0$ and concave up where $f'' > 0$. It has an inflection point each time f'' changes sign, provided a tangent line exists there.

128. The graph f is concave down where $f'' < 0$, and concave up where $f'' > 0$. It has an inflection point each time f'' changes sign, provided a tangent line exists there.

82. $\lim_{x \rightarrow \infty} \left(\sqrt{x^2 + 1} - \sqrt{x} \right) = \lim_{x \rightarrow \infty} x \left(\frac{\sqrt{x^2 + 1}}{x} - \frac{\sqrt{x}}{x} \right) = \lim_{x \rightarrow \infty} x \left(\sqrt{\frac{x^2 + 1}{x^2}} - \sqrt{\frac{x}{x^2}} \right) = \lim_{x \rightarrow \infty} x \left(\sqrt{1 + \frac{1}{x^2}} - \sqrt{\frac{1}{x}} \right) = \infty$

83. The graph indicates a limit near -1 . The limit leads to the indeterminate form $\frac{0}{0}$:

$$\begin{aligned} \lim_{x \rightarrow 1} \frac{2x^2 - (3x + 1)\sqrt{x} + 2}{x - 1} &= \lim_{x \rightarrow 1} \frac{2x^2 - 3x^{3/2} - x^{1/2} + 2}{x - 1} = \lim_{x \rightarrow 1} \frac{4x - \frac{9}{2}x^{1/2} - \frac{1}{2}x^{-1/2}}{1} \\ &= \frac{4 - \frac{9}{2} - \frac{1}{2}}{1} = \frac{4 - 5}{1} = -1 \end{aligned}$$

84. (a) The limit leads to the indeterminate form 1^∞ . Let $f(x) = \left(1 + \frac{1}{x}\right)^x \Rightarrow \ln f(x) = x \ln \left(1 + \frac{1}{x}\right) \Rightarrow \lim_{x \rightarrow \infty} \ln f(x)$

$$\begin{aligned} &= \lim_{x \rightarrow \infty} \frac{\ln \left(1 + \frac{1}{x}\right)}{\left(\frac{1}{x}\right)} = \lim_{x \rightarrow \infty} \frac{\ln(1 + x^{-1})}{x^{-1}} = \lim_{x \rightarrow \infty} \frac{\left(\frac{-x^{-2}}{1 + x^{-1}}\right)}{-x^{-2}} = \lim_{x \rightarrow \infty} \frac{1}{1 + \left(\frac{1}{x}\right)} = \frac{1}{1 + 0} = 1 \Rightarrow \lim_{x \rightarrow \infty} \left(1 + \frac{1}{x}\right)^x = \lim_{x \rightarrow \infty} f(x) \\ &= \lim_{x \rightarrow \infty} e^{\ln f(x)} = e^1 = e \end{aligned}$$

(b) $x \quad \left(1 + \frac{1}{x}\right)^x$

10	2.5937424601
100	2.70481382942
1000	2.71692393224
10,000	2.71814592683
100,000	2.71826823717

Both functions have limits as x approaches infinity. The function f has a maximum but no minimum while g has no extrema. The limit of $f(x)$ leads to the indeterminate form 1^∞ .

(c) Let $f(x) = \left(1 + \frac{1}{x^2}\right)^x \Rightarrow \ln f(x) = x \ln \left(1 + x^{-2}\right)$

$$\Rightarrow \lim_{x \rightarrow \infty} \ln f(x) = \lim_{x \rightarrow \infty} \frac{\ln(1 + x^{-2})}{x^{-1}} = \lim_{x \rightarrow \infty} \frac{\left(\frac{-2x^{-3}}{1 + x^{-2}}\right)}{-x^{-2}} = \lim_{x \rightarrow \infty} \frac{2x^2}{x^3 + x} = \lim_{x \rightarrow \infty} \frac{4x}{3x^2 + 1} = \lim_{x \rightarrow \infty} \frac{4}{6x} = 0.$$

Therefore $\lim_{x \rightarrow \infty} \left(1 + \frac{1}{x^2}\right)^x = \lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} e^{\ln f(x)} = e^0 = 1$

85. Let $f(k) = \left(1 + \frac{r}{k}\right)^k \Rightarrow \ln f(k) = \frac{\ln(1+rk^{-1})}{k^{-1}} \Rightarrow \lim_{k \rightarrow \infty} \frac{\ln(1+rk^{-1})}{k^{-1}} = \lim_{k \rightarrow \infty} \frac{\left(\frac{-rk^{-2}}{1+rk^{-1}}\right)}{-k^{-2}} = \lim_{k \rightarrow \infty} \frac{r}{1+rk^{-1}} = \lim_{k \rightarrow \infty} \frac{rk}{k+r} = \lim_{k \rightarrow \infty} \frac{r}{1} = r$. Therefore $\lim_{k \rightarrow \infty} \left(1 + \frac{r}{k}\right)^k = \lim_{k \rightarrow \infty} f(k) = \lim_{k \rightarrow \infty} e^{\ln f(k)} = e^r$.

86. (a) $y = x^{1/x} \Rightarrow \ln y = \frac{\ln x}{x} \Rightarrow \frac{y'}{y} = \frac{\left(\frac{1}{x}\right)(x) - \ln x}{x^2} \Rightarrow y' = \left(\frac{1 - \ln x}{x^2}\right)(x^{1/x})$. The sign pattern is $y' = \underset{0}{|+++++} \underset{e}{|-----}$ which indicates a maximum value of $y = e^{1/e}$ when $x = e$

(b) $y = x^{1/x^2} \Rightarrow \ln y = \frac{\ln x}{x^2} \Rightarrow \frac{y'}{y} = \frac{\left(\frac{1}{x}\right)(x^2) - 2x \ln x}{x^4} \Rightarrow y' = \left(\frac{1 - 2 \ln x}{x^3}\right)(x^{1/x^2})$. The sign pattern is $y' = \underset{0}{|+++} \underset{\sqrt{e}}{|-----}$ which indicates a maximum of $y = e^{1/(2e)}$ when $x = \sqrt{e}$

(c) $y = x^{1/x^n} \Rightarrow \ln y = \frac{\ln x}{x^n} = \frac{\left(\frac{1}{x}\right)(x^n) - (\ln x)(nx^{n-1})}{x^{2n}} \Rightarrow y' = \frac{x^{n-1}(1 - n \ln x)}{x^{2n}} \cdot x^{1/x}$. The sign pattern is $y' = \underset{0}{|+++} \underset{\sqrt[n]{e}}{|-----}$ which indicates a maximum of $y = e^{1/(ne)}$ when $x = \sqrt[n]{e}$

(d) $\lim_{x \rightarrow \infty} x^{1/x^n} = \lim_{x \rightarrow \infty} \left(e^{\ln x}\right)^{1/x^n} = \lim_{x \rightarrow \infty} e^{(\ln x)x^{-n}} = \exp\left(\lim_{x \rightarrow \infty} \frac{\ln x}{x^n}\right) = \exp\left(\lim_{x \rightarrow \infty} \left(\frac{1}{nx^n}\right)\right) = e^0 = 1$

87. (a) $y = x \tan\left(\frac{1}{x}\right), \lim_{x \rightarrow \infty} \left(x \tan\left(\frac{1}{x}\right)\right) = \lim_{x \rightarrow \infty} \left(\frac{\tan\left(\frac{1}{x}\right)}{\frac{1}{x}}\right) = \lim_{x \rightarrow \infty} \left(\frac{\sec^2\left(\frac{1}{x}\right)\left(-\frac{1}{x^2}\right)}{\left(-\frac{1}{x^2}\right)}\right) = \lim_{x \rightarrow \infty} \sec^2\left(\frac{1}{x}\right) = 1; \lim_{x \rightarrow -\infty} \left(x \tan\left(\frac{1}{x}\right)\right) = \lim_{x \rightarrow -\infty} \left(\frac{\tan\left(\frac{1}{x}\right)}{\frac{1}{x}}\right) = \lim_{x \rightarrow -\infty} \left(\frac{\sec^2\left(\frac{1}{x}\right)\left(-\frac{1}{x^2}\right)}{\left(-\frac{1}{x^2}\right)}\right) = \lim_{x \rightarrow -\infty} \sec^2\left(\frac{1}{x}\right) = 1 \Rightarrow$ the horizontal asymptote is $y = 1$ as $x \rightarrow \infty$ and as $x \rightarrow -\infty$.

(b) $y = \frac{3x + e^{2x}}{2x + e^{3x}}, \lim_{x \rightarrow \infty} \left(\frac{3x + e^{2x}}{2x + e^{3x}}\right) = \lim_{x \rightarrow \infty} \left(\frac{3 + 2e^{2x}}{2 + 3e^{3x}}\right) = \lim_{x \rightarrow \infty} \left(\frac{4e^{2x}}{9e^{3x}}\right) = \lim_{x \rightarrow \infty} \left(\frac{4}{9e^x}\right) = 0; \lim_{x \rightarrow -\infty} \left(\frac{3x + e^{2x}}{2x + e^{3x}}\right) = \lim_{x \rightarrow -\infty} \left(\frac{3 + e^{2x}}{2 + 3e^{3x}}\right) = \frac{3}{2} \Rightarrow$ the horizontal asymptotes are $y = 0$ as $x \rightarrow \infty$ and $y = \frac{3}{2}$ as $x \rightarrow -\infty$.

88. $f'(0) = \lim_{h \rightarrow 0} \frac{f(0+h) - f(0)}{h} = \lim_{h \rightarrow 0} \frac{e^{-1/h^2} - 0}{h} = \lim_{h \rightarrow 0} \frac{e^{-1/h^2}}{h} = \lim_{h \rightarrow 0} \left(\frac{\frac{1}{h}}{e^{1/h^2}}\right) = \lim_{h \rightarrow 0} \left(\frac{-\frac{1}{h^2}}{e^{1/h^2}\left(\frac{-2}{h^3}\right)}\right) = \lim_{h \rightarrow 0} \left(\frac{h}{2e^{1/h^2}}\right) = \lim_{h \rightarrow 0} \left(\frac{h}{2} e^{-1/h^2}\right) = 0$

89. (a) We should assign the value 1 to $f(x) = (\sin x)^x$ to make it continuous at $x = 0$.

$$(b) \ln f(x) = x \ln(\sin x) = \frac{\ln(\sin x)}{\left(\frac{1}{x}\right)} \Rightarrow \lim_{x \rightarrow 0^+} \ln f(x) = \lim_{x \rightarrow 0^+} \frac{\ln(\sin x)}{\left(\frac{1}{x}\right)} = \lim_{x \rightarrow 0^+} \frac{\left(\frac{1}{\sin x}\right)(\cos x)}{\left(-\frac{1}{x^2}\right)} = \lim_{x \rightarrow 0} \frac{-x^2}{\tan x}$$

$$= \lim_{x \rightarrow 0} \frac{-2x}{\sec^2 x} = 0 \Rightarrow \lim_{x \rightarrow 0} f(x) = e^0 = 1$$

- (c) The maximum value of $f(x)$ is close to 1 near the point $x \approx 1.55$ (see the graph in part (a)).
 (d) The root in question is near 1.57.

90. (a) When $\sin x < 0$ there are gaps in the sketch. The width of each gap is π .

(b) Let $f(x) = (\sin x)^{\tan x}$

$$\Rightarrow \ln f(x) = (\tan x) \ln(\sin x) \Rightarrow \lim_{x \rightarrow \left(\frac{\pi}{2}\right)^-} \ln f(x)$$

$$= \lim_{x \rightarrow \left(\frac{\pi}{2}\right)^-} \frac{\ln(\sin x)}{\cot x} = \lim_{x \rightarrow \left(\frac{\pi}{2}\right)^-} \frac{\left(\frac{1}{\sin x}\right)(\cos x)}{-\csc^2 x}$$

$$= \lim_{x \rightarrow \left(\frac{\pi}{2}\right)^-} \frac{\cos x}{(-\csc x)} = 0 \Rightarrow \lim_{x \rightarrow \left(\frac{\pi}{2}\right)^-} f(x) = e^0 = 1.$$

Similarly, $\lim_{x \rightarrow \left(\frac{\pi}{2}\right)^+} f(x) = e^0 = 1$. Therefore,

$$\lim_{x \rightarrow \frac{\pi}{2}} f(x) = 1.$$

- (c) From the graph in part (b) we have a minimum of about 0.665 at $x \approx 0.47$ and the maximum is about 1.491 at $x \approx 2.66$.

4.6 APPLIED OPTIMIZATION

- Let ℓ and w represent the length and width of the rectangle, respectively. With an area of 16 in.^2 , we have that $(\ell)(w) = 16 \Rightarrow w = 16\ell^{-1} \Rightarrow$ the perimeter is $P = 2\ell + 2w = 2\ell + 32\ell^{-1}$ and $P'(\ell) = 2 - \frac{32}{\ell^2} = \frac{2(\ell^2 - 16)}{\ell^2}$. Solving $P'(\ell) = 0 \Rightarrow \frac{2(\ell+4)(\ell-4)}{\ell^2} = 0 \Rightarrow \ell = -4, 4$. Since $\ell > 0$ for the length of a rectangle, ℓ must be 4 and $w = 4 \Rightarrow$ the perimeter is 16 in., a minimum since $P''(\ell) = \frac{16}{\ell^3} > 0$.
- Let x represent the length of the rectangle in meters ($0 < x < 4$). Then the width is $4 - x$ and the area is $A(x) = x(4 - x) = 4x - x^2$. Since $A'(x) = 4 - 2x$, the critical point occurs at $x = 2$. Since, $A'(x) > 0$ for $0 < x < 2$ and $A'(x) < 0$ for $2 < x < 4$, this critical point corresponds to the maximum area. The rectangle with the largest area measures 2 m by $4 - 2 = 2$ m, so it is a square.

Graphical Support:

- The line containing point P also contains the points $(0, 1)$ and $(1, 0) \Rightarrow$ the line containing P is $y = 1 - x \Rightarrow$ a general point on that line is $(x, 1 - x)$.
 - The area $A(x) = 2x(1 - x)$, where $0 \leq x \leq 1$.
 - When $A(x) = 2x - 2x^2$, then $A'(x) = 0 \Rightarrow 2 - 4x = 0 \Rightarrow x = \frac{1}{2}$. Since $A(0) = 0$ and $A(1) = 0$, we conclude that $A(\frac{1}{2}) = \frac{1}{2}$ sq units is the largest area. The dimensions are 1 unit by $\frac{1}{2}$ unit.

- The area of the rectangle is $A = 2xy = 2x(12 - x^2)$, where $0 \leq x \leq \sqrt{12}$. Solving $A'(x) = 0 \Rightarrow 24 - 6x^2 = 0 \Rightarrow x = -2$ or 2 . Now -2 is not in the domain, and since $A(0) = 0$ and $A(\sqrt{12}) = 0$, we conclude that $A(2) = 32$ square units is the maximum area. The dimensions are 4 units by 8 units.

- The volume of the box is $V(x) = x(15 - 2x)(8 - 2x) = 120x - 46x^2 + 4x^3$, where $0 \leq x \leq 4$. Solving $V'(x) = 0 \Rightarrow 120 - 92x + 12x^2 = 4(6 - x)(5 - 3x) = 0 \Rightarrow x = \frac{5}{3}$ or 6 , but 6 is not in the domain. Since $V(0) = V(4) = 0$, $V(\frac{5}{3}) = \frac{2450}{27} \approx 91 \text{ in}^3$ must be the maximum volume of the box with dimensions $\frac{14}{3} \times \frac{35}{3} \times \frac{5}{3}$ inches.

6. The area of the triangle is $A = \frac{1}{2}ba = \frac{b}{2}\sqrt{400-b^2}$, where $0 \leq b \leq 20$. Then $\frac{dA}{db} = \frac{1}{2}\sqrt{400-b^2} - \frac{b^2}{2\sqrt{400-b^2}} = \frac{200-b^2}{\sqrt{400-b^2}} = 0 \Rightarrow$ the interior critical point is $b = 10\sqrt{2}$.

When $b = 0$ or 20 , the area is zero $\Rightarrow A(10\sqrt{2})$ is the maximum area. When $a^2 + b^2 = 400$ and $b = 10\sqrt{2}$, the value of a is also $10\sqrt{2} \Rightarrow$ the maximum area occurs when $a = b$.

7. The area is $A(x) = x(800 - 2x)$, where $0 \leq x \leq 400$. Solving $A'(x) = 800 - 4x = 0 \Rightarrow x = 200$. With $A(0) = A(400) = 0$, the maximum area is $A(200) = 80,000 \text{ m}^2$. The dimensions are 200 m by 400 m.

8. The area is $2xy = 216 \Rightarrow y = \frac{108}{x}$. The amount of fence needed is $P = 4x + 3y = 4x + 324x^{-1}$, where $0 < x$; $\frac{dP}{dx} = 4 - \frac{324}{x^2} = 0 \Rightarrow x^2 - 81 = 0 \Rightarrow$ the critical points are 0 and ± 9 , but 0 and -9 are not in the domain. Then $P''(9) > 0 \Rightarrow$ at $x = 9$ there is a minimum \Rightarrow the dimensions of the outer rectangle are 18 m by 12 m \Rightarrow 72 meters of fence will be needed.

9. (a) We minimize the weight $= tS$ where S is the surface area, and t is the thickness of the steel walls of the tank. The surface area is $S = x^2 + 4xy$ where x is the length of a side of the square base of the tank, and y is its depth. The volume of the tank must be $500 \text{ ft}^3 \Rightarrow y = \frac{500}{x^2}$. Therefore, the weight of the tank is $w(x) = t\left(x^2 + \frac{2000}{x}\right)$. Treating the thickness as a constant gives $w'(x) = t\left(2x - \frac{2000}{x^2}\right)$. The critical value is at $x = 10$. Since $w''(10) = t\left(2 + \frac{4000}{10^3}\right) > 0$, there is a minimum at $x = 10$. Therefore, the optimum dimensions of the tank are 10 ft on the base edges and 5 ft deep.
- (b) Minimizing the surface area of the tank minimizes its weight for a given wall thickness. The thickness of the steel walls would likely be determined by other considerations such as structural requirements.
10. (a) The volume of the tank being 1125 ft^3 , we have that $yx^2 = 1125 \Rightarrow y = \frac{1125}{x^2}$. The cost of building the tank is $c(x) = 5x^2 + 30x\left(\frac{1125}{x^2}\right)$, where $0 < x$. Then $c'(x) = 10x - \frac{33750}{x^2} = 0 \Rightarrow$ the critical points are 0 and 15, but 0 is not in the domain. Thus, $c''(15) > 0 \Rightarrow$ at $x = 15$ we have a minimum. The values of $x = 15$ ft and $y = 5$ ft will minimize the cost.
- (b) The cost function $c = 5(x^2 + 4xy) + 10xy$, can be separated into two items: (1) the cost of the materials and labor to fabricate the tank, and (2) the cost for the excavation. Since the area of the sides and bottom of the tanks is $(x^2 + 4xy)$, it can be deduced that the unit cost to fabricate the tanks is $\$5/\text{ft}^2$. Normally, excavation costs are per unit volume of excavated material. Consequently, the total excavation cost can be taken as $10xy = \left(\frac{10}{x}\right)(x^2 y)$. This suggests that the unit cost of excavation is $\frac{\$10/\text{ft}^2}{x}$ where x is the length of a side of the square base of the tank in feet. For the least expensive tank, the unit cost for the excavation is

$\frac{\$10/\text{ft}^2}{15 \text{ ft}} = \frac{\$0.67}{\text{ft}^3} = \frac{\$18}{\text{yd}^3}$. The total cost of the least expensive tank is \$3375, which is the sum of \$2625 for fabrication and \$750 for the excavation.

11. The area of the printing is $(y - 4)(x - 8) = 50$.
Consequently, $y = \left(\frac{50}{x-8}\right) + 4$. The area of the paper is

$$A(x) = x\left(\frac{50}{x-8} + 4\right), \text{ where } 8 < x. \text{ Then}$$

$$A'(x) = \left(\frac{50}{x-8} + 4\right) - x\left(\frac{50}{(x-8)^2}\right) = \frac{4(x-8)^2 - 400}{(x-8)^2} = 0$$

\Rightarrow the critical points are -2 and 18 , but -2 is not in the domain. Thus $A''(18) > 0 \Rightarrow$ at $x = 18$ we have a minimum. Therefore the dimensions 18 by 9 inches minimize the amount of paper.

12. The volume of the cone is $V = \frac{1}{3}\pi r^2 h$, where $r = x = \sqrt{9 - y^2}$ and $h = y + 3$ (from the figure in the text). Thus, $V(y) = \frac{\pi}{3}(9 - y^2)(y + 3) = \frac{\pi}{3}(27 + 9y - 32y^2 - y^3) \Rightarrow V'(y) = \frac{\pi}{3}(9 - 6y - 3y^2) = \pi(1 - y)(3 + y)$. The critical points are -3 and 1 , but -3 is not in the domain. Thus $V''(1) = \frac{\pi}{3}(-6 - 6(1)) < 0 \Rightarrow$ at $y = 1$ we have a maximum volume of $V(1) = \frac{\pi}{3}(8)(4) = \frac{32\pi}{3}$ cubic units.

13. The area of the triangle is $A(\theta) = \frac{ab \sin \theta}{2}$, where $0 < \theta < \pi$. Solving $A'(\theta) = 0 \Rightarrow \frac{ab \cos \theta}{2} = 0 \Rightarrow \theta = \frac{\pi}{2}$. Since $A''(\theta) = -\frac{ab \sin \theta}{2} \Rightarrow A''\left(\frac{\pi}{2}\right) < 0$, there is a maximum at $\theta = \frac{\pi}{2}$.

14. A volume $V = \pi r^2 h = 1000 \Rightarrow h = \frac{1000}{\pi r^2}$. The amount of material is the surface area given by the sides and bottom of the can $\Rightarrow S = 2\pi r h + \pi r^2 = \frac{2000}{r} + \pi r^2$, $0 < r$. Then $\frac{dS}{dr} = -\frac{2000}{r^2} + 2\pi r = 0 \Rightarrow \frac{\pi r^3 - 1000}{r^2} = 0$. The critical points are 0 and $\frac{10}{\sqrt[3]{\pi}}$, but 0 is not in the domain. Since $\frac{d^2S}{dr^2} = \frac{4000}{r^3} + 2\pi > 0$, we have a minimum surface area when $r = \frac{10}{\sqrt[3]{\pi}}$ cm and $h = \frac{1000}{\pi r^2} = \frac{10}{\sqrt[3]{\pi}}$ cm. Comparing this result to the result found in Example 2, if we include both ends of the can, then we have a minimum surface area when the can is shorter—specifically, when the height of the can is the same as its diameter.

15. With a volume of 1000 cm^3 and $V = \pi r^2 h$, then $h = \frac{1000}{\pi r^2}$. The amount of aluminum used per can is $A = 8r^2 + 2\pi r h = 8r^2 + \frac{2000}{r}$. Then $A'(r) = 16r - \frac{2000}{r^2} = 0 \Rightarrow \frac{8r^3 - 1000}{r^2} = 0 \Rightarrow$ the critical points are 0 and 5 , but $r = 0$ results in no can. Since $A''(r) = 16 + \frac{4000}{r^3} > 0$ we have a minimum at $r = 5 \Rightarrow h = \frac{40}{\pi}$ and $h:r = 8:\pi$.

16. (a) The base measures $10 - 2x$ in. by $\frac{15-2x}{2}$ in., so the volume formula is $V(x) = \frac{x(10-2x)(15-2x)}{2} = 2x^3 - 25x^2 + 75x$.
- (b) We require $x > 0$, $2x < 10$, and $2x < 15$. Combining these requirements, the domain is the interval $(0, 5)$.

- (c) The maximum volume is approximately 66.02 in.^3 when $x \approx 1.96$ in.
- (d) $V'(x) = 6x^2 - 50x + 75$. The critical point occurs when $V'(x) = 0$, at $x = \frac{50 \pm \sqrt{(-50)^2 - 4(6)(75)}}{2(6)} = \frac{50 \pm \sqrt{700}}{12} = \frac{25 \pm 5\sqrt{7}}{6}$, that is, $x \approx 1.96$ or $x \approx 6.37$. We discard the larger value because it is not in the domain. Since $V''(x) = 12x - 50$, which is negative when $x \approx 1.96$, the critical point corresponds to the maximum volume. The maximum volume occurs when $x = \frac{25 - 5\sqrt{7}}{6} \approx 1.96$, which confirms the result in (c).
17. (a) The “sides” of the suitcase will measure $24 - 2x$ in. by $18 - 2x$ in. and will be $2x$ in. apart, so the volume formula is $V(x) = 2x(24 - 2x)(18 - 2x) = 8x^3 - 168x^2 + 862x$.
- (b) We require $x > 0$, $2x < 18$, and $2x < 12$. Combining these requirements, the domain is the interval $(0, 9)$.

- (c) The maximum volume is approximately 1309.95 in.^3 when $x \approx 3.39$ in.
- (d) $V'(x) = 24x^2 - 336x + 864 = 24(x^2 - 14x + 36)$. The critical point is at $x = \frac{14 \pm \sqrt{(-14)^2 - 4(1)(36)}}{2(1)} = \frac{14 \pm \sqrt{52}}{2} = 7 \pm \sqrt{13}$, that is, $x \approx 3.39$ or $x \approx 10.61$. We discard the larger value because it is not in the domain. Since $V''(x) = 24(2x - 14)$ which is negative when $x \approx 3.39$, the critical point corresponds to the maximum volume. The maximum value occurs at $x = 7 - \sqrt{13} \approx 3.39$, which confirms the results in (c).
- (e) $8x^3 - 168x^2 + 862x = 1120 \Rightarrow 8(x^3 - 21x^2 + 108x - 140) = 0 \Rightarrow 8(x - 2)(x - 5)(x - 14) = 0$. Since 14 is not in the domain, the possible values of x are $x = 2$ in. or $x = 5$ in.
- (f) The dimensions of the resulting box are $2x$ in., $(24 - 2x)$ in., and $(18 - 2x)$. Each of these measurements must be positive, so that gives the domain of $(0, 9)$.
18. If the upper right vertex of the rectangle is located at $(x, 4 \cos 0.5x)$ for $0 < x < \pi$, then the rectangle has width $2x$ and height $4 \cos 0.5x$, so the area is $A(x) = 8x \cos 0.5x$. Solving $A'(x) = 0$ graphically for $0 < x < \pi$, we find that $x \approx 2.214$. Evaluating $2x$ and $4 \cos 0.5x$ for $x \approx 2.214$, the dimensions of the rectangle are approximately 4.43 (width) by 1.79 (height), and the maximum area is approximately 7.923.

19. Let the radius of the cylinder be r cm, $0 < r < 10$. Then the height is $2\sqrt{100 - r^2}$ and the volume is $V(r) = 2\pi r^2 \sqrt{100 - r^2} \text{ cm}^3$. Then, $V'(r) = 2\pi r^2 \left(\frac{1}{2\sqrt{100 - r^2}} \right) (-2r) + \left(2\pi \sqrt{100 - r^2} \right) (2r) = \frac{-2\pi r^3 + 4\pi r(100 - r^2)}{\sqrt{100 - r^2}}$

$= \frac{2\pi r(200-3r^2)}{\sqrt{100-r^2}}$. The critical point for $0 < r < 10$ occurs at $r = \sqrt{\frac{200}{3}} = 10\sqrt{\frac{2}{3}}$. Since $V'(r) > 0$ for $0 < r < 10\sqrt{\frac{2}{3}}$ and $V'(r) < 0$ for $10\sqrt{\frac{2}{3}} < r < 10$, the critical point corresponds to the maximum volume. The dimensions are $r = 10\sqrt{\frac{2}{3}} \approx 8.16$ cm and $h = \frac{20}{\sqrt{3}} \approx 11.55$ cm, and the volume is $\frac{4000\pi}{3\sqrt{3}} \approx 2418.40$ cm³.

20. (a) From the diagram we have $4x + \ell = 108$ and $V = x^2\ell$. The volume of the box is $V(x) = x^2(108 - 4x)$, where $0 \leq x \leq 27$. Then $V'(x) = 216x - 12x^2 = 12x(18 - x) = 0 \Rightarrow$ the critical points are 0 and 18, but $x = 0$ results in no box. Since $V''(x) = 216 - 24x < 0$ at $x = 18$ we have a maximum. The dimensions of the box are $18 \times 18 \times 36$ in.

- (b) In terms of length, $V(\ell) = x^2\ell = \left(\frac{108-\ell}{4}\right)^2 \ell$. The graph indicates that the maximum volume occurs near $\ell = 36$, which is consistent with the result of part (a).

21. (a) From the diagram we have $3h + 2w = 108$ and $V = h^2w \Rightarrow V(h) = h^2\left(54 - \frac{3}{2}h\right) = 54h^2 - \frac{3}{2}h^3$. Then $V'(h) = 108h - \frac{9}{2}h^2 = \frac{9}{2}h(24 - h) = 0 \Rightarrow h = 0$ or $h = 24$, but $h = 0$ results in no box. Since $V''(h) = 108 - 9h < 0$ at $h = 24$, we have a maximum volume at $h = 24$ and $w = 54 - \frac{3}{2}h = 18$.

22. From the diagram the perimeter is $P = 2r + 2h + \pi r$, where r is the radius of the semicircle and h is the height of the rectangle. The amount of light transmitted proportional to $A = 2rh + \frac{1}{4}\pi r^2$
 $= r(P - 2r - \pi r) + \frac{1}{4}\pi r^2 = rP - 2r^2 - \frac{3}{4}\pi r^2$. Then $\frac{dA}{dr} = P - 4r - \frac{3}{2}\pi r = 0 \Rightarrow r = \frac{2P}{8+3\pi}$
 $\Rightarrow 2h = P - \frac{4P}{8+3\pi} - \frac{2\pi P}{8+3\pi} = \frac{(4+\pi)P}{8+3\pi}$. Therefore, $\frac{2r}{h} = \frac{8}{4+\pi}$ gives the proportions that admit the most light since $\frac{d^2A}{dr^2} = -4 - \frac{3}{2}\pi < 0$.

23. The fixed volume is $V = \pi r^2 h + \frac{2}{3} \pi r^3 \Rightarrow h = \frac{V}{\pi r^2} - \frac{2r}{3}$, where h is the height of the cylinder and r is the radius of the hemisphere. To minimize the cost we must minimize surface area of the cylinder added to twice the surface area of the hemisphere. Thus, we minimize $C = 2\pi r h + 4\pi r^2 = 2\pi r \left(\frac{V}{\pi r^2} - \frac{2r}{3} \right) + 4\pi r^2 = \frac{2V}{r} + \frac{8}{3} \pi r^2$.

Then $\frac{dC}{dr} = -\frac{2V}{r^2} + \frac{16}{3} \pi r = 0 \Rightarrow V = \frac{8}{3} \pi r^3 \Rightarrow r = \left(\frac{3V}{8\pi} \right)^{1/3}$. From the volume equation, $h = \frac{V}{\pi r^2} - \frac{2r}{3} = \frac{4V^{1/3}}{\pi^{1/3} \cdot 3^{2/3}} - \frac{2 \cdot 3^{1/3} \cdot V^{1/3}}{3 \cdot 2 \cdot \pi^{1/3}} = \frac{3^{1/3} \cdot 2 \cdot 4^{1/3} V^{1/3} - 2 \cdot 3^{1/3} \cdot V^{1/3}}{3 \cdot 2 \cdot \pi^{1/3}} = \left(\frac{3V}{\pi} \right)^{1/3}$. Since $\frac{d^2C}{dr^2} = \frac{4V}{r^3} + \frac{16}{3} \pi > 0$, these dimensions do minimize the cost.

24. The volume of the trough is maximized when the area of the cross section is maximized. From the diagram the area of the cross section is $A(\theta) = \cos \theta + \sin \theta \cos \theta$, $0 < \theta < \frac{\pi}{2}$. Then $A'(\theta) = -\sin \theta + \cos^2 \theta - \sin^2 \theta = -(2 \sin^2 \theta + \sin \theta - 1) = -(2 \sin \theta - 1)(\sin \theta + 1)$ so $A'(\theta) = 0 \Rightarrow \sin \theta = \frac{1}{2}$ or $\sin \theta = -1 \Rightarrow \theta = \frac{\pi}{6}$ because $\sin \theta \neq -1$ when $0 < \theta < \frac{\pi}{2}$. Also, $A'(\theta) > 0$ for $0 < \theta < \frac{\pi}{6}$ and $A'(\theta) < 0$ for $\frac{\pi}{6} < \theta < \frac{\pi}{2}$. Therefore, at $\theta = \frac{\pi}{6}$ there is a maximum.

25. (a) From the diagram we have: $\overline{AP} = x$, $\overline{RA} = \sqrt{L^2 - x^2}$, $\overline{PB} = 8.5 - x$,
 $\overline{CH} = \overline{DR} = 11 - \overline{RA} = 11 - \sqrt{L^2 - x^2}$, $\overline{QB} = \sqrt{x^2 - (8.5 - x)^2}$,
 $\overline{HQ} = 11 - \overline{CH} - \overline{QB} = 11 - \left[11 - \sqrt{L^2 - x^2} + \sqrt{x^2 - (8.5 - x)^2} \right]$
 $= \sqrt{L^2 - x^2} - \sqrt{x^2 - (8.5 - x)^2}$, $\overline{RQ}^2 = \overline{RH}^2 + \overline{HQ}^2$
 $= (8.5)^2 + \left(\sqrt{L^2 - x^2} - \sqrt{x^2 - (8.5 - x)^2} \right)^2$. It follows that $\overline{RP}^2 = \overline{PQ}^2 + \overline{RQ}^2$
 $\Rightarrow L^2 = x^2 + \left(\sqrt{L^2 - x^2} - \sqrt{x^2 - (8.5 - x)^2} \right)^2 + (8.5)^2$
 $\Rightarrow L^2 = x^2 + L^2 - x^2 - 2\sqrt{L^2 - x^2} \cdot \sqrt{x^2 - (8.5 - x)^2} + 17x - (8.5)^2 + (8.5)^2$
 $\Rightarrow 17^2 x^2 = 4(L^2 - x^2)(17x - (8.5)^2) \Rightarrow L^2 = x^2 + \frac{17^2 x^2}{4[17x - (8.5)^2]}$
 $= \frac{17x^3}{17x - (8.5)^2} = \frac{17x^3}{17x - \left(\frac{17}{2}\right)^2} = \frac{4x^3}{4x - 17} = \frac{2x^3}{2x - 8.5}$.

- (b) If $f(x) = \frac{4x^3}{4x-17}$ is minimized, then L^2 is minimized. Now $f'(x) = \frac{4x^2(8x-51)}{(4x-17)^2} \Rightarrow f'(x) < 0$ when $x < \frac{51}{8}$ and $f'(x) > 0$ when $x > \frac{51}{8}$. Thus L^2 is minimized when $x = \frac{51}{8}$.
 (c) When $x > \frac{51}{8}$, then $L \approx 11.0$ in.

26. (a) From the figure in the text we have $P = 2x + 2y \Rightarrow y = \frac{P}{2} - x$. If $P = 36$, then $y = 18 - x$. When the cylinder is formed, $x = 2\pi r \Rightarrow r = \frac{x}{2\pi}$ and $h = y \Rightarrow h = 18 - x$. The volume of the cylinder is $V = \pi r^2 h \Rightarrow V(x) = \frac{18x^2 - x^3}{4\pi}$. Solving $V'(x) = \frac{3x(12-x)}{4\pi} = 0 \Rightarrow x = 0$ or 12 ; but when $x = 0$ there is no cylinder. Then $V''(x) = \frac{3}{\pi} \left(3 - \frac{x}{2} \right) \Rightarrow V''(12) < 0 \Rightarrow$ there is a maximum at $x = 12$. The values of $x = 12$ cm and $y = 6$ cm give the largest volume.

- (b) In this case $V(x) = \pi x^2(18-x)$. Solving $V'(x) = 3\pi x(12-x) = 0 \Rightarrow x = 0$ or 12 ; but $x = 0$ would result in no cylinder. Then $V''(x) = 6\pi(6-x) \Rightarrow V''(12) < 0 \Rightarrow$ there is a maximum at $x = 12$. The values of $x = 12$ cm and $y = 6$ cm give the largest volume.
27. Note that $h^2 + r^2 = 3$ and so $r = \sqrt{3-h^2}$. Then the volume is given by $V = \frac{\pi}{3}r^2h = \frac{\pi}{3}(3-h^2)h = \pi h - \frac{\pi}{3}h^3$ for $0 < h < \sqrt{3}$, and so $\frac{dV}{dh} = \pi - \pi r^2 = \pi(1-r^2)$. The critical point (for $h > 0$) occurs at $h = 1$. Since $\frac{dV}{dh} > 0$ for $0 < h < 1$, and $\frac{dV}{dh} < 0$ for $1 < h < \sqrt{3}$, the critical point corresponds to the maximum volume. The cone of greatest volume has radius $\sqrt{2}$ m, height 1 m, and volume $\frac{2\pi}{3}$ m³.
28. Let $d = \sqrt{(x-0)^2 + (y-0)^2} = \sqrt{x^2 + y^2}$ and $\frac{x}{a} + \frac{y}{b} = 1 \Rightarrow y = -\frac{b}{a}x + b$. We can minimize d by minimizing $D = \left(\sqrt{x^2 + y^2}\right)^2 = x^2 + \left(-\frac{b}{a}x + b\right)^2 \Rightarrow D' = 2x + 2\left(-\frac{b}{a}x + b\right)\left(-\frac{b}{a}\right) = 2x + \frac{2b^2}{a^2}x - \frac{2b^2}{a}$. $D' = 0 \Rightarrow 2\left(x + \frac{b^2}{a^2}x - \frac{b^2}{a}\right) = 0 \Rightarrow x = \frac{ab^2}{a^2+b^2}$ is the critical point $\Rightarrow y = -\frac{b}{a}\left(\frac{ab^2}{a^2+b^2}\right) + b = \frac{a^2b}{a^2+b^2}$. $D'' = 2 + \frac{2b^2}{a^2} \Rightarrow D''\left(\frac{ab^2}{a^2+b^2}\right) = 2 + \frac{2b^2}{a^2} > 0 \Rightarrow$ the critical point is a local minimum $\Rightarrow \left(\frac{ab^2}{a^2+b^2}, \frac{a^2b}{a^2+b^2}\right)$ is the point on the line $\frac{x}{a} + \frac{y}{b} = 1$ that is closest to the origin.
29. Let $S(x) = x + \frac{1}{x}$, $x > 0 \Rightarrow S'(x) = 1 - \frac{1}{x^2} = \frac{x^2-1}{x^2}$. $S'(x) = 0 \Rightarrow \frac{x^2-1}{x^2} = 0 \Rightarrow x^2 - 1 = 0 \Rightarrow x = \pm 1$. Since $x > 0$, we only consider $x = 1$. $S''(x) = \frac{2}{x^3} \Rightarrow S''(1) = \frac{2}{1^3} > 0 \Rightarrow$ local minimum when $x = 1$.
30. Let $S(x) = \frac{1}{x} + 4x^2$, $x > 0 \Rightarrow S'(x) = -\frac{1}{x^2} + 8x = \frac{8x^3-1}{x^2}$. $S'(x) = 0 \Rightarrow \frac{8x^3-1}{x^2} = 0 \Rightarrow 8x^3 - 1 = 0 \Rightarrow x = \frac{1}{2}$. $S''(x) = \frac{2}{x^3} + 8 \Rightarrow S''\left(\frac{1}{2}\right) = \frac{2}{(1/2)^3} + 8 > 0 \Rightarrow$ local minimum when $x = \frac{1}{2}$.
31. The length of the wire b = perimeter of the triangle + circumference of the circle. Let x = length of a side of the equilateral triangle $\Rightarrow P = 3x$, and let r = radius of the circle $\Rightarrow C = 2\pi r$. Thus $b = 3x + 2\pi r \Rightarrow r = \frac{b-3x}{2\pi}$. The area of the circle is πr^2 and the area of an equilateral triangle whose sides are x is $\frac{1}{2}(x)\left(\frac{\sqrt{3}}{2}x\right) = \frac{\sqrt{3}}{4}x^2$. Thus, the total area is given by $A = \frac{\sqrt{3}}{4}x^2 + \pi r^2 = \frac{\sqrt{3}}{4}x^2 + \pi\left(\frac{b-3x}{2\pi}\right)^2 = \frac{\sqrt{3}}{4}x^2 + \frac{(b-3x)^2}{4\pi}$. $\Rightarrow A' = \frac{\sqrt{3}}{2}x - \frac{3}{2\pi}(b-3x) = \frac{\sqrt{3}}{2}x - \frac{3b}{2\pi} + \frac{9}{2\pi}x$. $A' = 0 \Rightarrow \frac{\sqrt{3}}{2}x - \frac{3b}{2\pi} + \frac{9}{2\pi}x = 0 \Rightarrow x = \frac{3b}{\sqrt{3}\pi+9}$. $A'' = \frac{\sqrt{3}}{2} + \frac{9}{2\pi} > 0 \Rightarrow$ local minimum at the critical point. $P = 3\left(\frac{3b}{\sqrt{3}\pi+9}\right) = \frac{9b}{\sqrt{3}\pi+9}$ m is the length of the triangular segment and $C = 2\pi\left(\frac{b-3x}{2\pi}\right) = b - 3x = b - \frac{9b}{\sqrt{3}\pi+9} = \frac{\sqrt{3}\pi b}{\sqrt{3}\pi+9}$ m is the length of the circular segment.
32. The length of the wire b = perimeter of the triangle + circumference of the circle. Let x = length of a side of the square $\Rightarrow P = 4x$, and let r = radius of the circle $\Rightarrow C = 2\pi r$. Thus $b = 4x + 2\pi r \Rightarrow r = \frac{b-4x}{2\pi}$. The area of the circle is πr^2 and the area of a square whose sides are x is x^2 . Thus, the total area is given by $A = x^2 + \pi r^2 = x^2 + \pi\left(\frac{b-4x}{2\pi}\right)^2 = x^2 + \frac{(b-4x)^2}{4\pi} \Rightarrow A' = 2x - \frac{4}{2\pi}(b-4x) = 2x - \frac{2b}{\pi} + \frac{8}{\pi}x$, $A' = 0 \Rightarrow 2x - \frac{2b}{\pi} + \frac{8}{\pi}x = 0 \Rightarrow x = \frac{b}{4+\pi}$. $A'' = 2 + \frac{8}{\pi} > 0 \Rightarrow$ local minimum at the critical point. $P = 4\left(\frac{b}{4+\pi}\right) = \frac{4b}{4+\pi}$ m is the length of the square segment and $C = 2\pi\left(\frac{b-4x}{2\pi}\right) = b - 4x = b - \frac{4b}{4+\pi} = \frac{b\pi}{4+\pi}$ m is the length of the circular segment.

33. Let $(x, y) = \left(x, \frac{4}{3}x\right)$ be the coordinates of the corner that intersects the line. Then base $= 3 - x$ and height $= y = \frac{4}{3}x$, thus the area of the rectangle is given by $A = (3 - x)\left(\frac{4}{3}x\right) = 4x - \frac{4}{3}x^2$, $0 \leq x \leq 3$. $A' = 4 - \frac{8}{3}x$, $A' = 0 \Rightarrow x = \frac{3}{2}$. $A'' = -\frac{8}{3} \Rightarrow A''\left(\frac{3}{2}\right) < 0 \Rightarrow$ local maximum at the critical point. The base $= 3 - \frac{3}{2} = \frac{3}{2}$ and the height $= \frac{4}{3}\left(\frac{3}{2}\right) = 2$.
34. Let $(x, y) = \left(x, \sqrt{9 - x^2}\right)$ be the coordinates of the corner that intersects the semicircle. Then base $= 2x$ and height $= y = \sqrt{9 - x^2}$, thus the area of the inscribed rectangle is given by $A = (2x)\sqrt{9 - x^2}$, $0 \leq x \leq 3$. Then $A' = 2\sqrt{9 - x^2} + (2x)\frac{-x}{\sqrt{9 - x^2}} = \frac{2(9 - x^2) - 2x^2}{\sqrt{9 - x^2}} = \frac{18 - 4x^2}{\sqrt{9 - x^2}}$, $A' = 0 \Rightarrow 18 - 4x^2 = 0 \Rightarrow x = \pm \frac{3\sqrt{2}}{2}$, only $x = \frac{3\sqrt{2}}{2}$ lies in $0 \leq x \leq 3$. A is continuous on the closed interval $0 \leq x \leq 3 \Rightarrow A$ has an absolute maxima and absolute minima. $A(0) = 0$, $A(3) = 0$, and $A\left(\frac{3\sqrt{2}}{2}\right) = \left(3\sqrt{2}\right)\left(\frac{3\sqrt{2}}{2}\right) = 9 \Rightarrow$ absolute maxima. Base of rectangle is $3\sqrt{2}$ and height is $\frac{3\sqrt{2}}{2}$.
35. (a) $f(x) = x^2 + \frac{a}{x} \Rightarrow f'(x) = x^{-2}(2x^3 - a)$, so that $f'(x) = 0$ when $x = 2$ implies $a = 16$
 (b) $f(x) = x^2 + \frac{a}{x} \Rightarrow f''(x) = 2x^{-3}(x^3 + a)$, so that $f''(x) = 0$ when $x = 1$ implies $a = -1$
36. If $f(x) = x^3 + ax^2 + bx$, then $f'(x) = 3x^2 + 2ax + b$ and $f''(x) = 6x + 2a$.
 (a) A local maximum at $x = -1$ and local minimum at $x = 3 \Rightarrow f'(-1) = 0$ and $f'(3) = 0 \Rightarrow 3 - 2a + b = 0$ and $27 + 6a + b = 0 \Rightarrow a = -3$ and $b = -9$.
 (b) A local minimum at $x = 4$ and a point inflection at $x = 1 \Rightarrow f'(4) = 0$ and $f''(1) = 0 \Rightarrow 48 + 8a + b = 0$ and $6 + 2a = 0 \Rightarrow a = -3$ and $b = -24$.
37. (a) $s(t) = -16t^2 + 96t + 112 \Rightarrow v(t) = s'(t) = -32t + 96$. At $t = 0$, the velocity is $v(0) = 96$ ft/sec.
 (b) The maximum height occurs when $v(t) = 0$, when $t = 3$. The maximum height is $s(3) = 256$ ft and it occurs at $t = 3$ sec.
 (c) Note that $s(t) = -16t^2 + 96t + 112 = -16(t + 1)(t - 7)$, so $s = 0$ at $t = -1$ or $t = 7$. Choosing the positive value of t , the velocity when $s = 0$ is $v(7) = -128$ ft/sec.

38.

Let x be the distance from the point on the shoreline nearest Jane's boat to the point where she lands her boat. Then she needs to row $\sqrt{4 + x^2}$ mi at 2 mph and walk $6 - x$ mi at 5 mph. The total amount of time to reach the village is $f(x) = \frac{\sqrt{4 + x^2}}{2} + \frac{6 - x}{5}$ hours ($0 \leq x \leq 6$). Then $f'(x) = \frac{1}{2} \frac{1}{\sqrt{4 + x^2}}(2x) - \frac{1}{5} = \frac{x}{2\sqrt{4 + x^2}} - \frac{1}{5}$. Solving $f'(x) = 0$, we have: $\frac{x}{2\sqrt{4 + x^2}} = \frac{1}{5} \Rightarrow 5x = 2\sqrt{4 + x^2} \Rightarrow 25x^2 = 4(4 + x^2) \Rightarrow 21x^2 = 16 \Rightarrow x = \pm \frac{4}{\sqrt{21}}$. We discard the negative value of x because it is not in the domain. Checking the endpoints and critical point, we have $f(0) = 2.2$, $f\left(\frac{4}{\sqrt{21}}\right) \approx 2.12$, and $f(6) \approx 3.16$. Jane should land her boat $\frac{4}{\sqrt{21}} \approx 0.87$ miles down the shoreline from the point nearest her boat.

39. $\frac{8}{x} = \frac{h}{x+27} \Rightarrow h = 8 + \frac{216}{x}$ and $L(x) = \sqrt{h^2 + (x+27)^2}$
 $= \sqrt{\left(8 + \frac{216}{x}\right)^2 + (x+27)^2}$ when $x \geq 0$. Note that $L(x)$
 is minimized when $f(x) = \left(8 + \frac{216}{x}\right)^2 + (x+27)^2$ is
 minimized. If $f'(x) = 0$, then
 $2\left(8 + \frac{216}{x}\right)\left(-\frac{216}{x^2}\right) + 2(x+27) = 0$
 $\Rightarrow (x+27)\left(1 - \frac{1728}{x^3}\right) = 0 \Rightarrow x = -27$ (not acceptable
 since distance is never negative) or $x = 12$. Then
 $L(12) = \sqrt{2197} \approx 46.87$ ft.

40. (a) $s_1 = s_2 \Rightarrow \sin t = \sin\left(t + \frac{\pi}{3}\right) \Rightarrow \sin t = \sin t \cos \frac{\pi}{3} + \sin \frac{\pi}{3} \cos t \Rightarrow \sin t = \frac{1}{2} \sin t + \frac{\sqrt{3}}{2} \cos t \Rightarrow \tan t = \sqrt{3}$
 $\Rightarrow t = \frac{\pi}{3}$ or $\frac{4\pi}{3}$

(b) The distance between the particles is $s(t) = |s_1 - s_2| = \left| \sin t - \sin\left(t + \frac{\pi}{3}\right) \right| = \frac{1}{2} \left| \sin t - \sqrt{3} \cos t \right|$
 $\Rightarrow s'(t) = \frac{(\sin t - \sqrt{3} \cos t)(\cos t + \sqrt{3} \sin t)}{2|\sin t - \sqrt{3} \cos t|}$ since $\frac{d}{dx} |x| = \frac{x}{|x|} \Rightarrow$ critical times and endpoints are
 $0, \frac{\pi}{3}, \frac{5\pi}{6}, \frac{4\pi}{3}, \frac{11\pi}{6}, 2\pi$; then $s(0) = \frac{\sqrt{3}}{2}, s\left(\frac{\pi}{3}\right) = 0, s\left(\frac{5\pi}{6}\right) = 1, s\left(\frac{4\pi}{3}\right) = 0, s\left(\frac{11\pi}{6}\right) = 1, s(2\pi) = \frac{\sqrt{3}}{2} \Rightarrow$ the
 greatest distance between the particles is 1.

(c) Since $s'(t) = \frac{(\sin t - \sqrt{3} \cos t)(\cos t + \sqrt{3} \sin t)}{2|\sin t - \sqrt{3} \cos t|}$ we can conclude that at $t = \frac{\pi}{3}$ and $\frac{4\pi}{3}, s'(t)$ has cusps and the
 distance between the particles is changing the fastest near these points.

41. $I = \frac{k}{d^2}$, let $x =$ distance the point is from the stronger light source $\Rightarrow 6 - x =$ distance the point is from the other
 light source. The intensity of illumination at the point from the stronger light is $I_1 = \frac{k_1}{x^2}$, and intensity of
 illumination at the point from the weaker light is $I_2 = \frac{k_2}{(6-x)^2}$. Since the intensity of the first light is eight times
 the intensity of the second light $\Rightarrow k_1 = 8k_2 \Rightarrow I_1 = \frac{8k_2}{x^2}$. The total intensity is given by $I = I_1 + I_2 = \frac{8k_2}{x^2} + \frac{k_2}{(6-x)^2}$
 $\Rightarrow I' = -\frac{16k_2}{x^3} + \frac{2k_2}{(6-x)^3} = \frac{-16(6-x)^3 k_2 + 2x^3 k_2}{x^3(6-x)^3}$ and $I' = 0 \Rightarrow \frac{-16(6-x)^3 k_2 + 2x^3 k_2}{x^3(6-x)^3} = 0 \Rightarrow -16(6-x)^3 k_2 + 2x^3 k_2 = 0$
 $\Rightarrow x = 4$ m. $I'' = \frac{48k_2}{x^4} + \frac{6k_2}{(6-x)^4} \Rightarrow I''(4) = \frac{48k_2}{4^4} + \frac{6k_2}{(6-4)^4} > 0 \Rightarrow$ local minimum. The point should be 4 m from the
 stronger light source.

42. $R = \frac{v_0^2}{g} \sin 2\alpha \Rightarrow \frac{dR}{d\alpha} = \frac{2v_0^2}{g} \cos 2\alpha$ and $\frac{dR}{d\alpha} = 0 \Rightarrow \frac{2v_0^2}{g} \cos 2\alpha = 0 \Rightarrow \alpha = \frac{\pi}{4} \cdot \frac{d^2 R}{d\alpha^2} = -\frac{4v_0^2}{g} \sin 2\alpha$
 $\Rightarrow \frac{d^2 R}{d\alpha^2} \Big|_{\alpha=\frac{\pi}{4}} = -\frac{4v_0^2}{g} \sin 2\left(\frac{\pi}{4}\right) = -\frac{4v_0^2}{g} < 0 \Rightarrow$ local maximum. Thus, the firing angle of $\alpha = \frac{\pi}{4} = 45^\circ$
 will maximize the range R .

43. (a) From the diagram we have $d^2 = 4r^2 - w^2$. The strength of the beam is $S = kw d^2 = kw(4r^2 - w^2)$.
 When $r = 6$, then $S = 144kw - kw^3$. Also, $S'(w) = 144k - 3kw^2 = 3k(48 - w^2)$ so $S'(w) = 0 \Rightarrow w = \pm 4\sqrt{3}$;
 $S''(4\sqrt{3}) < 0$ and $-4\sqrt{3}$ is not acceptable. Therefore $S(4\sqrt{3})$ is the maximum strength. The dimensions of
 the strongest beam are $4\sqrt{3}$ by $4\sqrt{6}$ inches.

(b)

(c)

Both graphs indicate the same maximum value and are consistent with each other. Changing k does not change the dimensions that give the strongest beam (i.e., do not change the values of w and d that produce the strongest beam).

44. (a) From the situation we have $w^2 = 144 - d^2$. The stiffness of the beam is $S = kwd^3 = kd^3(144 - d^2)^{1/2}$, where $0 \leq d \leq 12$. Also, $S'(d) = \frac{4kd^2(108 - d^2)}{\sqrt{144 - d^2}} \Rightarrow$ critical points at 0, 12, and $6\sqrt{3}$. Both $d = 0$ and $d = 12$ cause $S = 0$. The maximum occurs at $d = 6\sqrt{3}$. The dimensions are 6 by $6\sqrt{3}$ inches.

(b)

(c)

Both graphs indicate the same maximum value and are consistent with each other. The changing of k has no effect.

45. (a) $s = 10 \cos(\pi t) \Rightarrow v = -10\pi \sin(\pi t) \Rightarrow \text{speed} = |10\pi \sin(\pi t)| = 10\pi |\sin(\pi t)| \Rightarrow$ the maximum speed is $10\pi \approx 31.42$ cm/sec since the maximum value of $|\sin(\pi t)|$ is 1; the cart is moving the fastest at $t = 0.5$ sec, 1.5 sec, 2.5 sec and 3.5 sec when $|\sin(\pi t)|$ is 1. At these times the distance is $s = 10 \cos\left(\frac{\pi}{2}\right) = 0$ cm and $a = -10\pi^2 \cos(\pi t) \Rightarrow |a| = 10\pi^2 |\cos(\pi t)| \Rightarrow |a| = 0$ cm/sec²
- (b) $|a| = 10\pi^2 |\cos(\pi t)|$ is greatest at $t = 0.0$ sec, 1.0 sec, 2.0 sec, 3.0 sec, and 4.0 sec, and at these times the magnitude of the cart's position is $|s| = 10$ cm from the rest position and the speed is 0 cm/sec.

46. (a) $2 \sin t = \sin 2t \Rightarrow 2 \sin t - 2 \sin t \cos t = 0 \Rightarrow (2 \sin t)(1 - \cos t) = 0 \Rightarrow t = k\pi$ where k is a positive integer

- (b) The vertical distance between the masses is $s(t) = |s_1 - s_2| = \left((s_1 - s_2)^2\right)^{1/2} = \left((\sin 2t - 2 \sin t)^2\right)^{1/2}$
 $\Rightarrow s'(t) = \left(\frac{1}{2}\right) \left((\sin 2t - 2 \sin t)^2\right)^{-1/2} (2)(\sin 2t - 2 \sin t)(2 \cos 2t - 2 \cos t) = \frac{2(\cos 2t - 2 \cos t)(\sin 2t - 2 \sin t)}{|\sin 2t - 2 \sin t|}$
 $= \frac{4(2 \cos t + 1)(\cos t - 1)(\sin t)(\cos t - 1)}{|\sin 2t - 2 \sin t|} \Rightarrow$ critical times at $0, \frac{2\pi}{3}, \pi, \frac{4\pi}{3}, 2\pi$; then $s(0) = 0$,
 $s\left(\frac{2\pi}{3}\right) = \left|\sin\left(\frac{4\pi}{3}\right) - 2 \sin\left(\frac{2\pi}{3}\right)\right| = \frac{3\sqrt{3}}{2}$, $s(\pi) = 0$, $s\left(\frac{4\pi}{3}\right) = \left|\sin\left(\frac{8\pi}{3}\right) - 2 \sin\left(\frac{4\pi}{3}\right)\right| = \frac{3\sqrt{3}}{2}$, $s(2\pi) = 0$
 \Rightarrow the greatest distance is $\frac{3\sqrt{3}}{2}$ at $t = \frac{2\pi}{3}$ and $\frac{4\pi}{3}$

47. (a) $s = \sqrt{(12 - 12t)^2 + (8t)^2} = \left((12 - 12t)^2 + 64t^2\right)^{1/2}$

- (b) $\frac{ds}{dt} = \frac{1}{2} \left((12 - 12t)^2 + 64t^2\right)^{-1/2} [2(12 - 12t)(-12) + 128t] = \frac{208t - 144}{\sqrt{(12 - 12t)^2 + 64t^2}} \Rightarrow \frac{ds}{dt}\Big|_{t=0} = -12$ knots and
 $\frac{ds}{dt}\Big|_{t=1} = 8$ knots

- (c) The graph indicates that the ships did not see each other because $s(t) > 5$ for all values of t .

- (d) The graph supports the conclusions in parts (b) and (c).

- (e) $\lim_{t \rightarrow \infty} \frac{ds}{dt} = \sqrt{\lim_{t \rightarrow \infty} \frac{(208t-144)^2}{144(1-t)^2 + 64t^2}} = \sqrt{\lim_{t \rightarrow \infty} \frac{(208 - \frac{144}{t})^2}{144(\frac{1}{t}-1)^2 + 64}} = \sqrt{\frac{208^2}{144+64}} = \sqrt{208} = 4\sqrt{13}$ which equals the square root of the sums of the squares of the individual speeds.

48. The distance $OT + TB$ is minimized when \overline{OB} is a straight line. Hence $\angle \alpha = \angle \beta \Rightarrow \theta_1 = \theta_2$.

49. If $v = kax - kx^2$, then $v' = ka - 2kx$ and $v'' = -2k$, so $v' = 0 \Rightarrow x = \frac{a}{2}$. At $x = \frac{a}{2}$ there is a maximum since $v''(\frac{a}{2}) = -2k < 0$. The maximum value of v is $\frac{ka^2}{4}$.

50. (a) According to the graph, $y'(0) = 0$.
 (b) According to the graph, $y'(-L) = 0$.
 (c) $y(0) = 0$, so $d = 0$. Now $y'(x) = 3ax^2 + 2bx + c$, so $y'(0) = 0$ implies that $c = 0$. Therefore, $y'(x) = ax^3 + bx^2$ and $y'(x) = 3ax^2 + 2bx$. then $y(-L) = -aL^3 + bL^2 = H$ and $y'(-L) = 3aL^2 + 2bL = 0$, so we have two linear equations in two unknowns a and b . The second equation gives $b = \frac{3aL}{2}$. Substituting into the first equation, we have $-aL^3 + \frac{3aL^3}{2} = H$, or $\frac{aL^3}{2} = H$, so $a = 2\frac{H}{L^3}$. Therefore, $b = 3\frac{H}{L^2}$ and the equation for y is $y(x) = 2\frac{H}{L^3}x^3 + 3\frac{H}{L^2}x^2$, or $y(x) = H\left[2\left(\frac{x}{L}\right)^3 + 3\left(\frac{x}{L}\right)^2\right]$.

51. The profit is $p = nx - nc = n(x - c) = [a(x - c)^{-1} + b(100 - x)](x - c) = a + b(100 - x)(x - c)$
 $= a + (bc + 100b)x - 100bc - bx^2$. Then $p'(x) = bc + 100b - 2bx$ and $p''(x) = -2b$. Solving $p'(x) = 0 \Rightarrow x = \frac{c}{2} + 50$. At $x = \frac{c}{2} + 50$ there is a maximum profit since $p''(x) = -2b < 0$ for all x .

52. Let x represent the number of people over 50. The profit is $p(x) = (50 + x)(200 - 2x) - 32(50 + x) - 6000$
 $= -2x^2 + 68x + 2400$. Then $p'(x) = -4x + 68$ and $p'' = -4$. Solving $p'(x) = 0 \Rightarrow x = 17$. At $x = 17$ there is a maximum since $p''(17) < 0$. It would take 67 people to maximize the profit.

53. (a) $A(q) = kmq^{-1} + cm + \frac{h}{2}q$, where $q > 0 \Rightarrow A'(q) = -kmq^{-2} + \frac{h}{2} = \frac{hq^2 - 2km}{2q^2}$ and $A''(q) = 2kmq^{-3}$. The critical points are $-\sqrt{\frac{2km}{h}}$, 0, and $\sqrt{\frac{2km}{h}}$, but only $\sqrt{\frac{2km}{h}}$ is in the domain. Then $A''\left(\sqrt{\frac{2km}{h}}\right) > 0 \Rightarrow$ at $q = \sqrt{\frac{2km}{h}}$ there is a minimum average weekly cost.
- (b) $A(q) = \frac{(k+bq)m}{q} + cm + \frac{h}{2}q = kmq^{-1} + bm + cm + \frac{h}{2}q$, where $q > 0 \Rightarrow A'(q) = 0$ at $q = \sqrt{\frac{2km}{h}}$ as in (a). Also $A''(q) = 2kmq^{-3} > 0$ so the most economical quantity to order is still $q = \sqrt{\frac{2km}{h}}$ which minimizes the average weekly cost.
54. We start with $c(x)$ = the cost of producing x items, $x > 0$, and $\frac{c(x)}{x}$ = the average cost of producing x items, assumed to be differentiable. If the average cost can be minimized, it will be at a production level at which $\frac{d}{dx}\left(\frac{c(x)}{x}\right) = 0 \Rightarrow \frac{xc'(x) - c(x)}{x^2} = 0$ (by the quotient rule) $\Rightarrow xc'(x) - c(x) = 0$ (multiply both sides by x^2) $\Rightarrow c'(x) = \frac{c(x)}{x}$ where $c'(x)$ is the marginal cost. This concludes the proof. (Note: The theorem does not assure a production level that will give a minimum cost, but rather, it indicates where to look to see if there is one. Find the production levels where the average cost equals the marginal cost, then check to see if any of them give a minimum.)
55. The profit $p(x) = r(x) - c(x) = 6x - (x^3 - 6x^2 + 15x) = -x^3 + 6x^2 - 9x$, where $x \geq 0$. Then $p'(x) = -3x^2 + 12x - 9 = -3(x-3)(x-1)$ and $p''(x) = -6x + 12$. The critical points are 1 and 3. Thus $p''(1) = 6 > 0 \Rightarrow$ at $x = 1$ there is a local minimum, and $p''(3) = -6 < 0 \Rightarrow$ at $x = 3$ there is a local maximum. But $p(3) = 0 \Rightarrow$ the best you can do is break even.
56. The average cost of producing x items is $\bar{c}(x) = \frac{c(x)}{x} = x^2 - 20x + 20,000 \Rightarrow \bar{c}'(x) = 2x - 20 = 0 \Rightarrow x = 10$, the only critical value. The average cost is $\bar{c}(10) = \$19,900$ per item is a minimum cost because $\bar{c}''(10) = 2 > 0$.
57. Let x = the length of a side of the square base of the box and h = the height of the box. $V = x^2h = 48 \Rightarrow h = \frac{48}{x^2}$. The total cost is given by $C = 6 \cdot x^2 + 4(4 \cdot xh) = 6x^2 + 16x\left(\frac{48}{x^2}\right) = 6x^2 + \frac{768}{x}$, $x > 0 \Rightarrow C' = 12x - \frac{768}{x^2} = \frac{12x^3 - 768}{x^2}$. $C' = 0 \Rightarrow \frac{12x^3 - 768}{x^2} = 0 \Rightarrow 12x^3 - 768 = 0 \Rightarrow x = 4$; $C'' = 12 + \frac{1536}{x^3} \Rightarrow C''(4) = 12 + \frac{1536}{4^3} > 0 \Rightarrow$ local minimum. $x = 4 \Rightarrow h = \frac{48}{4^2} = 3$ and $C(4) = 6(4)^2 + \frac{768}{4} = 288 \Rightarrow$ the box is 4 ft \times 4 ft \times 3 ft, with a minimum cost of \$288.
58. Let x = the number of \$10 increases in the charge per room, then price per room = $50 + 10x$, and the number of rooms filled each night = $800 - 40x \Rightarrow$ the total revenue is $R(x) = (50 + 10x)(800 - 40x)$
 $= -400x^2 + 6000x + 40000$, $0 \leq x \leq 20 \Rightarrow R'(x) = -800x + 6000$; $R'(x) = 0 \Rightarrow -800x + 6000 = 0$
 $\Rightarrow x = \frac{15}{2}$; $R''(x) = -800 \Rightarrow R''\left(\frac{15}{2}\right) = -800 < 0 \Rightarrow$ local maximum. The price per room is $50 + 10\left(\frac{15}{2}\right) = \125 .
59. We have $\frac{dR}{dM} = CM - M^2$. Solving $\frac{d^2R}{dM^2} = C - 2M = 0 \Rightarrow M = \frac{C}{2}$. Also, $\frac{d^3R}{dM^3} = -2 < 0 \Rightarrow$ at $M = \frac{C}{2}$ there is a maximum.

60. (a) If $v = cr_0r^2 - cr^3$, then $v' = 2cr_0r - 3cr^2 = cr(2r_0 - 3r)$ and $v'' = 2cr_0 - 6cr = 2c(r_0 - 3r)$. The solution of $v' = 0$ is $r = 0$ or $\frac{2r_0}{3}$, but 0 is not in the domain. Also, $v' > 0$ for $r < \frac{2r_0}{3}$ and $v' < 0$ for $r > \frac{2r_0}{3} \Rightarrow$ at $r = \frac{2r_0}{3}$ there is a maximum.

- (b) The graph confirms the findings in (a).

61. If $x > 0$, then $(x-1)^2 \geq 0 \Rightarrow x^2 + 1 \geq 2x \Rightarrow \frac{x^2+1}{x} \geq 2$. In particular if a, b, c and d are positive integers, then $\left(\frac{a^2+1}{a}\right)\left(\frac{b^2+1}{b}\right)\left(\frac{c^2+1}{c}\right)\left(\frac{d^2+1}{d}\right) \geq 16$.

62. (a) $f(x) = \frac{x}{\sqrt{a^2+x^2}} \Rightarrow f'(x) = \frac{(a^2+x^2)^{1/2} - x^2(a^2+x^2)^{-1/2}}{(a^2+x^2)} = \frac{a^2+x^2-x^2}{(a^2+x^2)^{3/2}} = \frac{a^2}{(a^2+x^2)^{3/2}} > 0 \Rightarrow f(x)$ is an increasing function of x

(b) $g(x) = \frac{d-x}{\sqrt{b^2+(d-x)^2}} \Rightarrow g'(x) = \frac{-(b^2+(d-x)^2)^{1/2} + (d-x)^2(b^2+(d-x)^2)^{-1/2}}{b^2+(d-x)^2} = \frac{-(b^2+(d-x)^2) + (d-x)^2}{(b^2+(d-x)^2)^{3/2}}$
 $= \frac{-b^2}{(b^2+(d-x)^2)^{3/2}} < 0 \Rightarrow g(x)$ is a decreasing function of x

- (c) Since $c_1, c_2 > 0$, the derivative $\frac{dt}{dx}$ is an increasing function of x (from part (a)) minus a decreasing function of x (from part (b)): $\frac{dt}{dx} = \frac{1}{c_1} f(x) - \frac{1}{c_2} g(x) \Rightarrow \frac{d^2t}{dx^2} = \frac{1}{c_1} f'(x) - \frac{1}{c_2} g'(x) > 0$ since $f'(x) > 0$ and $g'(x) < 0 \Rightarrow \frac{dt}{dx}$ is an increasing function of x .

63. At $x = c$, the tangents to the curves are parallel. Justification: The vertical distance between the curves is $D(x) = f(x) - g(x)$, so $D'(x) = f'(x) - g'(x)$. The maximum value of D will occur at a point c where $D' = 0$. At such a point, $f'(c) - g'(c) = 0$, or $f'(c) = g'(c)$.

64. (a) $f(x) = 3 + 4 \cos x + \cos 2x$ is a periodic function with period 2π
 (b) No, $f(x) = 3 + 4 \cos x + \cos 2x = 3 + 4 \cos x + (2 \cos^2 x - 1) = 2(1 + 2 \cos x + \cos^2 x) = 2(1 + \cos x)^2 \geq 0 \Rightarrow f(x)$ is never negative.

65. (a) If $y = \cot x - \sqrt{2} \csc x$ where $0 < x < \pi$, then $y' = (\csc x)(\sqrt{2} \cot x - \csc x)$. Solving $y' = 0 \Rightarrow \cos x = \frac{1}{\sqrt{2}} \Rightarrow x = \frac{\pi}{4}$. For $0 < x < \frac{\pi}{4}$ we have $y' > 0$ and $y' < 0$ when $\frac{\pi}{4} < x < \pi$. Therefore, at $x = \frac{\pi}{4}$ there is a maximum value of $y = -1$.

(b)

The graph confirms the findings in (a).

66. (a) If $y = \tan x + 3 \cot x$ where $0 < x < \frac{\pi}{2}$, then $y' = \sec^2 x - 3 \csc^2 x$. Solving $y' = 0 \Rightarrow \tan x = \pm\sqrt{3} \Rightarrow x = \pm\frac{\pi}{3}$, but $-\frac{\pi}{3}$ is not in the domain. Also, $y'' = 2 \sec^2 x \tan x + 6 \csc^2 x \cot x > 0$ for all $0 < x < \frac{\pi}{2}$. Therefore at $x = \frac{\pi}{3}$ there is a minimum value of $y = 2\sqrt{3}$.

(b)

The graph confirms the findings in (a).

67. (a) The square of the distance is $D(x) = \left(x - \frac{3}{2}\right)^2 + (\sqrt{x} + 0)^2 = x^2 - 2x + \frac{9}{4}$, so $D'(x) = 2x - 2$ and the critical point occurs at $x = 1$. Since $D'(x) < 0$ for $x < 1$ and $D'(x) > 0$ for $x > 1$, the critical point corresponds to the minimum distance. The minimum distance is $\sqrt{D(1)} = \frac{\sqrt{5}}{2}$.

(b)

The minimum distance is from the point $\left(\frac{3}{2}, 0\right)$ to the point $(1, 1)$ on the graph of $y = \sqrt{x}$, and this occurs at the value $x = 1$ where $D(x)$, the distance squared, has its minimum value.

68. (a) Calculus Method:

The square of the distance from the point $(1, \sqrt{3})$ to $(x, \sqrt{16-x^2})$ is given by

$$D(x) = (x-1)^2 + (\sqrt{16-x^2} - \sqrt{3})^2 = x^2 - 2x + 1 + 16 - x^2 - 2\sqrt{48-3x^2} + 3 = -2x + 20 - 2\sqrt{48-3x^2}.$$

Then $D'(x) = -2 - \frac{1}{2} \cdot \frac{2}{\sqrt{48-3x^2}}(-6x) = -2 + \frac{6x}{\sqrt{48-3x^2}}$. Solving $D'(x) = 0$ we have:

$6x = 2\sqrt{48-3x^2} \Rightarrow 36x^2 = 4(48-3x^2) \Rightarrow 9x^2 = 48-3x^2 \Rightarrow 12x^2 = 48 \Rightarrow x = \pm 2$ We discard $x = -2$ as an extraneous solution, leaving $x = 2$. Since $D'(x) < 0$ for $-4 < x < 2$ and $D'(x) > 0$ for $2 < x < 4$, the critical point corresponds to the minimum distance. The minimum distance is $\sqrt{D(2)} = 2$.

Geometry Method:

The semicircle is centered at the origin and has radius 4. The distance from the origin to $(1, \sqrt{3})$ is

$\sqrt{1^2 + (\sqrt{3})^2} = 2$. The shortest distance from the point to the semicircle is the distance along the radius containing the point $(1, \sqrt{3})$. That distance is $4 - 2 = 2$.

(b)

The minimum distance is from the point $(1, \sqrt{3})$ to the point $(2, 2\sqrt{3})$ on the graph of $y = \sqrt{16-x^2}$, and this occurs at the value $x = 2$ where $D(x)$, the distance squared, has its minimum value.

 $= \frac{5}{4} - \frac{113}{2000} = \frac{2500 - 113}{2000} = \frac{2387}{2000} \approx 1.1935$

6. From Exercise 5, $x_{n+1} = x_n - \frac{x_n^4 - 2}{4x_n^3}$; $x_0 = -1 \Rightarrow x_1 = -1 - \frac{1 - 2}{-4} = -1 - \frac{1}{4} = -\frac{5}{4} \Rightarrow x_2 = -\frac{5}{4} - \frac{\frac{625}{64} - 2}{-\frac{125}{16}}$
 $= -\frac{5}{4} - \frac{625 - 512}{-2000} = -\frac{5}{4} + \frac{113}{2000} \approx -1.1935$

7. $f(x_0) = 0$ and $f'(x_0) \neq 0 \Rightarrow x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$ gives $x_1 = x_0 \Rightarrow x_2 = x_0 \Rightarrow x_n = x_0$ for all $n \geq 0$. That is all, of the approximations in Newton's method will be the root of $f(x) = 0$.

8. It does matter. If you start too far away from $x = \frac{\pi}{2}$, the calculated values may approach some other root. Starting with $x_0 = -0.5$, for instance, leads to $x = -\frac{\pi}{2}$ as the root, not $x = \frac{\pi}{2}$.

9. If $x_0 = h > 0 \Rightarrow x_1 = x_0 - \frac{f(x_0)}{f'(x_0)} = h - \frac{f(h)}{f'(h)}$
 $= h - \frac{\sqrt{h}}{\left(\frac{1}{2\sqrt{h}}\right)} = h - (\sqrt{h})(2\sqrt{h}) = -h$;

if $x_0 = -h < 0 \Rightarrow x_1 = x_0 - \frac{f(x_0)}{f'(x_0)} = -h - \frac{f(-h)}{f'(-h)}$
 $= -h - \frac{\sqrt{h}}{\left(\frac{-1}{2\sqrt{h}}\right)} = -h + (\sqrt{h})(2\sqrt{h}) = h$.

10. $f(x) = x^{1/3} \Rightarrow f'(x) = \left(\frac{1}{3}\right)x^{-2/3}$
 $\Rightarrow x_{n+1} = x_n - \frac{x_n^{1/3}}{\left(\frac{1}{3}\right)x_n^{-2/3}} = -2x_n$; $x_0 = 1$
 $\Rightarrow x_1 = -2, x_2 = 4, x_3 = -8, \text{ and } x_4 = 16$ and so forth. Since $|x_n| = 2|x_{n-1}|$ we may conclude that $n \rightarrow \infty \Rightarrow |x_n| \rightarrow \infty$.

11. i) is equivalent to solving $x^3 - 3x - 1 = 0$.
 ii) is equivalent to solving $x^3 - 3x - 1 = 0$.
 iii) is equivalent to solving $x^3 - 3x - 1 = 0$.
 iv) is equivalent to solving $x^3 - 3x - 1 = 0$.
 All four equations are equivalent.

12. $f(x) = x - 1 - 0.5 \sin x \Rightarrow f'(x) = 1 - 0.5 \cos x \Rightarrow x_{n+1} = x_n - \frac{x_n - 1 - 0.5 \sin x_n}{1 - 0.5 \cos x_n}$; if $x_0 = 1.5$, then $x_1 = 1.49870$

13. $f(x) = \tan x - 2x \Rightarrow f'(x) = \sec^2 x - 2 \Rightarrow x_{n+1} = x_n - \frac{\tan(x_n) - 2x_n}{\sec^2(x_n)}$; $x_0 = 1 \Rightarrow x_1 = 1.2920445$
 $\Rightarrow x_2 = 1.155327774 \Rightarrow x_{16} = x_{17} = 1.165561185$

14. $f(x) = x^4 - 2x^3 - x^2 - 2x + 2 \Rightarrow f'(x) = 4x^3 - 6x^2 - 2x - 2 \Rightarrow x_{n+1} = x_n - \frac{x_n^4 - 2x_n^3 - x_n^2 - 2x_n + 2}{4x_n^3 - 6x_n^2 - 2x_n - 2}$; if $x_0 = 0.5$, then $x_4 = 0.630115396$; if $x_0 = 2.5$, then $x_4 = 2.57327196$

15. (a) The graph of $f(x) = \sin 3x - 0.99 + x^2$ in the window $-2 \leq x \leq 2, -2 \leq y \leq 3$ suggests three roots. However, when you zoom in on the x -axis near $x = 1.2$, you can see that the graph lies above the axis there. There are only two roots, one near $x = -1$, the other near $x = 0.4$.

(b) $f(x) = \sin 3x - 0.99 + x^2$
 $\Rightarrow f'(x) = 3 \cos 3x + 2x$
 $\Rightarrow x_{n+1} = x_n - \frac{\sin(3x_n) - 0.99 + x_n^2}{3 \cos(3x_n) + 2x_n}$
 and the solutions are approximately 0.35003501505249 and -1.0261731615301

16. (a) Yes, three times as indicated by the graphs
 (b) $f(x) = \cos 3x - x \Rightarrow f'(x) = -3 \sin 3x - 1$
 $\Rightarrow x_{n+1} = x_n - \frac{\cos(3x_n) - x_n}{-3 \sin(3x_n) - 1}$; at approximately $-0.979367, -0.887726$, and 0.39004 we have $\cos 3x = x$

17. $f(x) = 2x^4 - 4x^2 + 1 \Rightarrow f'(x) = 8x^3 - 8x \Rightarrow x_{n+1} = x_n - \frac{2x_n^4 - 4x_n^2 + 1}{8x_n^3 - 8x_n}$; if $x_0 = -2$, then $x_6 = -1.30656296$; if $x_0 = -0.5$, then $x_3 = -0.5411961$; the roots are approximately ± 0.5411961 and ± 1.30656296 because $f(x)$ is an even function.

18. $f(x) = \tan x \Rightarrow f'(x) = \sec^2 x \Rightarrow x_{n+1} = x_n - \frac{\tan(x_n)}{\sec^2(x_n)}$; $x_0 = 3 \Rightarrow x_1 = 3.13971 \Rightarrow x_2 = 3.14159$ and we approximate π to be 3.14159.

19. From the graph we let $x_0 = 0.5$ and $f(x) = \cos x - 2x$
 $\Rightarrow x_{n+1} = x_n - \frac{\cos(x_n) - 2x_n}{-\sin(x_n) - 2} \Rightarrow x_1 = .45063$
 $\Rightarrow x_2 = .45018 \Rightarrow$ at $x \approx 0.45$ we have $\cos x = 2x$.

20. From the graph we let $x_0 = -0.7$ and
 $f(x) = \cos x + x \Rightarrow x_{n+1} = x_n - \frac{x_n + \cos(x_n)}{1 - \sin(x_n)}$
 $\Rightarrow x_1 = -0.73944 \Rightarrow x_2 = -0.73908 \Rightarrow$ at $x \approx -0.74$
 we have $\cos x = -x$.

21. The x -coordinate of the point of intersection of $y = x^2(x+1)$ and $y = \frac{1}{x}$ is the solution of $x^2(x+1) = \frac{1}{x}$
 $\Rightarrow x^3 + x^2 - \frac{1}{x} = 0 \Rightarrow$ The x -coordinate is the root of $f(x) = x^3 + x^2 - \frac{1}{x} \Rightarrow f'(x) = 3x^2 + 2x + \frac{1}{x^2}$. Let $x_0 = 1$
 $\Rightarrow x_{n+1} = x_n - \frac{x_n^3 + x_n^2 - \frac{1}{x_n}}{3x_n^2 + 2x_n + \frac{1}{x_n^2}} \Rightarrow x_1 = 0.83333 \Rightarrow x_2 = 0.81924 \Rightarrow x_3 = 0.81917 \Rightarrow x_7 = 0.81917 \Rightarrow r \approx 0.8192$
22. The x -coordinate of the point of intersection of $y = \sqrt{x}$ and $y = 3 - x^2$ is the solution of $\sqrt{x} = 3 - x^2$
 $\Rightarrow \sqrt{x} - 3 + x^2 = 0 \Rightarrow$ The x -coordinate is the root of $f(x) = \sqrt{x} - 3 + x^2 \Rightarrow f'(x) = \frac{1}{2\sqrt{x}} + 2x$. Let $x_0 = 1$
 $\Rightarrow x_{n+1} = x_n - \frac{\sqrt{x_n} - 3 + x_n^2}{\frac{1}{2\sqrt{x_n}} + 2x_n} \Rightarrow x_1 = 1.4 \Rightarrow x_2 = 1.35556 \Rightarrow x_3 = 1.35498 \Rightarrow x_7 = 1.35498 \Rightarrow r \approx 1.3550$
23. Graphing e^{-x^2} and $x^2 - x + 1$ shows that there are two places where the curves intersect, one at $x = 0$ and the other between $x = 0.5$ and $x = 0.6$. Let $f(x) = e^{-x^2} - x^2 + x - 1$, $x_0 = 0.5$, and
 $x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{e^{-x_n^2} - x_n^2 + x_n - 1}{-2x_n - 2x_n e^{-x_n^2}}$. Performing iterations on a calculator, spreadsheet, or CAS gives
 $x_1 = 0.536981$, $x_2 = 0.534856$, $x_3 = 0.53485$, $x_4 = 0.53485$. (You may get different results depending upon what you select for $f(x)$ and x_0 , and what calculator or computer you may use.) Therefore, the two curves intersect at $x = 0$ and $x = 0.53485$.
24. Graphing $\ln(1 - x^2)$ and $x - 1$ shows that there are two places where the curves intersect, one between $x = -1$ and $x = -0.9$, and the other between $x = 0.5$ and $x = 0.6$. Let $f(x) = \ln(1 - x^2) - x + 1$, and
 $x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{\ln(1 - x_n^2) - x_n + 1}{\frac{-2x_n}{1 - x_n^2} - 1}$. Performing iterations on a calculator, spreadsheet, or CAS with
 $x_0 = 0.5$ gives $x_1 = 0.590992$, $x_2 = 0.583658$, $x_3 = 0.583597$, $x_4 = 0.583597$ and with $x_0 = -0.9$ gives
 $x_1 = -0.928237$, $x_2 = -0.924247$, $x_3 = -0.924119$, $x_4 = -0.924119$. (You may get different results depending upon what you select for $f(x)$ and x_0 , and what calculator or computer you may use.) Therefore, the two curves intersect at $x = -0.924119$ and $x = 0.583597$.
25. If $f(x) = x^3 + 2x - 4$, then $f(1) = -1 < 0$ and $f(2) = 8 > 0 \Rightarrow$ by the Intermediate Value Theorem the equation $x^3 + 2x - 4 = 0$ has a solution between 1 and 2. Consequently, $f'(x) = 3x^2 + 2$ and $x_{n+1} = x_n - \frac{x_n^3 + 2x_n - 4}{3x_n^2 + 2}$. Then
 $x_0 = 1 \Rightarrow x_1 = 1.2 \Rightarrow x_2 = 1.17975 \Rightarrow x_3 = 1.179509 \Rightarrow x_4 = 1.1795090 \Rightarrow$ the root is approximately 1.17951.

26. We wish to solve $8x^4 - 14x^3 - 9x^2 + 11x - 1 = 0$. Let $f(x) = 8x^4 - 14x^3 - 9x^2 + 11x - 1$, then

$$f'(x) = 32x^3 - 42x^2 - 18x + 11 \Rightarrow x_{n+1} = x_n - \frac{8x_n^4 - 14x_n^3 - 9x_n^2 + 11x_n - 1}{32x_n^3 - 42x_n^2 - 18x_n + 11}.$$

27. $f(x) = 4x^4 - 4x^2 \Rightarrow f'(x) = 16x^3 - 8x \Rightarrow x_{i+1} = x_i - \frac{f(x_i)}{f'(x_i)} = x_i - \frac{x_i^3 - x_i}{4x_i^2 - 2}$. Iterations are performed using the procedure in problem 13 in this section.

- (a) For $x_0 = -2$ or $x_0 = -0.8$, $x_i \rightarrow -1$ as i gets large.
- (b) For $x_0 = -0.5$ or $x_0 = 0.25$, $x_i \rightarrow 0$ as i gets large.
- (c) For $x_0 = 0.8$ or $x_0 = 2$, $x_i \rightarrow 1$ as i gets large.
- (d) (If your calculator has a CAS, put it in exact mode, otherwise approximate the radicals with a decimal value.) For $x_0 = -\frac{\sqrt{21}}{7}$ or $x_0 = \frac{\sqrt{21}}{7}$, Newton's method does not converge. The values of x_i alternate between $x_0 = -\frac{\sqrt{21}}{7}$ or $x_0 = \frac{\sqrt{21}}{7}$ as i increases.

28. (a) The distance can be represented by $D(x) = \sqrt{(x-2)^2 + \left(x^2 + \frac{1}{2}\right)^2}$, where $x \geq 0$. The distance $D(x)$ is minimized when $f(x) = (x-2)^2 + \left(x^2 + \frac{1}{2}\right)^2$ is minimized. If $f(x) = (x-2)^2 + \left(x^2 + \frac{1}{2}\right)^2$, then $f'(x) = 4(x^3 + x - 1)$ and $f''(x) = 4(3x^2 + 1) > 0$. Now $f'(x) = 0 \Rightarrow x^3 + x - 1 = 0 \Rightarrow x(x^2 + 1) = 1 \Rightarrow x = \frac{1}{x^2 + 1}$.

(b) Let $g(x) = \frac{1}{x^2 + 1} - x = (x^2 + 1)^{-1} - x \Rightarrow g'(x) = -(x^2 + 1)^{-2} (2x) - 1 = \frac{-2x}{(x^2 + 1)^2} - 1 \Rightarrow x_{n+1} = x_n - \frac{\left(\frac{1}{x_n^2 + 1} - x_n\right)}{\left(\frac{-2x_n}{(x_n^2 + 1)^2} - 1\right)}$.

$x_0 = 1 \Rightarrow x_4 = 0.68233$ to five decimal places.

29. $f(x) = (x-1)^{40} \Rightarrow f'(x) = 40(x-1)^{39} \Rightarrow x_{n+1} = x_n - \frac{(x_n-1)^{40}}{40(x_n-1)^{39}} = \frac{39x_n+1}{40}$. With $x_0 = 2$, our computer gave $x_{87} = x_{88} = x_{89} = \dots = x_{200} = 1.11051$, coming within 0.11051 of the root $x = 1$.

30. Since $s = r\theta \Rightarrow 3 = r\theta \Rightarrow \theta = \frac{3}{r}$. Bisect the angle θ to obtain a right triangle with hypotenuse r and opposite side of length 1. Then $\sin \frac{\theta}{2} = \frac{1}{r} \Rightarrow \sin \left(\frac{3}{2r}\right) = \frac{1}{r} \Rightarrow \sin \left(\frac{3}{2r}\right) - \frac{1}{r} = 0$. Thus the solution r is a root of

$$f(r) = \sin \left(\frac{3}{2r}\right) - \frac{1}{r} \Rightarrow f'(r) = -\frac{3}{2r^2} \cos \left(\frac{3}{2r}\right) + \frac{1}{r^2}; \quad r_0 = 1 \Rightarrow r_{n+1} = r_n - \frac{\sin \left(\frac{3}{2r_n}\right) - \frac{1}{r_n}}{-\frac{3}{2r_n^2} \cos \left(\frac{3}{2r_n}\right) + \frac{1}{r_n^2}} \Rightarrow r_1 = 1.00280$$

$$\Rightarrow r_2 = 1.00282 \Rightarrow r_3 = 1.00282 \Rightarrow r \approx 1.0028 \Rightarrow \theta = \frac{3}{1.00282} \approx 2.9916$$

116. $\frac{dy}{dx} = x - 1 \Rightarrow y = \int (x - 1) dx = \frac{x^2}{2} - x + C$; at $(-1, 1)$ on the curve we have
 $1 = \frac{(-1)^2}{2} - (-1) + C \Rightarrow C = -\frac{1}{2} \Rightarrow y = \frac{x^2}{2} - x - \frac{1}{2}$

117. $\frac{dy}{dx} = \sin x - \cos x \Rightarrow y = \int (\sin x - \cos x) dx = -\cos x - \sin x + C$; at $(-\pi, -1)$ on the curve we have
 $-1 = -\cos(-\pi) - \sin(-\pi) + C \Rightarrow C = -2 \Rightarrow y = -\cos x - \sin x - 2$

118. $\frac{dy}{dx} = \frac{1}{2\sqrt{x}} + \pi \sin \pi x = \frac{1}{2}x^{-1/2} + \pi \sin \pi x \Rightarrow y = \int \left(\frac{1}{2}x^{-1/2} + \sin \pi x\right) dx = x^{1/2} - \cos \pi x + C$; at $(1, 2)$ on the curve
we have $2 = 1^{1/2} - \cos \pi(1) + C \Rightarrow C = 0 \Rightarrow y = \sqrt{x} - \cos \pi x$

119. (a) $\frac{ds}{dt} = 9.8t - 3 \Rightarrow s = 4.9t^2 - 3t + C$; (i) at $s = 5$ and $t = 0$ we have $C = 5 \Rightarrow s = 4.9t^2 - 3t + 5$;
displacement = $s(3) - s(1) = ((4.9)(9) - 9 + 5) - (4.9 - 3 + 5) = 33.2$ units; (ii) at $s = -2$ and $t = 0$ we have
 $C = -2 \Rightarrow s = 4.9t^2 - 3t - 2$; displacement = $s(3) - s(1) = ((4.9)(9) - 9 - 2) - (4.9 - 3 - 2) = 33.2$ units;
(iii) at $s = s_0$ and $t = 0$ we have $C = s_0 \Rightarrow s = 4.9t^2 - 3t + s_0$;
displacement = $s(3) - s(1) = ((4.9)(9) - 9 + s_0) - (4.9 - 3 + s_0) = 33.2$ units

(b) True. Given an antiderivative $f(t)$ of the velocity function, we know that the body's position function is $s = f(t) + C$ for some constant C . Therefore, the displacement from $t = a$ to $t = b$ is
 $(f(b) + C) - (f(a) + C) = f(b) - f(a)$. Thus we can find the displacement from any antiderivative f as the numerical difference $f(b) - f(a)$ without knowing the exact values of C and s .

120. $a(t) = v'(t) = 20 \Rightarrow v(t) = 20t + C$; at $(0, 0)$ we have $C = 0 \Rightarrow v(t) = 20t$. When $t = 60$, then $v(60) = 20(60) = 1200$ m/sec.

121. Step 1: $\frac{d^2s}{dt^2} = -k \Rightarrow \frac{ds}{dt} = -kt + C_1$; at $\frac{ds}{dt} = 88$ and $t = 0$ we have

$$C_1 = 88 \Rightarrow \frac{ds}{dt} = -kt + 88 \Rightarrow s = -k\left(\frac{t^2}{2}\right) + 88t + C_2; \text{ at } s = 0 \text{ and } t = 0 \text{ we have } C_2 = 0 \Rightarrow s = -\frac{kt^2}{2} + 88t$$

Step 2: $\frac{ds}{dt} = 0 \Rightarrow 0 = -kt + 88 \Rightarrow t = \frac{88}{k}$

Step 3: $242 = -\frac{k\left(\frac{88}{k}\right)^2}{2} + 88\left(\frac{88}{k}\right) \Rightarrow 242 = -\frac{(88)^2}{2k} + \frac{(88)^2}{k} \Rightarrow 242 = \frac{(88)^2}{2k} \Rightarrow k = 16$

122. $\frac{d^2s}{dt^2} = -k \Rightarrow \frac{ds}{dt} = \int -k dt = -kt + C$; at $\frac{ds}{dt} = 44$ when $t = 0$ we have

$$44 = -k(0) + C \Rightarrow C = 44 \Rightarrow \frac{ds}{dt} = -kt + 44 \Rightarrow s = -\frac{kt^2}{2} + 44t + C_1; \text{ at } s = 0 \text{ when } t = 0 \text{ we have}$$

$$0 = -\frac{k(0)^2}{2} + 44(0) + C_1 \Rightarrow C_1 = 0 \Rightarrow s = -\frac{kt^2}{2} + 44t. \text{ Then } \frac{ds}{dt} = 0 \Rightarrow -kt + 44 = 0 \Rightarrow t = \frac{44}{k} \text{ and}$$

$$s\left(\frac{44}{k}\right) = -\frac{k\left(\frac{44}{k}\right)^2}{2} + 44\left(\frac{44}{k}\right) = 45 \Rightarrow -\frac{968}{k} + \frac{1936}{k} = 45 \Rightarrow k = \frac{968}{45} \approx 21.5 \frac{\text{ft}}{\text{sec}^2}.$$

123. (a) $v = \int a dt = \int (15t^{1/2} - 3t^{-1/2}) dt = 10t^{3/2} - 6t^{1/2} + C$;

$$\frac{ds}{dt}(1) = 4 \Rightarrow 4 = 10(1)^{3/2} - 6(1)^{1/2} + C \Rightarrow C = 0 \Rightarrow v = 10t^{3/2} - 6t^{1/2}$$

(b) $s = \int v dt = \int (10t^{3/2} - 6t^{1/2}) dt = 4t^{5/2} - 4t^{3/2} + C$;

$$s(1) = 0 \Rightarrow 0 = 4(1)^{5/2} - 4(1)^{3/2} + C \Rightarrow C = 0 \Rightarrow s = 4t^{5/2} - 4t^{3/2}$$

124. $\frac{d^2s}{dt^2} = -5.2 \Rightarrow \frac{ds}{dt} = -5.2t + C_1$; at $\frac{ds}{dt} = 0$ and $t = 0$ we have $C_1 = 0 \Rightarrow \frac{ds}{dt} = -5.2t \Rightarrow s = -2.6t^2 + C_2$; at $s = 4$

and $t = 0$ we have $C_2 = 4 \Rightarrow s = -2.6t^2 + 4$. Then $s = 0 \Rightarrow 0 = -2.6t^2 + 4 \Rightarrow t = \sqrt{\frac{4}{2.6}} \approx 1.24$ sec, since $t > 0$

125. $\frac{d^2s}{dt^2} = a \Rightarrow \frac{ds}{dt} = \int a dt = at + C$; $\frac{ds}{dt} = v_0$ when $t = 0 \Rightarrow C = v_0 \Rightarrow \frac{ds}{dt} = at + v_0 \Rightarrow s = \frac{at^2}{2} + v_0t + C_1$; $s = s_0$

$$\text{when } t = 0 \Rightarrow s_0 = \frac{a(0)^2}{2} + v_0(0) + C_1 \Rightarrow C_1 = s_0 \Rightarrow s = \frac{at^2}{2} + v_0t + s_0$$

126. The appropriate initial value problem is: Differential Equation: $\frac{d^2s}{dt^2} = -g$ with Initial Conditions: $\frac{ds}{dt} = v_0$ and

$$s = s_0 \text{ when } t = 0. \text{ Thus } \frac{ds}{dt} = \int -g dt = -gt + C_1; \frac{ds}{dt}(0) = v_0 \Rightarrow v_0 = (-g)(0) + C_1 \Rightarrow C_1 = v_0 \Rightarrow \frac{ds}{dt} = -gt + v_0.$$

$$\text{Thus } s = \int (-gt + v_0) dt = -\frac{1}{2}gt^2 + v_0t + C_2; s(0) = s_0 = -\frac{1}{2}(g)(0)^2 + v_0(0) + C_2 \Rightarrow C_2 = s_0$$

$$\text{Thus } s = -\frac{1}{2}gt^2 + v_0t + s_0.$$

127 (a) $\int f(x) dx = 1 - \sqrt{x} + C_1 = -\sqrt{x} + C$

(b) $\int g(x) dx = x + 2 + C_1 = x + C$

(c) $\int -f(x) dx = -(1 - \sqrt{x}) + C_1 = \sqrt{x} + C$

(d) $\int -g(x) dx = -(x + 2) + C_1 = -x + C$

(e) $\int [f(x) + g(x)] dx = (1 - \sqrt{x}) + (x + 2) + C_1 = x - \sqrt{x} + C$

(f) $\int [f(x) - g(x)] dx = (1 - \sqrt{x}) - (x + 2) + C_1 = -x - \sqrt{x} + C$

128. Yes. If $F(x)$ and $G(x)$ both solve the initial value problem on an interval I then they both have the same first derivative. Therefore, by Corollary 2 of the Mean Value Theorem there is a constant C such that $F(x) = G(x) + C$ for all x . In particular, $F(x_0) = G(x_0) + C$, so $C = F(x_0) - G(x_0) = 0$. Hence $F(x) = G(x)$ for all x .

```

Mathematica: (functions and values may vary)

The following commands use the definite integral and the Fundamental Theorem of calculus to construct the solution of the initial value problems for Exercises 129-132.

```
Clear[x, y, yprime]
yprime[x_] = Cos[x]^2 + Sin[x];
initxvalue = Pi; inityvalue = 1;
y[x_] = Integrate[yprime[t], {t, initxvalue, x}] + inityvalue
```

If the solution satisfies the differential equation and initial condition, the following yield True

```
yprime[x]==D[y[x], x]//Simplify
y[initxvalue]==inityvalue
```

Since exercise 132 is a second order differential equation, two integrations will be required.

```
Clear[x, y, yprime]
y2prime[x_] = 3 Exp[x/2] + 1;
initxval = 0; inityval = 4; inityprimeval = -1;
yprime[x_] = Integrate[y2prime[t], {t, initxval, x}] + inityprimeval
y[x_] = Integrate[yprime[t], {t, initxval, x}] + inityval
```

Verify that $y[x]$ solves the differential equation and initial condition and plot the solution (red) and its derivative (blue).

```
y2prime[x]==D[y[x], {x, 2}]/Simplify

CHAPTER 4 PRACTICE EXERCISES

- No, since $f(x) = x^3 + 2x + \tan x \Rightarrow f'(x) = 3x^2 + 2 + \sec^2 x > 0 \Rightarrow f(x)$ is always increasing on its domain
- No, since $g(x) = \csc x + 2 \cot x \Rightarrow g'(x) = -\csc x \cot x - 2 \csc^2 x = -\frac{\cos x}{\sin^2 x} - \frac{2}{\sin^2 x} = -\frac{1}{\sin^2 x}(\cos x + 2) < 0$
 $\Rightarrow g(x)$ is always decreasing on its domain
- No absolute minimum because $\lim_{x \rightarrow \infty} (7+x)(11-3x)^{1/3} = -\infty$. Next $f'(x) = (11-3x)^{1/3} - (7+x)(11-3x)^{-2/3}$
 $= \frac{(11-3x)-(7+x)}{(11-3x)^{2/3}} = \frac{4(1-x)}{(11-3x)^{2/3}} \Rightarrow x = 1$ and $x = \frac{11}{3}$ are critical points. Since $f' > 0$ if $x < 1$ and $f' < 0$ if $x > 1$, $f(1) = 16$ is the absolute maximum.
- $f(x) = \frac{ax+b}{x^2-1} \Rightarrow f'(x) = \frac{a(x^2-1)-2x(ax+b)}{(x^2-1)^2} = \frac{-(ax^2+2bx+a)}{(x^2-1)^2}$; $f'(3) = 0 \Rightarrow -\frac{1}{64}(9a+6b+a) = 0 \Rightarrow 5a+3b = 0$. We require also that $f(3) = 1$. Thus $1 = \frac{3a+b}{8} \Rightarrow 3a+b = 8$. Solving both equations yields $a = 6$ and $b = -10$. Now, $f'(x) = \frac{-2(3x-1)(x-3)}{(x^2-1)^2}$ so that $f' = \begin{matrix} - & - & - & | & - & - & - & | & + & + & + & | & + & + & + & | & - & - & - & - \end{matrix}$. Thus f' changes sign at $x = 3$ from positive to negative so there is a local maximum at $x = 3$ which has a value $f(3) = 1$.
- $g(x) = e^x - x \Rightarrow g'(x) = e^x - 1 \Rightarrow g' = \begin{matrix} - & - & - & - & | & + & + & + & + \end{matrix}$
 \Rightarrow the graph is decreasing on $(-\infty, 0)$, increasing on $(0, \infty)$;
an absolute minimum value is 1 at $x = 0$; $x = 0$ is the only critical point of g ; there is no absolute maximum value
- $f(x) = \frac{2e^x}{1+x^2} \Rightarrow f'(x) = \frac{(1+x^2) \cdot 2e^x - 2e^x \cdot 2x}{(1+x^2)^2} = \frac{2e^x(1-x)^2}{(1+x^2)^2} \Rightarrow f' = \begin{matrix} + & + & + & | & + & + & + & + \end{matrix}$
 \Rightarrow the graph is increasing on $(-\infty, \infty)$;
 $x = 1$ is the only critical point of f ; there are no absolute maximum values or absolute minimum values.
- $f(x) = x - 2 \ln x$ on $1 \leq x \leq 3 \Rightarrow f'(x) = 1 - \frac{2}{x} \Rightarrow f' = \begin{matrix} - & - & - & | & + & + & + & | \end{matrix}$
 \Rightarrow the graph is decreasing on $(1, 2)$, increasing on $(2, 3)$; an absolute minimum value is $2 - 2 \ln 2$ at $x = 2$; an absolute maximum value is 1 at $x = 1$.
- $f(x) = \frac{4}{x} + \ln x^2$ on $1 \leq x \leq 4 \Rightarrow f'(x) = -\frac{4}{x^2} + \frac{2}{x} = \frac{2x-4}{x^2} \Rightarrow f' = \begin{matrix} - & - & - & | & + & + & + & | \end{matrix}$
 \Rightarrow the graph is decreasing on $(1, 2)$, increasing on $(2, 4)$; an absolute minimum value is $2 + \ln 4$ at $x = 2$; an absolute maximum value is 4 at $x = 1$.
- Yes, because at each point of $[0, 1)$ except $x = 0$, the function's value is a local minimum value as well as a local maximum value. At $x = 0$ the function's value, 0, is not a local minimum value because each open interval around $x = 0$ on the x -axis contains points to the left of 0 where f equals -1 .
- (a) The first derivative of the function $f(x) = x^3$ is zero at $x = 0$ even though f has no local extreme value at $x = 0$.
(b) Theorem 2 says only that if f is differentiable and f has a local extreme at $x = c$ then $f'(c) = 0$. It does not assert the (false) reverse implication $f'(c) = 0 \Rightarrow f$ has a local extreme at $x = c$.
- No, because the interval $0 < x < 1$ fails to be closed. The Extreme Value Theorem says that if the function is continuous throughout a finite closed interval $a \leq x \leq b$ then the existence of absolute extrema is guaranteed on that interval.

12. The absolute maximum is $|-1| = 1$ and the absolute minimum is $|0| = 0$. This is not inconsistent with the Extreme Value Theorem for continuous functions, which says a continuous function on a closed interval attains its extreme values on that interval. The theorem says nothing about the behavior of a continuous function on an interval which is half open and half closed, such as $[-1, 1)$, so there is nothing to contradict.

13. (a) There appear to be local minima at $x = -1.75$ and 1.8 . Points of inflection are indicated at approximately $x = 0$ and $x = \pm 1$.

(b) $f'(x) = x^7 - 3x^5 - 5x^4 + 15x^2 = x^2(x^2 - 3)(x^3 - 5)$. The pattern $y' = \text{---} | \text{+++} | \text{+++} | \text{---} | \text{+++}$ indicates a local maximum at $x = \sqrt[3]{5}$ and local minima at $x = \pm\sqrt{3}$.

(c)

14. (a) The graph does not indicate any local extremum. Points of inflection are indicated at approximately $x = -\frac{3}{4}$ and $x = 1$.

(b) $f'(x) = x^7 - 2x^4 - 5 + \frac{10}{x^3} = x^{-3}(x^3 - 2)(x^7 - 5)$. The pattern $f' = \text{---} | \text{+++} | \text{---} | \text{+++}$ indicates a local maximum at $x = \sqrt[3]{5}$ and a local minimum at $x = \sqrt[3]{2}$.

(c)

15. (a) $g(t) = \sin^2 t - 3t \Rightarrow g'(t) = 2 \sin t \cos t - 3 = \sin(2t) - 3 \Rightarrow g' < 0 \Rightarrow g(t)$ is always falling and hence must decrease on every interval in its domain.
 (b) One, since $\sin^2 t - 3t - 5 = 0$ and $\sin^2 t - 3t = 5$ have the same solutions: $f(t) = \sin^2 t - 3t - 5$ has the same derivative as $g(t)$ in part (a) and is always decreasing with $f(-3) > 0$ and $f(0) < 0$. The Intermediate Value Theorem guarantees the continuous function f has a root in $[-3, 0]$.
16. (a) $y = \tan \theta \Rightarrow \frac{dy}{d\theta} = \sec^2 \theta > 0 \Rightarrow y = \tan \theta$ is always rising on its domain $\Rightarrow y = \tan \theta$ increases on every interval in its domain
 (b) The interval $\left[\frac{\pi}{4}, \pi\right]$ is not in the tangent's domain because $\tan \theta$ is undefined at $\theta = \frac{\pi}{2}$. Thus the tangent need not increase on this interval.
17. (a) $f(x) = x^4 + 2x^2 - 2 \Rightarrow f'(x) = 4x^3 + 4x$. Since $f(0) = -2 < 0$, $f(1) = 1 > 0$ and $f'(x) \geq 0$ for $0 \leq x \leq 1$, we may conclude from the Intermediate Value Theorem that $f(x)$ has exactly one solution when $0 \leq x \leq 1$.
 (b) $x^2 = \frac{-2 \pm \sqrt{4+8}}{2} > 0 \Rightarrow x^2 = \sqrt{3} - 1$ and $x \geq 0 \Rightarrow x \approx \sqrt{.7320508076} \approx .8555996772$
18. (a) $y = \frac{x}{x+1} \Rightarrow y' = \frac{1}{(x+1)^2} > 0$, for all x in the domain of $\frac{x}{x+1} \Rightarrow y = \frac{x}{x+1}$ is increasing in every interval in its domain.
 (b) $y = x^3 + 2x \Rightarrow y' = 3x^2 + 2 > 0$ for all $x \Rightarrow$ the graph of $y = x^3 + 2x$ is always increasing and can never have a local maximum or minimum
19. Let $V(t)$ represent the volume of the water in the reservoir at time t , in minutes, let $V(0) = a_0$ be the initial amount and $V(1440) = a_0 + (1400)(43,560)(7.58)$ gallons be the amount of water contained in the reservoir after the rain, where 24 hr = 1440 min. Assume that $V(t)$ is continuous on $[0, 1440]$ and differentiable on $(0, 1440)$. The Mean Value Theorem says that for some t_0 in $(0, 1440)$ we have $V'(t_0) = \frac{V(1440) - V(0)}{1440 - 0} = \frac{a_0 + (1400)(43,560)(7.48) - a_0}{1440} = \frac{456,160,320 \text{ gal}}{1440 \text{ min}} = 316,778 \text{ gal/min}$. Therefore at t_0 the reservoir's volume was increasing at a rate in excess of 225,000 gal/min.
20. Yes, all differentiable functions $g(x)$ having 3 as a derivative differ by only a constant. Consequently, the difference $3x - g(x)$ is a constant K because $g'(x) = 3 = \frac{d}{dx}(3x)$. Thus $g(x) = 3x + K$, the same form as $F(x)$.
21. No, $\frac{x}{x+1} = 1 + \frac{-1}{x+1} \Rightarrow \frac{x}{x+1}$ differs from $\frac{-1}{x+1}$ by the constant 1. Both functions have the same derivative $\frac{d}{dx}\left(\frac{x}{x+1}\right) = \frac{(x+1) - x(1)}{(x+1)^2} = \frac{1}{(x+1)^2} = \frac{d}{dx}\left(\frac{-1}{x+1}\right)$.
22. $f'(x) = g'(x) = \frac{2x}{(x^2+1)^2} \Rightarrow f(x) - g(x) = C$ for some constant $C \Rightarrow$ the graphs differ by a vertical shift.
23. The global minimum value of $\frac{1}{2}$ occurs at $x = 2$.
24. (a) The function is increasing on the intervals $[-3, -2]$ and $[1, 2]$.
 (b) The function is decreasing on the intervals $[-2, 0]$ and $(0, 1]$.
 (c) The local maximum values occur only at $x = -2$, and at $x = 2$; local minimum values occur at $x = -3$ and at $x = 1$ provided f is continuous at $x = 0$.
25. (a) $t = 0, 6, 12$ (b) $t = 3, 9$ (c) $6 < t < 12$ (d) $0 < t < 6, 12 < t < 14$
26. (a) $t = 4$ (b) at no time (c) $0 < t < 4$ (d) $4 < t < 8$

49. The values of the first derivative indicate that the curve is rising on $(0, \infty)$ and falling on $(-\infty, 0)$. The slope of the curve approaches $-\infty$ as $x \rightarrow 0^-$, and approaches ∞ as $x \rightarrow 0^+$ and $x \rightarrow 1$. The curve should therefore have a cusp and local minimum at $x = 0$, and a vertical tangent at $x = 1$.

50. The values of the first derivative indicate that the curve is rising on $(0, \frac{1}{2})$ and $(1, \infty)$, and falling on $(-\infty, 0)$ and $(\frac{1}{2}, 1)$. The slope of the curve approaches $-\infty$ as $x \rightarrow 0^-$ and $x \rightarrow 1^-$, and approaches ∞ as $x \rightarrow 0^+$ and as $x \rightarrow 1^+$, indicating cusps and local minima at both $x = 0$ and $x = 1$.

51. The values of the first derivative indicate that the curve is always rising. The slope of the curve approaches ∞ as $x \rightarrow 0$ and as $x \rightarrow 1$, indicating vertical tangents at both $x = 0$ and $x = 1$.

52. The graph of the first derivative indicates that the curve is rising on $(0, \frac{17-\sqrt{33}}{16})$ and $(\frac{17+\sqrt{33}}{16}, \infty)$, falling on $(-\infty, 0)$ and $(\frac{17-\sqrt{33}}{16}, \frac{17+\sqrt{33}}{16}) \Rightarrow$ a local maximum at $x = \frac{17-\sqrt{33}}{16}$, a local minimum at $x = \frac{17+\sqrt{33}}{16}$. The derivative approaches $-\infty$ as $x \rightarrow 0^-$ and $x \rightarrow 1$, and approaches ∞ as $x \rightarrow 0^+$, indicating a cusp and local minimum at $x = 0$ and a vertical tangent at $x = 1$.

Notice that $x = \sqrt{x^2}$ for $x > 0$ so this is equivalent to

$$= \lim_{x \rightarrow \infty} \frac{\frac{2x+1}{x}}{\sqrt{\frac{x^2+x+1}{x^2} + \sqrt{\frac{x^2-x}{x^2}}} = \lim_{x \rightarrow \infty} \frac{2+\frac{1}{x}}{\sqrt{1+\frac{1}{x}+\frac{1}{x^2}} + \sqrt{1-\frac{1}{x}}} = \frac{2}{\sqrt{1} + \sqrt{1}} = 1$$

85. (a) Maximize $f(x) = \sqrt{x} - \sqrt{36-x} = x^{1/2} - (36-x)^{1/2}$ where $0 \leq x \leq 36$
 $\Rightarrow f'(x) = \frac{1}{2}x^{-1/2} - \frac{1}{2}(36-x)^{-1/2}(-1) = \frac{\sqrt{36-x} + \sqrt{x}}{2\sqrt{x}\sqrt{36-x}} \Rightarrow$ derivative fails to exist at 0 and 36; $f(0) = -6$, and $f(36) = 6 \Rightarrow$ the numbers are 0 and 36
- (b) Maximize $g(x) = \sqrt{x} + \sqrt{36-x} = x^{1/2} + (36-x)^{1/2}$ where $0 \leq x \leq 36 \Rightarrow g'(x) = \frac{1}{2}x^{-1/2} + \frac{1}{2}(36-x)^{-1/2}(-1) = \frac{\sqrt{36-x} - \sqrt{x}}{2\sqrt{x}\sqrt{36-x}} \Rightarrow$ critical points at 0, 18 and 36; $g(0) = 6$, $g(18) = 2\sqrt{18} = 6\sqrt{2}$ and $g(36) = 6 \Rightarrow$ the numbers are 18 and 18
86. (a) Maximize $f(x) = \sqrt{x}(20-x) = 20x^{1/2} - x^{3/2}$ where $0 \leq x \leq 20 \Rightarrow f'(x) = 10x^{-1/2} - \frac{3}{2}x^{1/2} = \frac{20-3x}{2\sqrt{x}} = 0$
 $\Rightarrow x = 0$ and $x = \frac{20}{3}$ are critical points; $f(0) = f(20) = 0$ and $f\left(\frac{20}{3}\right) = \sqrt{\frac{20}{3}}\left(20 - \frac{20}{3}\right) = \frac{40\sqrt{20}}{3\sqrt{3}} \Rightarrow$ the numbers are $\frac{20}{3}$ and $\frac{40}{3}$.

(b) Maximize $g(x) = x + \sqrt{20-x} = x + (20-x)^{1/2}$ where $0 \leq x \leq 20 \Rightarrow g'(x) = \frac{2\sqrt{20-x}-1}{2\sqrt{20-x}} = 0 \Rightarrow \sqrt{20-x} = \frac{1}{2}$
 $\Rightarrow x = \frac{79}{4}$. The critical points are $x = \frac{79}{4}$ and $x = 20$. Since $g\left(\frac{79}{4}\right) = \frac{81}{4}$ and $g(20) = 20$, the numbers must be $\frac{79}{4}$ and $\frac{1}{4}$.

87. $A(x) = \frac{1}{2}(2x)(27-x^2)$ for $0 \leq x \leq \sqrt{27}$
 $\Rightarrow A'(x) = 3(3+x)(3-x)$ and $A''(x) = -6x$. The critical points are -3 and 3 , but -3 is not in the domain. Since $A''(3) = -18 < 0$ and $A(\sqrt{27}) = 0$, the maximum occurs at $x = 3 \Rightarrow$ the largest area is $A(3) = 54$ sq units.

88. The volume is $V = x^2h = 32 \Rightarrow h = \frac{32}{x^2}$. The surface area is $S(x) = x^2 + 4x\left(\frac{32}{x^2}\right) = x^2 + \frac{128}{x}$, where $x > 0$
 $\Rightarrow S'(x) = \frac{2(x-4)(x^2+4x+16)}{x^2} \Rightarrow$ the critical points are 0 and 4 , but 0 is not in the domain. Now $S''(4) = 2 + \frac{256}{4^3} > 0 \Rightarrow$ at $x = 4$ there is a minimum. The dimensions 4 ft by 4 ft by 2 ft minimize the surface area.

89. From the diagram we have $\left(\frac{h}{2}\right)^2 + r^2 = (\sqrt{3})^2$
 $\Rightarrow r^2 = \frac{12-h^2}{4}$. The volume of the cylinder is $V = \pi r^2 h = \pi\left(\frac{12-h^2}{4}\right)h = \frac{\pi}{4}(12h-h^3)$, where $0 \leq h \leq 2\sqrt{3}$. Then $V'(h) = \frac{3\pi}{4}(2+h)(2-h) \Rightarrow$ the critical points are -2 and 2 , but -2 is not in the domain. At $h = 2$ there is a maximum since $V''(2) = -3\pi < 0$. The dimensions of the largest cylinder are radius $= \sqrt{2}$ and height $= 2$.

90. From the diagram we have $x =$ radius and $y =$ height $= 12 - 2x$ and $V(x) = \frac{1}{3}\pi x^2(12 - 2x)$, where $0 \leq x \leq 6$
 $\Rightarrow V'(x) = 2\pi x(4-x)$ and $V''(4) = -8\pi$. The critical points are 0 and 4 ; $V(0) = V(6) = 0 \Rightarrow x = 4$ gives the maximum. Thus the values of $r = 4$ and $h = 4$ yield the largest volume for the smaller cone.

91. The profit $P = 2px + py = 2px + p\left(\frac{40-10x}{5-x}\right)$, where p is the profit on grade B tires and $0 \leq x \leq 4$. Thus $P'(x) = \frac{2p}{(5-x)^2}(x^2 - 10x + 20) \Rightarrow$ the critical points are $(5 - \sqrt{5})$, 5 , and $(5 + \sqrt{5})$, but only $(5 - \sqrt{5})$ is in the domain. Now $P'(x) > 0$ for $0 < x < (5 - \sqrt{5})$ and $P'(x) < 0$ for $(5 - \sqrt{5}) < x < 4 \Rightarrow$ at $x = (5 - \sqrt{5})$ there is a local maximum. Also $P(0) = 8p$, $P(5 - \sqrt{5}) = 4p(5 - \sqrt{5}) \approx 11p$, and $P(4) = 8p \Rightarrow$ at $x = (5 - \sqrt{5})$ there is an absolute maximum. The maximum occurs when $x = (5 - \sqrt{5})$ and $y = 2(5 - \sqrt{5})$, the units are hundreds of tires, i.e., $x \approx 276$ tires and $y \approx 553$ tires.

92. (a) The distance between the particles is $|f(t)|$ where $f(t) = -\cos t + \cos\left(t + \frac{\pi}{4}\right)$. Then, $f'(t) = \sin t - \sin\left(t + \frac{\pi}{4}\right)$. Solving $f'(t) = 0$ graphically, we obtain $t \approx 1.178$, $t \approx 4.320$, and so on.

Alternatively, $f'(t) = 0$ may be solved analytically as follows. $f'(t) = \sin\left[\left(t + \frac{\pi}{8}\right) - \frac{\pi}{8}\right] - \sin\left[\left(t + \frac{\pi}{8}\right) + \frac{\pi}{8}\right]$
 $= \left[\sin\left(t + \frac{\pi}{8}\right)\cos\frac{\pi}{8} - \cos\left(t + \frac{\pi}{8}\right)\sin\frac{\pi}{8}\right] - \left[\sin\left(t + \frac{\pi}{8}\right)\cos\frac{\pi}{8} + \cos\left(t + \frac{\pi}{8}\right)\sin\frac{\pi}{8}\right] = -2\sin\frac{\pi}{8}\cos\left(t + \frac{\pi}{8}\right)$ so the critical points occur when $\cos\left(t + \frac{\pi}{8}\right) = 0$, or $t = \frac{3\pi}{8} + k\pi$. At each of these values, $f(t) = \pm\cos\frac{3\pi}{8} \approx \pm 0.765$ units, so the maximum distance between the particles is 0.765 units.

- (b) Solving $\cos t = \cos\left(t + \frac{\pi}{4}\right)$ graphically, we obtain $t \approx 2.749$, $t \approx 5.890$, and so on.

Alternatively, this problem can be solved analytically as follows.

$$\begin{aligned} \cos t &= \cos\left(t + \frac{\pi}{4}\right) \\ \cos\left[\left(t + \frac{\pi}{8}\right) - \frac{\pi}{8}\right] &= \cos\left[\left(t + \frac{\pi}{8}\right) + \frac{\pi}{8}\right] \\ \cos\left(t + \frac{\pi}{8}\right)\cos\frac{\pi}{8} + \sin\left(t + \frac{\pi}{8}\right)\sin\frac{\pi}{8} &= \cos\left(t + \frac{\pi}{8}\right)\cos\frac{\pi}{8} - \sin\left(t + \frac{\pi}{8}\right)\sin\frac{\pi}{8} \\ 2\sin\left(t + \frac{\pi}{8}\right)\sin\frac{\pi}{8} &= 0 \\ \sin\left(t + \frac{\pi}{8}\right) &= 0; \quad t = \frac{7\pi}{8} + k\pi \end{aligned}$$

The particles collide when $t = \frac{7\pi}{8} \approx 2.749$. (Plus multiples of π if they keep going.)

93. The dimensions will be x in. by $10 - 2x$ in. by $16 - 2x$ in., so $V(x) = x(10 - 2x)(16 - 2x) = 4x^3 - 52x^2 + 160x$ for $0 < x < 5$. Then $V'(x) = 12x^2 - 104x + 160 = 4(x - 2)(3x - 20)$, so the critical point in the correct domain is $x = 2$. This critical point corresponds to the maximum possible volume because $V'(x) > 0$ for $0 < x < 2$ and $V'(x) < 0$ for $2 < x < 5$. The box of largest volume has a height of 2 in. and a base measuring 6 in. by 12 in., and its volume is 144 in.^3

 We wish to maximize $I(\theta) = 8 \sec \theta + 6 \csc \theta$
 $\Rightarrow I'(\theta) = 8 \sec \theta \tan \theta - 6 \csc \theta \cot \theta$. Then $I'(\theta) = 0$

$$\frac{d}{d\theta} \left[\sqrt{7+\theta^2} + C \right] = \frac{\theta}{\sqrt{7+\theta^2}}. \text{ Thus } \int \frac{\theta}{\sqrt{7+\theta^2}} d\theta = \sqrt{7+\theta^2} + C.$$

105. Our trial solution based on the chain rule is $\frac{1}{3}(1+x^4)^{3/4} + C$. Differentiate the solution to check:

$$\frac{d}{dx} \left[\frac{1}{3}(1+x^4)^{3/4} + C \right] = x^3(1+x^4)^{-1/4}. \text{ Thus } \int x^3(1+x^4)^{-1/4} dx = \frac{1}{3}(1+x^4)^{3/4} + C.$$

106. Our trial solution based on the chain rule is $-\frac{5}{8}(2-x)^{8/5} + C$. Differentiate the solution to check:

$$\frac{d}{dx} \left[-\frac{5}{8}(2-x)^{8/5} + C \right] = (2-x)^{3/5}. \text{ Thus } \int (2-x)^{3/5} dx = -\frac{5}{8}(2-x)^{8/5} + C.$$

107. Our trial solution based on the chain rule is $10 \tan \frac{s}{10} + C$. Differentiate the solution to check:

$$\frac{d}{ds} \left[10 \tan \frac{s}{10} + C \right] = \sec^2 \frac{s}{10}. \text{ Thus } \int \sec^2 \frac{s}{10} ds = 10 \tan \frac{s}{10} + C.$$

108. Our trial solution based on the chain rule is $-\frac{1}{\pi} \cot \pi s + C$. Differentiate the solution to check:

$$\frac{d}{ds} \left[-\frac{1}{\pi} \cot \pi s + C \right] = \csc^2 \pi s. \text{ Thus } \int \csc^2 \pi s ds = -\frac{1}{\pi} \cot \pi s + C.$$

109. Our trial solution based on the chain rule is $-\frac{1}{\sqrt{2}} \csc \sqrt{2}\theta + C$. Differentiate the solution to check:

$$\frac{d}{d\theta} \left[-\frac{1}{\sqrt{2}} \csc \sqrt{2}\theta + C \right] = \csc \sqrt{2}\theta \cot \sqrt{2}\theta. \text{ Thus } \int \csc \sqrt{2}\theta \cot \sqrt{2}\theta d\theta = -\frac{1}{\sqrt{2}} \csc \sqrt{2}\theta + C.$$

110. Our trial solution based on the chain rule is $3 \sec \frac{\theta}{3} + C$. Differentiate the solution to check:

$$\frac{d}{d\theta} \left[3 \sec \frac{\theta}{3} + C \right] = \sec \frac{\theta}{3} \tan \frac{\theta}{3}. \text{ Thus } \int \sec \frac{\theta}{3} \tan \frac{\theta}{3} \cot \sqrt{2}\theta d\theta = 3 \sec \frac{\theta}{3} + C.$$

111. Our trial solution based on the chain rule is $\frac{x}{2} - \sin \frac{x}{2} + C$. Differentiate the solution to check:

$$\frac{d}{dx} \left[\frac{x}{2} - \sin \frac{x}{2} + C \right] = \frac{1}{2} - \frac{1}{2} \cos \frac{x}{2} = \sin^2 \frac{x}{4}. \text{ Thus } \int \sin^2 \frac{x}{4} dx = \frac{x}{2} - \sin \frac{x}{2} + C.$$

112. Our trial solution based on the chain rule is $\frac{x}{2} + \frac{1}{2} \sin x + C$. Differentiate the solution to check:

$$\frac{d}{dx} \left[\frac{x}{2} + \frac{1}{2} \sin x + C \right] = \frac{1}{2} + \frac{1}{2} \cos x = \cos^2 \frac{x}{2}. \text{ Thus } \int \cos^2 \frac{x}{2} dx = \frac{x}{2} + \frac{1}{2} \sin x + C.$$

$$113. \int \left(\frac{3}{x} - x \right) dx = 3 \ln |x| - \frac{x^2}{2} + C$$

$$114. \int \left(\frac{5}{x^2} + \frac{2}{x^2+1} \right) dx = \int \left(5x^{-2} + \frac{2}{x^2+1} \right) dx = -5x^{-1} + 2 \tan^{-1} x + C$$

$$115. \int \left(\frac{1}{2} e^t - e^{-t} \right) dt = \frac{1}{2} e^t - \frac{e^{-t}}{-1} + C = \frac{1}{2} e^t + e^{-t} + C$$

$$116. \int (5^s + s^5) ds = \frac{5^s}{\ln 5} + \frac{s^6}{6} + C$$

$$117. \int (\theta^{1-\pi}) d\theta = \frac{\theta^{2-\pi}}{2-\pi} + C$$

118. $\int (2^{\pi+r}) dr = \frac{2^{\pi+r}}{\ln 2} + C$

119. $\int \frac{3}{2x\sqrt{x^2-1}} dx = \frac{3}{2} \int \frac{1}{x\sqrt{x^2-1}} dx = \frac{3}{2} \sec^{-1} x + C$

120. $\int \frac{d\theta}{\sqrt{16-\theta^2}} = \int \frac{d\theta}{\sqrt{16\left(1-\frac{\theta^2}{16}\right)}} = \int \frac{\frac{1}{4}d\theta}{\sqrt{1-\frac{\theta^2}{16}}} = \sin^{-1}\left(\frac{\theta}{4}\right) + C$

121. $y = \int \frac{x^2+1}{x^2} dx = \int (1+x^{-2}) dx = x - x^{-1} + C = x - \frac{1}{x} + C$; $y = -1$ when $x = 1 \Rightarrow 1 - \frac{1}{1} + C = -1 \Rightarrow C = -1$
 $\Rightarrow y = x - \frac{1}{x} - 1$

122. $y = \int \left(x + \frac{1}{x}\right)^2 dx = \int \left(x^2 + 2 + \frac{1}{x^2}\right) dx = \int (x^2 + 2 + x^{-2}) dx = \frac{x^3}{3} + 2x - x^{-1} + C = \frac{x^3}{3} + 2x - \frac{1}{x} + C$;
 $y = 1$ when $x = 1 \Rightarrow \frac{1}{3} + 2 - \frac{1}{1} + C = 1 \Rightarrow C = -\frac{1}{3} \Rightarrow y = \frac{x^3}{3} + 2x - \frac{1}{x} - \frac{1}{3}$

123. $\frac{dr}{dt} = \int \left(15\sqrt{t} + \frac{3}{\sqrt{t}}\right) dt = \int (15t^{1/2} + 3t^{-1/2}) dt = 10t^{3/2} + 6t^{1/2} + C$; $\frac{dr}{dt} = 8$ when $t = 1 \Rightarrow 10(1)^{3/2} + 6(1)^{1/2} + C = 8$
 $\Rightarrow C = -8$. Thus $\frac{dr}{dt} = 10t^{3/2} + 6t^{1/2} - 8 \Rightarrow r = \int (10t^{3/2} + 6t^{1/2} - 8) dt = 4t^{5/2} + 4t^{3/2} - 8t + C$; $r = 0$ when $t = 1$
 $\Rightarrow 4(1)^{5/2} + 4(1)^{3/2} - 8(1) + C_1 = 0 \Rightarrow C_1 = 0$. Therefore, $r = 4t^{5/2} + 4t^{3/2} - 8t$

124. $\frac{d^2r}{dt^2} = \int -\cos t dt = -\sin t + C$; $r'' = 0$ when $t = 0 \Rightarrow -\sin 0 + C = 0 \Rightarrow C = 0$. Thus, $\frac{d^2r}{dt^2} = -\sin t$
 $\Rightarrow \frac{dr}{dt} = \int -\sin t dt = \cos t + C_1$; $r' = 0$ when $t = 0 \Rightarrow 1 + C_1 = 0 \Rightarrow C_1 = -1$. Then
 $\frac{dr}{dt} = \cos t - 1 \Rightarrow r = \int (\cos t - 1) dt = \sin t - t + C_2$; $r = -1$ when $t = 0 \Rightarrow 0 - 0 + C_2 = -1 \Rightarrow C_2 = -1$. Therefore,
 $r = \sin t - t - 1$

125. Yes, $\sin^{-1} x$ and $-\cos^{-1} x$ differ by the constant $\frac{\pi}{2}$

126. Yes, the derivatives of $y = -\cos^{-1} x + C$ and $y = \cos^{-1}(-x) + C$ are both $\frac{1}{\sqrt{1-x^2}}$.

127. $A = xy = xe^{-x^2} \Rightarrow \frac{dA}{dx} = e^{-x^2} + (x)(-2x)e^{-x^2} = e^{-x^2}(1-2x^2)$. Solving $\frac{dA}{dx} = 0 \Rightarrow 1-2x^2 = 0 \Rightarrow x = \frac{1}{\sqrt{2}}$; $\frac{dA}{dx} < 0$
for $x > \frac{1}{\sqrt{2}}$ and $\frac{dA}{dx} > 0$ for $0 < x < \frac{1}{\sqrt{2}} \Rightarrow$ absolute maximum of $\frac{1}{\sqrt{2}}e^{-1/2} = \frac{1}{\sqrt{2}e}$ at $x = \frac{1}{\sqrt{2}}$ units long by
 $y = e^{-1/2} = \frac{1}{\sqrt{e}}$ units high.

128. $A = xy = x\left(\frac{\ln x}{x^2}\right) = \frac{\ln x}{x} \Rightarrow \frac{dA}{dx} = \frac{1}{x^2} - \frac{\ln x}{x^2} = \frac{1-\ln x}{x^2}$. Solving $\frac{dA}{dx} = 0 \Rightarrow 1 - \ln x = 0 \Rightarrow x = e$; $\frac{dA}{dx} < 0$ for $x > e$ and
 $\frac{dA}{dx} > 0$ for $x < e \Rightarrow$ absolute maximum of $\frac{\ln e}{e} = \frac{1}{e}$ at $x = e$ units long and $y = \frac{1}{e^2}$ units high.

129. $y = x \ln 2x - x$
 $\Rightarrow y' = x\left(\frac{2}{2x}\right) + \ln(2x) - 1 = \ln 2x$; solving
 $y' = 0 \Rightarrow x = \frac{1}{2}$; $y' > 0$ for $x > \frac{1}{2}$ and $y' < 0$ for
 $x < \frac{1}{2} \Rightarrow$ relative minimum of $-\frac{1}{2}$ at
 $x = \frac{1}{2}$; $f\left(\frac{1}{2e}\right) = -\frac{1}{e}$ and $f\left(\frac{e}{2}\right) = 0 \Rightarrow$ absolute
 minimum is $-\frac{1}{2}$ at $x = \frac{1}{2}$ and the absolute
 maximum is 0 at $x = \frac{e}{2}$

130. $y = 10x(2 - \ln x) \Rightarrow y' = 10(2 - \ln x) - 10x\left(\frac{1}{x}\right)$
 $= 20 - 10 \ln x - 10$
 $= 10(1 - \ln x)$;
 solving $y' = 0 \Rightarrow x = e$; $y' < 0$ for $x > e$ and $y' > 0$
 for $x < e \Rightarrow$ relative maximum at $x = e$ of $10e$; $y \geq 0$
 on $(0, e^2]$ and $y(e^2) = 10e^2(2 - 2 \ln 3) = 0 \Rightarrow$
 absolute minimum is 0 at $x = e^2$ and the absolute
 maximum is $10e$ at $x = e$

131. $f(x) = e^{x/\sqrt{x^4+1}}$ for all x in $(-\infty, \infty)$;
 $f'(x) = \left[\frac{(\sqrt{x^4+1}) \cdot 1 - x \left(\frac{2x^3}{\sqrt{x^4+1}} \right)}{(\sqrt{x^4+1})^2} \right] e^{x/\sqrt{x^4+1}} = \frac{1-x^4}{(\sqrt{x^4+1})^3} e^{x/\sqrt{x^4+1}} = \frac{(1-x^2)(1+x^2)}{(x^4+1)^{3/2}} e^{x/\sqrt{x^4+1}} = 0 \Rightarrow 1-x^2 = 0 \Rightarrow x = \pm 1$

are critical points. Consider the behavior of f as $x \rightarrow \pm\infty$; $\lim_{x \rightarrow \infty} e^{x/\sqrt{x^4+1}} = \lim_{x \rightarrow -\infty} e^{x/\sqrt{x^4+1}} = 1$ as suggested by
 the following table (14 digit precision, 12 digits displayed):

x	$x/\sqrt{x^4+1}$	$e^{x/\sqrt{x^4+1}}$

Therefore, $y = 1$ is a horizontal asymptote in both directions. Check the critical points for absolute extreme values: $f(-1) = e^{-\sqrt{2}/2} \approx 0.4931$, $f(1) = e^{\sqrt{2}/2} \approx 2.0281 \Rightarrow$ the absolute minimum value of the function is $e^{-\sqrt{2}/2}$ at $x = -1$, and the absolute maximum value is $e^{\sqrt{2}/2}$ at $x = 1$.

132. $f(x) = e^{\sqrt{3-2x-x^2}}$; the domain of g is all x such that $3-2x-x^2 \geq 0$. The parabola $y = 3-2x-x^2$ is concave down with x -intercepts at $x = -3$ and $x = 1$, therefore $3-2x-x^2 \geq 0$ if $-3 \leq x \leq 1$, and this interval is the domain of g ; $g'(x) = -\frac{1+x}{\sqrt{3-2x-x^2}} e^{\sqrt{3-2x-x^2}} = 0 \Rightarrow 1+x=0 \Rightarrow x = -1$ is a critical point;
 $g(-3) = g(1) = e^0 = 1$, $g(1) = e^2 \approx 7.3891 \Rightarrow$ the absolute minimum value of the function is 1 at $x = -3$ and $x = 1$, and the absolute maximum value is e^2 at $x = -1$.

133. (a) $y = \frac{\ln x}{\sqrt{x}} \Rightarrow y' = \frac{1}{x\sqrt{x}} - \frac{\ln x}{2x^{3/2}} = \frac{2-\ln x}{2x\sqrt{x}}$
 $\Rightarrow y'' = -\frac{3}{4}x^{-5/2}(2-\ln x) - \frac{1}{2}x^{-5/2}$
 $= x^{-5/2}(\frac{3}{4}\ln x - 2)$;
 solving $y' = 0 \Rightarrow \ln x = 2 \Rightarrow x = e^2$; $y' < 0$
 for $x > e^2$ and $y' > 0$ for $x < e^2$
 \Rightarrow a maximum of $\frac{2}{e}$; $y'' = 0 \Rightarrow$
 $\ln x = \frac{8}{3} \Rightarrow x = e^{8/3}$; the curve is concave down
 on $(0, e^{8/3})$ and concave up on $(e^{8/3}, \infty)$; so
 there is an inflection point at $(e^{8/3}, \frac{8}{3e^{4/3}})$.

- (b) $y = e^{-x^2} \Rightarrow y' = -2xe^{-x^2}$
 $\Rightarrow y'' = -2e^{-x^2} + 4x^2e^{-x^2} = (4x^2 - 2)e^{-x^2}$;
 solving $y' = 0 \Rightarrow x = 0$; $y' < 0$ for $x > 0$ and
 $y' > 0$ for $x < 0 \Rightarrow$ a maximum at $x = 0$ or
 $e^0 = 1$; there are points of inflection at
 $x = \pm \frac{1}{\sqrt{2}}$; the curve is concave down for
 $-\frac{1}{\sqrt{2}} < x < \frac{1}{\sqrt{2}}$ and concave up otherwise.

- (c) $y = (1+x)e^{-x}$
 $\Rightarrow y' = e^{-x} - (1+x)e^{-x} = -xe^{-x}$
 $\Rightarrow y'' = -e^{-x} + e^{-x} = (x-1)e^{-x}$; solving
 $y' = 0 \Rightarrow -xe^{-x} = 0 \Rightarrow x = 0$; $y' < 0$ for
 $x > 0$ and $y' > 0$ for $x < 0 \Rightarrow$ a maximum at $x =$
 0 of $(1+0)e^0 = 1$; there is a point of inflection
at $x = 1$ and the curve is concave up for $x > 1$
and concave down for $x < 1$.

134. $y = x \ln x \Rightarrow y' = \ln x + x\left(\frac{1}{x}\right) = \ln x + 1$; solving
 $y' = 0 \Rightarrow \ln x + 1 = 0 \Rightarrow \ln x = -1 \Rightarrow x = e^{-1}$;
 $y' > 0$ for $x > e^{-1}$ and $y' < 0$ for $x < e^{-1}$
 \Rightarrow a minimum of $e^{-1} \ln e^{-1} = -\frac{1}{e}$ at $x = e^{-1}$. This
minimum is an absolute minimum since $y'' = \frac{1}{x}$ is
positive for all $x > 0$.

135. In the interval $\pi < x < 2\pi$ the function
 $\sin x < 0 \Rightarrow (\sin x)^{\sin x}$ is not defined for all values
in that interval or its translation by 2π .

136. $v = x^2 \ln\left(\frac{1}{x}\right) = x^2(\ln 1 - \ln x) = -x^2 \ln x \Rightarrow \frac{dv}{dx} = -2x \ln x - x^2\left(\frac{1}{x}\right) = -x(2 \ln x + 1)$; solving
 $\frac{dv}{dx} = 0 \Rightarrow 2 \ln x + 1 = 0 \Rightarrow \ln x = -\frac{1}{2} \Rightarrow x = e^{-1/2}$; $\frac{dv}{dx} < 0$ for $x > e^{-1/2}$ and $\frac{dv}{dx} > 0$ for $x < e^{-1/2} \Rightarrow$ a relative
maximum at $x = e^{-1/2}$; $\frac{r}{h} = x$ and $r = 1 \Rightarrow h = e^{1/2} = \sqrt{e} \approx 1.65$ cm

CHAPTER 4 ADDITIONAL AND ADVANCED EXERCISES

- If M and m are the maximum and minimum values, respectively, then $m \leq f(x) \leq M$ for all $x \in I$. If $m = M$ then f is constant on I .
- No, the function $f(x) = \begin{cases} 3x + 6, & -2 \leq x < 0 \\ 9 - x^2, & 0 \leq x \leq 2 \end{cases}$ has an absolute minimum value of 0 at $x = -2$ and an absolute maximum value of 9 at $x = 0$, but it is discontinuous at $x = 0$.
- On an open interval the extreme values of a continuous function (if any) must occur at an interior critical point. On a half-open interval the extreme values of a continuous function may be at a critical point or at the closed endpoint. Extreme values occur only where $f' = 0$, f' does not exist, or at the endpoints of the interval. Thus the extreme points will not be at the ends of an open interval.
- The pattern $f' = \underset{1}{+++} | \underset{2}{----} | \underset{3}{----} | \underset{4}{++++} | \underset{4}{++++}$ indicates a local maximum at $x = 1$ and a local minimum at $x = 3$.
- (a) If $y' = 6(x+1)(x-2)^2$, then $y' < 0$ for $x < -1$ and $y' > 0$ for $x > -1$. The sign pattern is $f' = \underset{-1}{----} | \underset{2}{+++} | \underset{2}{+++} \Rightarrow f$ has a local minimum at $x = -1$. Also $y'' = 6(x-2)^2 + 12(x+1)(x-2) = 6(x-2)(3x) \Rightarrow y'' > 0$ for $x < 0$ or $x > 2$, while $y'' < 0$ for $0 < x < 2$. Therefore f has points of inflection at $x = 0$ and $x = 2$. There is no local maximum.
 (b) If $y' = 6x(x+1)(x-2)$, then $y' < 0$ for $x < -1$ and $0 < x < 2$; $y' > 0$ for $-1 < x < 0$ and $x > 2$. The sign pattern is $y' = \underset{-1}{----} | \underset{0}{+++} | \underset{2}{----} | \underset{2}{+++}$. Therefore f has a local maximum at $x = 0$ and local minima at $x = -1$ and $x = 2$. Also, $y'' = 18 \left[x - \left(\frac{1-\sqrt{7}}{3} \right) \right] \left[x - \left(\frac{1+\sqrt{7}}{3} \right) \right]$, so $y'' < 0$ for $\frac{1-\sqrt{7}}{3} < x < \frac{1+\sqrt{7}}{3}$ and $y'' > 0$ for all other $x \Rightarrow f$ has points of inflection at $x = \frac{1 \pm \sqrt{7}}{3}$.
- The Mean Value Theorem indicates that $\frac{f(6)-f(0)}{6-0} = f'(c) \leq 2$ for some c in $(0, 6)$. Then $f(6) - f(0) \leq 12$ indicates the most that f can increase is 12.
- If f is continuous on $[a, c]$ and $f'(x) \leq 0$ on $[a, c]$, then by the Mean Value Theorem for all $x \in [a, c]$ we have $\frac{f(c)-f(x)}{c-x} \leq 0 \Rightarrow f(c) - f(x) \leq 0 \Rightarrow f(x) \geq f(c)$. Also if f is continuous on $(c, b]$ and $f'(x) \geq 0$ on $(c, b]$, then for all $x \in (c, b]$ we have $\frac{f(x)-f(c)}{x-c} \geq 0 \Rightarrow f(x) - f(c) \geq 0 \Rightarrow f(x) \geq f(c)$. Therefore $f(x) \geq f(c)$ for all $x \in [a, b]$.
- (a) For all x , $-(x+1)^2 \leq 0 \leq (x-1)^2 \Rightarrow -(1+x^2) \leq 2x \leq (1+x^2) \Rightarrow -\frac{1}{2} \leq \frac{x}{1+x^2} \leq \frac{1}{2}$.
 (b) There exists $c \in (a, b)$ such that $\frac{c}{1+c^2} = \frac{f(b)-f(a)}{b-a} \Rightarrow \left| \frac{f(b)-f(a)}{b-a} \right| = \left| \frac{c}{1+c^2} \right| \leq \frac{1}{2}$, from part (a) $\Rightarrow |f(b) - f(a)| \leq \frac{1}{2} |b - a|$.
- No. Corollary 1 requires that $f'(x) = 0$ for all x in some interval I , not $f'(x) = 0$ at a single point in I .
- (a) $h(x) = f(x)g(x) \Rightarrow h'(x) = f'(x)g(x) + f(x)g'(x)$ which changes signs at $x = a$ since $f'(x), g'(x) > 0$ when $x < a$, $f'(x), g'(x) < 0$ when $x > a$ and $f(x), g(x) > 0$ for all x . Therefore $h(x)$ does have a local maximum at $x = a$.
 (b) No, let $f(x) = g(x) = x^3$ which have points of inflection at $x = 0$, but $h(x) = x^6$ has no point of inflection (it has a local minimum at $x = 0$).

11. From (ii), $f(-1) = \frac{-1+a}{b-c+2} = 0 \Rightarrow a = 1$; from (iii), either $1 = \lim_{x \rightarrow \infty} f(x)$ or $1 = \lim_{x \rightarrow -\infty} f(x)$. In either case,

$$\lim_{x \rightarrow \pm\infty} f(x) = \lim_{x \rightarrow \pm\infty} \frac{x+1}{bx^2+cx+2} = \lim_{x \rightarrow \pm\infty} \frac{1+\frac{1}{x}}{bx+c+\frac{2}{x}} = 1 \Rightarrow b = 0 \text{ and } c = 1. \text{ For if } b = 1, \text{ then } \lim_{x \rightarrow \pm\infty} \frac{1+\frac{1}{x}}{x+c+\frac{2}{x}} = 0 \text{ and if } c = 0, \text{ then } \lim_{x \rightarrow \pm\infty} \frac{1+\frac{1}{x}}{bx+\frac{2}{x}} = \lim_{x \rightarrow \pm\infty} \frac{1+\frac{1}{x}}{\frac{2}{x}} = \pm\infty. \text{ Thus } a = 1, b = 0, \text{ and } c = 1.$$

12. $\frac{dy}{dx} = 3x^2 + 2kx + 3 = 0 \Rightarrow x = \frac{-2k \pm \sqrt{4k^2 - 36}}{6} \Rightarrow x$ has only one value when $4k^2 - 36 = 0 \Rightarrow k^2 = 9$ or $k = \pm 3$.

13. The area of the $\triangle ABC$ is $A(x) = \frac{1}{2}(2)\sqrt{1-x^2} = (1-x^2)^{1/2}$, where $0 \leq x \leq 1$. Thus $A'(x) = \frac{-x}{\sqrt{1-x^2}} \Rightarrow 0$ and ± 1 are critical points. Also $A(\pm 1) = 0$ so $A(0) = 1$ is the maximum. When $x = 0$ the $\triangle ABC$ is isosceles since $AC = BC = \sqrt{2}$.

14. $\lim_{h \rightarrow 0} \frac{f'(c+h) - f'(c)}{h} = f''(c) \Rightarrow$ for $\varepsilon = \frac{1}{2}|f''(c)| > 0$ there exists a $\delta > 0$ such that $0 < |h| < \delta$
 $\Rightarrow \left| \frac{f'(c+h) - f'(c)}{h} - f''(c) \right| < \frac{1}{2}|f''(c)|$. Then $f'(c) = 0 \Rightarrow -\frac{1}{2}|f''(c)| < \frac{f'(c+h)}{h} - f''(c) < \frac{1}{2}|f''(c)|$
 $\Rightarrow f''(c) - \frac{1}{2}|f''(c)| < \frac{f'(c+h)}{h} < f''(c) + \frac{1}{2}|f''(c)|$. If $f''(c) < 0$, then $|f''(c)| = -f''(c)$
 $\Rightarrow \frac{3}{2}f''(c) < \frac{f'(c+h)}{h} < \frac{1}{2}f''(c) < 0$; likewise if $f''(c) > 0$, then $0 < \frac{1}{2}f''(c) < \frac{f'(c+h)}{h} < \frac{3}{2}f''(c)$.
 (a) If $f''(c) < 0$, then $-\delta < h < 0 \Rightarrow f'(c+h) > 0$ and $0 < h < \delta \Rightarrow f'(c+h) < 0$. Therefore, $f(c)$ is a local maximum.
 (b) If $f''(c) > 0$, then $-\delta < h < 0 \Rightarrow f'(c+h) < 0$ and $0 < h < \delta \Rightarrow f'(c+h) > 0$. Therefore, $f(c)$ is a local minimum.

15. The time it would take the water to hit the ground from height y is $\sqrt{\frac{2y}{g}}$, where g is the acceleration of gravity. The product of time and exit velocity (rate) yields the distance the water travels:
 $D(y) = \sqrt{\frac{2y}{g}} \sqrt{64(h-y)} = 8\sqrt{\frac{2}{g}}(hy - y^2)^{1/2}$, $0 \leq y \leq h \Rightarrow D'(y) = -4\sqrt{\frac{2}{g}}(hy - y^2)^{-1/2}(h - 2y) \Rightarrow 0$, $\frac{h}{2}$ and h are critical points. Now $D(0) = 0$, $D(\frac{h}{2}) = 8\sqrt{\frac{2}{g}}\left(h\left(\frac{h}{2}\right) - \left(\frac{h}{2}\right)^2\right)^{1/2} = 4h\sqrt{\frac{2}{g}}$ and $D(h) = 0 \Rightarrow$ the best place to drill the hole is at $y = \frac{h}{2}$.

16. From the figure in the text, $\tan(\beta + \theta) = \frac{b+a}{n}$; $\tan(\beta + \theta) = \frac{\tan \beta + \tan \theta}{1 - \tan \beta \tan \theta}$; and $\tan \theta = \frac{a}{h}$. These equations give
 $\frac{b+a}{h} = \frac{\tan \beta + \frac{a}{h}}{1 - \tan \beta \frac{a}{h}} = \frac{h \tan \beta + a}{h - a \tan \beta}$. Solving for $\tan \beta$ gives $\tan \beta = \frac{bh}{h^2 + a(b+a)}$ or $(h^2 - a(b+a)) \tan \beta = bh$.
 Differentiating both sides with respect to h gives $2h \tan \beta + (h^2 + a(b+a)) \sec^2 \beta \frac{d\beta}{dh} = b$. Then
 $\frac{d\beta}{dh} = 0 \Rightarrow 2h \tan \beta = b \Rightarrow 2h \left(\frac{bh}{h^2 + a(b+a)} \right) = b \Rightarrow 2bh^2 = bh^2 + ab(b+a) \Rightarrow h^2 = a(b+a) \Rightarrow h = \sqrt{a(b+a)}$.

17. The surface area of the cylinder is $S = 2\pi r^2 + 2\pi rh$.
 From the diagram we have $\frac{r}{R} = \frac{H-h}{H} \Rightarrow h = \frac{RH-rH}{R}$
 and $S(r) = 2\pi r(r+h) = 2\pi r\left(r+H-r\frac{H}{R}\right)$
 $= 2\pi\left(1-\frac{H}{R}\right)r^2 + 2\pi Hr$, where $0 \leq r \leq R$.

Case 1: $H < R \Rightarrow S(r)$ is a quadratic equation containing the origin and concave upward $\Rightarrow S(r)$ is maximum at $r = R$.

Case 2: $H = R \Rightarrow S(r)$ is a linear equation containing the origin with a positive slope $\Rightarrow S(r)$ is maximum at $r = R$.

Case 3: $H > R \Rightarrow S(r)$ is a quadratic equation containing the origin and concave downward.

Then $\frac{dS}{dr} = 4\pi\left(1-\frac{H}{R}\right)r + 2\pi H$ and $\frac{dS}{dr} = 0 \Rightarrow 4\pi\left(1-\frac{H}{R}\right)r + 2\pi H = 0 \Rightarrow r = \frac{RH}{2(H-R)}$. For simplification we let $r^* = \frac{RH}{2(H-R)}$.

(a) If $R < H < 2R$, then $0 > H - 2R \Rightarrow H > 2(H - R) \Rightarrow r^* = \frac{RH}{2(H-R)} > R$. Therefore, the maximum occurs at the right endpoint R of the interval $0 \leq r \leq R$ because $S(r)$ is an increasing function of r .

(b) If $H = 2R$, then $r^* = \frac{2R^2}{2R} = R \Rightarrow S(r)$ is maximum at $r = R$.

(c) If $H > 2R$, then $2R + H < 2H \Rightarrow H < 2(H - R) \Rightarrow \frac{RH}{2(H-R)} < 1 \Rightarrow \frac{RH}{2(H-R)} < R \Rightarrow r^* < R$. Therefore, $S(r)$ is a maximum at $r = r^* = \frac{RH}{2(H-R)}$.

Conclusion: If $H \in (0, 2R]$, then the maximum surface area is at $r = R$. If $H \in (2R, \infty)$, then the maximum is at $r = r^* = \frac{RH}{2(H-R)}$.

18. $f(x) = mx - 1 + \frac{1}{x} \Rightarrow f'(x) = m - \frac{1}{x^2}$ and $f''(x) = \frac{2}{x^3} > 0$ when $x > 0$. Then $f'(x) = 0 \Rightarrow x = \frac{1}{\sqrt{m}}$ yields a minimum.
 If $f\left(\frac{1}{\sqrt{m}}\right) \geq 0$, then $\sqrt{m} - 1 + \sqrt{m} = 2\sqrt{m} - 1 \geq 0 \Rightarrow m \geq \frac{1}{4}$. Thus the smallest acceptable value for m is $\frac{1}{4}$.

19. (a) $\lim_{x \rightarrow 0} \frac{2\sin(5x)}{3x} = \lim_{x \rightarrow 0} \frac{2\sin(5x)}{\frac{2}{3}(5x)} = \lim_{x \rightarrow 0} \frac{10}{3} \frac{\sin(5x)}{5x} = \frac{10}{3} \cdot 1 = \frac{10}{3}$
- (b) $\lim_{x \rightarrow 0} \sin(5x) \cot(3x) = \lim_{x \rightarrow 0} \frac{\sin(5x)\cos(3x)}{\sin(3x)} = \lim_{x \rightarrow 0} \frac{-3\sin(5x)\sin(3x) + 5\cos(5x)\cos(3x)}{3\cos(3x)} = \frac{5}{3}$
- (c) $\lim_{x \rightarrow 0} x \csc^2 \sqrt{2x} = \lim_{x \rightarrow 0} \frac{x}{\sin^2 \sqrt{2x}} = \lim_{x \rightarrow 0} \frac{1}{\frac{2\sin \sqrt{2x} \cos \sqrt{2x}}{\sqrt{2x}}} = \lim_{x \rightarrow 0} \frac{\sqrt{2x}}{\sin(2\sqrt{2x})} = \lim_{x \rightarrow 0} \frac{\frac{1}{\sqrt{2x}}}{\cos(2\sqrt{2x})} = \lim_{x \rightarrow 0} \frac{1}{\cos(2\sqrt{2x}) \cdot 2} = \frac{1}{2}$
- (d) $\lim_{x \rightarrow \pi/2} (\sec x - \tan x) = \lim_{x \rightarrow \pi/2} \frac{1 - \sin x}{\cos x} = \lim_{x \rightarrow \pi/2} \frac{-\cos x}{-\sin x} = 0$

- (f) $\lim_{x \rightarrow 0} \frac{\sin(x^2)}{x \sin x} = \lim_{x \rightarrow 0} \frac{2x \cos(x^2)}{x \cos x + \sin x} = \lim_{x \rightarrow 0} \frac{-(2x^2) \sin(x^2) + 2 \cos(x^2)}{-x \sin x + 2 \cos x} = \frac{2}{2} = 1$
- (g) $\lim_{x \rightarrow 0} \frac{\sec x - 1}{x^2} = \lim_{x \rightarrow 0} \frac{\sec x \tan x}{2x} = \lim_{x \rightarrow 0} \frac{\sec^3 x + \tan^2 x \sec x}{2} = \frac{1+0}{2} = \frac{1}{2}$
- (h) $\lim_{x \rightarrow 2} \frac{x^3 - 8}{x^2 - 4} = \lim_{x \rightarrow 2} \frac{(x-2)(x^2 + 2x + 4)}{(x-2)(x+2)} = \lim_{x \rightarrow 2} \frac{x^2 + 2x + 4}{x + 2} = \frac{4+4+4}{4} = 3$

20. (a) $\lim_{x \rightarrow \infty} \frac{\sqrt{x+5}}{\sqrt{x+5}} = \lim_{x \rightarrow \infty} \frac{\sqrt{x+5}}{\sqrt{x}} = \lim_{x \rightarrow \infty} \frac{\sqrt{1+\frac{5}{x}}}{1+\frac{5}{\sqrt{x}}} = \frac{1}{1} = 1$

(b) $\lim_{x \rightarrow \infty} \frac{2x}{x+7\sqrt{x}} = \lim_{x \rightarrow \infty} \frac{\frac{2x}{x}}{\frac{x+7\sqrt{x}}{x}} = \lim_{x \rightarrow \infty} \frac{2}{1+7\sqrt{\frac{1}{x}}} = \frac{2}{1+0} = 2$

21. (a) The profit function is $P(x) = (c - ex)x - (a + bx) = -ex^2 + (c - b)x - a$. $P'(x) = -2ex + c - b = 0 \Rightarrow x = \frac{c-b}{2e}$. $P''(x) = -2e < 0$ if $e > 0$ so that the profit function is maximized at $x = \frac{c-b}{2e}$.

(b) The price therefore that corresponds to a production level yielding a maximum profit is

$$p \Big|_{x=\frac{c-b}{2e}} = c - e \left(\frac{c-b}{2e} \right) = \frac{c+b}{2} \text{ dollars.}$$

(c) The weekly profit at this production level is $P(x) = -e \left(\frac{c-b}{2e} \right)^2 + (c-b) \left(\frac{c-b}{2e} \right) - a = \frac{(c-b)^2}{4e} - a$.

(d) The tax increases cost to the new profit function is $F(x) = (c - ex)x - (a + bx + tx) = -ex^2 + (c - b - t)x - a$. Now $F'(x) = -2ex + c - b - t = 0$ when $x = \frac{t+b-c}{-2e} = \frac{c-b-t}{2e}$. Since $F''(x) = -2e < 0$ if $e > 0$, F is maximized when $x = \frac{c-b-t}{2e}$ units per week. Thus the price per unit is $p = c - e \left(\frac{c-b-t}{2e} \right) = \frac{c+b+t}{2}$ dollars. Thus, such a tax increases the cost per unit by $\frac{c+b+t}{2} - \frac{c+b}{2} = \frac{t}{2}$ dollars if units are priced to maximize profit.

22. (a)

The x -intercept occurs when $\frac{1}{x} - 3 = 0 \Rightarrow \frac{1}{x} = 3 \Rightarrow x = \frac{1}{3}$.

(b) By Newton's method, $x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$. Here $f'(x_n) = -x_n^{-2} = -\frac{1}{x_n^2}$. So $x_{n+1} = x_n - \frac{\frac{1}{x_n} - 3}{-\frac{1}{x_n^2}} = x_n + \left(\frac{1}{x_n} - 3 \right) x_n^2 = x_n + x_n - 3x_n^2 = 2x_n - 3x_n^2 = x_n(2 - 3x_n)$.

23. $x_1 = x_0 - \frac{f(x_0)}{f'(x_0)} = x_0 - \frac{x_0^q - a}{qx_0^{q-1}} = \frac{qx_0^q - x_0^q + a}{qx_0^{q-1}} = \frac{x_0^q(q-1) + a}{qx_0^{q-1}} = x_0 \left(\frac{q-1}{q} \right) + \frac{a}{x_0^{q-1}} \left(\frac{1}{q} \right)$ so that x_1 is a weighted average of x_0 and $\frac{a}{x_0^{q-1}}$ with weights $m_0 = \frac{q-1}{q}$ and $m_1 = \frac{1}{q}$.

In the case where $x_0 = \frac{a}{x_0^{q-1}}$ we have $x_0^q = a$ and $x_1 = \frac{a}{x_0^{q-1}} \left(\frac{q-1}{q} \right) + \frac{a}{x_0^{q-1}} \left(\frac{1}{q} \right) = \frac{a}{x_0^{q-1}} \left(\frac{q-1}{q} + \frac{1}{q} \right) = \frac{a}{x_0^{q-1}}$.

24. We have that $(x-h)^2 + (y-h)^2 = r^2$ and so $2(x-h) + 2(y-h) \frac{dy}{dx} = 0$ and $2 + 2 \frac{dy}{dx} + 2(y-h) \frac{d^2y}{dx^2} = 0$ hold. Thus

$2x + 2y \frac{dy}{dx} = 2h + 2h \frac{dy}{dx}$, by the former. Solving for h , we obtain $h = \frac{x+y \frac{dy}{dx}}{1+\frac{dy}{dx}}$. Substituting this into the second

equation yields $2 + 2 \frac{dy}{dx} + 2y \frac{d^2y}{dx^2} - 2 \left(\frac{x+y \frac{dy}{dx}}{1+\frac{dy}{dx}} \right) \frac{d^2y}{dx^2} = 0$. Dividing by 2 results in $1 + \frac{dy}{dx} + y \frac{d^2y}{dx^2} - \left(\frac{x+y \frac{dy}{dx}}{1+\frac{dy}{dx}} \right) \frac{d^2y}{dx^2} = 0$.

25. $\frac{ds}{dt} = ks \Rightarrow \frac{ds}{s} = k dt \Rightarrow \ln s = kt + C \Rightarrow s = s_0 e^{kt}$
 \Rightarrow the 14th century model of free fall was exponential; note that the motion starts too slowly at first and then becomes too fast after about 7 seconds.

26. Two views of the graph of $y = 1000\left[1 - (.99)^x + \frac{1}{x}\right]$ are shown below.

At about $x = 11$ there is a minimum. There is no maximum; however, the curve is asymptotic to $y = 1000$. The curve is near 1000 when $x \geq 643$.

27. (a) $a(t) = s''(t) = -k$ ($k > 0$) $\Rightarrow s'(t) = -kt + C_1$, where $s'(0) = 88 \Rightarrow C_1 = 88 \Rightarrow s'(t) = -kt + 88$. So $s(t) = \frac{-kt^2}{2} + 88t + C_2$ where $s(0) = 0 \Rightarrow C_2 = 0$ so $s(t) = \frac{-kt^2}{2} + 88t$. Now $s(t) = 100$ when $\frac{-kt^2}{2} + 88t = 100$. Solving for t we obtain $t = \frac{88 \pm \sqrt{88^2 - 200k}}{k}$. At such t we want $s'(t) = 0$, thus $-k\left(\frac{88 + \sqrt{88^2 - 200k}}{k}\right) + 88 = 0$ or $-k\left(\frac{88 - \sqrt{88^2 - 200k}}{k}\right) + 88 = 0$. In either case we obtain $88^2 - 200k = 0$ so that $k = \frac{88^2}{200} \approx 38.72$ ft/sec².
- (b) The initial condition that $s'(0) = 44$ ft/sec implies that $s'(t) = -kt + 44$ and $s(t) = \frac{-kt^2}{2} + 44t$ where k is as above. The car is stopped at a time t such that $s'(t) = -kt + 44 = 0 \Rightarrow t = \frac{44}{k}$. At this time the car has traveled a distance $s\left(\frac{44}{k}\right) = \frac{-k}{2}\left(\frac{44}{k}\right)^2 + 44\left(\frac{44}{k}\right) = \frac{44^2}{2k} = \frac{968}{k} = 968\left(\frac{200}{88^2}\right) = 25$ feet. Thus halving the initial velocity quarters stopping distance.

28. $h(x) = f^2(x) + g^2(x) \Rightarrow h'(x) = 2f(x)f'(x) + 2g(x)g'(x) = 2[f(x)f'(x) + g(x)g'(x)]$
 $= 2[f(x)g(x) + g(x)(-f(x))] = 2 \cdot 0 = 0$. Thus $h(x) = c$, a constant. Since $h(0) = 5$, $h(x) = 5$ for all x in the domain of h . Thus $h(10) = 5$.

29. Yes. The curve $y = x$ satisfies all three conditions since $\frac{dy}{dx} = 1$ everywhere, when $x = 0$, $y = 0$, and $\frac{d^2y}{dx^2} = 0$ everywhere.

30. $y' = 3x^2 + 2$ for all $x \Rightarrow y = x^3 + 2x + C$ where $-1 = 1^3 + 2 \cdot 1 + C \Rightarrow C = -4 \Rightarrow y = x^3 + 2x - 4$.

31. $s''(t) = a = -t^2 \Rightarrow v = s'(t) = \frac{-t^3}{3} + C$. We seek $v_0 = s'(0) = C$. We know that $s(t^*) = b$ for some t^* and s is at a maximum for this t^* . Since $s(t) = \frac{-t^4}{12} + Ct + k$ and $s(0) = 0$ we have that $s(t) = \frac{-t^4}{12} + Ct$ and also $s'(t^*) = 0$ so that $t^* = (3C)^{1/3}$. So $\frac{[-(3C)^{1/3}]^4}{12} + C(3C)^{1/3} = b \Rightarrow (3C)^{1/3}(C - \frac{3C}{12}) = b \Rightarrow (3C)^{1/3}(\frac{3C}{4}) = b \Rightarrow 3^{1/3}C^{4/3} = \frac{4b}{3} \Rightarrow C = \frac{(4b)^{3/4}}{3}$. Thus $v_0 = s'(0) = \frac{(4b)^{3/4}}{3} = \frac{2\sqrt{2}}{3}b^{3/4}$.
32. (a) $s''(t) = t^{1/2} - t^{-1/2} \Rightarrow v(t) = s'(t) = \frac{2}{3}t^{3/2} - 2t^{1/2} + k$ where $v(0) = k = \frac{4}{3} \Rightarrow v(t) = \frac{2}{3}t^{3/2} - 2t^{1/2} + \frac{4}{3}$.
 (b) $s(t) = \frac{4}{15}t^{5/2} - \frac{4}{3}t^{3/2} + \frac{4}{3}t + k_2$ where $s(0) = k_2 = -\frac{4}{15}$. Thus $s(t) = \frac{4}{15}t^{5/2} - \frac{4}{3}t^{3/2} + \frac{4}{3}t - \frac{4}{15}$.
33. The graph of $f(x) = ax^2 + bx + c$ with $a > 0$ is a parabola opening upwards. Thus $f(x) \geq 0$ for all x if $f(x) = 0$ for at most one real value of x . The solutions to $f(x) = 0$ are, by the quadratic equation $\frac{-2b \pm \sqrt{(2b)^2 - 4ac}}{2a}$. Thus we require $(2b)^2 - 4ac \leq 0 \Rightarrow b^2 - ac \leq 0$.
34. (a) Clearly $f(x) = (a_1x + b_1)^2 + \dots + (a_nx + b_n)^2 \geq 0$ for all x . Expanding we see

$$f(x) = (a_1^2x^2 + 2a_1b_1x + b_1^2) + \dots + (a_n^2x^2 + 2a_nb_nx + b_n^2)$$

$$= (a_1^2 + a_2^2 + \dots + a_n^2)x^2 + 2(a_1b_1 + a_2b_2 + \dots + a_nb_n)x + (b_1^2 + b_2^2 + \dots + b_n^2) \geq 0$$
. Thus

$$(a_1b_1 + a_2b_2 + \dots + a_nb_n)^2 - (a_1^2 + a_2^2 + \dots + a_n^2)(b_1^2 + b_2^2 + \dots + b_n^2) \leq 0$$
 by Exercise 29. Thus

$$(a_1b_1 + a_2b_2 + \dots + a_nb_n)^2 \leq (a_1^2 + a_2^2 + \dots + a_n^2)(b_1^2 + b_2^2 + \dots + b_n^2)$$
.
- (b) Referring to Exercise 33: It is clear that $f(x) = 0$ for some real $x \Leftrightarrow b^2 - 4ac = 0$, by quadratic formula. Now notice that this implies that $f(x) = (a_1x + b_1)^2 + \dots + (a_nx + b_n)^2$

$$= (a_1^2 + a_2^2 + \dots + a_n^2)x^2 + 2(a_1b_1 + a_2b_2 + \dots + a_nb_n)x + (b_1^2 + b_2^2 + \dots + b_n^2) = 0$$

$$\Leftrightarrow (a_1b_1 + a_2b_2 + \dots + a_nb_n)^2 - (a_1^2 + a_2^2 + \dots + a_n^2)(b_1^2 + b_2^2 + \dots + b_n^2) = 0$$

$$\Leftrightarrow (a_1b_1 + a_2b_2 + \dots + a_nb_n)^2 = (a_1^2 + a_2^2 + \dots + a_n^2)(b_1^2 + b_2^2 + \dots + b_n^2)$$
 But now $f(x) = 0 \Leftrightarrow a_ix + b_i = 0$ for all $i = 1, 2, \dots, n \Leftrightarrow a_ix = -b_i = 0$ for all $i = 1, 2, \dots, n$.
35. (a) $L = k \left(\frac{a - b \cot \theta}{R^4} + \frac{b \csc \theta}{r^4} \right) \Rightarrow \frac{dL}{d\theta} = k \left(\frac{b \csc^2 \theta}{R^4} - \frac{b \csc \theta \cot \theta}{r^4} \right)$; solving

$$\frac{dL}{d\theta} = 0 \Rightarrow r^4 b \csc^2 \theta - b R^4 \csc \theta \cot \theta = 0 \Rightarrow (b \csc \theta)(r^4 \csc \theta - R^4 \cot \theta) = 0$$
; but $b \csc \theta \neq 0$ since

$$\theta \neq \frac{\pi}{2} \Rightarrow r^4 \csc \theta - R^4 \cot \theta = 0 \Rightarrow \cos \theta = \frac{r^4}{R^4} \Rightarrow \theta = \cos^{-1} \left(\frac{r^4}{R^4} \right)$$
, the critical value of θ
- (b) $\theta = \cos^{-1} \left(\frac{5}{6} \right)^4 \approx \cos^{-1}(0.48225) \approx 61^\circ$

CHAPTER 5 INTEGRATION

5.1 AREA AND ESTIMATING WITH FINITE SUMS

1. $f(x) = x^2$

Since f is increasing on $[0, 1]$, we use left endpoints to obtain lower sums and right endpoints to obtain upper sums.

(a) $\Delta x = \frac{1-0}{2} = \frac{1}{2}$ and $x_i = i\Delta x = \frac{i}{2} \Rightarrow$ a lower sum is $\sum_{i=0}^1 \left(\frac{i}{2}\right)^2 \cdot \frac{1}{2} = \frac{1}{2} \left(0^2 + \left(\frac{1}{2}\right)^2\right) = \frac{1}{8}$

(b) $\Delta x = \frac{1-0}{4} = \frac{1}{4}$ and $x_i = i\Delta x = \frac{i}{4} \Rightarrow$ a lower sum is $\sum_{i=0}^3 \left(\frac{i}{4}\right)^2 \cdot \frac{1}{4} = \frac{1}{4} \left(0^2 + \left(\frac{1}{4}\right)^2 + \left(\frac{2}{4}\right)^2 + \left(\frac{3}{4}\right)^2\right) = \frac{1}{4} \cdot \frac{7}{8} = \frac{7}{32}$

(c) $\Delta x = \frac{1-0}{2} = \frac{1}{2}$ and $x_i = i\Delta x = \frac{i}{2} \Rightarrow$ an upper sum is $\sum_{i=1}^2 \left(\frac{i}{2}\right)^2 \cdot \frac{1}{2} = \frac{1}{2} \left(\left(\frac{1}{2}\right)^2 + 1^2\right) = \frac{5}{8}$

(d) $\Delta x = \frac{1-0}{4} = \frac{1}{4}$ and $x_i = i\Delta x = \frac{i}{4} \Rightarrow$ an upper sum is $\sum_{i=1}^4 \left(\frac{i}{4}\right)^2 \cdot \frac{1}{4} = \frac{1}{4} \left(\left(\frac{1}{4}\right)^2 + \left(\frac{2}{4}\right)^2 + \left(\frac{3}{4}\right)^2 + 1^2\right) = \frac{1}{4} \cdot \left(\frac{30}{16}\right) = \frac{15}{32}$

2. $f(x) = x^3$

Since f is increasing on $[0, 1]$, we use left endpoints to obtain lower sums and right endpoints to obtain upper sums.

(a) $\Delta x = \frac{1-0}{2} = \frac{1}{2}$ and $x_i = i\Delta x = \frac{i}{2} \Rightarrow$ a lower sum is $\sum_{i=0}^1 \left(\frac{i}{2}\right)^3 \cdot \frac{1}{2} = \frac{1}{2} \left(0^3 + \left(\frac{1}{2}\right)^3\right) = \frac{1}{16}$

(b) $\Delta x = \frac{1-0}{4} = \frac{1}{4}$ and $x_i = i\Delta x = \frac{i}{4} \Rightarrow$ a lower sum is $\sum_{i=0}^3 \left(\frac{i}{4}\right)^3 \cdot \frac{1}{4} = \frac{1}{4} \left(0^3 + \left(\frac{1}{4}\right)^3 + \left(\frac{2}{4}\right)^3 + \left(\frac{3}{4}\right)^3\right) = \frac{36}{256} = \frac{9}{64}$

(c) $\Delta x = \frac{1-0}{2} = \frac{1}{2}$ and $x_i = i\Delta x = \frac{i}{2} \Rightarrow$ an upper sum is $\sum_{i=1}^2 \left(\frac{i}{2}\right)^3 \cdot \frac{1}{2} = \frac{1}{2} \left(\left(\frac{1}{2}\right)^3 + 1^3\right) = \frac{1}{2} \cdot \frac{9}{8} = \frac{9}{16}$

(d) $\Delta x = \frac{1-0}{4} = \frac{1}{4}$ and $x_i = i\Delta x = \frac{i}{4} \Rightarrow$ an upper sum is $\sum_{i=1}^4 \left(\frac{i}{4}\right)^3 \cdot \frac{1}{4} = \frac{1}{4} \left(\left(\frac{1}{4}\right)^3 + \left(\frac{2}{4}\right)^3 + \left(\frac{3}{4}\right)^3 + 1^3\right) = \frac{100}{256} = \frac{25}{64}$

3. $f(x) = \frac{1}{x}$

Since f is decreasing on $[1, 5]$, we use left endpoints to obtain upper sums and right endpoints to obtain lower sums.

(a) $\Delta x = \frac{5-1}{2} = 2$ and $x_i = 1 + i\Delta x = 1 + 2i \Rightarrow$ a lower sum is $\sum_{i=1}^2 \frac{1}{x_i} \cdot 2 = 2\left(\frac{1}{3} + \frac{1}{5}\right) = \frac{16}{15}$

(b) $\Delta x = \frac{5-1}{4} = 1$ and $x_i = 1 + i\Delta x = 1 + i \Rightarrow$ a lower sum is $\sum_{i=1}^4 \frac{1}{x_i} \cdot 1 = 1\left(\frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5}\right) = \frac{77}{60}$

(c) $\Delta x = \frac{5-1}{2} = 2$ and $x_i = 1 + i\Delta x = 1 + 2i \Rightarrow$ an upper sum is $\sum_{i=0}^1 \frac{1}{x_i} \cdot 2 = 2\left(1 + \frac{1}{3}\right) = \frac{8}{3}$

(d) $\Delta x = \frac{5-1}{4} = 1$ and $x_i = 1 + i\Delta x = 1 + i \Rightarrow$ an upper sum is $\sum_{i=0}^3 \frac{1}{x_i} \cdot 1 = 1\left(1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4}\right) = \frac{25}{12}$

4. $f(x) = 4 - x^2$

Since f is increasing on $[-2, 0]$ and decreasing on $[0, 2]$, we use left endpoints on $[-2, 0]$ and right endpoints on $[0, 2]$ to obtain lower sums and use right endpoints on $[-2, 0]$ and left endpoints on $[0, 2]$ to obtain upper sums.

(a) $\Delta x = \frac{2-(-2)}{2} = 2$ and $x_i = -2 + i\Delta x = -2 + 2i \Rightarrow$ a lower sum is $2 \cdot (4 - (-2)^2) + 2 \cdot (4 - 2^2) = 0$

(b) $\Delta x = \frac{2-(-2)}{4} = 1$ and $x_i = -2 + i\Delta x = -2 + i \Rightarrow$ a lower sum is $\sum_{i=0}^1 (4 - (x_i)^2) \cdot 1 + \sum_{i=3}^4 (4 - (x_i)^2) \cdot 1$
 $= 1((4 - (-2)^2) + (4 - (-1)^2) + (4 - 1^2) + (4 - 2^2)) = 6$

(c) $\Delta x = \frac{2-(-2)}{2} = 2$ and $x_i = -2 + i\Delta x = -2 + 2i \Rightarrow$ an upper sum is $2 \cdot (4 - (0)^2) + 2 \cdot (4 - 0^2) = 16$

(d) $\Delta x = \frac{2-(-2)}{4} = 1$ and $x_i = -2 + i\Delta x = -2 + i \Rightarrow$ an upper sum is $\sum_{i=1}^2 (4 - (x_i)^2) \cdot 1 + \sum_{i=2}^3 (4 - (x_i)^2) \cdot 1$
 $= 1((4 - (-1)^2) + (4 - 0^2) + (4 - 0^2) + (4 - 1^2)) = 14$

5. $f(x) = x^2$

Using 2 rectangles $\Rightarrow \Delta x = \frac{1-0}{2} = \frac{1}{2}$

$\Rightarrow \frac{1}{2} \left(f\left(\frac{1}{4}\right) + f\left(\frac{3}{4}\right) \right) = \frac{1}{2} \left(\left(\frac{1}{4}\right)^2 + \left(\frac{3}{4}\right)^2 \right) = \frac{10}{32} = \frac{5}{16}$

Using 4 rectangles $\Rightarrow \Delta x = \frac{1-0}{4} = \frac{1}{4}$

$\Rightarrow \frac{1}{4} \left(f\left(\frac{1}{8}\right) + f\left(\frac{3}{8}\right) + f\left(\frac{5}{8}\right) + f\left(\frac{7}{8}\right) \right)$
 $= \frac{1}{4} \left(\left(\frac{1}{8}\right)^2 + \left(\frac{3}{8}\right)^2 + \left(\frac{5}{8}\right)^2 + \left(\frac{7}{8}\right)^2 \right) = \frac{21}{64}$

6. $f(x) = x^3$

Using 2 rectangles $\Rightarrow \Delta x = \frac{1-0}{2} = \frac{1}{2}$
 $\Rightarrow \frac{1}{2} \left(f\left(\frac{1}{4}\right) + f\left(\frac{3}{4}\right) \right) = \frac{1}{2} \left(\left(\frac{1}{4}\right)^3 + \left(\frac{3}{4}\right)^3 \right) = \frac{28}{2 \cdot 64} = \frac{7}{32}$

Using 4 rectangles $\Rightarrow \Delta x = \frac{1-0}{4} = \frac{1}{4}$
 $\Rightarrow \frac{1}{4} \left(f\left(\frac{1}{8}\right) + f\left(\frac{3}{8}\right) + f\left(\frac{5}{8}\right) + f\left(\frac{7}{8}\right) \right)$
 $= \frac{1}{4} \left(\frac{1^3+3^3+5^3+7^3}{8^3} \right) = \frac{496}{4 \cdot 8^3} = \frac{124}{8^3} = \frac{31}{128}$

7. $f(x) = \frac{1}{x}$

Using 2 rectangles $\Rightarrow \Delta x = \frac{5-1}{2} = 2 \Rightarrow 2(f(2) + f(4))$
 $= 2 \left(\frac{1}{2} + \frac{1}{4} \right) = \frac{3}{2}$

Using 4 rectangles $\Rightarrow \Delta x = \frac{5-1}{4} = 1$
 $\Rightarrow 1 \left(f\left(\frac{3}{2}\right) + f\left(\frac{5}{2}\right) + f\left(\frac{7}{2}\right) + f\left(\frac{9}{2}\right) \right) = 1 \left(\frac{2}{3} + \frac{2}{5} + \frac{2}{7} + \frac{2}{9} \right)$
 $= \frac{1488}{3 \cdot 5 \cdot 7 \cdot 9} = \frac{496}{5 \cdot 7 \cdot 9} = \frac{496}{315}$

8. $f(x) = 4 - x^2$

Using 2 rectangles $\Rightarrow \Delta x = \frac{2-(-2)}{2} = 2$
 $\Rightarrow 2(f(-1) + f(1)) = 2(3 + 3) = 12$

Using 4 rectangles $\Rightarrow \Delta x = \frac{2-(-2)}{4} = 1$
 $\Rightarrow 1 \left(f\left(-\frac{3}{2}\right) + f\left(-\frac{1}{2}\right) + f\left(\frac{1}{2}\right) + f\left(\frac{3}{2}\right) \right)$
 $= 1 \left(\left(4 - \left(-\frac{3}{2}\right)^2 \right) + \left(4 - \left(-\frac{1}{2}\right)^2 \right) + \left(4 - \left(\frac{1}{2}\right)^2 \right) + \left(4 - \left(\frac{3}{2}\right)^2 \right) \right)$
 $= 16 - \left(\frac{9}{4} \cdot 2 + \frac{1}{4} \cdot 2 \right) = 16 - \frac{10}{2} = 11$

9. (a) $D \approx (0)(1) + (12)(1) + (22)(1) + (10)(1) + (5)(1) + (13)(1) + (11)(1) + (6)(1) + (2)(1) + (6)(1) = 87$ inches
 (b) $D \approx (12)(1) + (22)(1) + (10)(1) + (5)(1) + (13)(1) + (11)(1) + (6)(1) + (2)(1) + (6)(1) + (0)(1) = 87$ inches

10. (a) $D \approx (1)(300) + (1.2)(300) + (1.7)(300) + (2.0)(300) + (1.8)(300) + (1.6)(300) + (1.4)(300) + (1.2)(300) + (1.0)(300) + (1.8)(300) + (1.5)(300) + (1.2)(300) = 5220$ meters (NOTE: 5 minutes = 300 seconds)
 (b) $D \approx (1.2)(300) + (1.7)(300) + (2.0)(300) + (1.8)(300) + (1.6)(300) + (1.4)(300) + (1.2)(300) + (1.0)(300) + (1.8)(300) + (1.5)(300) + (1.2)(300) + (0)(300) = 4920$ meters (NOTE: 5 minutes = 300 seconds)

11. (a) $D \approx (0)(10) + (44)(10) + (15)(10) + (35)(10) + (30)(10) + (44)(10) + (35)(10) + (15)(10) + (22)(10) + (35)(10) + (44)(10) + (30)(10) = 3490$ feet ≈ 0.66 miles
 (b) $D \approx (44)(10) + (15)(10) + (35)(10) + (30)(10) + (44)(10) + (35)(10) + (15)(10) + (22)(10) + (35)(10) + (44)(10) + (30)(10) + (35)(10) = 3840$ feet ≈ 0.73 miles

12. (a) The distance traveled will be the area under the curve. We will use the approximate velocities at the midpoints of each time interval to approximate this area using rectangles. Thus,
 $D \approx (20)(0.001) + (50)(0.001) + (72)(0.001) + (90)(0.001) + (102)(0.001) + (112)(0.001) + (120)(0.001) + (128)(0.001) + (134)(0.001) + (139)(0.001) \approx 0.967$ miles
 (b) Roughly, after 0.0063 hours, the car would have gone 0.484 miles, where 0.0060 hours = 22.7 sec. At 22.7 sec, the velocity was approximately 120 mi/hr.

13. (a) Because the acceleration is decreasing, an upper estimate is obtained using left endpoints in summing acceleration $\cdot \Delta t$. Thus, $\Delta t = 1$ and speed $\approx [32.00 + 19.41 + 11.77 + 7.14 + 4.33](1) = 74.65$ ft/sec
 (b) Using right endpoints we obtain a lower estimate: speed $\approx [19.41 + 11.77 + 7.14 + 4.33 + 2.63](1) = 45.28$ ft/sec
 (c) Upper estimates for the speed at each second are:

t	0	1	2	3	4	5
v	0	32.00	51.41	63.18	70.32	74.65

Thus, the distance fallen when $t = 3$ seconds is $s \approx [32.00 + 51.41 + 63.18](1) = 146.59$ ft.

14. (a) The speed is a decreasing function of time \Rightarrow right endpoints give a lower estimate for the height (distance) attained. Also

t	0	1	2	3	4	5
v	400	368	336	304	272	240

gives the time-velocity table by subtracting the constant $g = 32$ from the speed at each time increment $\Delta t = 1$ sec. Thus, the speed ≈ 240 ft/sec after 5 seconds.

- (b) A lower estimate for height attained is $h \approx [368 + 336 + 304 + 272 + 240](1) = 1520$ ft.
15. Partition $[0, 2]$ into the four subintervals $[0, 0.5]$, $[0.5, 1]$, $[1, 1.5]$, and $[1.5, 2]$. The midpoints of these subintervals are $m_1 = 0.25$, $m_2 = 0.75$, $m_3 = 1.25$, and $m_4 = 1.75$. The heights of the four approximating rectangles are $f(m_1) = (0.25)^3 = \frac{1}{64}$, $f(m_2) = (0.75)^3 = \frac{27}{64}$, $f(m_3) = (1.25)^3 = \frac{125}{64}$, and $f(m_4) = (1.75)^3 = \frac{343}{64}$

Notice that the average value is approximated by $\frac{1}{2} \left[\left(\frac{1}{4}\right)^3 \left(\frac{1}{2}\right) + \left(\frac{3}{4}\right)^3 \left(\frac{1}{2}\right) + \left(\frac{5}{4}\right)^3 \left(\frac{1}{2}\right) + \left(\frac{7}{4}\right)^3 \left(\frac{1}{2}\right) \right] = \frac{31}{16}$

$= \frac{1}{\text{length of } [0, 2]} \cdot \left[\begin{array}{c} \text{approximate area under} \\ \text{curve } f(x) = x^3 \end{array} \right]$. We use this observation in solving the next several exercises.

16. Partition $[1, 9]$ into the four subintervals $[1, 3]$, $[3, 5]$, $[5, 7]$, and $[7, 9]$. The midpoints of these subintervals are $m_1 = 2$, $m_2 = 4$, $m_3 = 6$, and $m_4 = 8$. The heights of the four approximating rectangles are $f(m_1) = \frac{1}{2}$, $f(m_2) = \frac{1}{4}$, $f(m_3) = \frac{1}{6}$, and $f(m_4) = \frac{1}{8}$. The width of each rectangle is $\Delta x = 2$. Thus,

$$\text{Area} \approx 2 \left(\frac{1}{2} \right) + 2 \left(\frac{1}{4} \right) + 2 \left(\frac{1}{6} \right) + 2 \left(\frac{1}{8} \right) = \frac{25}{12} \Rightarrow \text{average value} \approx \frac{\text{area}}{\text{length of } [1, 9]} = \frac{\left(\frac{25}{12}\right)}{8} = \frac{25}{96}.$$

17. Partition $[0, 2]$ into the four subintervals $[0, 0.5]$, $[0.5, 1]$, $[1, 1.5]$, and $[1.5, 2]$. The midpoints of the subintervals are $m_1 = 0.25$, $m_2 = 0.75$, $m_3 = 1.25$, and $m_4 = 1.75$. The heights of the four approximating rectangles are $f(m_1) = \frac{1}{2} + \sin^2 \frac{\pi}{4} = \frac{1}{2} + \frac{1}{2} = 1$, $f(m_2) = \frac{1}{2} + \sin^2 \frac{3\pi}{4} = \frac{1}{2} + \frac{1}{2} = 1$, $f(m_3) = \frac{1}{2} + \sin^2 \frac{5\pi}{4} = \frac{1}{2} + \left(-\frac{1}{\sqrt{2}}\right)^2 = \frac{1}{2} + \frac{1}{2} = 1$, and $f(m_4) = \frac{1}{2} + \sin^2 \frac{7\pi}{4} = \frac{1}{2} + \left(-\frac{1}{\sqrt{2}}\right)^2 = 1$. The width of each rectangle is $\Delta x = \frac{1}{2}$. Thus, $\text{Area} \approx (1 + 1 + 1 + 1) \left(\frac{1}{2}\right) = 2 \Rightarrow \text{average value} \approx \frac{\text{area}}{\text{length of } [0, 2]} = \frac{2}{2} = 1$.

18. Partition $[0, 4]$ into the four subintervals $[0, 1]$, $[1, 2]$, $[2, 3]$, and $[3, 4]$. The midpoints of the subintervals are $m_1 = \frac{1}{2}$, $m_2 = \frac{3}{2}$, $m_3 = \frac{5}{2}$, and $m_4 = \frac{7}{2}$. The heights of the four approximating rectangles are

$$f(m_1) = 1 - \left(\cos \left(\frac{\pi \left(\frac{1}{2}\right)}{4} \right) \right)^4 = 1 - \left(\cos \left(\frac{\pi}{8} \right) \right)^4 = 0.27145 \text{ (to 5 decimal places), } f(m_2) = 1 - \left(\cos \left(\frac{\pi \left(\frac{3}{2}\right)}{4} \right) \right)^4$$

$$= 1 - \left(\cos \left(\frac{3\pi}{8} \right) \right)^4 = 0.97855, f(m_3) = 1 - \left(\cos \left(\frac{\pi \left(\frac{5}{2}\right)}{4} \right) \right)^4 = 1 - \left(\cos \left(\frac{5\pi}{8} \right) \right)^4 = 0.97855, \text{ and}$$

$$f(m_4) = 1 - \left(\cos \left(\frac{\pi \left(\frac{7}{2} \right)}{4} \right) \right)^4 = 1 - \left(\cos \left(\frac{7\pi}{8} \right) \right)^4 = 0.27145. \text{ The width of each rectangle is } \Delta x = 1. \text{ Thus,}$$

$$\text{Area} \approx (0.27145)(1) + (0.97855)(1) + (0.97855)(1) + (0.27145)(1) = 2.5 \Rightarrow \text{average value} \approx \frac{\text{area}}{\text{length of } [0,4]} = \frac{2.5}{4} = \frac{5}{8}$$

19. Since the leakage is increasing, an upper estimate uses right endpoints and a lower estimate uses left endpoints:

(a) upper estimate = $(70)(1) + (97)(1) + (136)(1) + (190)(1) + (265)(1) = 758$ gal,

lower estimate = $(50)(1) + (70)(1) + (97)(1) + (136)(1) + (190)(1) = 543$ gal.

(b) upper estimate = $(70 + 97 + 136 + 190 + 265 + 369 + 516 + 720) = 2363$ gal,

lower estimate = $(50 + 70 + 97 + 136 + 190 + 265 + 369 + 516) = 1693$ gal.

(c) worst case: $2363 + 720t = 25,000 \Rightarrow t \approx 31.4$ hrs;

best case: $1693 + 720t = 25,000 \Rightarrow t \approx 32.4$ hrs

20. Since the pollutant release increases over time, an upper estimate uses right endpoints and a lower estimate uses left endpoints;

(a) upper estimate = $(0.2)(30) + (0.25)(30) + (0.27)(30) + (0.34)(30) + (0.45)(30) + (0.52)(30) = 60.9$ tons

lower estimate = $(0.05)(30) + (0.2)(30) + (0.25)(30) + (0.27)(30) + (0.34)(30) + (0.45)(30) = 46.8$ tons

(b) Using the lower (best case) estimate: $46.8 + (0.52)(30) + (0.63)(30) + (0.70)(30) + (0.81)(30) = 126.6$ tons, so near the end of September 125 tons of pollutants will have been released.

21. (a) The diagonal of the square has length 2, so the side length is $\sqrt{2}$. Area = $(\sqrt{2})^2 = 2$

(b) Think of the octagon as a collection of 16 right triangles with a hypotenuse of length 1 and an acute angle measuring $\frac{2\pi}{16} = \frac{\pi}{8}$.

$$\text{Area} = 16 \left(\frac{1}{2} \right) \left(\sin \frac{\pi}{8} \right) \left(\cos \frac{\pi}{8} \right) = 4 \sin \frac{\pi}{4} = 2\sqrt{2} \approx 2.828$$

(c) Think of the 16-gon as a collection of 32 right triangles with a hypotenuse of length 1 and an acute angle measuring $\frac{2\pi}{32} = \frac{\pi}{16}$.

$$\text{Area} = 32 \left(\frac{1}{2} \right) \left(\sin \frac{\pi}{16} \right) \left(\cos \frac{\pi}{16} \right) = 8 \sin \frac{\pi}{8} = 2\sqrt{2} \approx 3.061$$

(d) Each area is less than the area of the circle, π . As n increase, the area approaches π .

22. (a) Each of the isosceles triangles is made up of two right triangles having hypotenuse 1 and an acute angle measuring $\frac{2\pi}{2n} = \frac{\pi}{n}$. The area of each isosceles triangle is $A_T = 2 \left(\frac{1}{2} \right) \left(\sin \frac{\pi}{n} \right) \left(\cos \frac{\pi}{n} \right) = \frac{1}{2} \sin \frac{2\pi}{n}$.

(b) The area of the polygon is $A_P = nA_T = \frac{n}{2} \sin \frac{2\pi}{n}$, so $\lim_{n \rightarrow \infty} \frac{n}{2} \sin \frac{2\pi}{n} = \lim_{n \rightarrow \infty} \pi \cdot \frac{\sin \frac{2\pi}{n}}{\left(\frac{2\pi}{n} \right)} = \pi$

(c) Multiply each area by r^2 .

$$A_T = \frac{1}{2} r^2 \sin \frac{2\pi}{n}$$

$$A_P = \frac{n}{2} r^2 \sin \frac{2\pi}{n}$$

$$\lim_{n \rightarrow \infty} A_P = \pi r^2$$

63. Consider the partition P that subdivides the interval $[a, b]$ into n subintervals of width $\Delta x = \frac{b-a}{n}$ and let c_k be the right endpoint of each subinterval. So the partition is $P = \left\{ a, a + \frac{b-a}{n}, a + \frac{2(b-a)}{n}, \dots, a + \frac{n(b-a)}{n} \right\}$ and

$c_k = a + \frac{k(b-a)}{n}$. We get the Riemann sum $\sum_{k=1}^n f(c_k) \Delta x = \sum_{k=1}^n c \cdot \frac{b-a}{n} = \frac{c(b-a)}{n} \sum_{k=1}^n 1 = \frac{c(b-a)}{n} \cdot n = c(b-a)$.

As $n \rightarrow \infty$ and $\|P\| \rightarrow 0$ this expression remains $c(b-a)$. Thus, $\int_a^b c dx = c(b-a)$.

64. Consider the partition P that subdivides the interval $[0, 2]$ into n subintervals of width $\Delta x = \frac{2-0}{n} = \frac{2}{n}$ and let c_k be the right endpoint of each subinterval. So the partition is $P = \left\{ 0, \frac{2}{n}, 2 \cdot \frac{2}{n}, \dots, n \cdot \frac{2}{n} = 2 \right\}$ and $c_k = k \cdot \frac{2}{n} = \frac{2k}{n}$.

We get the Riemann sum

$\sum_{k=1}^n f(c_k) \Delta x = \sum_{k=1}^n \left[2 \left(\frac{2k}{n} \right) + 1 \right] \cdot \frac{2}{n} = \frac{2}{n} \sum_{k=1}^n \left(\frac{4k}{n} + 1 \right) = \frac{8}{n^2} \sum_{k=1}^n k + \frac{2}{n} \sum_{k=1}^n 1 = \frac{8}{n^2} \cdot \frac{n(n+1)}{2} + \frac{2}{n} \cdot n = \frac{4(n+1)}{n} + 2$. As $n \rightarrow \infty$ and

$\|P\| \rightarrow 0$ the expression $\frac{4(n+1)}{n} + 2$ has the value $4 + 2 = 6$. Thus, $\int_0^2 (2x+1) dx = 6$.

65. Consider the partition P that subdivides the interval $[a, b]$ into n subintervals of width $\Delta x = \frac{b-a}{n}$ and let c_k be the right endpoint of each subinterval. So the partition is $P = \left\{ a, a + \frac{b-a}{n}, a + \frac{2(b-a)}{n}, \dots, a + \frac{n(b-a)}{n} \right\}$ and

$$\begin{aligned}
 c_k &= a + \frac{k(b-a)}{n}. \text{ We get the Riemann sum } \sum_{k=1}^n f(c_k)\Delta x = \sum_{k=1}^n c_k^2 \left(\frac{b-a}{n}\right) = \frac{b-a}{n} \sum_{k=1}^n \left(a + \frac{k(b-a)}{n}\right)^2 \\
 &= \frac{b-a}{n} \sum_{k=1}^n \left(a^2 + \frac{2ak(b-a)}{n} + \frac{k^2(b-a)^2}{n^2}\right) = \frac{b-a}{n} \left(\sum_{k=1}^n a^2 + \frac{2a(b-a)}{n} \sum_{k=1}^n k + \frac{(b-a)^2}{n^2} \sum_{k=1}^n k^2\right) \\
 &= \frac{b-a}{n} \cdot na^2 + \frac{2a(b-a)}{n^2} \cdot \frac{n(n+1)}{2} + \frac{(b-a)^3}{n^3} \cdot \frac{n(n+1)(2n+1)}{6} = (b-a)a^2 + a(b-a)^2 \cdot \frac{n+1}{n} + \frac{(b-a)^3}{6^2} \cdot \frac{(n+1)(2n+1)}{n} \\
 &= (b-a)a^2 + a(b-a)^2 \cdot \frac{1+\frac{1}{n}}{1} + \frac{(b-a)^3}{6} \cdot \frac{2+\frac{3}{n}+\frac{1}{n^2}}{1} \text{ As } n \rightarrow \infty \text{ and } \|P\| \rightarrow 0 \text{ this expression has value} \\
 &(b-a)a^2 + a(b-a)^2 \cdot 1 + \frac{(b-a)^3}{6} \cdot 2 = ba^2 - a^3 + ab^2 - 2a^2b + a^3 + \frac{1}{3}(b^3 - 3b^2a + 3ba^2 - a^3) = \frac{b^3}{3} - \frac{a^3}{3}. \text{ Thus,} \\
 &\int_a^b x^2 dx = \frac{b^3}{3} - \frac{a^3}{3}.
 \end{aligned}$$

66. Consider the partition P that subdivides the interval $[-1, 0]$ into n subintervals of width $\Delta x = \frac{0-(-1)}{n} = \frac{1}{n}$ and let c_k be the right endpoint of each subinterval. So the partition is $P = \left\{ -1, -1 + \frac{1}{n}, -1 + 2 \cdot \frac{1}{n}, \dots, -1 + n \cdot \frac{1}{n} = 0 \right\}$

$$\begin{aligned}
 \text{and } c_k &= -1 + k \cdot \frac{1}{n} = -1 + \frac{k}{n}. \text{ We get the Riemann sum } \sum_{k=1}^n f(c_k)\Delta x = \sum_{k=1}^n \left(\left(-1 + \frac{k}{n}\right) - \left(-1 + \frac{k}{n}\right)^2 \right) \cdot \frac{1}{n} \\
 &= \frac{1}{n} \sum_{k=1}^n \left(-1 + \frac{k}{n} - 1 + \frac{2k}{n} - \left(\frac{k}{n}\right)^2 \right) = -\frac{2}{n} \sum_{k=1}^n 1 + \frac{3}{n^2} \sum_{k=1}^n k - \frac{1}{n^3} \sum_{k=1}^n k^2 = -\frac{2}{n} \cdot n + \frac{3}{n^2} \cdot \frac{n(n+1)}{2} - \frac{1}{n^3} \cdot \frac{n(n+1)(2n+1)}{6} \\
 &= -2 + \frac{3(n+1)}{2n} - \frac{(n+1)(2n+1)}{6n^2}. \text{ As } n \rightarrow \infty \text{ and } \|P\| \rightarrow 0 \text{ this expression has value } -2 + \frac{3}{2} - \frac{1}{3} = -\frac{5}{6}. \\
 \text{Thus, } &\int_{-1}^0 (x - x^2) dx = -\frac{5}{6}.
 \end{aligned}$$

67. Consider the partition P that subdivides the interval $[-1, 2]$ into n subintervals of width $\Delta x = \frac{2-(-1)}{n} = \frac{3}{n}$ and let c_k be the right endpoint of each subinterval. So the partition is $P = \left\{ -1, -1 + \frac{3}{n}, -1 + 2 \cdot \frac{3}{n}, \dots, -1 + n \cdot \frac{3}{n} = 2 \right\}$

$$\begin{aligned}
 \text{and } c_k &= -1 + k \cdot \frac{3}{n} = -1 + \frac{3k}{n}. \text{ We get the Riemann sum } \sum_{k=1}^n f(c_k)\Delta x = \sum_{k=1}^n \left(3\left(-1 + \frac{3k}{n}\right)^2 - 2\left(-1 + \frac{3k}{n}\right) + 1 \right) \cdot \frac{3}{n} \\
 &= \frac{3}{n} \sum_{k=1}^n \left(3 - \frac{18k}{n} + \frac{27k^2}{n^2} + 2 - \frac{6k}{n} + 1 \right) = \frac{18}{n} \sum_{k=1}^n 1 - \frac{72}{n^2} \sum_{k=1}^n k + \frac{81}{n^3} \sum_{k=1}^n k^2 = \frac{18}{n} \cdot n - \frac{72}{n^2} \cdot \frac{n(n+1)}{2} + \frac{81}{n^3} \cdot \frac{n(n+1)(2n+1)}{6} \\
 &= 18 - \frac{36(n+1)}{n} + \frac{27(n+1)(2n+1)}{2n^2}. \text{ As } n \rightarrow \infty \text{ and } \|P\| \rightarrow 0 \text{ this expression has value } 18 - 36 + 27 = 9. \\
 \text{Thus, } &\int_{-1}^2 (3x^2 - 2x + 1)dx = 9.
 \end{aligned}$$

68. Consider the partition P that subdivides the interval $[-1, 1]$ into n subintervals of width $\Delta x = \frac{1-(-1)}{n} = \frac{2}{n}$ and let c_k be the right endpoint of each subinterval. So the partition is $P = \left\{ -1, -1 + \frac{2}{n}, -1 + 2 \cdot \frac{2}{n}, \dots, -1 + n \cdot \frac{2}{n} = 1 \right\}$ and

$$\begin{aligned}
 c_k &= -1 + k \cdot \frac{2}{n} = -1 + \frac{2k}{n}. \text{ We get the Riemann sum } \sum_{k=1}^n f(c_k)\Delta x = \sum_{k=1}^n c_k^3 \left(\frac{2}{n}\right) = \frac{2}{n} \sum_{k=1}^n \left(-1 + \frac{2k}{n}\right)^3 \\
 &= \frac{2}{n} \sum_{k=1}^n \left(-1 + \frac{6k}{n} - \frac{12k^2}{n^2} + \frac{8k^3}{n^3} \right) = \frac{2}{n} \left(-\sum_{k=1}^n 1 + \frac{6}{n} \sum_{k=1}^n k - \frac{12}{n^2} \sum_{k=1}^n k^2 + \frac{8}{n^3} \sum_{k=1}^n k^3 \right) \\
 &= -\frac{2}{n} \cdot n + \frac{12}{n^2} \cdot \frac{n(n+1)}{2} - \frac{24}{n^3} \cdot \frac{n(n+1)(2n+1)}{6} + \frac{16}{n^4} \cdot \left(\frac{n(n+1)}{2}\right)^2 = -2 + 6 \cdot \frac{n+1}{n} - 4 \cdot \frac{(n+1)(2n+1)}{n^2} + 4 \cdot \frac{(n+1)^2}{n^2} = -2 + 6 \cdot \frac{1+\frac{1}{n}}{1}
 \end{aligned}$$

$$= -2 + 6 \cdot \frac{1+\frac{1}{n}}{1} - 4 \cdot \frac{2+\frac{3}{n}+\frac{1}{n^2}}{1} + 4 \cdot \frac{1+\frac{2}{n}+\frac{1}{n^2}}{1}. \text{ As } n \rightarrow \infty \text{ and } \|P\| \rightarrow 0 \text{ this expression has value } -2 + 6 - 8 + 4 = 0.$$

Thus, $\int_{-1}^1 x^3 dx = 0$.

69. Consider the partition P that subdivides the interval $[a, b]$ into n subintervals of width $\Delta x = \frac{b-a}{n}$ and let c_k be the right endpoint of each subinterval. So the partition is $P = \left\{ a, a + \frac{b-a}{n}, a + \frac{2(b-a)}{n}, \dots, a + \frac{n(b-a)}{n} = b \right\}$ and

$$\begin{aligned} c_k &= a + \frac{k(b-a)}{n}. \text{ We get the Riemann sum } \sum_{k=1}^n f(c_k)\Delta x = \sum_{k=1}^n c_k^3 \left(\frac{b-a}{n}\right) = \frac{b-a}{n} \sum_{k=1}^n \left(a + \frac{k(b-a)}{n}\right)^3 \\ &= \frac{b-a}{n} \sum_{k=1}^n \left(a^3 + \frac{3a^2k(b-a)}{n} + \frac{3ak^2(b-a)^2}{n^2} + \frac{k^3(b-a)^3}{n^3}\right) = \frac{b-a}{n} \left(\sum_{k=1}^n a^3 + \frac{3a^2(b-a)}{n} \sum_{k=1}^n k + \frac{3a(b-a)^2}{n^2} \sum_{k=1}^n k^2 + \frac{(b-a)^3}{n^3} \sum_{k=1}^n k^3\right) \\ &= \frac{b-a}{n} \cdot na^3 + \frac{3a^2(b-a)^2}{n^2} \cdot \frac{n(n+1)}{2} + \frac{3a(b-a)^3}{n^3} \cdot \frac{n(n+1)(2n+1)}{6} + \frac{(b-a)^4}{n^4} \cdot \left(\frac{n(n+1)}{2}\right)^2 \\ &= (b-a)a^3 + \frac{3a^2(b-a)^2}{2} \cdot \frac{n+1}{n} + \frac{a(b-a)^3}{2} \cdot \frac{(n+1)(2n+1)}{n^2} + \frac{(b-a)^4}{4} \cdot \frac{(n+1)^2}{n^2} \\ &= (b-a)a^3 + \frac{3a^2(b-a)^2}{2} \cdot \frac{1+\frac{1}{n}}{1} + \frac{a(b-a)^3}{2} \cdot \frac{2+\frac{3}{n}+\frac{1}{n^2}}{1} + \frac{(b-a)^4}{4} \cdot \frac{1+\frac{2}{n}+\frac{1}{n^2}}{1}. \text{ As } n \rightarrow \infty \text{ and } \|P\| \rightarrow 0 \text{ this expression has} \\ &\text{value } (b-a)a^3 + \frac{3a^2(b-a)^2}{2} + a(b-a)^3 + \frac{(b-a)^4}{4} = \frac{b^4}{4} - \frac{a^4}{4}. \text{ Thus, } \int_a^b x^3 dx = \frac{b^4}{4} - \frac{a^4}{4}. \end{aligned}$$

70. Consider the partition P that subdivides the interval $[0, 1]$ into n subintervals of width $\Delta x = \frac{1-0}{n} = \frac{1}{n}$ and let c_k be the right endpoint of each subinterval. So the partition is $P = \left\{ 0, 0 + \frac{1}{n}, 0 + 2 \cdot \frac{1}{n}, \dots, 0 + n \cdot \frac{1}{n} = 1 \right\}$ and

$$\begin{aligned} c_k &= 0 + k \cdot \frac{1}{n} = \frac{k}{n}. \text{ We get the Riemann sum } \sum_{k=1}^n f(c_k)\Delta x = \sum_{k=1}^n (3c_k - c_k^3) \left(\frac{1}{n}\right) = \frac{1}{n} \sum_{k=1}^n \left(3 \cdot \frac{k}{n} - \left(\frac{k}{n}\right)^3\right) \\ &= \frac{1}{n} \left(\frac{3}{n} \sum_{k=1}^n k - \frac{1}{n^3} \sum_{k=1}^n k^3\right) = \frac{3}{n^2} \cdot \frac{n(n+1)}{2} - \frac{1}{n^4} \cdot \left(\frac{n(n+1)}{2}\right)^2 = \frac{3}{2} \cdot \frac{n+1}{n} - \frac{1}{4} \cdot \frac{(n+1)^2}{n^2} = \frac{3}{2} \cdot \frac{1+\frac{1}{n}}{1} - \frac{1}{4} \cdot \frac{1+\frac{2}{n}+\frac{1}{n^2}}{1}. \text{ As } n \rightarrow \infty \text{ and} \end{aligned}$$

$\|P\| \rightarrow 0$ this expression has value $\frac{3}{2} - \frac{1}{4} = \frac{5}{4}$. Thus, $\int_0^1 (3x - x^3) dx = \frac{5}{4}$.

71. To find where $x - x^2 \geq 0$, let $x - x^2 = 0 \Rightarrow x(1-x) = 0 \Rightarrow x = 0$ or $x = 1$. If $0 < x < 1$, then $0 < x - x^2 \Rightarrow a = 0$ and $b = 1$ maximize the integral.

72. To find where $x^4 - 2x^2 \leq 0$, let $x^4 - 2x^2 = 0 \Rightarrow x^2(x^2 - 2) = 0 \Rightarrow x = 0$ or $x = \pm\sqrt{2}$. By the sign graph, $\begin{matrix} ++++++ & 0 & - - - - & 0 & ++++++ \\ & -\sqrt{2} & & \sqrt{2} & \end{matrix}$, we can see that $x^4 - 2x^2 \leq 0$ on $[-\sqrt{2}, \sqrt{2}] \Rightarrow a = -\sqrt{2}$ and $b = \sqrt{2}$ minimize the integral.

73. $f(x) = \frac{1}{1+x^2}$ is decreasing on $[0, 1] \Rightarrow$ maximum value of f occurs at $0 \Rightarrow \max f = f(0) = 1$; minimum value of f occurs at $1 \Rightarrow \min f = f(1) = \frac{1}{1+1^2} = \frac{1}{2}$. Therefore, $(1-0) \min f \leq \int_0^1 \frac{1}{1+x^2} dx \leq (1-0) \max f \Rightarrow \frac{1}{2} \leq \int_0^1 \frac{1}{1+x^2} dx \leq 1$. That is, an upper bound = 1 and a lower bound = $\frac{1}{2}$.

74. See Exercise 73 above. On $[0, 0.5]$, $\max f = \frac{1}{1+0^2} = 1$, $\min f = \frac{1}{1+(0.5)^2} = 0.8$. Therefore
 $(0.5-0) \min f \leq \int_0^{0.5} f(x) dx \leq (0.5-0) \max f \Rightarrow \frac{2}{5} \leq \int_0^{0.5} \frac{1}{1+x^2} dx \leq \frac{1}{2}$. On $[0.5, 1]$, $\max f = \frac{1}{1+(0.5)^2} = 0.8$
and $\min f = \frac{1}{1+1^2} = 0.5$. Therefore $(1-0.5) \min f \leq \int_{0.5}^1 \frac{1}{1+x^2} dx \leq (1-0.5) \max f \Rightarrow \frac{1}{4} \leq \int_{0.5}^1 \frac{1}{1+x^2} dx \leq \frac{2}{5}$.
Then $\frac{1}{4} + \frac{2}{5} \leq \int_0^{0.5} \frac{1}{1+x^2} dx + \int_{0.5}^1 \frac{1}{1+x^2} dx \leq \frac{1}{2} + \frac{2}{5} \Rightarrow \frac{13}{20} \leq \int_0^1 \frac{1}{1+x^2} dx \leq \frac{9}{10}$.
75. $-1 \leq \sin(x^2) \leq 1$ for all $x \Rightarrow (1-0)(-1) \leq \int_0^1 \sin(x^2) dx \leq (1-0)(1)$ or $\int_0^1 \sin x^2 dx \leq 1 \Rightarrow \int_0^1 \sin x^2 dx$ cannot equal 2.
76. $f(x) = \sqrt{x+8}$ is increasing on $[0, 1] \Rightarrow \max f = f(1) = \sqrt{1+8} = 3$ and $\min f = f(0) = \sqrt{0+8} = 2\sqrt{2}$. Therefore,
 $(1-0) \min f \leq \int_0^1 \sqrt{x+8} dx \leq (1-0) \max f \Rightarrow 2\sqrt{2} \leq \int_0^1 \sqrt{x+8} dx \leq 3$.
77. If $f(x) \geq 0$ on $[a, b]$, then $\min f \geq 0$ and $\max f \geq 0$ on $[a, b]$. Now, $(b-a) \min f \leq \int_a^b f(x) dx \leq (b-a) \max f$.
Then $b \geq a \Rightarrow b-a \geq 0 \Rightarrow (b-a) \min f \geq 0 \Rightarrow \int_a^b f(x) dx \geq 0$.
78. If $f(x) \leq 0$ on $[a, b]$, then $\min f \leq 0$ and $\max f \leq 0$. Now, $(b-a) \min f \leq \int_a^b f(x) dx \leq (b-a) \max f$. Then
 $b \geq a \Rightarrow b-a \geq 0 \Rightarrow (b-a) \max f \leq 0 \Rightarrow \int_a^b f(x) dx \leq 0$.
79. $\sin x \leq x$ for $x \geq 0 \Rightarrow \sin x - x \leq 0$ for $x \geq 0 \Rightarrow \int_0^1 (\sin x - x) dx \leq 0$ (see Exercise 78) $\Rightarrow \int_0^1 \sin x dx - \int_0^1 x dx \leq 0$
 $\Rightarrow \int_0^1 \sin x dx \leq \int_0^1 x dx \Rightarrow \int_0^1 \sin x dx \leq \left(\frac{1^2}{2} - \frac{0^2}{2}\right) \Rightarrow \int_0^1 \sin x dx \leq \frac{1}{2}$. Thus an upper bound is $\frac{1}{2}$.
80. $\sec x \geq 1 + \frac{x^2}{2}$ on $(-\frac{\pi}{2}, \frac{\pi}{2}) \Rightarrow \sec x - \left(1 + \frac{x^2}{2}\right) \geq 0$ on $(-\frac{\pi}{2}, \frac{\pi}{2}) \Rightarrow \int_0^1 \left[\sec x - \left(1 + \frac{x^2}{2}\right)\right] dx \geq 0$ (see Exercise 77)
since $[0, 1]$ is contained in $(-\frac{\pi}{2}, \frac{\pi}{2}) \Rightarrow \int_0^1 \sec x dx - \int_0^1 \left(1 + \frac{x^2}{2}\right) dx \geq 0 \Rightarrow \int_0^1 \sec x dx \geq \int_0^1 \left(1 + \frac{x^2}{2}\right) dx$
 $\Rightarrow \int_0^1 \sec x dx \geq \int_0^1 1 dx + \frac{1}{2} \int_0^1 x^2 dx \Rightarrow \int_0^1 \sec x dx \geq (1-0) + \frac{1}{2} \left(\frac{1^3}{3}\right) \Rightarrow \int_0^1 \sec x dx \geq \frac{7}{6}$. Thus a lower bound is $\frac{7}{6}$.
81. Yes, for the following reasons: $\text{av}(f) = \frac{1}{b-a} \int_a^b f(x) dx$ is a constant K . Thus
 $\int_a^b \text{av}(f) dx = \int_a^b K dx = K(b-a) \Rightarrow \int_a^b \text{av}(f) dx = (b-a)K = (b-a) \cdot \frac{1}{b-a} \int_a^b f(x) dx = \int_a^b f(x) dx$.
82. All three rules hold. The reasons: On any interval $[a, b]$ on which f and g are integrable, we have:
(a) $\text{av}(f+g) = \frac{1}{b-a} \int_a^b [f(x)+g(x)] dx = \frac{1}{b-a} \left[\int_a^b f(x) dx + \int_a^b g(x) dx \right] = \frac{1}{b-a} \int_a^b f(x) dx + \frac{1}{b-a} \int_a^b g(x) dx$
 $= \text{av}(f) + \text{av}(g)$
(b) $\text{av}(kf) = \frac{1}{b-a} \int_a^b kf(x) dx = \frac{1}{b-a} \left[k \int_a^b f(x) dx \right] = k \left[\frac{1}{b-a} \int_a^b f(x) dx \right] = k \text{av}(f)$

(c) $av(f) = \frac{1}{b-a} \int_a^b f(x) dx = \frac{1}{b-a} \int_a^b g(x) dx$ since $f(x) \leq g(x)$ on $[a, b]$, and $\frac{1}{b-a} \int_a^b g(x) dx = av(g)$.

Therefore, $av(f) \leq av(g)$.

83. (a) $U = \max_1 \Delta x + \max_2 \Delta x + \dots + \max_n \Delta x$ where $\max_1 = f(x_1), \max_2 = f(x_2), \dots, \max_n = f(x_n)$ since f is increasing on $[a, b]$; $L = \min_1 \Delta x + \min_2 \Delta x + \dots + \min_n \Delta x$ where $\min_1 = f(x_0), \min_2 = f(x_1), \dots, \min_n = f(x_{n-1})$ since f is increasing on $[a, b]$. Therefore

$$U - L = (\max_1 - \min_1) \Delta x + (\max_2 - \min_2) \Delta x + \dots + (\max_n - \min_n) \Delta x$$

$$= (f(x_1) - f(x_0)) \Delta x + (f(x_2) - f(x_1)) \Delta x + \dots + (f(x_n) - f(x_{n-1})) \Delta x = (f(x_n) - f(x_0)) \Delta x$$

$$= (f(b) - f(a)) \Delta x.$$

(b) $U = \max_1 \Delta x_1 + \max_2 \Delta x_2 + \dots + \max_n \Delta x_n$ where $\max_1 = f(x_1), \max_2 = f(x_2), \dots, \max_n = f(x_n)$ since f is increasing on $[a, b]$; $L = \min_1 \Delta x_1 + \min_2 \Delta x_2 + \dots + \min_n \Delta x_n$ where $\min_1 = f(x_0), \min_2 = f(x_1), \dots, \min_n = f(x_{n-1})$ since f is increasing on $[a, b]$. Therefore

$$U - L = (\max_1 - \min_1) \Delta x_1 + (\max_2 - \min_2) \Delta x_2 + \dots + (\max_n - \min_n) \Delta x_n$$

$$= (f(x_1) - f(x_0)) \Delta x_1 + (f(x_2) - f(x_1)) \Delta x_2 + \dots + (f(x_n) - f(x_{n-1})) \Delta x_n$$

$$\leq (f(x_1) - f(x_0)) \Delta x_{\max} + (f(x_2) - f(x_1)) \Delta x_{\max} + \dots + (f(x_n) - f(x_{n-1})) \Delta x_{\max}.$$

Then

$$U - L \leq (f(x_n) - f(x_0)) \Delta x_{\max} = (f(b) - f(a)) \Delta x_{\max} = |f(b) - f(a)| \Delta x_{\max}$$

since $f(b) \geq f(a)$. Thus

$$\lim_{\|P\| \rightarrow 0} (U - L) = \lim_{\|P\| \rightarrow 0} (f(b) - f(a)) \Delta x_{\max} = 0, \text{ since } \Delta x_{\max} = \|P\|.$$

84. (a) $U = \max_1 \Delta x + \max_2 \Delta x + \dots + \max_n \Delta x$ where $\max_1 = f(x_0), \max_2 = f(x_1), \dots, \max_n = f(x_{n-1})$ since f is decreasing on $[a, b]$;

$L = \min_1 \Delta x + \min_2 \Delta x + \dots + \min_n \Delta x$ where $\min_1 = f(x_1), \min_2 = f(x_2), \dots, \min_n = f(x_n)$ since f is decreasing on $[a, b]$. Therefore

$$U - L = (\max_1 - \min_1) \Delta x + (\max_2 - \min_2) \Delta x$$

$$+ \dots + (\max_n - \min_n) \Delta x$$

$$= (f(x_0) - f(x_1)) \Delta x + (f(x_1) - f(x_2)) \Delta x$$

$$+ \dots + (f(x_{n-1}) - f(x_n)) \Delta x$$

$$= (f(x_0) - f(x_n)) \Delta x = (f(a) - f(b)) \Delta x.$$

(b) $U = \max_1 \Delta x_1 + \max_2 \Delta x_2 + \dots + \max_n \Delta x_n$ where $\max_1 = f(x_0), \max_2 = f(x_1), \dots, \max_n = f(x_{n-1})$ since f is decreasing on $[a, b]$; $L = \min_1 \Delta x_1 + \min_2 \Delta x_2 + \dots + \min_n \Delta x_n$ where $\min_1 = f(x_1), \min_2 = f(x_2), \dots, \min_n = f(x_n)$ since f is decreasing on $[a, b]$. Therefore

$$U - L = (\max_1 - \min_1) \Delta x_1 + (\max_2 - \min_2) \Delta x_2 + \dots + (\max_n - \min_n) \Delta x_n$$

$$= (f(x_0) - f(x_1)) \Delta x_1 + (f(x_1) - f(x_2)) \Delta x_2 + \dots + (f(x_{n-1}) - f(x_n)) \Delta x_n \leq (f(x_0) - f(x_n)) \Delta x_{\max}$$

$$= (f(a) - f(b)) \Delta x_{\max} = |f(b) - f(a)| \Delta x_{\max}$$

since $f(b) \leq f(a)$. Thus

$$\lim_{\|P\| \rightarrow 0} (U - L) = \lim_{\|P\| \rightarrow 0} |f(b) - f(a)| \Delta x_{\max} = 0, \text{ since } \Delta x_{\max} = \|P\|.$$

85. (a) Partition $\left[0, \frac{\pi}{2}\right]$ into n subintervals, each of length $\Delta x = \frac{\pi}{2n}$ with points $x_0 = 0, x_1 = \Delta x, x_2 = 2\Delta x, \dots, x_n = n\Delta x = \frac{\pi}{2}$. Since $\sin x$ is increasing on $\left[0, \frac{\pi}{2}\right]$, the upper sum U is the sum of the areas of the circumscribed rectangles of areas $f(x_1) \Delta x = (\sin \Delta x) \Delta x, f(x_2) \Delta x = (\sin 2\Delta x) \Delta x, \dots, f(x_n) \Delta x = (\sin n\Delta x) \Delta x$.

$$\begin{aligned} \text{Then } U &= (\sin \Delta x + \sin 2\Delta x + \dots + \sin n\Delta x)\Delta x = \left[\frac{\cos \frac{\Delta x}{2} - \cos \left((n + \frac{1}{2})\Delta x \right)}{2 \sin \frac{\Delta x}{2}} \right] \Delta x = \left[\frac{\cos \frac{\pi}{4n} - \cos \left((n + \frac{1}{2})\frac{\pi}{2n} \right)}{2 \sin \frac{\pi}{4n}} \right] \left(\frac{\pi}{2n} \right) \\ &= \frac{\pi \left(\cos \frac{\pi}{4n} - \cos \left(\frac{\pi}{2} + \frac{\pi}{4n} \right) \right)}{4n \sin \frac{\pi}{4n}} = \frac{\cos \frac{\pi}{4n} - \cos \left(\frac{\pi}{2} + \frac{\pi}{4n} \right)}{\left(\frac{\sin \frac{\pi}{4n}}{\frac{\pi}{4n}} \right)} \end{aligned}$$

(b) The area is $\int_0^{\pi/2} \sin x \, dx = \lim_{n \rightarrow \infty} \frac{\cos \frac{\pi}{4n} - \cos \left(\frac{\pi}{2} + \frac{\pi}{4n} \right)}{\left(\frac{\sin \frac{\pi}{4n}}{\frac{\pi}{4n}} \right)} = \frac{1 - \cos \frac{\pi}{2}}{1} = 1.$

86. (a) The area of the shaded region is $\sum_{i=1}^n \Delta x_i \cdot m_i$ which is equal to L .
 (b) The area of the shaded region is $\sum_{i=1}^n \Delta x_i \cdot M_i$ which is equal to U .
 (c) The area of the shaded region is the difference in the areas of the shaded regions shown in the second part of the figure and the first part of the figure. Thus this area is $U - L$.

87. By Exercise 86, $U - L = \sum_{i=1}^n \Delta x_i \cdot M_i - \sum_{i=1}^n \Delta x_i \cdot m_i$ where $M_i = \max \{f(x) \text{ on the } i\text{th subinterval}\}$ and $m_i = \min \{f(x) \text{ on } i\text{th subinterval}\}$. Thus $U - L = \sum_{i=1}^n (M_i - m_i)\Delta x_i < \sum_{i=1}^n \epsilon \cdot \Delta x_i$ provided $\Delta x_i < \delta$ for each $i = 1, \dots, n$. Since $\sum_{i=1}^n \epsilon \cdot \Delta x_i = \epsilon \sum_{i=1}^n \Delta x_i = \epsilon(b - a)$ the result, $U - L < \epsilon(b - a)$ follows.

88. The car drove the first 150 miles in 5 hours and the second 150 miles in 3 hours, which means it drove 300 miles in 8 hours, for an average value of $\frac{300}{8}$ mi/hr = 37.5 mi/hr. In terms of average value of functions, the function whose average value we seek is $v(t) = \begin{cases} 30, & 0 \leq t \leq 5 \\ 50, & 5 \leq t \leq 8 \end{cases}$, and the average value is $\frac{(30)(5) + (50)(3)}{8} = 37.5$.

61. The area of the rectangle bounded by the lines $y = 2$, $y = 0$, $x = \pi$, and $x = 0$ is 2π . The area under the curve $y = 1 + \cos x$ on $[0, \pi]$ is $\int_0^\pi (1 + \cos x) dx = [x + \sin x]_0^\pi = (\pi + \sin \pi) - (0 + \sin 0) = \pi$. Therefore the area of the shaded region is $2\pi - \pi = \pi$.
62. The area of the rectangle bounded by the lines by the lines $x = \frac{\pi}{6}$, $x = \frac{5\pi}{6}$, $y = \sin \frac{\pi}{6} = \frac{1}{2} = \sin \frac{5\pi}{6}$, and $y = 0$ is $\frac{1}{2}(\frac{5\pi}{6} - \frac{\pi}{6}) = \frac{\pi}{3}$. The area under the curve $y = \sin x$ on $[\frac{\pi}{6}, \frac{5\pi}{6}]$ is $\int_{\pi/6}^{5\pi/6} \sin x dx = [-\cos x]_{\pi/6}^{5\pi/6} = (-\cos \frac{5\pi}{6}) - (-\cos \frac{\pi}{6}) = -(-\frac{\sqrt{3}}{2}) + \frac{\sqrt{3}}{2} = \sqrt{3}$. Therefore the area of the shaded region is $\sqrt{3} - \frac{\pi}{3}$.
63. On $[-\frac{\pi}{4}, 0]$: The area of the rectangle bounded by the lines $y = \sqrt{2}$, $y = 0$, $\theta = 0$, and $\theta = -\frac{\pi}{4}$ is $\sqrt{2}(\frac{\pi}{4}) = \frac{\pi\sqrt{2}}{4}$. The area between the curve $y = \sec \theta \tan \theta$ and $y = 0$ is $-\int_{-\pi/4}^0 \sec \theta \tan \theta d\theta = [-\sec \theta]_{-\pi/4}^0 = (-\sec 0) - (-\sec(-\frac{\pi}{4})) = \sqrt{2} - 1$. Therefore the area of the shaded region on $[-\frac{\pi}{4}, 0]$ is $\frac{\pi\sqrt{2}}{4} + (\sqrt{2} - 1)$.
On $[0, \frac{\pi}{4}]$: The area of the rectangle bounded by $\theta = \frac{\pi}{4}$, $\theta = 0$, $y = \sqrt{2}$, and $y = 0$ is $\sqrt{2}(\frac{\pi}{4}) = \frac{\pi\sqrt{2}}{4}$. The area under the curve $y = \sec \theta \tan \theta$ is $\int_0^{\pi/4} \sec \theta \tan \theta d\theta = [\sec \theta]_0^{\pi/4} = \sec \frac{\pi}{4} - \sec 0 = \sqrt{2} - 1$. Therefore the area of the shaded region on $[0, \frac{\pi}{4}]$ is $\frac{\pi\sqrt{2}}{4} - (\sqrt{2} - 1)$. Thus, the area of the total shaded region is $(\frac{\pi\sqrt{2}}{4} + \sqrt{2} - 1) + (\frac{\pi\sqrt{2}}{4} - \sqrt{2} + 1) = \frac{\pi\sqrt{2}}{2}$.
64. The area of the rectangle bounded by the lines $y = 2$, $y = 0$, $t = -\frac{\pi}{4}$, and $t = 1$ is $2(1 - (-\frac{\pi}{4})) = 2 + \frac{\pi}{2}$. The area under the curve $y = \sec^2 t$ on $[-\frac{\pi}{4}, 0]$ is $\int_{-\pi/4}^0 \sec^2 t dt = [\tan t]_{-\pi/4}^0 = \tan 0 - \tan(-\frac{\pi}{4}) = 1$. The area under the curve $y = 1 - t^2$ on $[0, 1]$ is $\int_0^1 (1 - t^2) dt = [t - \frac{t^3}{3}]_0^1 = (1 - \frac{1^3}{3}) - (0 - \frac{0^3}{3}) = \frac{2}{3}$. Thus, the total area under the curves on $[-\frac{\pi}{4}, 1]$ is $1 + \frac{2}{3} = \frac{5}{3}$. Therefore the area of the shaded region is $(2 + \frac{\pi}{2}) - \frac{5}{3} = \frac{1}{3} + \frac{\pi}{2}$.
65. $y = \int_\pi^x \frac{1}{t} dt - 3 \Rightarrow \frac{dy}{dx} = \frac{1}{x}$ and $y(\pi) = \int_\pi^\pi \frac{1}{t} dt - 3 = 0 - 3 = -3 \Rightarrow (d)$ is a solution to this problem.

(b) $a = \frac{df}{dt}$ is negative since the slope of the tangent line at $t = 5$ is negative

(c) $s = \int_0^3 f(x) dx = \frac{1}{2}(3)(3) = \frac{9}{2}$ m since the integral is the area of the triangle formed by $y = f(x)$, the x -axis and $x = 3$

(d) $t = 6$ since from $t = 6$ to $t = 9$, the region lies below the x -axis

(e) At $t = 4$ and $t = 7$, since there are horizontal tangents there

(f) Toward the origin between $t = 6$ and $t = 9$ since the velocity is negative on this interval. Away from the origin between $t = 0$ and $t = 6$ since the velocity is positive there.

(g) Right or positive side, because the integral of f from 0 to 9 is positive, there being more area above the x -axis than below it.

84. $\lim_{x \rightarrow \infty} \frac{1}{\sqrt{x}} \int_1^x \frac{dt}{\sqrt{t}} = \lim_{x \rightarrow \infty} \frac{1}{\sqrt{x}} [2\sqrt{t}]_1^x = \lim_{x \rightarrow \infty} \frac{1}{\sqrt{x}} (2\sqrt{x} - 2) = \lim_{x \rightarrow \infty} \left(2 - \frac{2}{\sqrt{x}} \right) = 2 - 0 = 2$

Mathematica: (assigned function and values for a, and b may vary)

For transcendental functions the FindRoot is needed instead of the Solve command.

The Map command executes FindRoot over a set of initial guesses

Initial guesses will vary as the functions vary.

```
Clear[x, f, F]
{a, b}={0, 2π}; f[x_] = Sin[2x] Cos[x/3]
F[x_] = Integrate[f[t], {t, a, x}]
Plot[{f[x], F[x]}, {x, a, b}]
x/.Map[FindRoot[F'[x]==0, {x, #}] &, {2, 3, 5, 6}]
x/.Map[FindRoot[f'[x]==0, {x, #}] &, {1, 2, 4, 5, 6}]
```

Slightly alter above commands for 89–94.

```
Clear[x, f, F, u]
a=0; f[x_] = x2 - 2x - 3
u[x_] = 1 - x2
F[x_] = Integrate[f[t], {t, a, u(x)}]
x/.Map[FindRoot[F'[x]==0, {x, #}] &, {1, 2, 3, 4}]
x/.Map[FindRoot[F''[x]==0, {x, #}] &, {1, 2, 3, 4}]
```

After determining an appropriate value for b, the following can be entered

```
b = 4;
Plot[{F[x]}, {x, a, b}]
```

 Limits of integration: $y = x$ and $y = \frac{1}{x^2} \Rightarrow x = \frac{1}{x^2}, x \neq 0$
 $\Rightarrow x^3 = 1 \Rightarrow x = 1, f_1(x) - g_1(x) = x - 0 = x$
 $\Rightarrow A_1 = \int_0^1 x dx = \left[\frac{x^2}{2} \right]_0^1 = \frac{1}{2}; f_2(x) - g_2(x) = \frac{1}{x^2} - 0$
 $= x^{-2} \Rightarrow A_2 = \int_1^2 x^{-2} dx = \left[\frac{-1}{x} \right]_1^2 = -\frac{1}{2} + 1 = \frac{1}{2};$
 $A = A_1 + A_2 = \frac{1}{2} + \frac{1}{2} = 1$

96. Limits of integration: $\sin x = \cos x \Rightarrow x = \frac{\pi}{4} \Rightarrow a = 0$ and
 $b = \frac{\pi}{4}$; $f(x) - g(x) = \cos x - \sin x$
 $\Rightarrow A = \int_0^{\pi/4} (\cos x - \sin x) dx = [\sin x + \cos x]_0^{\pi/4}$
 $= \left(\frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2}\right) - (0 + 1) = \sqrt{2} - 1$

97. $\int_1^5 (\ln 2x - \ln x) dx = \int_1^5 (-\ln x + \ln 2 + \ln x) dx = (\ln 2) \int_1^5 dx = (\ln 2)(5 - 1) = \ln 2^4 = \ln 16$

98. $\int_{-\pi/4}^0 -\tan x dx + \int_0^{\pi/3} \tan x dx = \int_{-\pi/4}^0 \frac{-\sin x}{\cos x} dx - \int_0^{\pi/3} \frac{\sin x}{\cos x} dx = [\ln|\cos x|]_{-\pi/4}^0 - [\ln|\cos x|]_0^{\pi/3} =$
 $(\ln 1 - \ln \frac{1}{\sqrt{2}}) - (\ln \frac{1}{2} - \ln 1) = \ln \sqrt{2} + \ln 2 = \frac{3}{2} \ln 2$

99. $\int_0^{\ln 3} (e^{2x} - e^x) dx = \left[\frac{e^{2x}}{2} - e^x\right]_0^{\ln 3} = \left(\frac{e^{2\ln 3}}{2} - e^{\ln 3}\right) - \left(\frac{e^0}{2} - e^0\right) = \left(\frac{9}{2} - 3\right) - \left(\frac{1}{2} - 1\right) = \frac{8}{2} - 2 = 2$

100. $\int_0^{2\ln 2} (e^{x/2} - e^{-x/2}) dx = \left[2e^{x/2} + 2e^{-x/2}\right]_0^{2\ln 2} = (2e^{\ln 2} + 2e^{-\ln 2}) - (2e^0 + 2e^0) = (4 + 1) - (2 + 2) = 5 - 4 = 1$

101. $\int_{-2}^2 \frac{2x}{1+x^2} dx = 2 \int_0^2 \frac{2x}{1+x^2} dx$; $[u = 1 + x^2 \Rightarrow du = 2x dx; x = 0 \Rightarrow u = 1, x = 2 \Rightarrow u = 5]$
 $= 2 \int_1^5 \frac{1}{u} du = 2 [\ln|u|]_1^5 = 2(\ln 5 - \ln 1) = 2 \ln 5$

102. $\int_{-1}^1 2^{(1-x)} dx = 2 \int_{-1}^1 \left(\frac{1}{2}\right)^x dx = 2 \left[\frac{\frac{1}{2}^x}{\ln(\frac{1}{2})}\right]_{-1}^1 = -\frac{2}{\ln 2} \left(\frac{1}{2} - 2\right) = \left(-\frac{2}{\ln 2}\right) \left(-\frac{3}{2}\right) = \frac{3}{\ln 2}$

103. (a) The coordinates of the points of intersection of the line and parabola are $c = x^2 \Rightarrow x = \pm\sqrt{c}$ and $y = c$
 (b) $f(y) - g(y) = \sqrt{y} - (-\sqrt{y}) = 2\sqrt{y} \Rightarrow$ the area of the lower section is, $A_L = \int_0^c [f(y) - g(y)] dy$
 $= 2 \int_0^c \sqrt{y} dy = 2 \left[\frac{2}{3} y^{3/2}\right]_0^c = \frac{4}{3} c^{3/2}$. The area of

the entire shaded region can be found by setting $c = 4$: $A = \left(\frac{4}{3}\right) 4^{3/2} = \frac{4 \cdot 8}{3} = \frac{32}{3}$. Since we want c to divide the region into subsections of equal area we have $A = 2A_L \Rightarrow \frac{32}{3} = 2\left(\frac{4}{3} c^{3/2}\right) \Rightarrow c = 4^{2/3}$

(c) $f(x) - g(x) = c - x^2 \Rightarrow A_L = \int_{-\sqrt{c}}^{\sqrt{c}} [f(x) - g(x)] dx = \int_{-\sqrt{c}}^{\sqrt{c}} (c - x^2) dx = \left[cx - \frac{x^3}{3} \right]_{-\sqrt{c}}^{\sqrt{c}} = 2 \left[c^{3/2} - \frac{c^{3/2}}{3} \right] = \frac{4}{3} c^{3/2}$. Again, the area of the whole shaded region can be found by setting $c = 4 \Rightarrow A = \frac{32}{3}$. From the condition $A = 2A_L$, we get $\frac{4}{3} c^{3/2} = \frac{32}{3} \Rightarrow c = 4^{2/3}$ as in part (b).

104. (a) Limits of integration: $y = 3 - x^2$ and $y = -1$
 $\Rightarrow 3 - x^2 = -1 \Rightarrow x^2 = 4 \Rightarrow a = -2$ and $b = 2$;
 $f(x) - g(x) = (3 - x^2) - (-1) = 4 - x^2$
 $\Rightarrow A = \int_{-2}^2 (4 - x^2) dx = \left[4x - \frac{x^3}{3} \right]_{-2}^2$
 $= \left(8 - \frac{8}{3} \right) - \left(-8 + \frac{8}{3} \right) = 16 - \frac{16}{3} = \frac{32}{3}$

(b) Limits of integration: let $x = 0$ in $y = 3 - x^2$
 $\Rightarrow y = 3$; $f(y) - g(y) = \sqrt{3 - y} - (-\sqrt{3 - y})$
 $= 2(3 - y)^{1/2} \Rightarrow A = 2 \int_{-1}^3 (3 - y)^{1/2} dy = -2 \int_{-1}^3 (3 - y)^{1/2} (-1) dy = (-2) \left[\frac{2(3 - y)^{3/2}}{3} \right]_{-1}^3$
 $= \left(-\frac{4}{3} \right) \left[0 - (3 + 1)^{3/2} \right] = \left(\frac{4}{3} \right) (8) = \frac{32}{3}$

105. Limits of integration: $y = 1 + \sqrt{x}$ and $y = \frac{2}{\sqrt{x}}$
 $\Rightarrow 1 + \sqrt{x} = \frac{2}{\sqrt{x}}, x \neq 0 \Rightarrow \sqrt{x} + x = 2 \Rightarrow x = (2 - x)^2$
 $\Rightarrow x = 4 - 4x + x^2 \Rightarrow x^2 - 5x + 4 = 0$
 $\Rightarrow (x - 4)(x - 1) = 0 \Rightarrow x = 1, 4$ (but $x = 4$ does not satisfy the equation); $y = \frac{2}{\sqrt{x}}$ and $y = \frac{x}{4} \Rightarrow \frac{2}{\sqrt{x}} = \frac{x}{4}$
 $\Rightarrow 8 = x\sqrt{x} \Rightarrow 64 = x^3 \Rightarrow x = 4$. Therefore,
 AREA = $A_1 + A_2$; $f_1(x) - g_1(x) = \left(1 + x^{1/2} \right) - \frac{x}{4}$

$\Rightarrow A_1 = \int_0^1 \left(1 + x^{1/2} - \frac{x}{4} \right) dx = \left[x + \frac{2}{3} x^{3/2} - \frac{x^2}{8} \right]_0^1 = \left(1 + \frac{2}{3} - \frac{1}{8} \right) - 0 = \frac{37}{24}$; $f_2(x) - g_2(x) = 2x^{-1/2} - \frac{x}{4}$
 $\Rightarrow A_2 = \int_1^4 \left(2x^{-1/2} - \frac{x}{4} \right) dx = \left[4x^{1/2} - \frac{x^2}{8} \right]_1^4 = \left(4 \cdot 2 - \frac{16}{8} \right) - \left(4 - \frac{1}{8} \right) = 4 - \frac{15}{8} = \frac{17}{8}$; Therefore,
 AREA = $A_1 + A_2 = \frac{37}{24} + \frac{17}{8} = \frac{37+51}{24} = \frac{88}{24} = \frac{11}{3}$

106. Limits of integration: $(y - 1)^2 = 3 - y$
 $\Rightarrow y^2 - 2y + 1 = 3 - y \Rightarrow y^2 - y - 2 = 0$
 $\Rightarrow (y - 2)(y + 1) = 0 \Rightarrow y = 2$ since $y > 0$; also,
 $2\sqrt{y} = 3 - y \Rightarrow 4y = 9 - 6y + y^2 \Rightarrow y^2 - 10y + 9 = 0$
 $\Rightarrow (y - 9)(y - 1) = 0 \Rightarrow y = 1$ since $y = 9$ does not satisfy the equation;
 AREA = $A_1 + A_2$

$f_1(y) - g_1(y) = 2\sqrt{y} - 0 = 2y^{1/2} \Rightarrow A_1 = 2 \int_0^1 y^{1/2} dy = 2 \left[\frac{2y^{3/2}}{3} \right]_0^1 = \frac{4}{3}$;

$f_2(y) - g_2(y) = (3 - y) - (y - 1)^2 \Rightarrow A_2 = \int_1^2 [3 - y - (y - 1)^2] dy = \left[3y - \frac{1}{2}y^2 - \frac{1}{3}(y - 1)^3 \right]_1^2$
 $= \left(6 - 2 - \frac{1}{3} \right) - \left(3 - \frac{1}{2} + 0 \right) = 1 - \frac{1}{3} + \frac{1}{2} = \frac{7}{6}$. Therefore, $A_1 + A_2 = \frac{4}{3} + \frac{7}{6} = \frac{15}{6} = \frac{5}{2}$

107. Area between parabola and $y = a^2$: $A = 2 \int_0^a (a^2 - x^2) dx = 2 \left[a^2 x - \frac{1}{3} x^3 \right]_0^a = 2 \left(a^3 - \frac{a^3}{3} \right) - 0 = \frac{4a^3}{3}$;

Area of triangle AOC: $\frac{1}{2}(2a)(a^2) = a^3$; limit of ratio = $\lim_{a \rightarrow 0^+} \frac{a^3}{\left(\frac{4a^3}{3}\right)} = \frac{3}{4}$ which is independent of a .

108. $A = \int_a^b 2f(x) dx - \int_a^b f(x) dx = 2 \int_a^b f(x) dx - \int_a^b f(x) dx = \int_a^b f(x) dx = 4$

109. Neither one; they are both zero. Neither integral takes into account the changes in the formulas for the region's upper and lower bounding curves at $x = 0$. The area of the shaded region is actually

$$A = \int_{-1}^0 [-x - (-x)] dx + \int_0^1 [x - (-x)] dx = \int_{-1}^0 -2x dx + \int_0^1 2x dx = 2.$$

110. It is sometimes true. It is true if $f(x) \geq g(x)$ for all x between a and b . Otherwise it is false. If the graph of f lies below the graph of g for a portion of the interval of integration, the integral over that portion will be negative and the integral over $[a, b]$ will be less than the area between the curves (see Exercise 71).

111. Let $u = 2x \Rightarrow du = 2 dx \Rightarrow \frac{1}{2} du = dx$; $x = 1 \Rightarrow u = 2$, $x = 3 \Rightarrow u = 6$

$$\int_1^3 \frac{\sin 2x}{x} dx = \int_2^6 \frac{\sin u}{\left(\frac{u}{2}\right)} \left(\frac{1}{2} du\right) = \int_2^6 \frac{\sin u}{u} du = [F(u)]_2^6 = F(6) - F(2)$$

112. Let $u = 1 - x \Rightarrow du = -dx \Rightarrow -du = dx$; $x = 0 \Rightarrow u = 1$, $x = 1 \Rightarrow u = 0$

$$\int_0^1 f(1-x) dx = \int_1^0 f(u)(-du) = -\int_1^0 f(u) du = \int_0^1 f(u) du = \int_0^1 f(x) dx$$

113. (a) Let $u = -x \Rightarrow du = -dx$; $x = -1 \Rightarrow u = 1$, $x = 0 \Rightarrow u = 0$

$$\begin{aligned} f \text{ odd} \Rightarrow f(-x) = -f(x). \text{ Then } \int_{-1}^0 f(x) dx &= \int_1^0 f(-u)(-du) = \int_1^0 -f(u)(-du) = \int_1^0 f(u) du \\ &= -\int_0^1 f(u) du = -3 \end{aligned}$$

(b) Let $u = -x \Rightarrow du = -dx$; $x = -1 \Rightarrow u = 1$, $x = 0 \Rightarrow u = 0$

$$f \text{ even} \Rightarrow f(-x) = f(x). \text{ Then } \int_{-1}^0 f(x) dx = \int_1^0 f(-u)(-du) = -\int_1^0 f(u) du = \int_0^1 f(u) du = 3$$

114. (a) Consider $\int_{-a}^0 f(x) dx$ when f is odd. Let $u = -x \Rightarrow du = -dx \Rightarrow -du = dx$ and $x = -a \Rightarrow u = a$ and

$$x = 0 \Rightarrow u = 0. \text{ Thus } \int_{-a}^0 f(x) dx = \int_a^0 -f(-u) du = \int_a^0 f(u) du = -\int_0^a f(u) du = -\int_0^a f(x) dx. \text{ Thus}$$

$$\int_{-a}^a f(x) dx = \int_{-a}^0 f(x) dx + \int_0^a f(x) dx = -\int_0^a f(x) dx + \int_0^a f(x) dx = 0.$$

(b) $\int_{-\pi/2}^{\pi/2} \sin x dx = [-\cos x]_{-\pi/2}^{\pi/2} = -\cos\left(\frac{\pi}{2}\right) + \cos\left(-\frac{\pi}{2}\right) = 0 + 0 = 0.$

115. Let $u = a - x \Rightarrow du = -dx$; $x = 0 \Rightarrow u = a$, $x = a \Rightarrow u = 0$

$$I = \int_0^a \frac{f(x) dx}{f(x)+f(a-x)} = \int_a^0 \frac{f(a-u)}{f(a-u)+f(u)} (-du) = \int_0^a \frac{f(a-u) du}{f(u)+f(a-u)} = \int_0^a \frac{f(a-x) dx}{f(x)+f(a-x)}$$

$$\Rightarrow I + I = \int_0^a \frac{f(x) dx}{f(x)+f(a-x)} + \int_0^a \frac{f(a-x) dx}{f(x)+f(a-x)} = \int_0^a \frac{f(x)+f(a-x)}{f(x)+f(a-x)} dx = \int_0^a dx = [x]_0^a = a - 0 = a.$$

Therefore, $2I = a \Rightarrow I = \frac{a}{2}$.

116. Let $u = \frac{xy}{t} \Rightarrow du = -\frac{xy}{t^2} dt \Rightarrow -\frac{t}{xy} du = \frac{1}{t} dt \Rightarrow -\frac{1}{u} du = \frac{1}{t} dt$; $t = x \Rightarrow u = y$, $t = xy \Rightarrow u = 1$. Therefore,

$$\int_x^{xy} \frac{1}{t} dt = \int_y^1 -\frac{1}{u} du = -\int_y^1 \frac{1}{u} du = \int_1^y \frac{1}{u} du = \int_1^y \frac{1}{t} dt$$

117. Let $u = x + c \Rightarrow du = dx$; $x = a - c \Rightarrow u = a$, $x = b - c \Rightarrow u = b$

$$\int_{a-c}^{b-c} f(x+c) dx = \int_a^b f(u) du = \int_a^b f(x) dx$$

CHAPTER 5 PRACTICE EXERCISES

1. (a) Each time subinterval is of length $\Delta t = 0.4$ sec. The distance traveled over each subinterval, using the midpoint rule, is $\Delta h = \frac{1}{2}(v_i + v_{i+1})\Delta t$, where v_i is the velocity at the left endpoint and v_{i+1} the velocity at the right endpoint of the subinterval. We then add Δh to the height attained so far at the left endpoint v_i to arrive at the height associated with velocity v_{i+1} at the right endpoint. Using this methodology we build the following table based on the figure in the text:

t (sec)	0	0.4	0.8	1.2	1.6	2.0	2.4	2.8	3.2	3.6	4.0	4.4	4.8	5.2	5.6	6.0
v (fps)	0	10	25	55	100	190	180	165	150	140	130	115	105	90	76	65
h (ft)	0	2	9	25	56	114	188	257	320	378	432	481	525	564	592	620.2

t (sec)	6.4	6.8	7.2	7.6	8.0
v (fps)	50	37	25	12	0
h (ft)	643.2	660.6	672	679.4	681.8

NOTE: Your table values may vary slightly from ours depending on the v -values you read from the graph. Remember that some shifting of the graph occurs in the printing process. The total height attained is about 680 ft.

- (b) The graph is based on the table in part (a).

2. (a) Each time subinterval is of length $\Delta t = 1$ sec. The distance traveled over each subinterval, using the midpoint rule, is $\Delta s = \frac{1}{2}(v_i + v_{i+1}) \Delta t$, where v_i is the velocity at the left, and v_{i+1} the velocity at the right, endpoint of the subinterval. We then add Δs to the distance attained so far at the left endpoint v_i to arrive at the distance associated with velocity v_{i+1} at the right endpoint. Using this methodology we build the table given below based on the figure in the text, obtaining approximately 26 m for the total distance traveled:

t (sec)	0	1	2	3	4	5	6	7	8	9	10
v (m/sec)	0	0.5	1.2	2	3.4	4.5	4.8	4.5	3.5	2	0
s (m)	0	0.25	1.1	2.7	5.4	9.35	14	18.65	22.65	25.4	26.4

- (b) The graph shows the distance traveled by the moving body as a function of time for $0 \leq t \leq 10$.

119. We want to evaluate

$$\frac{1}{365-0} \int_0^{365} f(x) dx = \frac{1}{365} \int_0^{365} \left(37 \sin \left[\frac{2\pi}{365} (x-101) \right] + 25 \right) dx = \frac{37}{365} \int_0^{365} \sin \left[\frac{2\pi}{365} (x-101) \right] dx + \frac{25}{365} \int_0^{365} dx$$

Notice that the period of $y = \sin \left[\frac{2\pi}{365} (x-101) \right]$ is $\frac{2\pi}{\frac{2\pi}{365}} = 365$ and that we are integrating this function over an interval of length 365. Thus the value of $\frac{37}{365} \int_0^{365} \sin \left[\frac{2\pi}{365} (x-101) \right] dx + \frac{25}{365} \int_0^{365} dx$ is $\frac{37}{365} \cdot 0 + \frac{25}{365} \cdot 365 = 25$.

$$120. \frac{1}{675-20} \int_{20}^{675} (8.27 + 10^{-5} (26T - 1.87T^2)) dT = \frac{1}{655} \left[8.27T + \frac{26T^2}{2 \cdot 10^5} - \frac{1.87T^3}{3 \cdot 10^5} \right]_{20}^{675}$$

$$= \frac{1}{655} \left(\left[8.27(675) + \frac{26(675)^2}{2 \cdot 10^5} - \frac{1.87(675)^3}{3 \cdot 10^5} \right] - \left[8.27(20) + \frac{26(20)^2}{2 \cdot 10^5} - \frac{1.87(20)^3}{3 \cdot 10^5} \right] \right)$$

$\approx \frac{1}{655} (3724.44 - 165.40) = 5.43 =$ the average value of C_v on $[20, 675]$. To find the temperature T at which $C_v = 5.43$, solve $5.43 = 8.27 + 10^{-5} (26T - 1.87T^2)$ for T . We obtain $1.87T^2 - 26T - 284000 = 0$

$\Rightarrow T = \frac{26 \pm \sqrt{(26)^2 - 4(1.87)(-284000)}}{2(1.87)} = \frac{26 \pm \sqrt{2124996}}{3.74}$. So $T = -382.82$ or $T = 396.72$. Only $T = 396.72$ lies in the interval $[20, 675]$, so $T = 396.72^\circ\text{C}$.

129. Yes. The function f , being differentiable on $[a, b]$, is then continuous on $[a, b]$. The Fundamental Theorem of Calculus says that every continuous function on $[a, b]$ is the derivative of a function on $[a, b]$.

130. The second part of the Fundamental Theorem of Calculus states that if $F(x)$ is an antiderivative of $f(x)$ on $[a, b]$, then $\int_a^b f(x) dx = F(b) - F(a)$. In particular, if $F(x)$ is an antiderivative of $\sqrt{1+x^4}$ on $[0, 1]$, then

$$\int_0^1 \sqrt{1+x^4} dx = F(1) - F(0).$$

$$131. y = \int_x^1 \sqrt{1+t^2} dt = - \int_1^x \sqrt{1+t^2} dt \Rightarrow \frac{dy}{dx} = \frac{d}{dx} \left[- \int_1^x \sqrt{1+t^2} dt \right] = - \frac{d}{dx} \left[\int_1^x \sqrt{1+t^2} dt \right] = -\sqrt{1+x^2}$$

$$= - \left(\frac{1}{1-\cos^2 x} \right) \left(\frac{d}{dx} (\cos x) \right) = - \left(\frac{1}{\sin^2 x} \right) (-\sin x) = \frac{1}{\sin x} = \csc x$$

133. We estimate the area A using midpoints of the vertical intervals, and we will estimate the width of the parking lot on each interval by averaging the widths at top and bottom. This gives the estimate $A \approx 15 \cdot \left(\frac{0+36}{2} + \frac{36+54}{2} + \frac{54+51}{2} + \frac{51+49.5}{2} + \frac{49.5+54}{2} + \frac{54+64.4}{2} + \frac{64.4+67.5}{2} + \frac{67.5+42}{2} \right) \approx 5961 \text{ ft}^2$. The cost is $\text{Area} \cdot (\$2.10/\text{ft}^2) \approx (5961 \text{ ft}^2)(\$2.10/\text{ft}^2) = \$12,518.10 \Rightarrow$ the job cannot be done for \$11,000.

134. (a) Before the chute opens for A , $a = -32 \text{ ft/sec}^2$. Since the helicopter is hovering $v_0 = 0 \text{ ft/sec}$
 $\Rightarrow v = \int -32 dt = -32t + v_0 = -32t$. Then $s_0 = 6400 \text{ ft} \Rightarrow s = \int -32t dt = -16t^2 + s_0 = -16t^2 + 6400$.
 At $t = 4 \text{ sec}$, $s = -16(4)^2 + 6400 = 6144 \text{ ft}$ when A 's chute opens;
- (b) For B , $s_0 = 7000 \text{ ft}$, $v_0 = 0$, $a = -32 \text{ ft/sec}^2 \Rightarrow v = \int -32 dt = -32t + v_0 = -32t \Rightarrow s = \int -32t dt = -16t^2 + s_0 = -16t^2 + 7000$. At $t = 13 \text{ sec}$, $s = -16(13)^2 + 7000 = 4296 \text{ ft}$ when B 's chute opens;
- (c) After the chutes open, $v = -16 \text{ ft/sec} \Rightarrow s = \int -16 dt = -16t + s_0$. For A , $s_0 = 6144 \text{ ft}$ and for B , $s_0 = 4296 \text{ ft}$. Therefore, for A , $s = -16t + 6144$ and for B , $s = -16t + 4296$. When they hit the ground, $s = 0 \Rightarrow$ for A , $0 = -16t + 6144 \Rightarrow t = \frac{6144}{16} = 384$ seconds, and for B , $0 = -16t + 4296 \Rightarrow t = \frac{4296}{16} = 268.5$ seconds to hit the ground after the chutes open, Since B 's chutes opens 58 seconds after A 's opens $\Rightarrow B$ hits the ground first.

CHAPTER 5 ADDITIONAL AND ADVANCED EXERCISES

1. (a) Yes, because $\int_0^1 f(x) dx = \frac{1}{7} \int_0^1 7f(x) dx = \frac{1}{7}(7) = 1$

(b) No. For example, $\int_0^1 8x dx = [4x^2]_0^1 = 4$, but $\int_0^1 \sqrt{8x} dx = \left[2\sqrt{2} \left(\frac{x^{3/2}}{\frac{3}{2}} \right) \right]_0^1 = \frac{4\sqrt{2}}{3} (1^{3/2} - 0^{3/2}) = \frac{4\sqrt{2}}{3} \neq \sqrt{4}$

2. (a) True: $\int_5^2 f(x) dx = - \int_2^5 f(x) dx = -3$

(b) True: $\int_{-2}^5 [f(x) + g(x)] dx = \int_{-2}^5 f(x) dx + \int_{-2}^5 g(x) dx = \int_{-2}^2 f(x) dx + \int_2^5 f(x) dx + \int_{-2}^5 g(x) dx$
 $= 4 + 3 + 2 = 9$

(c) False: $\int_{-2}^5 f(x) dx = 4 + 3 = 7 > 2 = \int_{-2}^5 g(x) dx \Rightarrow \int_{-2}^5 [f(x) - g(x)] dx > 0 \Rightarrow \int_{-2}^5 [g(x) - f(x)] dx < 0$. On the other hand, $f(x) \leq g(x) \Rightarrow [g(x) - f(x)] \geq 0 \Rightarrow \int_{-2}^5 [g(x) - f(x)] dx \geq 0$ which is a contradiction.

8. The derivative of the left side of the equation is: $\frac{d}{dx} \left[\int_0^x \left[\int_0^u f(t) dt \right] du \right] = \int_0^x f(t) dt$; the derivative of the right side of the equation is: $\frac{d}{dx} \left[\int_0^x f(u)(x-u) du \right] = \frac{d}{dx} \int_0^x f(u) x du - \frac{d}{dx} \int_0^x u f(u) du$

 $= \int_0^x f(u) du$. Since each side has the same derivative, they differ by a constant, and since both sides equal 0 when $x = 0$, the constant must be 0. Therefore, $\int_0^x \left[\int_0^u f(t) dt \right] du = \int_0^x f(u)(x-u) du$.

9. $\frac{dy}{dx} = 3x^2 + 2 \Rightarrow y = \int (3x^2 + 2) dx = x^3 + 2x + C$. Then $(1, -1)$ lies on the curve $\Rightarrow 1^3 + 2(1) + C = -1$
 $\Rightarrow C = -4 \Rightarrow y = x^3 + 2x - 4$

10. The acceleration due to gravity downward is $-32 \text{ ft/sec}^2 \Rightarrow v = \int -32 dt = -32t + v_0$, where v_0 is the initial velocity $\Rightarrow v = -32t + 32 \Rightarrow s = \int (-32t + 32) dt = -16t^2 + 32t + C$. If the release point, at $t = 0$, is $s = 0$, then $C = 0 \Rightarrow s = -16t^2 + 32t$. Then $s = 17 \Rightarrow 17 = -16t^2 + 32t \Rightarrow 16t^2 - 32t + 17 = 0$. The discriminant of this quadratic equation is -64 which says there is no real time when $s = 17$ ft. You had better duck.

27. (a) Let the polygon be inscribed in a circle of radius r . If we draw a radius from the center of the circle (and the polygon) to each vertex of the polygon, we have n isosceles triangles formed (the equal sides are equal to r , the radius of the circle) and a vertex angle of θ_n where $\theta_n = \frac{2\pi}{n}$. The area of each triangle is $A_n = \frac{1}{2} r^2 \sin \theta_n \Rightarrow$ the area of the polygon is $A = nA_n = \frac{nr^2}{2} \sin \theta_n = \frac{nr^2}{2} \sin \frac{2\pi}{n}$.
- (b) $\lim_{n \rightarrow \infty} A = \lim_{n \rightarrow \infty} \frac{nr^2}{2} \sin \frac{2\pi}{n} = \lim_{n \rightarrow \infty} \frac{n\pi r^2}{2\pi} \sin \frac{2\pi}{n} = \lim_{n \rightarrow \infty} \left(\pi r^2 \right) \frac{\sin\left(\frac{2\pi}{n}\right)}{\left(\frac{2\pi}{n}\right)} = \left(\pi r^2 \right) \lim_{2\pi/n \rightarrow 0} \frac{\sin\left(\frac{2\pi}{n}\right)}{\left(\frac{2\pi}{n}\right)} = \pi r^2$
28. Partition $[0, 1]$ into n subintervals, each of length $\Delta x = \frac{1}{n}$ with the points $x_0 = 0, x_1 = \frac{1}{n}, x_2 = \frac{2}{n}, \dots, x_n = \frac{n}{n} = 1$. The inscribed rectangles so determined have areas $f(x_0) \Delta x = (0)^2 \Delta x, f(x_1) \Delta x = \left(\frac{1}{n}\right)^2 \Delta x, f(x_2) \Delta x = \left(\frac{2}{n}\right)^2 \Delta x, \dots, f(x_{n-1}) \Delta x = \left(\frac{n-1}{n}\right)^2 \Delta x$. The sum of these areas is $S_n = \left(0^2 + \left(\frac{1}{n}\right)^2 + \left(\frac{2}{n}\right)^2 + \dots + \left(\frac{n-1}{n}\right)^2 \right) \Delta x = \left(\frac{1^2}{n^2} + \frac{2^2}{n^2} + \dots + \frac{(n-1)^2}{n^2} \right) \frac{1}{n} = \frac{1^2}{n^3} + \frac{2^2}{n^3} + \dots + \frac{(n-1)^2}{n^3}$. Then $\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \left(\frac{1^2}{n^3} + \frac{2^2}{n^3} + \dots + \frac{(n-1)^2}{n^3} \right) = \int_0^1 x^2 dx = \frac{1^3}{3} = \frac{1}{3}$.

29. (a) $g(1) = \int_1^1 f(t) dt = 0$
- (b) $g(3) = \int_1^3 f(t) dt = -\frac{1}{2}(2)(1) = -1$
- (c) $g(-1) = \int_1^{-1} f(t) dt = -\int_{-1}^1 f(t) dt = -\frac{1}{4}(\pi 2^2) = -\pi$
- (d) $g'(x) = f(x) = 0 \Rightarrow x = -3, 1, 3$ and the sign chart for $g'(x) = f(x)$ is $\begin{array}{c|c|c|c} & -3 & 1 & 3 \\ \hline & + & + & + \\ \hline & - & - & - \\ \hline & + & + & + \end{array}$. So g has a relative maximum at $x = 1$.
- (e) $g'(-1) = f(-1) = 2$ is the slope and $g(-1) = \int_1^{-1} f(t) dt = -\pi$, by (c). Thus the equation is $y + \pi = 2(x + 1) \Rightarrow y = 2x + 2 - \pi$.
- (f) $g''(x) = f'(x) = 0$ at $x = -1$ and $g''(x) = f'(x)$ is negative on $(-3, -1)$ and positive on $(-1, 1)$ so there is an inflection point for g at $x = -1$. We notice that $g''(x) = f'(x) < 0$ for x on $(-1, 2)$ and $g''(x) = f'(x) > 0$ for x on $(2, 4)$, even though $g''(2)$ does not exist, g has a tangent line at $x = 2$, so there is an inflection point at $x = 2$.
- (g) g is continuous on $[-3, 4]$ and so it attains its absolute maximum and minimum values on this interval. We saw in (d) that $g'(x) = 0 \Rightarrow x = -3, 1, 3$. We have that $g(-3) = \int_1^{-3} f(t) dt = -\int_{-3}^1 f(t) dt = -\frac{\pi 2^2}{2} = -2\pi$
- $$g(1) = \int_1^1 f(t) dt = 0$$
- $$g(3) = \int_1^3 f(t) dt = -1$$
- $$g(4) = \int_1^4 f(t) dt = -1 + \frac{1}{2} \cdot 1 \cdot 1 = -\frac{1}{2}$$
- Thus, the absolute minimum is -2π and the absolute maximum is 0. Thus, the range is $[-2\pi, 0]$.

30. $y = \sin x + \int_x^\pi \cos 2t dt + 1 = \sin x - \int_\pi^x \cos 2t dt + 1 \Rightarrow y' = \cos x - \cos(2x)$; when $x = \pi$ we have $y' = \cos \pi - \cos(2\pi) = -1 - 1 = -2$. And $y'' = -\sin x + 2\sin(2x)$; when $x = \pi$, $y = \sin \pi + \int_x^\pi \cos 2t dt + 1 = 0 + 0 + 1 = 1$.

31. $f(x) = \int_{1/x}^x \frac{1}{t} dt \Rightarrow f'(x) = \frac{1}{x} \left(\frac{dx}{dx} \right) - \left(\frac{1}{x} \right) \left(\frac{d}{dx} \left(\frac{1}{x} \right) \right) = \frac{1}{x} - x \left(-\frac{1}{x^2} \right) = \frac{1}{x} + \frac{1}{x} = \frac{2}{x}$

37. $\int_0^{\ln x} \sin e^t \, dt \Rightarrow y' = (\sin e^{\ln x}) \cdot \frac{d}{dx}(\ln x) = \frac{\sin x}{x}$
38. $y = \int_{e^{4\sqrt{x}}}^{3^{2x}} \ln t \, dt \Rightarrow y' = (\ln e^{2x}) \cdot \frac{d}{dx}(e^{2x}) - (\ln e^{4\sqrt{x}}) \cdot \frac{d}{dx}(e^{4\sqrt{x}}) = (2x)(2e^{2x}) - (4\sqrt{x})(e^{4\sqrt{x}}) \cdot \frac{d}{dx}(4\sqrt{x})$
 $= 4xe^{2x} - 4\sqrt{x}e^{4\sqrt{x}}\left(\frac{2}{\sqrt{x}}\right) = 4xe^{2x} - 8e^{4\sqrt{x}}$
39. $f(x) = \int_x^{x+3} t(5-t) \, dt \Rightarrow f'(x) = (x+3)(5-(x+3))\left(\frac{d}{dx}(x+3)\right) - x(5-x)\left(\frac{dx}{dx}\right) = (x+3)(2-x) - x(5-x)$
 $= 6 - x - x^2 - 5x + x^2 = 6 - 6x$. Thus $f'(x) = 0 \Rightarrow 6 - 6x = 0 \Rightarrow x = 1$. Also, $f''(x) = -6 < 0 \Rightarrow x = 1$ gives a maximum.
40. $\ln x^{(x^x)} = x^x \ln x$ and $\ln(x^x)^x = x \ln x^x = x^2 \ln x$; then $x^x \ln x = x^2 \ln x \Rightarrow (x^x - x^2) \ln x = 0 \Rightarrow x^x = x^2$ or $\ln x = 0$. $\ln x = 0 \Rightarrow x = 1$; $x^x = x^2 \Rightarrow x \ln x = 2 \ln x \Rightarrow x = 2$. Therefore, $x^{(x^x)} = (x^x)^x$ when $x = 2$ or $x = 1$.

 (c) $\frac{df}{dx} = 2x \Rightarrow f(x) = x^2 + C$; $f(0) = 0 \Rightarrow C = 0 \Rightarrow f(x) = x^2 \Rightarrow$ the graph of $f(x)$ is a parabola.
43. $f(x) = e^{g(x)} \Rightarrow f'(x) = e^{g(x)} g'(x)$, where $g'(x) = \frac{x}{1+x^4} \Rightarrow f'(2) = e^0 \left(\frac{2}{1+16}\right) = \frac{2}{17}$
44. The area of the blue shaded region is $\int_0^1 \sin^{-1} x \, dx = \int_0^1 \sin^{-1} y \, dy$, which is the same as the area of the region to the left of the curve $y = \sin x$ (and part of the rectangle formed by the coordinate axes and dashed lines $y = 1$, $x = \frac{\pi}{2}$). The area of the rectangle is $\frac{\pi}{2} = \int_0^1 \sin^{-1} y \, dy + \int_0^{\pi/2} \sin x \, dx$, so we have
 $\frac{\pi}{2} = \int_0^1 \sin^{-1} x \, dx + \int_0^{\pi/2} \sin x \, dx \Rightarrow \int_0^{\pi/2} \sin x \, dx = \frac{\pi}{2} - \int_0^1 \sin^{-1} x \, dx$.
45. (a) slope of $L_3 <$ slope of $L_2 <$ slope of $L_1 \Rightarrow \frac{1}{b} < \frac{\ln b - \ln a}{b-a} < \frac{1}{a}$
 (b) area of small (shaded) rectangle $<$ area under curve $<$ area of large rectangle
 $\Rightarrow \frac{1}{b}(b-a) < \int_a^b \frac{1}{x} \, dx < \frac{1}{a}(b-a) \Rightarrow \frac{1}{b} < \frac{\ln b - \ln a}{b-a} < \frac{1}{a}$

46. (a) If f is continuously differentiable on $[a, b]$, then so is the function $g(x) = (x - c)f(x)$. So the two integrals on the right side exist and

$$\begin{aligned} \int_a^c (x - c)f(x) dx + \int_c^b (x - c)f(x) dx &= \int_a^b (x - c)f(x) dx \\ &= \int_a^b x f(x) dx - \int_a^b c f(x) dx = \int_a^b x f(x) dx - c(0) = \int_a^b x f(x) dx \end{aligned}$$

- (b) Split the right side in part (a) into two integrals and write it as $-\int_0^\ell t f(c - t) dt + \int_0^\ell t f(c + t) dt$. For the first integral above, use the substitution $t = c - x, \Rightarrow x = c - t, dt = -dx$; when $t = 0, x = c$ and when $t = \ell = (b - a)/2, x = (a + b)/2 - (b - a)/2 = a$. (Note that when x is in $[a, c], c - x$ is positive and thus $c - x$ agrees in sign with t .) $-\int_0^\ell t f(c - t) dt = \int_\ell^0 t f(c - t) dt = \int_a^c -(x - c)f(x)(-dx) = \int_a^c (x - c)f(x) dx$.

Thus the first integral above is equal to $\int_a^c (x - c)f(x) dx$. For the second integral above, use the substitution $t = x - c, \Rightarrow c + t = x$ and $dt = dx$; when $t = 0, x = c$ and when $t = \ell = (b - a)/2,$

$$\begin{aligned} x = (b - a)/2 + (a + b)/2 = b. \text{ Thus the second integral above is equal to } \int_c^b (x - c)f(x) dx \text{ and} \\ \int_a^b x f(x) dx = \int_a^c (x - c)f(x) dx + \int_c^b (x - c)f(x) dx = \int_0^\ell t f(c + t) dt - \int_0^\ell t f(c - t) dt \\ = \int_0^\ell t(f(c + t) - f(c - t)) dt. \end{aligned}$$

- (c) According to the mean value theorem of Section 4.2, for every t in $(0, \ell)$, there is a point in q in $(c - t, c + t)$ at which $\frac{f(c + t) - f(c - t)}{(c + t) - (c - t)} = \frac{f(c + t) - f(c - t)}{2t} = f'(q)$. Since for all these q belonging to each t , we have $f'(q) \leq M, f(c + t) - f(c - t) \leq 2tM$ for all t in $(0, \ell)$. Thus

$$\left| \int_a^b x f(x) dx \right| = \left| \int_0^\ell t(f(c + t) - f(c - t)) dt \right| \leq \int_0^\ell (t)(2tM) = \frac{2}{3} M t^3 \Big|_0^{(b-a)/2} = \frac{(b-a)^3}{12} M.$$

(b) STEP 1) $A(x) = (\text{edge})^2 = (\sec x - \tan x)^2 = \left(2 \sec^2 x - 1 - 2 \frac{\sin x}{\cos^2 x}\right)$

STEP 2) $a = -\frac{\pi}{3}, b = \frac{\pi}{3}$

STEP 3) $V = \int_a^b A(x) dx = \int_{-\pi/3}^{\pi/3} \left(2 \sec^2 x - 1 - \frac{2 \sin x}{\cos^2 x}\right) dx = 2 \left(2\sqrt{3} - \frac{\pi}{3}\right) = 4\sqrt{3} - \frac{2\pi}{3}$

7. (a) STEP 1) $A(x) = (\text{length}) \cdot (\text{height}) = (6 - 3x) \cdot (10) = 60 - 30x$

STEP 2) $a = 0, b = 2$

STEP 3) $V = \int_a^b A(x) dx = \int_0^2 (60 - 30x) dx = \left[60x - 15x^2\right]_0^2 = (120 - 60) - 0 = 60$

(b) STEP 1) $A(x) = (\text{length}) \cdot (\text{height}) = (6 - 3x) \cdot \left(\frac{20 - 2(6 - 3x)}{2}\right) = (6 - 3x)(4 + 3x) = 24 + 6x - 9x^2$

STEP 2) $a = 0, b = 2$

STEP 3) $V = \int_a^b A(x) dx = \int_0^2 (24 + 6x + 9x^2) dx = \left[24x + 3x^2 - 3x^3\right]_0^2 = (48 + 12 - 24) - 0 = 36$

8. (a) STEP 1) $A(x) = \frac{1}{2}(\text{base}) \cdot (\text{height}) = \left(\sqrt{x} - \frac{x}{2}\right) \cdot (6) = 6\sqrt{x} - 3x$

STEP 2) $a = 0, b = 4$

STEP 3) $V = \int_a^b A(x) dx = \int_0^4 (6x^{1/2} - 3x) dx = \left[4x^{3/2} - \frac{3}{2}x^2\right]_0^4 = (32 - 24) - 0 = 8$

(b) STEP 1) $A(x) = \frac{1}{2} \cdot \pi \left(\frac{\text{diameter}}{2}\right)^2 = \frac{1}{2} \cdot \pi \left(\frac{\sqrt{x} - \frac{x}{2}}{2}\right)^2 = \frac{\pi}{2} \cdot \frac{x - x^{3/2} + \frac{1}{4}x^2}{4} = \frac{\pi}{8} \left(x - x^{3/2} + \frac{1}{4}x^2\right)$

STEP 2) $a = 0, b = 4$

STEP 3) $V = \int_a^b A(x) dx = \frac{\pi}{8} \int_0^4 \left(x - x^{3/2} + \frac{1}{4}x^2\right) dx = \left[\frac{1}{2}x^2 - \frac{2}{5}x^{5/2} + \frac{1}{12}x^3\right]_0^4 = \frac{\pi}{8} \left(8 - \frac{64}{5} + \frac{16}{3}\right) - \frac{\pi}{8}(0) = \frac{\pi}{15}$

9. $A(y) = \frac{\pi}{4}(\text{diameter})^2 = \frac{\pi}{4}(\sqrt{5}y^2 - 0)^2 = \frac{5\pi}{4}y^4;$

$c = 0, d = 2; V = \int_c^d A(y) dy$

$= \int_0^2 \frac{5\pi}{4}y^4 dy = \left[\left(\frac{5\pi}{4}\right)\left(\frac{y^5}{5}\right)\right]_0^2 = \frac{\pi}{4}(2^5 - 0) = 8\pi$

10. $A(y) = \frac{1}{2}(\text{leg})(\text{leg}) = \frac{1}{2} \left[\sqrt{1 - y^2} - \left(-\sqrt{1 - y^2}\right) \right]^2 = \frac{1}{2} \left(2\sqrt{1 - y^2} \right)^2 = 2(1 - y^2); c = -1, d = 1;$

$V = \int_c^d A(y) dy = \int_{-1}^1 2(1 - y^2) dy = 2 \left[y - \frac{y^3}{3} \right]_{-1}^1 = 4 \left(1 - \frac{1}{3} \right) = \frac{8}{3}$

11. The slices perpendicular to the edge labeled 5 are triangles, and by similar triangles we have $\frac{b}{h} = \frac{4}{3} \Rightarrow h = \frac{3}{4}b$. The equation of the line through (5, 0) and (0, 4) is $y = -\frac{4}{5}x + 4$, thus the length of the base $= -\frac{4}{5}x + 4$ and the height $= \frac{3}{4}(-\frac{4}{5}x + 4) = -\frac{3}{5}x + 3$. Thus $A(x) = \frac{1}{2}(\text{base}) \cdot (\text{height}) = \frac{1}{2}(-\frac{4}{5}x + 4) \cdot (-\frac{3}{5}x + 3)$
 $= \frac{6}{25}x^2 - \frac{12}{5}x + 6$ and $V = \int_a^b A(x) dx = \int_0^5 (\frac{6}{25}x^2 - \frac{12}{5}x + 6) dx = [\frac{2}{25}x^3 - \frac{6}{5}x^2 + 6x]_0^5 = (10 - 30 + 30) - 0 = 10$

12. The slices parallel to the base are squares. The cross section of the pyramid is a triangle, and by similar triangles we have $\frac{b}{h} = \frac{3}{5} \Rightarrow b = \frac{3}{5}h$. Thus $A(y) = (\text{base})^2 = (\frac{3}{5}y)^2 = \frac{9}{25}y^2 \Rightarrow V = \int_c^d A(y) dy = \int_0^5 \frac{9}{25}y^2 dy$
 $= [\frac{3}{25}y^3]_0^5 = 15 - 0 = 15$

13. (a) It follows from Cavalieri's Principle that the volume of a column is the same as the volume of a right prism with a square base of side length s and altitude h . Thus,
 STEP 1) $A(x) = (\text{sidelength})^2 = s^2$;
 STEP 2) $a = 0, b = h$;
 STEP 3) $V = \int_a^b A(x) dx = \int_0^h s^2 dx = s^2h$
 (b) From Cavalieri's Principle we conclude that the volume of the column is the same as the volume of the prism described above, regardless of the number of turns $\Rightarrow V = s^2h$

14. 1) The solid and the cone have the same altitude of 12.
 2) The cross sections of the solid are disks of diameter $x - (\frac{x}{2}) = \frac{x}{2}$. If we place the vertex of the cone at the origin of the coordinate system and make its axis of symmetry coincide with the x -axis then the cone's cross sections will be circular disks of diameter $\frac{x}{4} - (-\frac{x}{4}) = \frac{x}{2}$ (see accompanying figure).
 3) The solid and the cone have equal altitudes and identical parallel cross sections. From Cavalier's Principle we conclude that the solid and the cone have the same volume.

 (b) $V(h) = \int A(h)dh$, so $\frac{dV}{dh} = A(h)$. Therefore $\frac{dV}{dt} = \frac{dV}{dh} \cdot \frac{dh}{dt} = A(h) \cdot \frac{dh}{dt}$, so $\frac{dh}{dt} = \frac{1}{A(h)} \cdot \frac{dV}{dt}$.
 For $h = 4$, the area is $2\pi(4) = 8\pi$, so $\frac{dh}{dt} = \frac{1}{8\pi} \cdot 3 \frac{\text{units}^3}{\text{sec}} = \frac{3}{8\pi} \frac{\text{units}^3}{\text{sec}}$.

58. Suppose the solid is produced by revolving $y = 2 - x$ about the y -axis. Cast a shadow of the solid on a plane parallel to the xy -plane. Use an approximation such as the Trapezoid Rule, to estimate $\int_a^b \pi [R(y)]^2 dy \approx \sum_{k=1}^n \pi \left(\frac{d_k}{2} \right)^2 \Delta y$.

59. The cross section of a solid right circular cylinder with a cone removed is a disk with radius R from which a disk of radius h has been removed. Thus its area is $A_1 = \pi R^2 - \pi h^2 = \pi(R^2 - h^2)$. The cross section of the hemisphere is a disk of radius $\sqrt{R^2 - h^2}$. Therefore its area is $A_2 = \pi \left(\sqrt{R^2 - h^2} \right)^2 = \pi(R^2 - h^2)$. We can see that $A_1 = A_2$. The altitudes of both solids are R . Applying Cavalieri's Principle we find
 Volume of Hemisphere = (Volume of Cylinder) - (Volume of Cone) = $(\pi R^2) R - \frac{1}{3} \pi (R^2) R = \frac{2}{3} \pi R^3$.

The plumb bob will weigh about $W = (8.5) \left(\frac{36\pi}{5} \right) \approx 192$ gm, to the nearest gram.

$$61. \quad R(y) = \sqrt{256-y^2} \Rightarrow V = \int_{-16}^{-7} \pi [R(y)]^2 dy = \pi \int_{-16}^{-7} (256-y^2) dy = \pi \left[256y - \frac{y^3}{3} \right]_{-16}^{-7}$$

$$62. \quad (a) \quad R(x) = |c - \sin x|, \text{ so } V = \pi \int_0^\pi [R(x)]^2 dx = \pi \int_0^\pi (c - \sin x)^2 dx = \pi \int_0^\pi (c^2 - 2c \sin x + \sin^2 x) dx$$

$$= \pi \int_0^\pi \left(c^2 - 2c \sin x + \frac{1-\cos 2x}{2} \right) dx = \pi \int_0^\pi \left(c^2 + \frac{1}{2} - 2c \sin x - \frac{\cos 2x}{2} \right) dx = \pi \left[\left(c^2 + \frac{1}{2} \right) x + 2c \cos x - \frac{\sin 2x}{4} \right]_0^\pi$$

$$= \pi \left[\left(c^2 \pi + \frac{\pi}{2} - 2c - 0 \right) - \left(0 + 2c - 0 \right) \right] = \pi \left(c^2 \pi + \frac{\pi}{2} - 4c \right).$$

Let $V(c) = \pi \left(c^2 \pi + \frac{\pi}{2} - 4c \right)$. We find the extreme values of $V(c)$: $\frac{dV}{dc} = \pi(2c\pi - 4) = 0 \Rightarrow c = \frac{2}{\pi}$ is a critical point, and $V\left(\frac{2}{\pi}\right) = \pi \left(\frac{4}{\pi} + \frac{\pi}{2} - \frac{8}{\pi} \right) = \pi \left(\frac{\pi}{2} - \frac{4}{\pi} \right) = \frac{\pi^2}{2} - 4$; Evaluate V at the endpoints: $V(0) = \frac{\pi^2}{2}$ and $V(1) = \pi \left(\frac{3}{2} \pi - 4 \right) = \frac{\pi^2}{2} - (4 - \pi)\pi$.

Now we see that the function's absolute minimum value is $\frac{\pi^2}{2} - 4$, taken on at the critical point $c = \frac{2}{\pi}$.

(See also the accompanying graph.)

(b) From the discussion in part (a) we conclude that the function's absolute maximum value is $\frac{\pi^2}{2}$, taken on at the endpoint $c = 0$.

(c) The graph of the solid's volume as a function of c for $0 \leq c \leq 1$ is given at the right. As c moves away from $[0, 1]$ the volume of the solid increases without bound. If we approximate the solid as a set of solid disks, we can see that the radius of a typical disk increases without bounds as c moves away from $[0, 1]$.

$$63. \quad \text{Volume of the solid generated by rotating the region bounded by the } x\text{-axis and } y = f(x) \text{ from } x = a \text{ to } x = b \text{ about the } x\text{-axis is } V = \int_a^b \pi [f(x)]^2 dx = 4\pi, \text{ and the volume of the solid generated by rotating the same region about the line } y = -1 \text{ is } V = \int_a^b \pi [f(x) + 1]^2 dx = 8\pi. \text{ Thus } \int_a^b \pi [f(x) + 1]^2 dx - \int_a^b \pi [f(x)]^2 dx = 8\pi - 4\pi$$

31. (a) An equation of the tangent line segment is (see figure) $y = f(m_k) + f'(m_k)(x - m_k)$. When

$x = x_{k-1}$ we have

$$r_1 = f(m_k) + f'(m_k)(x_{k-1} - m_k)$$

$$= f(m_k) + f'(m_k)\left(-\frac{\Delta x_k}{2}\right) = f(m_k) - f'(m_k) \frac{\Delta x_k}{2};$$

when $x = x_k$ we have

$$r_2 = f(m_k) + f'(m_k)(x_k - m_k)$$

$$= f(m_k) + f'(m_k) \frac{\Delta x_k}{2};$$

(b) $L_k^2 = (\Delta x_k)^2 + (r_2 - r_1)^2 = (\Delta x_k)^2 + \left[f'(m_k) \frac{\Delta x_k}{2} - \left(-f'(m_k) \frac{\Delta x_k}{2}\right) \right]^2 = (\Delta x_k)^2 + [f'(m_k) \Delta x_k]^2$

$$\Rightarrow L_k = \sqrt{(\Delta x_k)^2 + [f'(m_k) \Delta x_k]^2}, \text{ as claimed}$$

(c) From geometry it is a fact that the lateral surface area of the frustum obtained by revolving the tangent line segment about the x -axis is given by $\Delta S_k = \pi(r_1 + r_2)L_k = \pi[2f(m_k)]\sqrt{(\Delta x_k)^2 + [f'(m_k) \Delta x_k]^2}$ using parts (a) and (b) above. 6.5 WORK AND FLUID FORCES

1. The force required to stretch the spring from its natural length of 2 m to a length of 5 m is $F(x) = kx$.

The work done by F is $W = \int_0^3 F(x) dx = k \int_0^3 x dx = \frac{k}{2} [x^2]_0^3 = \frac{9k}{2}$. This work is equal to 1800 J

$$\Rightarrow \frac{9}{2}k = 1800 \Rightarrow k = 400 \text{ N/m}$$

2. (a) We find the force constant from Hooke's Law: $F = kx \Rightarrow k = \frac{F}{x} \Rightarrow k = \frac{800}{4} = 200$ lb/in.
- (b) The work done to stretch the spring 2 inches beyond its natural length is $W = \int_0^2 kx \, dx = 200 \int_0^2 x \, dx$
 $= 200 \left[\frac{x^2}{2} \right]_0^2 = 200(2 - 0) = 400$ in-lb = 33.3 ft-lb
- (c) We substitute $F = 1600$ into the equation $F = 200x$ to find $1600 = 200x \Rightarrow x = 8$ in.
3. We find the force constant from Hooke's law: $F = kx$. A force of 2 N stretches the spring to 0.02 m
 $\Rightarrow 2 = k \cdot (0.02) \Rightarrow k = 100 \frac{\text{N}}{\text{m}}$. The force of 4 N will stretch the rubber band y m, where $F = ky \Rightarrow y = \frac{F}{k}$
 $\Rightarrow y = \frac{4 \text{ N}}{100 \frac{\text{N}}{\text{m}}} \Rightarrow y = 0.04 \text{ m} = 4 \text{ cm}$. The work done to stretch the rubber band 0.04 m is $W = \int_0^{0.04} kx \, dx$
 $= 100 \int_0^{0.04} x \, dx = 100 \left[\frac{x^2}{2} \right]_0^{0.04} = \frac{(100)(0.04)^2}{2} = 0.08 \text{ J}$
4. We find the force constant from Hooke's law: $F = kx \Rightarrow k = \frac{F}{x} \Rightarrow k = \frac{90}{1} \Rightarrow k = 90 \frac{\text{N}}{\text{m}}$. The work done to stretch the spring 5 m beyond its natural length is $W = \int_0^5 kx \, dx = 90 \int_0^5 x \, dx = 90 \left[\frac{x^2}{2} \right]_0^5 = (90) \left(\frac{25}{2} \right) = 1125 \text{ J}$
5. (a) We find the spring's constant from Hooke's law: $F = kx \Rightarrow k = \frac{F}{x} = \frac{21,714}{8-5} = \frac{21,714}{3} \Rightarrow k = 7238 \frac{\text{lb}}{\text{in}}$
- (b) The work done to compress the assembly the first half inch is $W = \int_0^{0.5} kx \, dx = 7238 \int_0^{0.5} x \, dx$
 $= 7238 \left[\frac{x^2}{2} \right]_0^{0.5} = (7238) \frac{(0.5)^2}{2} = \frac{(7238)(0.25)}{2} \approx 905$ in-lb. The work done to compress the assembly the second half inch is:
 $W = \int_{0.5}^{1.0} kx \, dx = 7238 \int_{0.5}^{1.0} x \, dx = 7238 \left[\frac{x^2}{2} \right]_{0.5}^{1.0} = \frac{7238}{2} [1 - (0.5)^2] = \frac{(7238)(0.75)}{2} \approx 2714$ in-lb
6. First, we find the force constant from Hooke's law: $F = kx \Rightarrow k = \frac{F}{x} = \frac{150}{\left(\frac{1}{16}\right)} = 16 \cdot 150 = 2,400 \frac{\text{lb}}{\text{in}}$. If someone compresses the scale $x = \frac{1}{8}$ in, he/she must weigh $F = kx = 2,400 \left(\frac{1}{8}\right) = 300$ lb. The work done to compress the scale this far is $W = \int_0^{1/8} kx \, dx = 2400 \left[\frac{x^2}{2} \right]_0^{1/8} = \frac{2400}{2} \left(\frac{1}{64} \right) = 18.75 \text{ lb} \cdot \text{in.} = \frac{2.5}{16} \text{ ft-lb}$
7. The force required to haul up the rope is equal to the rope's weight, which varies steadily and is proportional to x , the length of the rope still hanging: $F(x) = 0.624x$. The work done is: $W = \int_0^{50} F(x) \, dx = \int_0^{50} 0.624x \, dx$
 $= 0.624 \left[\frac{x^2}{2} \right]_0^{50} = 780 \text{ J}$
8. The weight of sand decreases steadily by 72 lb over the 18 ft, at 4 lb/ft. So the weight of sand when the bag is x ft off the ground is $F(x) = 144 - 4x$. The work done is: $W = \int_a^b F(x) \, dx = \int_0^{18} (144 - 4x) \, dx$
 $= \left[144x - 2x^2 \right]_0^{18} = 1944 \text{ ft-lb}$

9. The force required to lift the cable is equal to the weight of the cable paid out: $F(x) = (4.5)(180 - x)$ where x is the position of the car off the first floor. The work done is: $W = \int_0^{180} F(x) dx = 4.5 \int_0^{180} (180 - x) dx = 4.5 \left[180x - \frac{x^2}{2} \right]_0^{180} = 4.5 \left(180^2 - \frac{180^2}{2} \right) = \frac{4.5 \cdot 180^2}{2} = 72,900 \text{ ft}\cdot\text{lb}$

10. Since the force is acting toward the origin, it acts opposite to the positive x -direction. Thus $F(x) = -\frac{k}{x^2}$.

The work done is $W = \int_a^b -\frac{k}{x^2} dx = k \int_a^b \frac{1}{x^2} dx = k \left[-\frac{1}{x} \right]_a^b = k \left(\frac{1}{b} - \frac{1}{a} \right) = \frac{k(a-b)}{ab}$

11. Let $r =$ the constant rate of leakage. Since the bucket is leaking at a constant rate and the bucket is rising at a constant rate, the amount of water in the bucket is proportional to $(20 - x)$, the distance the bucket is being raised. The leakage rate of the water is 0.8 lb/ft raised and the weight of the water in the bucket is

$F = 0.8(20 - x)$. So: $W = \int_0^{20} 0.8(20 - x) dx = 0.8 \left[20x - \frac{x^2}{2} \right]_0^{20} = 160 \text{ ft}\cdot\text{lb}$.

12. Let $r =$ the constant rate of leakage. Since the bucket is leaking at a constant rate and the bucket is rising at a constant rate, the amount of water in the bucket is proportional to $(20 - x)$, the distance the bucket is being raised. The leakage rate of the water is 2 lb/ft raised and the weight of the water in the bucket is $F = 2(20 - x)$.

So: $W = \int_0^{20} 2(20 - x) dx = 2 \left[20x - \frac{x^2}{2} \right]_0^{20} = 400 \text{ ft}\cdot\text{lb}$.

Note that since the force in Exercise 12 is 2.5 times the force in Exercise 11 at each elevation, the total work is also 2.5 times as great.

13. We will use the coordinate system given.

(a) The typical slab between the planes at y and $y + \Delta y$ has a volume of $\Delta V = (10)(12)\Delta y = 120\Delta y \text{ ft}^3$. The force F required to lift the slab is equal to its weight: $F = 62.4 \Delta V = 62.4 \cdot 120\Delta y \text{ lb}$. The distance through which F must act is about y ft, so the work done lifting the slab is about $\Delta W = \text{force} \times \text{distance} = 62.4 \cdot 120 \cdot y \cdot \Delta y \text{ ft}\cdot\text{lb}$. The work it takes to lift all the water is approximately

$$W \approx \sum_0^{20} \Delta W = \sum_0^{20} 62.4 \cdot 120y \cdot \Delta y \text{ ft}\cdot\text{lb}.$$

This is a Riemann sum for the function $62.4 \cdot 120y$ over the interval $0 \leq y \leq 20$. The work of pumping the tank empty is the limit of these sums:

$$W = \int_0^{20} 62.4 \cdot 120y dy = (62.4)(120) \left[\frac{y^2}{2} \right]_0^{20} = (62.4)(120) \left(\frac{400}{2} \right) = (62.4)(120)(200) = 1,497,600 \text{ ft}\cdot\text{lb}$$

(b) The time t it takes to empty the full tank with $\left(\frac{5}{11}\right)$ -hp motor is $t = \frac{W}{250 \frac{\text{ft}\cdot\text{lb}}{\text{sec}}} = \frac{1,497,600 \text{ ft}\cdot\text{lb}}{250 \frac{\text{ft}\cdot\text{lb}}{\text{sec}}} = 5990.4 \text{ sec} = 1.664 \text{ hr} \Rightarrow t \approx 1 \text{ hr and } 40 \text{ min}$

(c) Following all the steps of part (a), we find that the work it takes to lower the water level 10 ft is

$$W = \int_0^{10} 62.4 \cdot 120y dy = (62.4)(120) \left[\frac{y^2}{2} \right]_0^{10} = (62.4)(120) \left(\frac{100}{2} \right) = 374,400 \text{ ft}\cdot\text{lb} \text{ and the time is } t = \frac{W}{250 \frac{\text{ft}\cdot\text{lb}}{\text{sec}}} = 1497.6 \text{ sec} = 0.416 \text{ hr} \approx 25 \text{ min}$$

(d) In a location where water weighs $62.26 \frac{\text{lb}}{\text{ft}^3}$:

a) $W = (62.26)(24,000) = 1,494,240 \text{ ft}\cdot\text{lb}$.

b) $t = \frac{1,494,240}{250} = 5976.96 \text{ sec} \approx 1.660 \text{ hr} \Rightarrow t \approx 1 \text{ hr and } 40 \text{ min}$

In a location where water weighs $62.59 \frac{\text{lb}}{\text{ft}^3}$:

a) $W = (62.59)(24,000) = 1,502,160 \text{ ft}\cdot\text{lb}$

b) $t = \frac{1,502,160}{250} = 6008.64 \text{ sec} \approx 1.669 \text{ hr} \Rightarrow t \approx 1 \text{ hr and } 40.1 \text{ min}$

14. We will use the coordinate system given.

- (a) The typical slab between the planes at y and $y + \Delta y$ has a volume of $\Delta V = (20)(12) \Delta y = 240\Delta y \text{ ft}^3$. The force F required to lift the slab is equal to its weight:
 $F = 62.4\Delta V = 62.4 \cdot 240\Delta y \text{ lb}$. The distance through which F must act is about $y \text{ ft}$, so the work done lifting the slab is about $\Delta W = \text{force} \times \text{distance}$

$= 62.4 \cdot 240 \cdot y \cdot \Delta y \text{ ft}\cdot\text{lb}$. The work it takes to lift all the water is approximately $W \approx \sum_{10}^{20} \Delta W$

$= \sum_{10}^{20} 62.4 \cdot 240 y \cdot \Delta y \text{ ft}\cdot\text{lb}$. This is a Riemann sum for the function $62.4 \cdot 240 y$ over the interval

$10 \leq y \leq 20$. The work it takes to empty the cistern is the limit of these sums:

$$W = \int_{10}^{20} 62.4 \cdot 240 y \, dy = (62.4)(240) \left[\frac{y^2}{2} \right]_{10}^{20} = (62.4)(240)(200 - 50) = (62.4)(240)(150) = 2,246,400 \text{ ft}\cdot\text{lb}$$

(b) $t = \frac{W}{275 \frac{\text{ft}\cdot\text{lb}}{\text{sec}}} = \frac{2,246,400 \text{ ft}\cdot\text{lb}}{275} \approx 8168.73 \text{ sec} \approx 2.27 \text{ hours} \approx 2 \text{ hr and } 16.1 \text{ min}$

- (c) Following all the steps of part (a), we find that the work it takes to empty the tank halfway is

$$W = \int_{10}^{15} 62.4 \cdot 240 y \, dy = (62.4)(240) \left[\frac{y^2}{2} \right]_{10}^{15} = (62.4)(240) \left(\frac{225}{2} - \frac{100}{2} \right) = (62.4)(240) \left(\frac{125}{2} \right) = 936,000 \text{ ft}\cdot\text{lb}$$

Then the time is $t = \frac{W}{275 \frac{\text{ft}\cdot\text{lb}}{\text{sec}}} = \frac{936,000}{275} \approx 3403.64 \text{ sec} \approx 56.7 \text{ min}$

(d) In a location where water weighs $62.26 \frac{\text{lb}}{\text{ft}^3}$:

a) $W = (62.26)(240)(150) = 2,241,360 \text{ ft}\cdot\text{lb}$.

b) $t = \frac{2,241,360}{275} = 8150.40 \text{ sec} = 2.264 \text{ hours} \approx 2 \text{ hr and } 15.8 \text{ min}$

c) $W = (62.26)(240) \left(\frac{125}{2} \right) = 933,900 \text{ ft}\cdot\text{lb}$; $t = \frac{933,900}{275} = 3396 \text{ sec} \approx 0.94 \text{ hours} \approx 56.6 \text{ min}$

In a location where water weighs $62.59 \frac{\text{lb}}{\text{ft}^3}$:

a) $W = (62.59)(240)(150) = 2,253,240 \text{ ft}\cdot\text{lb}$.

b) $t = \frac{2,253,240}{275} = 8193.60 \text{ sec} = 2.276 \text{ hours} \approx 2 \text{ hr and } 16.56 \text{ min}$

c) $W = (62.59)(240) \left(\frac{125}{2} \right) = 938,850 \text{ ft}\cdot\text{lb}$; $t = \frac{938,850}{275} \approx 3414 \text{ sec} \approx 0.95 \text{ hours} \approx 56.9 \text{ min}$

15. The slab is a disk of area $\pi x^2 = \pi \left(\frac{y}{2}\right)^2$, thickness Δy , and height below the top of the tank $(10 - y)$. So the work to pump the oil in this slab, ΔW , is $57(10 - y)\pi \left(\frac{y}{2}\right)^2$. The work to pump all the oil to top of the tank is

$$W = \int_0^{10} \frac{57\pi}{4} (10y^2 - y^3) dy = \frac{57\pi}{4} \left[\frac{10y^3}{3} - \frac{y^4}{4} \right]_0^{10} = 11,875\pi \text{ ft} \cdot \text{lb} \approx 37,306 \text{ ft} \cdot \text{lb}$$

16. Each slab of oil is to be pumped to a height of 14 ft. So the work to pump a slab is $(14 - y)(\pi) \left(\frac{y}{2}\right)^2$ and since the tank is half full and the volume of the original cone is $V = \frac{1}{3}\pi r^2 h = \frac{1}{3}\pi(5^2)(10) = \frac{250\pi}{3} \text{ ft}^3$, half the volume $= \frac{250\pi}{6} \text{ ft}^3$, and with half the volume the cone is filled to a height y , $\frac{250\pi}{6} = \frac{1}{3}\pi \frac{y^2}{4} y \Rightarrow y = \sqrt[3]{500}$ ft.

$$\text{So } W = \int_0^{\sqrt[3]{500}} \frac{57\pi}{4} (14y^2 - y^3) dy = \frac{57\pi}{4} \left[\frac{14y^3}{3} - \frac{y^4}{4} \right]_0^{\sqrt[3]{500}} \approx 60,042 \text{ ft} \cdot \text{lb}.$$

17. The typical slab between the planes at y and $y + \Delta y$ has a volume of $\Delta V = \pi(\text{radius})^2(\text{thickness}) = \pi \left(\frac{20}{2}\right)^2 \Delta y = \pi \cdot 100 \Delta y \text{ ft}^3$. The force F required to lift the slab is equal to its weight:

$$F = 51.2\Delta V = 51.2 \cdot 100\pi \Delta y \text{ lb} \Rightarrow F = 5120\pi \Delta y \text{ lb} \text{ The distance through which } F \text{ must act is about}$$

$$(30 - y) \text{ ft. The work it takes to lift all the kerosene is approximately } W \approx \sum_0^{30} \Delta W = \sum_0^{30} 5120\pi(30 - y)\Delta y \text{ ft} \cdot \text{lb}$$

which is a Riemann sum. The work to pump the tank dry is the limit of these sums:

$$W = \int_0^{30} 5120\pi(30 - y) dy = 5120\pi \left[30y - \frac{y^2}{2} \right]_0^{30} = 5120\pi \left(\frac{900}{2} \right) = (5120)(450\pi) \approx 7,238,229.48 \text{ ft} \cdot \text{lb}$$

18. (a) Follow all the steps of Example 5 but make the substitution of $64.5 \frac{\text{lb}}{\text{ft}^3}$ for $57 \frac{\text{lb}}{\text{ft}^3}$. Then,

$$\begin{aligned} W &= \int_0^8 \frac{64.5\pi}{4} (10 - y)y^2 dy = \frac{64.5\pi}{4} \left[\frac{10y^3}{3} - \frac{y^4}{4} \right]_0^8 = \frac{64.5\pi}{4} \left(\frac{10 \cdot 8^3}{3} - \frac{8^4}{4} \right) = \left(\frac{64.5\pi}{4} \right) (8^3) \left(\frac{10}{3} - 2 \right) = \frac{64.5\pi \cdot 8^3}{3} \\ &= 21.5\pi \cdot 8^3 \approx 34,582.65 \text{ ft} \cdot \text{lb} \end{aligned}$$

- (b) Exactly as done in Example 5 but change the distance through which F acts to distance $\approx (13 - y)$ ft.

$$\begin{aligned} \text{Then } W &= \int_0^8 \frac{57\pi}{4} (13 - y)y^2 dy = \frac{57\pi}{4} \left[\frac{13y^3}{3} - \frac{y^4}{4} \right]_0^8 = \frac{57\pi}{4} \left(\frac{13 \cdot 8^3}{3} - \frac{8^4}{4} \right) = \left(\frac{57\pi}{4} \right) (8^3) \left(\frac{13}{3} - 2 \right) = \frac{57\pi \cdot 8^3 \cdot 7}{3 \cdot 4} \\ &= (19\pi)(8^2)(7)(2) \approx 53,482.5 \text{ ft} \cdot \text{lb} \end{aligned}$$

19. The typical slab between the planes at y and $y + \Delta y$ has a volume of about $\Delta V = \pi(\text{radius})^2(\text{thickness}) = \pi(\sqrt{y})^2 \Delta y \text{ ft}^3$. The force $F(y)$ required to lift this slab is equal to its weight: $F(y) = 73 \cdot \Delta V$

$= 73\pi(\sqrt{y})^2 \Delta y = 73\pi y \Delta y \text{ lb}$. The distance through which $F(y)$ must act to lift the slab to the top of the reservoir is about $(4 - y)$ ft, so the work done is approximately $\Delta W \approx 73\pi y(4 - y)\Delta y \text{ ft} \cdot \text{lb}$. The work done

lifting all the slabs from $y = 0$ ft to $y = 4$ ft is approximately $W \approx \sum_{k=0}^n 73\pi y_k(4 - y_k)\Delta y \text{ ft} \cdot \text{lb}$. Taking the limit

of these Riemann sums as $n \rightarrow \infty$, we get $W = \int_0^4 73\pi y(4-y) dy = 73\pi \int_0^4 (4y - y^2) dy$
 $= 73\pi \left[2y^2 - \frac{1}{3}y^3 \right]_0^4 = 73\pi \left(32 - \frac{64}{3} \right) = \frac{2336\pi}{3} \text{ ft}\cdot\text{lb} \approx 2446.25 \text{ ft}\cdot\text{lb}.$

20. The typical slab between the planes at y and $y + \Delta y$ has volume of about $\Delta V = (\text{length})(\text{width})(\text{thickness})$
 $= \left(2\sqrt{25-y^2} \right) (10)\Delta y \text{ ft}^3$. The force $F(y)$ required to lift this slab is equal to its weight:

$F(y) = 53 \cdot \Delta V = 53 \left(2\sqrt{25-y^2} \right) (10) \Delta y = 1060\sqrt{25-y^2} \Delta y \text{ lb}$. The distance through which $F(y)$ must act to lift the slab to the level of 15 m above the top of the reservoir is about $(20-y)$ ft, so the work done is approximately $\Delta W \approx 1060\sqrt{25-y^2} (20-y)\Delta y \text{ ft}\cdot\text{lb}$. The work done lifting all the slabs from $y = -5$ ft to

$y = 5$ ft is approximately $W \approx \sum_{k=0}^n 1060\sqrt{25-y_k^2} (20-y_k) \Delta y \text{ ft}\cdot\text{lb}$. Taking the limit of these Riemann sums as

$n \rightarrow \infty$, we get $W = \int_{-5}^5 1060\sqrt{25-y^2} (20-y) dy = 1060 \int_{-5}^5 (20-y) \sqrt{25-y^2} dy$

$= 1060 \left[\int_{-5}^5 20\sqrt{25-y^2} dy - \int_{-5}^5 y\sqrt{25-y^2} dy \right]$. To evaluate the first integral, we use we can interpret

$\int_{-5}^5 \sqrt{25-y^2} dy$ as the area of the semicircle whose radius is 5, thus $\int_{-5}^5 20\sqrt{25-y^2} dy = 20 \int_{-5}^5 \sqrt{25-y^2} dy$

$= 20 \left[\frac{1}{2} \pi (5)^2 \right] = 250\pi$. To evaluate the second integral let $u = 25 - y^2 \Rightarrow du = -2y dy$; $y = -5 \Rightarrow u = 0$,

$y = 5 \Rightarrow u = 0$, thus $\int_{-5}^5 y\sqrt{25-y^2} dy = -\frac{1}{2} \int_0^0 \sqrt{u} du = 0$. Thus, $1060 \left[\int_{-5}^5 20\sqrt{25-y^2} dy -$

$\int_{-5}^5 y\sqrt{25-y^2} dy \right] = 1060(250\pi - 0) = 265000\pi \approx 832522 \text{ ft}\cdot\text{lb}$

21. The typical slab between the planes at y and $y + \Delta y$ has a volume of about $\Delta V = \pi (\text{radius})^2 (\text{thickness})$
 $= \pi \left(\sqrt{25-y^2} \right)^2 \Delta y \text{ m}^3$. The force $F(y)$ required to lift this slab is equal to its weight:

$F(y) = 9800 \cdot \Delta V = 9800\pi \left(\sqrt{25-y^2} \right)^2 \Delta y = 9800\pi (25-y^2) \Delta y \text{ N}$. The distance through which $F(y)$ must act to lift the slab to the level of 4 m above the top of the reservoir is about $(4-y)$ m, so the work done is approximately $\Delta W \approx 9800\pi (25-y^2) (4-y) \Delta y \text{ N}\cdot\text{m}$. The work done lifting all the slabs from $y = -5$ m to

$y = 0$ m is approximately $W \approx \sum_{-5}^0 9800\pi (25-y^2) (4-y) \Delta y \text{ N}\cdot\text{m}$. Taking the limit of these Riemann sums,

we get $W = \int_{-5}^0 9800\pi (25-y^2) (4-y) dy = 9800\pi \int_{-5}^0 (100 - 25y - 4y^2 + y^3) dy$

$= 9800\pi \left[100y - \frac{25}{2}y^2 - \frac{4}{3}y^3 + \frac{y^4}{4} \right]_{-5}^0 = -9800\pi \left(-500 - \frac{25 \cdot 25}{2} + \frac{4}{3} \cdot 125 + \frac{625}{4} \right) \approx 15,073,099.75 \text{ J}$

22. The typical slab between the planes at y and $y + \Delta y$ has a volume of about $\Delta V = \pi (\text{radius})^2 (\text{thickness})$
 $= \pi \left(\sqrt{100-y^2} \right)^2 \Delta y = \pi (100-y^2) \Delta y \text{ ft}^3$. The force is $F(y) = \frac{56 \text{ lb}}{\text{ft}^3} \cdot \Delta V = 56\pi (100-y^2) \Delta y \text{ lb}$. The

distance through which $F(y)$ must act to lift the slab to the level of 2 ft above the top of the tank is about $(12 - y)$ ft, so the work done is $\Delta W \approx 56\pi(100 - y^2)(12 - y)\Delta y$ lb·ft. The work done lifting all the slabs from $y = 0$ ft to $y = 10$ ft is approximately $W \approx \sum_0^{10} 56\pi(100 - y^2)(12 - y)\Delta y$ lb·ft. Taking the limit of these Riemann sums, we get $W = \int_0^{10} 56\pi(100 - y^2)(12 - y) dy = 56\pi \int_0^{10} (100 - y^2)(12 - y) dy$

$$= 56\pi \int_0^{10} (1200 - 100y - 12y^2 + y^3) dy = 56\pi \left[1200y - \frac{100y^2}{2} - \frac{12y^3}{3} + \frac{y^4}{4} \right]_0^{10}$$

$$= 56\pi \left(12,000 - \frac{10,000}{2} - 4 \cdot 1000 + \frac{10,000}{4} \right) = (56\pi) \left(12 - 5 - 4 + \frac{5}{2} \right) (1000) \approx 967,611 \text{ ft}\cdot\text{lb.}$$

29. We imagine the milkshake divided into thin slabs by planes perpendicular to the y -axis at the points of a partition of the interval $[0, 7]$. The typical slab between the planes at y and $y + \Delta y$ has a volume of about $\Delta V = \pi(\text{radius})^2(\text{thickness}) = \pi \left(\frac{y+17.5}{14}\right)^2 \Delta y$ in³. The force $F(y)$ required to lift this slab is equal to its weight: $F(y) = \frac{4}{9} \Delta V = \frac{4\pi}{9} \left(\frac{y+17.5}{14}\right)^2 \Delta y$ oz. The distance through which $F(y)$ must act to lift this slab to the level of 1 inch above the top is about $(8 - y)$ in. The work done lifting the slab is about $\Delta W = \left(\frac{4\pi}{9}\right) \frac{(y+17.5)^2}{14^2} (8 - y) \Delta y$ in·oz. The work done lifting all the slabs from $y = 0$ to $y = 7$ is approximately

$W = \sum_0^7 \frac{4\pi}{9.14^2} (y + 17.5)^2 (8 - y) \Delta y$ in · oz which is a Riemann sum. The work is the limit of these sums as the norm of the partition goes to zero:

$$W = \int_0^7 \frac{4\pi}{9.14^2} (y + 17.5)^2 (8 - y) dy = \frac{4\pi}{9.14^2} \int_0^7 (2450 - 26.25y - 27y^2 - y^3) dy$$

$$= \frac{4\pi}{9.14^2} \left[-\frac{y^4}{4} - 9y^3 - \frac{26.25}{2} y^2 + 2450y \right]_0^7 = \frac{4\pi}{9.14^2} \left[-\frac{7^4}{4} - 9 \cdot 7^3 - \frac{26.25}{2} \cdot 7^2 + 2450 \cdot 7 \right] \approx 91.32 \text{ in} \cdot \text{oz}$$

30. We fill the pipe and the tank. To find the work required to fill the tank note that radius = 10 ft, then $\Delta V = \pi \cdot 100 \Delta y \text{ ft}^3$. The force required will be $F = 62.4 \cdot \Delta V = 62.4 \cdot 100\pi \Delta y = 6240\pi \Delta y \text{ lb}$. The distance through which F must act is y so the work done lifting the slab is about $\Delta W_1 = 6240\pi \cdot y \cdot \Delta y \text{ lb} \cdot \text{ft}$. The work it

takes to lift all the water into the tank is: $W_1 \approx \sum_{360}^{385} \Delta W_1 = \sum_{360}^{385} 6240\pi \cdot y \cdot \Delta y \text{ lb} \cdot \text{ft}$. Taking the limit we end up

$$\text{with } W_1 = \int_{360}^{385} 6240\pi y dy = 6240\pi \left[\frac{y^2}{2} \right]_{360}^{385} = \frac{6240\pi}{2} [385^2 - 360^2] \approx 182,557,949 \text{ ft} \cdot \text{lb}$$

To find the work required to fill the pipe, do as above, but take the radius to be $\frac{4}{2} \text{ in} = \frac{1}{6} \text{ ft}$. Then

$\Delta V = \pi \cdot \frac{1}{36} \Delta y \text{ ft}^3$ and $F = 62.4 \cdot \Delta V = \frac{62.4\pi}{36} \Delta y$. Also take different limits of summation and integration:

$$W_2 \approx \sum_0^{360} \Delta W_2 \Rightarrow W_2 = \int_0^{360} \frac{62.4}{36} \pi y dy = \frac{62.4\pi}{36} \left[\frac{y^2}{2} \right]_0^{360} = \left(\frac{62.4\pi}{36} \right) \left(\frac{360^2}{2} \right) \approx 352,864 \text{ ft} \cdot \text{lb}$$

The total work is $W = W_1 + W_2 \approx 182,557,949 + 352,864 \approx 182,910,813 \text{ ft} \cdot \text{lb}$. The time it takes to fill the tank

and the pipe is $\text{Time} = \frac{W}{1650} \approx \frac{182,910,813}{1650} \approx 110,855 \text{ sec} \approx 31 \text{ hr}$

33. To find the width of the plate at a typical depth y , we first find an equation for the line of the plate's right-hand edge: $y = x - 5$. If we let x denote the width of the right-hand half of the triangle at depth y , then $x = 5 + y$ and the total width is $L(y) = 2x = 2(5 + y)$. The depth of the strip is $(-y)$. The force exerted by the water against

$$\begin{aligned} \text{one side of the plate is therefore } F &= \int_{-5}^{-2} w(-y) \cdot L(y) \, dy = \int_{-5}^{-2} 62.4 \cdot (-y) \cdot 2(5 + y) \, dy \\ &= 124.8 \int_{-5}^{-2} (-5y - y^2) \, dy = 124.8 \left[-\frac{5}{2}y^2 - \frac{1}{3}y^3 \right]_{-5}^{-2} = 124.8 \left[\left(-\frac{5}{2} \cdot 4 + \frac{1}{3} \cdot 8 \right) - \left(-\frac{5}{2} \cdot 25 + \frac{1}{3} \cdot 125 \right) \right] \\ &= (124.8) \left(\frac{105}{2} - \frac{117}{3} \right) = (124.8) \left(\frac{315 - 234}{6} \right) = 1684.8 \text{ lb} \end{aligned}$$

34. An equation for the line of the plate's right-hand edge is $y = x - 3 \Rightarrow x = y + 3$. Thus the total width is $L(y) = 2x = 2(y + 3)$. The depth of the strip is $(2 - y)$. The force exerted by the water is

$$\begin{aligned} F &= \int_{-3}^0 w(2 - y)L(y) \, dy = \int_{-3}^0 62.4 \cdot (2 - y) \cdot 2(3 + y) \, dy = 124.8 \int_{-3}^0 (6 - y - y^2) \, dy = 124.8 \left[6y - \frac{y^2}{2} - \frac{y^3}{3} \right]_{-3}^0 \\ &= (-124.8) \left(-18 - \frac{9}{2} + 9 \right) = (-124.8) \left(-\frac{27}{2} \right) = 1684.8 \text{ lb} \end{aligned}$$

35. (a) The width of the strip is $L(y) = 4$, the depth of the strip is $(10 - y) \Rightarrow F = \int_a^b w \cdot \left(\frac{\text{strip}}{\text{depth}} \right) F(y) \, dy$

$$= \int_0^3 62.4(10 - y)(4) \, dy = 249.6 \int_0^3 (10 - y) \, dy = 249.6 \left[10y - \frac{y^2}{2} \right]_0^3 = 249.6 \left(30 - \frac{9}{2} \right) = 6364.8 \text{ lb}$$

- (b) The width of the strip is $L(y) = 3$, the depth of the strip is $(10 - y) \Rightarrow F = \int_a^b w \cdot \left(\frac{\text{strip}}{\text{depth}} \right) F(y) \, dy$

$$= \int_0^4 62.4(10 - y)(3) \, dy = 187.2 \int_0^4 (10 - y) \, dy = 187.2 \left[10y - \frac{y^2}{2} \right]_0^4 = 187.2(40 - 8) = 5990.4 \text{ lb}$$

36. The width of the strip is $L(y) = 2\sqrt{25 - y^2}$, the depth of the strip is $(6 - y) \Rightarrow F = \int_a^b w \cdot \left(\frac{\text{strip}}{\text{depth}} \right) F(y) \, dy$

$$= \int_0^5 62.4(6 - y) \left(2\sqrt{25 - y^2} \right) \, dy = 124.8 \int_0^5 (6 - y)\sqrt{25 - y^2} \, dy = 124.8 \left[\int_0^5 6\sqrt{25 - y^2} \, dy - \int_0^5 y\sqrt{25 - y^2} \, dy \right]$$

To evaluate the first integral, we use we can interpret $\int_0^5 \sqrt{25 - y^2} \, dy$ as the area of a quarter circle whose radius is 5, thus $\int_0^5 6\sqrt{25 - y^2} \, dy = 6 \int_0^5 \sqrt{25 - y^2} \, dy = 6 \left[\frac{1}{4}\pi(5)^2 \right] = \frac{75\pi}{2}$. To evaluate the second integral let

$$\begin{aligned} u &= 25 - y^2 \Rightarrow du = -2y \, dy; \quad y = 0 \Rightarrow u = 25, \quad y = 5 \Rightarrow u = 0, \quad \text{thus } \int_0^5 y\sqrt{25 - y^2} \, dy = -\frac{1}{2} \int_{25}^0 \sqrt{u} \, du \\ &= \frac{1}{2} \int_0^{25} u^{1/2} \, du = \frac{1}{3} \left[u^{3/2} \right]_0^{25} = \frac{125}{3}. \quad \text{Thus, } 124.8 \left[\int_0^5 6\sqrt{25 - y^2} \, dy - \int_0^5 y\sqrt{25 - y^2} \, dy \right] = 124.8 \left(\frac{75\pi}{2} - \frac{125}{3} \right) \\ &\approx 9502.7 \text{ lb.} \end{aligned}$$

37. Using the coordinate system of Exercise 32, we find the equation for the line of the plate's right-hand edge to be $y = 2x - 4 \Rightarrow x = \frac{y+4}{2}$ and $L(y) = 2x = y + 4$. The depth of the strip is $(1 - y)$.

$$\begin{aligned} \text{(a) } F &= \int_{-4}^0 w(1 - y)L(y) \, dy = \int_{-4}^0 62.4 \cdot (1 - y)(y + 4) \, dy = 62.4 \int_{-4}^0 (4 - 3y - y^2) \, dy = 62.4 \left[4y - \frac{3y^2}{2} - \frac{y^3}{3} \right]_{-4}^0 \\ &= (-62.4) \left[(-4)(4) - \frac{(3)(16)}{2} + \frac{64}{3} \right] = (-62.4) \left(-16 - 24 + \frac{64}{3} \right) = \frac{(-62.4)(-120 + 64)}{3} = 1164.8 \text{ lb} \end{aligned}$$

$$\text{(b) } F = (-64.0) \left[(-4)(4) - \frac{(3)(16)}{2} + \frac{64}{3} \right] = \frac{(-64.0)(-120 + 64)}{3} \approx 1194.7 \text{ lb}$$

38. Using the coordinate system given, we find an equation for the line of the plate's right-hand edge to be $y = -2x + 4 \Rightarrow x = \frac{4-y}{2}$ and $L(y) = 2x = 4 - y$. The depth of the strip is $(1 - y)$

$$\begin{aligned} \Rightarrow F &= \int_0^1 w(1-y)(4-y) dy = 62.4 \int_0^1 (y^2 - 5y + 4) dy \\ &= 62.4 \left[\frac{y^3}{3} - \frac{5y^2}{2} + 4y \right]_0^1 = (62.4) \left(\frac{1}{3} - \frac{5}{2} + 4 \right) = (62.4) \left(\frac{2-15+24}{6} \right) \\ &= \frac{(62.4)(11)}{6} = 114.4 \text{ lb} \end{aligned}$$

39. Using the coordinate system given in the accompanying figure, we see that the total width is $L(y) = 63$ and the depth of the strip

$$\begin{aligned} \text{is } (33.5 - y) \Rightarrow F &= \int_0^{33} w(33.5 - y)L(y) dy \\ &= \int_0^{33} \frac{64}{12^3} \cdot (33.5 - y) \cdot 63 dy = \left(\frac{64}{12^3} \right) (63) \int_0^{33} (33.5 - y) dy \\ &= \left(\frac{64}{12^3} \right) (63) \left[33.5y - \frac{y^2}{2} \right]_0^{33} = \left(\frac{64 \cdot 63}{12^3} \right) \left[(33.5)(33) - \frac{33^2}{2} \right] \\ &= \frac{(64)(63)(33)(67-33)}{(2)(12^3)} = 1309 \text{ lb} \end{aligned}$$

40. Using the coordinate system given in the accompanying figure, we see that the right-hand edge is $x = \sqrt{1 - y^2}$ so the total width is $L(y) = 2x = 2\sqrt{1 - y^2}$ and the depth of the strip is $(-y)$. The force exerted by the water is therefore

$$\begin{aligned} F &= \int_{-1}^0 w \cdot (-y) \cdot 2\sqrt{1 - y^2} dy \\ &= 62.4 \int_{-1}^0 \sqrt{1 - y^2} (-2y) dy = 62.4 \left[\frac{2}{3} (1 - y^2)^{3/2} \right]_{-1}^0 \\ &= (62.4) \left(\frac{2}{3} \right) (1 - 0) = 41.6 \text{ lb} \end{aligned}$$

41. (a) $F = \left(62.4 \frac{\text{lb}}{\text{ft}^3} \right) (8 \text{ ft}) (25 \text{ ft}^2) = 12480 \text{ lb}$

(b) The width of the strip is $L(y) = 5$, the depth of the strip is $(8 - y) \Rightarrow F = \int_a^b w \cdot \left(\frac{\text{strip}}{\text{depth}} \right) F(y) dy$

$$= \int_0^5 62.4(8 - y)(5) dy = 312 \int_0^5 (8 - y) dy = 312 \left[8y - \frac{y^2}{2} \right]_0^5 = 312 \left(40 - \frac{25}{2} \right) = 8580 \text{ lb}$$

(c) The width of the strip is $L(y) = 5$, the depth of the strip is $(8 - y)$, the height of the strip is $\sqrt{2} dy$

$$\begin{aligned} \Rightarrow F &= \int_a^b w \cdot \left(\frac{\text{strip}}{\text{depth}} \right) F(y) dy = \int_0^{5/\sqrt{2}} 62.4(8 - y)(5)\sqrt{2} dy = 312\sqrt{2} \int_0^{5/\sqrt{2}} (8 - y) dy \\ &= 312\sqrt{2} \left[8y - \frac{y^2}{2} \right]_0^{5/\sqrt{2}} = 312\sqrt{2} \left(\frac{40}{\sqrt{2}} - \frac{25}{4} \right) = 9722.3 \end{aligned}$$

42. The width of the strip is $L(y) = \frac{3}{4}(2\sqrt{3} - y)$, the depth of the strip is $(6 - y)$, the height of the strip is $\frac{2}{\sqrt{3}} dy$

$$\Rightarrow F = \int_a^b w \cdot \left(\frac{\text{strip}}{\text{depth}}\right) F(y) dy = \int_0^{2\sqrt{3}} 62.4(6 - y) \cdot \frac{3}{4}(2\sqrt{3} - y) \cdot \frac{2}{\sqrt{3}} dy = \frac{93.6}{\sqrt{3}} \int_0^{2\sqrt{3}} (12\sqrt{3} - 6y - 2y\sqrt{3} + y^2) dy$$

$$= \frac{93.6}{\sqrt{3}} \left[12y\sqrt{3} - 3y^2 - y^2\sqrt{3} + \frac{y^3}{3} \right]_0^{2\sqrt{3}} = \frac{93.6}{\sqrt{3}} (72 - 36 - 12\sqrt{3} + 8\sqrt{3}) \approx 1571.04 \text{ lb}$$

43. The coordinate system is given in the text. The right-hand edge is $x = \sqrt{y}$ and the total width is $L(y) = 2x = 2\sqrt{y}$.

(a) The depth of the strip is $(2 - y)$ so the force exerted by the liquid on the gate is $F = \int_0^1 w(2 - y)L(y) dy$

$$= \int_0^1 50(2 - y) \cdot 2\sqrt{y} dy = 100 \int_0^1 (2 - y)\sqrt{y} dy = 100 \int_0^1 (2y^{1/2} - y^{3/2}) dy = 100 \left[\frac{4}{3}y^{3/2} - \frac{2}{5}y^{5/2} \right]_0^1$$

$$= 100 \left(\frac{4}{3} - \frac{2}{5} \right) = \left(\frac{100}{15} \right) (20 - 6) = 93.33 \text{ lb}$$

(b) We need to solve $160 = \int_0^1 w(H - y) \cdot 2\sqrt{y} dy$ for h . $160 = 100 \left(\frac{2H}{3} - \frac{2}{5} \right) \Rightarrow H = 3 \text{ ft}$.

44. Suppose that h is the maximum height. Using the coordinate system given in the text, we find an equation for the line of the end plate's right-hand edge is $y = \frac{5}{2}x \Rightarrow x = \frac{2}{5}y$. The total width is $L(y) = 2x = \frac{4}{5}y$ and the

depth of the typical horizontal strip at level y is $(h - y)$. Then the force is $F = \int_0^h w(h - y)L(y) dy = F_{\max}$,

where $F_{\max} = 6667 \text{ lb}$. Hence, $F_{\max} = w \int_0^h (h - y) \cdot \frac{4}{5}y dy = (62.4) \left(\frac{4}{5} \right) \int_0^h (hy - y^2) dy = (62.4) \left(\frac{4}{5} \right) \left[\frac{hy^2}{2} - \frac{y^3}{3} \right]_0^h$

$$= (62.4) \left(\frac{4}{5} \right) \left(\frac{h^3}{2} - \frac{h^3}{3} \right) = (62.4) \left(\frac{4}{5} \right) \left(\frac{1}{6} \right) h^3 = (10.4) \left(\frac{4}{5} \right) h^3 \Rightarrow h = \sqrt[3]{\left(\frac{5}{4} \right) \left(\frac{F_{\max}}{10.4} \right)} = \sqrt[3]{\left(\frac{5}{4} \right) \left(\frac{6667}{10.4} \right)} \approx 9.288 \text{ ft}$$

The volume of water which the tank can hold is $V = \frac{1}{2} (\text{Base})(\text{Height}) \cdot 30$, where Height = h and

$$\frac{1}{2} (\text{Base}) = \frac{2}{5}h \Rightarrow V = \left(\frac{2}{5}h^2 \right) (30) = 12h^2 \approx 12(9.288)^2 \approx 1035 \text{ ft}^3$$

45. The pressure at level y is $p(y) = w \cdot y \Rightarrow$ the average

pressure is $\bar{p} = \frac{1}{b} \int_0^b p(y) dy = \frac{1}{b} \int_0^b w \cdot y dy$

$$= \frac{1}{b} w \left[\frac{y^2}{2} \right]_0^b = \left(\frac{w}{b} \right) \left(\frac{b^2}{2} \right) = \frac{wb}{2}$$

This is the pressure at level $\frac{b}{2}$, which is the pressure at the middle of the plate.

46. The force exerted by the fluid is $F = \int_0^b w(\text{depth})(\text{length}) dy = \int_0^b w \cdot y \cdot a dy = (w \cdot a) \int_0^b y dy = (w \cdot a) \left[\frac{y^2}{2} \right]_0^b$

$$= w \left(\frac{ab^2}{2} \right) = \left(\frac{wb}{2} \right) (ab) = \bar{p} \cdot \text{Area}, \text{ where } \bar{p} \text{ is the average value of the pressure.}$$

47. When the water reaches the top of the tank the force on the movable side is $\int_{-2}^0 (62.4)(2\sqrt{4-y^2})(-y)dy$

$$= (62.4)\int_{-2}^0 (4-y^2)^{1/2} (-y) dy = (62.4)\left[\frac{2}{3}(4-y^2)^{3/2}\right]_{-2}^0 = (62.4)\left(\frac{2}{3}\right)(4^{3/2}) = 332.8 \text{ ft}\cdot\text{lb.}$$

The force compressing the spring is $F = 100x$ so when the tank is full we have $332.8 = 100x \Rightarrow x \approx 3.33$ ft. Therefore the movable end does not reach the required 5 ft to allow drainage \Rightarrow the tank will overflow.

48. (a) Using the given coordinate system we see that the total width $L(y) = 3$ and the depth of the strip is $(3 - y)$.

$$\begin{aligned} \text{Thus, } F &= \int_0^3 w(3-y)L(y) dy = \int_0^3 (62.4)(3-y) \cdot 3 dy \\ &= (62.4)(3)\int_0^3 (3-y) dy = (62.4)(3)\left[3y - \frac{y^2}{2}\right]_0^3 \\ &= (62.4)(3)\left(9 - \frac{9}{2}\right) = (62.4)(3)\left(\frac{9}{2}\right) = 842.4 \text{ lb} \end{aligned}$$

(b) Find a new water level Y such that $F_Y = (0.75)(842.4 \text{ lb}) = 631.8 \text{ lb}$. The new depth of the strip is $(Y - y)$

$$\begin{aligned} \text{and } Y \text{ is the new upper limit of integration. Thus, } F_Y &= \int_0^Y w(Y-y)L(y) dy = 62.4\int_0^Y (Y-y) \cdot 3 dy \\ &= (62.4)(3)\int_0^Y (Y-y) dy = (62.4)(3)\left[Yy - \frac{y^2}{2}\right]_0^Y = (62.4)(3)\left(Y^2 - \frac{Y^2}{2}\right) = (62.4)(3)\left(\frac{Y^2}{2}\right). \end{aligned}$$

$$Y = \sqrt{\frac{2F_Y}{(62.4)(3)}} = \sqrt{\frac{1263.6}{187.2}} = \sqrt{6.75} \approx 2.598 \text{ ft. So, } \Delta Y = 3 - Y \approx 3 - 2.598 \approx 0.402 \text{ ft} \approx 4.8 \text{ in}$$

6.6 MOMENTS AND CENTERS OF MASS

1. Since the plate is symmetric about the y -axis and its density is constant, the distribution of mass is symmetric about the y -axis and the center of mass lies on the y -axis. This means that $\bar{x} = 0$.

It remains to find $\bar{y} = \frac{M_x}{M}$. We model the distribution of mass with vertical strips. The typical strip has center of mass:

$$(\tilde{x}, \tilde{y}) = \left(x, \frac{x^2+4}{2}\right), \text{ length: } 4-x^2 \text{ width: } dx,$$

$$\text{area: } dA = (4-x^2) dx, \text{ mass: } dm = \delta dA = \delta(4-x^2) dx$$

The moment of the strip about the x -axis is $\tilde{y} dm = \left(\frac{x^2+4}{2}\right)\delta(4-x^2) dx = \frac{\delta}{2}(16-x^4) dx$. The moment of the

plate about the x -axis is $M_x = \int \tilde{y} dm = \int_{-2}^2 \frac{\delta}{2}(16-x^4) dx = \frac{\delta}{2}\left[16x - \frac{x^5}{5}\right]_{-2}^2 = \frac{\delta}{2}\left[\left(16 \cdot 2 - \frac{2^5}{5}\right) - \left(-16 \cdot 2 + \frac{2^5}{5}\right)\right]$

$$= \frac{\delta \cdot 2}{2}\left(32 - \frac{32}{5}\right) = \frac{128\delta}{5}. \text{ The mass of the plate is } M = \int \delta(4-x^2) dx = \delta\left[4x - \frac{x^3}{3}\right]_{-2}^2 = 2\delta\left(8 - \frac{8}{3}\right) = \frac{32\delta}{3}.$$

Therefore $\bar{y} = \frac{M_x}{M} = \frac{\left(\frac{128\delta}{5}\right)}{\left(\frac{32\delta}{3}\right)} = \frac{12}{5}$. The plate's center of mass is the point $(\bar{x}, \bar{y}) = \left(0, \frac{12}{5}\right)$.

2. Applying the symmetry argument analogous to the one in Exercise 1, we find $\bar{x} = 0$. To find $\bar{y} = \frac{M_x}{M}$, we use the vertical strips technique. The typical strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{25-x^2}{2}\right)$, length: $25 - x^2$, width: dx , area: $dA = (25 - x^2)dx$, mass: $dm = \delta dA = \delta(25 - x^2)dx$.

The moment of the strip about the x -axis is $\tilde{y} dm = \left(\frac{25-x^2}{2}\right)\delta(25-x^2)dx = \frac{\delta}{2}(25-x^2)^2 dx$.

The moment of the plate about the x -axis is $M_x = \int \tilde{y} dm = \int_{-5}^5 \frac{\delta}{2}(25-x^2)^2 dx = \frac{\delta}{2} \int_{-5}^5 (625 - 50x^2 + x^4) dx = \frac{\delta}{2} \left[625x - \frac{50}{3}x^3 + \frac{x^5}{5} \right]_{-5}^5 = 2 \cdot \frac{\delta}{2} \left(625 \cdot 5 - \frac{50}{3} \cdot 5^3 + \frac{5^5}{5} \right) = \delta \cdot 625 \left(5 - \frac{10}{3} + 1 \right) = \delta \cdot 625 \cdot \left(\frac{8}{3} \right)$. The mass of the plate is $M = \int dm = \int_{-5}^5 \delta(25-x^2) dx = \delta \left[25x - \frac{x^3}{3} \right]_{-5}^5 = 2\delta \left(5^3 - \frac{5^3}{3} \right) = \frac{4}{3}\delta \cdot 5^3$. Therefore $\bar{y} = \frac{M_x}{M} = \frac{\delta \cdot 5^4 \cdot \left(\frac{8}{3}\right)}{\delta \cdot 5^3 \cdot \left(\frac{4}{3}\right)} = 10$.

The plate's center of mass is the point $(\bar{x}, \bar{y}) = (0, 10)$.

3. Intersection points: $x - x^2 = -x \Rightarrow 2x - x^2 = 0 \Rightarrow x(2-x) = 0 \Rightarrow x = 0$ or $x = 2$. The typical vertical

strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{(x-x^2)+(-x)}{2}\right) = \left(x, -\frac{x^2}{2}\right)$, length: $(x - x^2) - (-x) = 2x - x^2$,

width: dx , area: $dA = (2x - x^2)dx$, mass: $dm = \delta dA$

$= \delta(2x - x^2)dx$. The moment of the strip about the x -axis is $\tilde{y} dm = \left(-\frac{x^2}{2}\right)\delta(2x - x^2)dx$; about the y -axis it is $\tilde{x} dm = x \cdot \delta(2x - x^2)dx$. Thus, $M_x = \int \tilde{y} dm = -\int_0^2 \left(\frac{\delta}{2}x^2\right)(2x - x^2)dx = -\frac{\delta}{2} \int_0^2 (2x^3 - x^4)dx$

$= -\frac{\delta}{2} \left[\frac{x^4}{2} - \frac{x^5}{5} \right]_0^2 = -\frac{\delta}{2} \left(2^4 - \frac{2^5}{5} \right) = -\frac{\delta}{2} \cdot 2^3 \left(1 - \frac{4}{5} \right) = -\frac{4\delta}{5}$; $M_y = \int \tilde{x} dm = \int_0^2 x \cdot \delta(2x - x^2)dx$

$= \delta \int_0^2 (2x^2 - x^3)dx = \delta \left[\frac{2}{3}x^3 - \frac{x^4}{4} \right]_0^2 = \delta \left(\frac{2}{3} \cdot 2^3 - \frac{2^4}{4} \right) = \frac{\delta \cdot 2^4}{12} = \frac{4\delta}{3}$; $M = \int dm = \int_0^2 \delta(2x - x^2)dx$

$= \delta \int_0^2 (2x - x^2)dx = \delta \left[x^2 - \frac{x^3}{3} \right]_0^2 = \delta \left(4 - \frac{8}{3} \right) = \frac{4\delta}{3}$. Therefore, $\bar{x} = \frac{M_y}{M} = \left(\frac{4\delta}{3}\right)\left(\frac{3}{4\delta}\right) = 1$ and $\bar{y} = \frac{M_x}{M}$

$= \left(-\frac{4\delta}{5}\right)\left(\frac{3}{4\delta}\right) = -\frac{3}{5} \Rightarrow (\bar{x}, \bar{y}) = \left(1, -\frac{3}{5}\right)$ is the center of mass.

4. Intersection points: $x^2 - 3 = -2x^2 \Rightarrow 3x^2 - 3 = 0 \Rightarrow 3(x-1)(x+1) = 0 \Rightarrow x = -1$ or $x = 1$. Applying the symmetry argument analogous to the one in Exercise 1, we find $\bar{x} = 0$. The typical vertical strip has center of mass:

$(\tilde{x}, \tilde{y}) = \left(x, \frac{-2x^2+(x^2-3)}{2}\right) = \left(x, \frac{-x^2-3}{2}\right)$, length: $-2x^2 - (x^2 - 3)$

$= 3(1 - x^2)$, width: dx , area: $dA = 3(1 - x^2)dx$,

mass: $dm = \delta dA = 3\delta(1-x^2) dx$. The moment of the strip about the x -axis is

$$\tilde{y} dm = \frac{3}{2}\delta(-x^2-3)(1-x^2) dx = \frac{3}{2}\delta(x^4+3x^2-x^2-3) dx = \frac{3}{2}\delta(x^4+2x^2-3) dx;$$

$$M_x = \int \tilde{y} dm = \frac{3}{2}\delta \int_{-1}^1 (x^4+2x^2-3) dx = \frac{3}{2}\delta \left[\frac{x^5}{5} + \frac{2x^3}{3} - 3x \right]_{-1}^1 = \frac{3}{2}\delta \cdot 2 \left(\frac{1}{5} + \frac{2}{3} - 3 \right) = 3\delta \left(\frac{3+10-45}{15} \right) = -\frac{32\delta}{5};$$

$$M = \int dm = 3\delta \int_{-1}^1 (1-x^2) dx = 3\delta \left[x - \frac{x^3}{3} \right]_{-1}^1 = 3\delta \cdot 2 \left(1 - \frac{1}{3} \right) = 4\delta. \text{ Therefore, } \bar{y} = \frac{M_x}{M} = -\frac{\delta \cdot 32}{5 \cdot \delta \cdot 4} = -\frac{8}{5}$$

$\Rightarrow (\bar{x}, \bar{y}) = \left(0, -\frac{8}{5} \right)$ is the center of mass.

5. The typical *horizontal* strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(\frac{y-y^3}{2}, y \right)$,

length: $y-y^3$, width: dy , area: $dA = (y-y^3) dy$,

mass: $dm = \delta dA = \delta(y-y^3) dy$. The moment of the strip about the

$$y\text{-axis is } \tilde{x} dm = \delta \left(\frac{y-y^3}{2} \right) (y-y^3) dy = \frac{\delta}{2} (y-y^3)^2 dy$$

$$= \frac{\delta}{2} (y^2-2y^4+y^6) dy; \text{ the moment about the } x\text{-axis is } \tilde{y} dm = \delta y (y-y^3) dy = \delta (y^2-y^4) dy. \text{ Thus,}$$

$$M_x = \int \tilde{y} dm = \delta \int_0^1 (y^2-y^4) dy = \delta \left[\frac{y^3}{3} - \frac{y^5}{5} \right]_0^1 = \delta \left(\frac{1}{3} - \frac{1}{5} \right) = \frac{2\delta}{15}; \quad M_y = \int \tilde{x} dm = \frac{\delta}{2} \int_0^1 (y^2-2y^4+y^6) dy$$

$$= \frac{\delta}{2} \left[\frac{y^3}{3} - \frac{2y^5}{5} + \frac{y^7}{7} \right]_0^1 = \frac{\delta}{2} \left(\frac{1}{3} - \frac{2}{5} + \frac{1}{7} \right) = \frac{\delta}{2} \left(\frac{35-42+15}{105} \right) = \frac{4\delta}{105}; \quad M = \int dm = \delta \int_0^1 (y-y^3) dy = \delta \left[\frac{y^2}{2} - \frac{y^4}{4} \right]_0^1$$

$= \delta \left(\frac{1}{2} - \frac{1}{4} \right) = \frac{\delta}{4}$. Therefore, $\bar{x} = \frac{M_y}{M} = \frac{(4\delta)}{(105)} \left(\frac{4}{\delta} \right) = \frac{16}{105}$ and $\bar{y} = \frac{M_x}{M} = \left(\frac{2\delta}{15} \right) \left(\frac{4}{\delta} \right) = \frac{8}{15} \Rightarrow (\bar{x}, \bar{y}) = \left(\frac{16}{105}, \frac{8}{15} \right)$ is the center of mass.

6. Intersection points: $y = y^2 - y \Rightarrow y^2 - 2y = 0$

$\Rightarrow y(y-2) = 0 \Rightarrow y = 0$ or $y = 2$ The typical *horizontal*

strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(\frac{(y^2-y)+y}{2}, y \right) = \left(\frac{y^2}{2}, y \right)$,

length: $y - (y^2 - y) = 2y - y^2$, width: dy ,

area: $dA = (2y - y^2) dy$, mass: $dm = \delta dA = \delta(2y - y^2) dy$.

The moment about the y -axis is $\tilde{x} dm = \frac{\delta}{2} \cdot y^2 (2y - y^2) dy = \frac{\delta}{2} (2y^3 - y^4) dy$; the moment about the x -axis

$$\text{is } \tilde{y} dm = \delta y (2y - y^2) dy = \delta (2y^2 - y^3) dy. \text{ Thus, } M_x = \int \tilde{y} dm = \delta \int_0^2 (2y^2 - y^3) dy = \delta \left[\frac{2y^3}{3} - \frac{y^4}{4} \right]_0^2$$

$$= \delta \left(\frac{16}{3} - \frac{16}{4} \right) = \frac{16\delta}{12} (4-3) = \frac{4\delta}{3}; \quad M_y = \int \tilde{x} dm = \int_0^2 \frac{\delta}{2} (2y^3 - y^4) dy = \frac{\delta}{2} \left[\frac{y^4}{2} - \frac{y^5}{5} \right]_0^2 = \frac{\delta}{2} \left(8 - \frac{32}{5} \right)$$

$$= \frac{\delta}{2} \left(\frac{40-32}{5} \right) = \frac{4\delta}{5}; \quad M = \int dm = \int_0^2 \delta (2y - y^2) dy = \delta \left[y^2 - \frac{y^3}{3} \right]_0^2 = \delta \left(4 - \frac{8}{3} \right) = \frac{4\delta}{3}. \text{ Therefore,}$$

$\bar{x} = \frac{M_y}{M} = \left(\frac{4\delta}{5} \right) \left(\frac{3}{4\delta} \right) = \frac{3}{5}$ and $\bar{y} = \frac{M_x}{M} = \left(\frac{4\delta}{3} \right) \left(\frac{3}{4\delta} \right) = 1 \Rightarrow (\bar{x}, \bar{y}) = \left(\frac{3}{5}, 1 \right)$ is the center of mass.

7. Applying the symmetry argument analogous to the one used in Exercise 1, we find $\bar{x} = 0$. The typical vertical strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{\cos x}{2}\right)$, length: $\cos x$, width: dx , area: $dA = \cos x dx$, mass: $dm = \delta dA = \delta \cos x dx$. The moment of the strip about the x -axis is $\tilde{y} dm = \delta \cdot \frac{\cos x}{2} \cdot \cos x dx$

$$= \frac{\delta}{2} \cos^2 x dx = \frac{\delta}{2} \left(\frac{1+\cos 2x}{2}\right) dx = \frac{\delta}{4} (1 + \cos 2x) dx; \text{ thus,}$$

$$M_x = \int \tilde{y} dm = \int_{-\pi/2}^{\pi/2} \frac{\delta}{4} (1 + \cos 2x) dx = \frac{\delta}{4} \left[x + \frac{\sin 2x}{2} \right]_{-\pi/2}^{\pi/2} = \frac{\delta}{4} \left[\left(\frac{\pi}{2} + 0\right) - \left(-\frac{\pi}{2}\right) \right] = \frac{6\delta}{4}; \quad M = \int dm$$

$$= \delta \int_{-\pi/2}^{\pi/2} \cos x dx = \delta [\sin x]_{-\pi/2}^{\pi/2} = 2\delta. \text{ Therefore, } \bar{y} = \frac{M_x}{M} = \frac{6\delta}{4 \cdot 2\delta} = \frac{\pi}{8} \Rightarrow (\bar{x}, \bar{y}) = \left(0, \frac{\pi}{8}\right) \text{ is the center of mass.}$$

8. Applying the symmetry argument analogous to the one used in Exercise 1, we find $\bar{x} = 0$. The typical vertical strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{\sec^2 x}{2}\right)$, length: $\sec^2 x$, width: dx ,

area: $dA = \sec^2 x dx$, mass: $dm = \delta dA = \delta \sec^2 x dx$. The moment about the x -axis is $\tilde{y} dm = \left(\frac{\sec^2 x}{2}\right) (\delta \sec^2 x) dx$

$$= \frac{\delta}{2} \sec^4 x dx. \quad M_x = \int_{-\pi/4}^{\pi/4} \tilde{y} dm = \frac{\delta}{2} \int_{-\pi/4}^{\pi/4} \sec^4 x dx = \frac{\delta}{2} \int_{-\pi/4}^{\pi/4} (\tan^2 x + 1) (\sec^2 x) dx$$

$$= \frac{\delta}{2} \int_{-\pi/4}^{\pi/4} (\tan x)^2 (\sec^2 x) dx + \frac{\delta}{2} \int_{-\pi/4}^{\pi/4} \sec^2 x dx = \frac{\delta}{2} \left[\frac{(\tan x)^3}{3} \right]_{-\pi/4}^{\pi/4} + \frac{\delta}{2} [\tan x]_{-\pi/4}^{\pi/4}$$

$$= \frac{\delta}{2} \left[\frac{1}{3} - \left(-\frac{1}{3}\right) \right] + \frac{\delta}{2} [1 - (-1)] = \frac{\delta}{3} + \delta = \frac{4\delta}{3}; \quad M = \int dm = \delta \int_{-\pi/4}^{\pi/4} \sec^2 x dx = \delta [\tan x]_{-\pi/4}^{\pi/4} = \delta [1 - (-1)] = 2\delta.$$

Therefore, $\bar{y} = \frac{M_x}{M} = \left(\frac{4\delta}{3}\right) \left(\frac{1}{2\delta}\right) = \frac{2}{3} \Rightarrow (\bar{x}, \bar{y}) = \left(0, \frac{2}{3}\right)$ is the center of mass.

9. $M_y = \int_1^2 x \left(\frac{1}{x}\right) dx = 1,$
- $$M_x = \int_1^2 \left(\frac{1}{2x}\right) \left(\frac{1}{x}\right) dx = \frac{1}{2} \int_1^2 \frac{1}{x^2} dx = \left[-\frac{1}{2x} \right]_1^2 = \frac{1}{4},$$
- $$M = \int_1^2 \frac{1}{x} dx = [\ln|x|]_1^2 = \ln 2 \Rightarrow \bar{X} = \frac{M_y}{M} = \frac{1}{\ln 2} \approx 1.44 \text{ and}$$
- $$\bar{y} = \frac{M_x}{M} = \frac{\left(\frac{1}{4}\right)}{\ln 2} \approx 0.36$$

10. (a) Since the plate is symmetric about the line $x = y$ and its density is constant, the distribution of mass is symmetric about this line. This means that $\bar{x} = \bar{y}$. The typical vertical

strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{\sqrt{9-x^2}}{2}\right)$,

length: $\sqrt{9-x^2}$ width: dx , area: $dA = \sqrt{9-x^2} dx$,

mass: $dm = \delta dA = \delta\sqrt{9-x^2} dx$. The moment about the

x -axis is $\tilde{y} dm = \delta \left(\frac{\sqrt{9-x^2}}{2}\right) \sqrt{9-x^2} dx = \frac{\delta}{2}(9-x^2) dx$

Thus, $M_x = \int \tilde{y} dm = \int_0^3 \frac{\delta}{2}(9-x^2) dx = \frac{\delta}{2} \left[9x - \frac{x^3}{3}\right]_0^3 = \frac{\delta}{2}(27-9) = 9\delta$; $M = \int dm = \int \delta dA = \delta \int dA$

$= \delta$ (Area of a quarter of a circle of radius 3) $= \delta \left(\frac{9\pi}{4}\right) = \frac{9\pi\delta}{4}$. Therefore, $\bar{y} = \frac{M_x}{M} = (9\delta) \left(\frac{4}{9\pi\delta}\right) = \frac{4}{\pi}$

$\Rightarrow (\bar{x}, \bar{y}) = \left(\frac{4}{\pi}, \frac{4}{\pi}\right)$ is the center of mass.

- (b) Applying the symmetry argument analogous to the one used in Exercise 1, we find that $\bar{x} = 0$. The typical vertical strip has the same parameters as in

part (a). Thus, $M_x = \int \tilde{y} dm = \int_{-3}^3 \frac{\delta}{2}(9-x^2) dx$

$= 2 \int_0^3 \frac{\delta}{2}(9-x^2) dx = 2(9\delta) = 18\delta$; $M = \int dm = \int \delta dA$

$= \delta \int dA = \delta$ (Area of a semi-circle of radius 3) $= \delta \left(\frac{9\pi}{2}\right) = \frac{9\pi\delta}{2}$. Therefore, $\bar{y} = \frac{M_x}{M} = (18\delta) \left(\frac{2}{9\pi\delta}\right) = \frac{4}{\pi}$, the

same \bar{y} as in part (a) $\Rightarrow (\bar{x}, \bar{y}) = \left(0, \frac{4}{\pi}\right)$ is the center of mass.

11. Since the plate is symmetric about the x -axis and its density is constant, the distribution of mass is symmetric about this line. This means that $\bar{y} = 0$. The typical vertical strip has center of

mass: $(\tilde{y}, \tilde{y}) = (x, 0)$, length: $\frac{1}{1+x^2} - \left(-\frac{1}{1+x^2}\right)$,

width: dx , area: $dA = \frac{2}{1+x^2} dx$, mass: $dm = \delta dA = \delta \left(\frac{2}{1+x^2}\right) dx$.

The moment about the y -axis is

$\tilde{x} dm = \delta x \left(\frac{2}{1+x^2}\right) dx = \delta \left(\frac{2x}{1+x^2}\right) dx = \frac{2\delta x}{1+x^2} dx$. Thus,

$M_y = \int_0^1 \frac{2\delta x}{1+x^2} dx = \delta [\ln(1+x^2)]_0^1 = \delta \ln 2$.

$M = \int dm = \int_0^1 \delta \left(\frac{2}{1+x^2}\right) dx = 2\delta [\arctan x]_0^1 = 2\delta(\arctan 1) = \frac{2\delta\pi}{4} = \frac{\delta\pi}{2}$. Therefore,

$\bar{x} = \frac{M_y}{M} = \frac{\delta \ln 2}{\delta\pi/2} = \frac{2\ln 2}{\pi} = \frac{\ln 4}{\pi} \Rightarrow (\bar{x}, \bar{y}) = \left(\frac{\ln 4}{\pi}, 0\right)$ is the center of mass.

12. Since the plate is symmetric about the line $x = 1$ and its density is constant, the distribution of mass is symmetric about this line and the center of mass lies on it. This means that $\bar{x} = 1$. The typical vertical strip has center of mass:

$$(\tilde{x}, \tilde{y}) = \left(x, \frac{(2x-x^2)+(2x^2-4x)}{2} \right) = \left(x, \frac{x^2-2x}{2} \right),$$

length: $(2x-x^2) - (2x^2-4x) = -3x^2 + 6x = 3(2x-x^2)$

width: dx , area: $dA = 3(2x-x^2) dx$, mass: $dm = \delta dA$

$= 3\delta(2x-x^2) dx$. The moment about the x -axis is

$$\tilde{y} dm = \frac{3}{2} \delta (x^2 - 2x)(2x - x^2) dx = -\frac{3}{2} \delta (x^2 - 2x)^2 dx = -\frac{3}{2} \delta (x^4 - 4x^3 + 4x^2) dx. \text{ Thus, } M_x = \int \tilde{y} dm$$

$$= -\int_0^2 \frac{3}{2} \delta (x^4 - 4x^3 + 4x^2) dx = -\frac{3}{2} \delta \left[\frac{x^5}{5} - x^4 + \frac{4}{3} x^3 \right]_0^2 = -\frac{3}{2} \delta \left(\frac{2^5}{5} - 2^4 + \frac{4}{3} \cdot 2^3 \right) = -\frac{3}{2} \delta \cdot 2^4 \left(\frac{2}{5} - 1 + \frac{2}{3} \right)$$

$$= -\frac{3}{2} \delta \cdot 2^4 \left(\frac{6-15+10}{15} \right) = -\frac{8\delta}{5}; \quad M = \int dm = \int_0^2 3\delta(2x-x^2) dx = 3\delta \left[x^2 - \frac{x^3}{3} \right]_0^2 = 3\delta \left(4 - \frac{8}{3} \right) = 4\delta. \text{ Therefore,}$$

$$\bar{y} = \frac{M_x}{M} = \left(-\frac{8\delta}{5} \right) \left(\frac{1}{4\delta} \right) = -\frac{2}{5} \Rightarrow (\bar{x}, \bar{y}) = \left(1, -\frac{2}{5} \right) \text{ is the center of mass.}$$

13. $M_y = \int_1^{16} x \left(\frac{1}{\sqrt{x}} \right) dx = \int_1^{16} x^{1/2} dx = \frac{2}{3} [x^{3/2}]_1^{16} = 42; \quad M_x = \int_1^{16} \left(\frac{1}{2\sqrt{x}} \right) \left(\frac{1}{\sqrt{x}} \right) dx = \frac{1}{2} \int_1^{16} \frac{1}{x} dx = \frac{1}{2} [\ln|x|]_1^{16} = \ln 4,$

$$M = \int_1^{16} \frac{1}{\sqrt{x}} dx = [2x^{1/2}]_1^{16} = 6 \Rightarrow \bar{x} = \frac{M_y}{M} = 7 \text{ and } \bar{y} = \frac{M_x}{M} = \frac{\ln 4}{6}$$

14. Applying the symmetry argument analogous to the one used in Exercise 1, we find that $\bar{y} = 0$. The typical vertical strip has center of mass:

$$(\tilde{x}, \tilde{y}) = \left(x, \frac{\frac{1}{x^3} - \frac{1}{x^3}}{2} \right) = (x, 0), \text{ length: } \frac{1}{x^3} - \left(-\frac{1}{x^3} \right) = \frac{2}{x^3}, \text{ width: } dx,$$

area: $dA = \frac{2}{x^3} dx$, mass: $dm = \delta dA = \frac{2\delta}{x^3} dx$. The moment about the y -axis is $\tilde{x} dm = x \cdot \frac{2\delta}{x^3} dx = \frac{2\delta}{x^2} dx$. Thus,

$$M_y = \int \tilde{x} dm = \int_1^a \frac{2\delta}{x^2} dx = 2\delta \left[-\frac{1}{x} \right]_1^a = 2\delta \left(-\frac{1}{a} + 1 \right) = \frac{2\delta(a-1)}{a}; \quad M = \int dm = \int_1^a \frac{2\delta}{x^3} dx = \delta \left[-\frac{1}{x^2} \right]_1^a = \delta \left(-\frac{1}{a^2} + 1 \right)$$

$$= \frac{\delta(a^2-1)}{a^2}. \text{ Therefore, } \bar{x} = \frac{M_y}{M} = \left(\frac{2\delta(a-1)}{a} \right) \left(\frac{a^2}{\delta(a^2-1)} \right) = \frac{2a}{a+1} \Rightarrow (\bar{x}, \bar{y}) = \left(\frac{2a}{a+1}, 0 \right). \text{ Also, } \lim_{a \rightarrow \infty} \bar{x} = 2.$$

15. $M_x = \int \tilde{y} dm = \int_1^2 \left(\frac{\frac{2}{x^2}}{2} \right) \cdot \delta \cdot \left(\frac{2}{x^2} \right) dx = \int_1^2 \left(\frac{1}{x^2} \right) \left(x^2 \right) \left(\frac{2}{x^2} \right) dx$

$$= \int_1^2 \frac{2}{x^2} dx = 2 \int_1^2 x^{-2} dx = 2 \left[-x^{-1} \right]_1^2 = 2 \left[\left(-\frac{1}{2} \right) - (-1) \right] = 2 \left(\frac{1}{2} \right) = 1;$$

$$M_y = \int \tilde{x} dm = \int_1^2 x \cdot \delta \cdot \left(\frac{2}{x^2} \right) dx$$

$$= \int_1^2 x \left(x^2 \right) \left(\frac{2}{x^2} \right) dx = 2 \int_1^2 x dx = 2 \left[\frac{x^2}{2} \right]_1^2 = 2 \left(2 - \frac{1}{2} \right) = 4 - 1 = 3; \quad M = \int dm = \int_1^2 \delta \left(\frac{2}{x^2} \right) dx = \int_1^2 x^2 \left(\frac{2}{x^2} \right) dx$$

$$= 2 \int_1^2 dx = 2[x]_1^2 = 2(2-1) = 2. \text{ So } \bar{x} = \frac{M_y}{M} = \frac{3}{2} \text{ and } \bar{y} = \frac{M_x}{M} = \frac{1}{2} \Rightarrow (\bar{x}, \bar{y}) = \left(\frac{3}{2}, \frac{1}{2} \right) \text{ is the center of mass.}$$

16. We use the *vertical strip* approach:

$$M_x = \int \tilde{y} \, dm = \int_0^1 \frac{(x+x^2)}{2} (x-x^2) \cdot \delta \, dx$$

$$= \frac{1}{2} \int_0^1 (x^2 - x^4) \cdot 12x \, dx = 6 \int_0^1 (x^3 - x^5) \, dx$$

$$= 6 \left[\frac{x^4}{4} - \frac{x^6}{6} \right]_0^1 = 6 \left(\frac{1}{4} - \frac{1}{6} \right) = \frac{6}{4} - 1 = \frac{1}{2};$$

$$M_y = \int \tilde{x} \, dm = \int_0^1 x(x-x^2) \cdot \delta \, dx = \int_0^1 (x^2 - x^3) \cdot 12x \, dx = 12 \int_0^1 (x^3 - x^4) \, dx = 12 \left[\frac{x^4}{4} - \frac{x^5}{5} \right]_0^1 = 12 \left(\frac{1}{4} - \frac{1}{5} \right) = \frac{12}{20} = \frac{3}{5};$$

$$M = \int dm = \int_0^1 (x-x^2) \cdot \delta \, dx = 12 \int_0^1 (x^2 - x^3) \, dx = 12 \left[\frac{x^3}{3} - \frac{x^4}{4} \right]_0^1 = 12 \left(\frac{1}{3} - \frac{1}{4} \right) = \frac{12}{12} = 1. \text{ So } \bar{x} = \frac{M_y}{M} = \frac{3}{5} \text{ and } \bar{y} = \frac{M_x}{M} = \frac{1}{2} \Rightarrow \left(\frac{3}{5}, \frac{1}{2} \right) \text{ is the center of mass.}$$

17. (a) We use the shell method: $V = \int_a^b 2\pi \left(\begin{smallmatrix} \text{shell} \\ \text{radius} \end{smallmatrix} \right) \left(\begin{smallmatrix} \text{shell} \\ \text{height} \end{smallmatrix} \right) dx = \int_1^4 2\pi x \left[\frac{4}{\sqrt{x}} - \left(-\frac{4}{\sqrt{x}} \right) \right] dx = 16\pi \int_1^4 \frac{x}{\sqrt{x}} dx$

$$= 16\pi \int_1^4 x^{1/2} dx = 16\pi \left[\frac{2}{3} x^{3/2} \right]_1^4 = 16\pi \left(\frac{2}{3} \cdot 8 - \frac{2}{3} \right) = \frac{32\pi}{3} (8-1) = \frac{224\pi}{3}$$

(b) Since the plate is symmetric about the x -axis and its density $\delta(x) = \frac{1}{x}$ is a function of x alone, the distribution of its mass is symmetric about the x -axis. This means that $\bar{y} = 0$. We use the vertical strip approach to find \bar{x} : $M_y = \int \tilde{x} \, dm = \int_1^4 x \cdot \left[\frac{4}{\sqrt{x}} - \left(-\frac{4}{\sqrt{x}} \right) \right] \cdot \delta \, dx = \int_1^4 x \cdot \frac{8}{\sqrt{x}} \cdot \frac{1}{x} dx = 8 \int_1^4 x^{-1/2} dx = 8 \left[2x^{1/2} \right]_1^4 = 8(2 \cdot 2 - 2) = 16$; $M = \int dm = \int_1^4 \left[\frac{4}{\sqrt{x}} - \left(-\frac{4}{\sqrt{x}} \right) \right] \cdot \delta \, dx = 8 \int_1^4 \left(\frac{1}{\sqrt{x}} \right) \left(\frac{1}{x} \right) dx = 8 \int_1^4 x^{-3/2} dx = 8 \left[-2x^{-1/2} \right]_1^4 = 8[-1 - (-2)] = 8$. So $\bar{x} = \frac{M_y}{M} = \frac{16}{8} = 2 \Rightarrow (\bar{x}, \bar{y}) = (2, 0)$ is the center of mass.

18. (a) We use the disk method: $V = \int_a^b \pi [R(x)]^2 dx = \int_1^4 \pi \left(\frac{4}{x^2} \right) dx = 4\pi \int_1^4 x^{-2} dx = 4\pi \left[-\frac{1}{x} \right]_1^4 = 4\pi \left[\frac{-1}{4} - (-1) \right] = \pi[-1+4] = 3\pi$

(b) We model the distribution of mass with vertical strips: $M_x = \int \tilde{y} \, dm = \int_1^4 \frac{(\frac{2}{x})}{2} \cdot \left(\frac{2}{x} \right) \cdot \delta \, dx = \int_1^4 \frac{2}{x^2} \cdot \sqrt{x} \, dx$

$$= 2 \int_1^4 x^{-3/2} dx = 2 \left[\frac{-2}{\sqrt{x}} \right]_1^4 = 2[-1 - (-2)] = 2$$
; $M_y = \int \tilde{x} \, dm = \int_1^4 x \cdot \frac{2}{x} \cdot \delta \, dx = 2 \int_1^4 x^{1/2} dx = 2 \left[\frac{2x^{3/2}}{3} \right]_1^4$

$$= 2 \left[\frac{16}{3} - \frac{2}{3} \right] = \frac{28}{3}$$
; $M = \int dm = \int_1^4 \frac{2}{x} \cdot \delta \, dx = 2 \int_1^4 \frac{\sqrt{x}}{x} dx = 2 \int_1^4 x^{-1/2} dx = 2 \left[2x^{1/2} \right]_1^4 = 2(4-2) = 4$.

So $\bar{x} = \frac{M_y}{M} = \frac{(\frac{28}{3})}{4} = \frac{7}{3}$ and $\bar{y} = \frac{M_x}{M} = \frac{2}{4} = \frac{1}{2} \Rightarrow (\bar{x}, \bar{y}) = \left(\frac{7}{3}, \frac{1}{2} \right)$ is the center of mass.

19. The mass of a horizontal strip is $dm = \delta dA = \delta L dy$, where L is the width of the triangle at a distance of y above its base on the x -axis as shown in the figure in the text. Also, by similar triangles we have $\frac{L}{b} = \frac{h-y}{h}$
- $$\Rightarrow L = \frac{b}{h}(h-y). \text{ Thus, } M_x = \int \tilde{y} dm = \int_0^h \delta y \left(\frac{b}{h}\right)(h-y) dy = \frac{\delta b}{h} \int_0^h (hy - y^2) dy = \frac{\delta b}{h} \left[\frac{hy^2}{2} - \frac{y^3}{3} \right]_0^h = \frac{\delta b}{h} \left(\frac{h^3}{2} - \frac{h^3}{3} \right)$$
- $$= \delta b h^2 \left(\frac{1}{2} - \frac{1}{3} \right) = \frac{\delta b h^2}{6}; \quad M = \int dm = \int_0^h \delta \left(\frac{b}{h}\right)(h-y) dy = \frac{\delta b}{h} \int_0^h (h-y) dy = \frac{\delta b}{h} \left[hy - \frac{y^2}{2} \right]_0^h = \frac{\delta b}{h} \left(h^2 - \frac{h^2}{2} \right) = \frac{\delta b h}{2}.$$
- So $\bar{y} = \frac{M_x}{M} = \left(\frac{\delta b h^2}{6} \right) \left(\frac{2}{\delta b h} \right) = \frac{h}{3} \Rightarrow$ the center of mass lies above the base of the triangle one-third of the way toward the opposite vertex. Similarly the other two sides of the triangle can be placed on the x -axis and the same results will occur. Therefore the centroid does lie at the intersection of the medians, as claimed.

20. From the symmetry about the y -axis it follows that $\bar{x} = 0$. It also follows that the line through the points $(0, 0)$ and $(0, 3)$ is a median
- $$\Rightarrow \bar{y} = \frac{1}{3}(3-0) = 1 \Rightarrow (\bar{x}, \bar{y}) = (0, 1).$$

21. From the symmetry about the line $x = y$ it follows that $\bar{x} = \bar{y}$. It also follows that the line through the points $(0, 0)$ and $(\frac{1}{2}, \frac{1}{2})$ is a median
- $$\Rightarrow \bar{y} = \bar{x} = \frac{2}{3} \cdot \left(\frac{1}{2} - 0 \right) = \frac{1}{3} \Rightarrow (\bar{x}, \bar{y}) = \left(\frac{1}{3}, \frac{1}{3} \right).$$

22. From the symmetry about the line $x = y$ it follows that $\bar{x} = \bar{y}$. It also follows that the line through the point $(0, 0)$ and $(\frac{a}{2}, \frac{a}{2})$ is a median
- $$\Rightarrow \bar{y} = \bar{x} = \frac{2}{3} \left(\frac{a}{2} - 0 \right) = \frac{1}{3} a \Rightarrow (\bar{x}, \bar{y}) = \left(\frac{a}{3}, \frac{a}{3} \right).$$

23. The point of intersection of the median from the vertex $(0, b)$ to the opposite side has coordinates $(0, \frac{a}{2}) \Rightarrow \bar{y} = (b-0) \cdot \frac{1}{3} = \frac{b}{3}$ and
- $$\bar{x} = \left(\frac{a}{2} - 0 \right) \cdot \frac{2}{3} = \frac{a}{3} \Rightarrow (\bar{x}, \bar{y}) = \left(\frac{a}{3}, \frac{b}{3} \right).$$

24. From the symmetry about the line $x = \frac{a}{2}$ it follows that $\bar{x} = \frac{a}{2}$. It also follows that the line through the points $(\frac{a}{2}, 0)$ and $(\frac{a}{2}, b)$ is a median $\Rightarrow \bar{y} = \frac{1}{3}(b-0) = \frac{b}{3} \Rightarrow (\bar{x}, \bar{y}) = (\frac{a}{2}, \frac{b}{3})$.

25. $y = x^{1/2} \Rightarrow dy = \frac{1}{2}x^{-1/2} dx \Rightarrow ds = \sqrt{(dx)^2 + (dy)^2} = \sqrt{1 + \frac{1}{4x}} dx$;
 $M_x = \delta \int_0^2 \sqrt{x} \sqrt{1 + \frac{1}{4x}} dx = \delta \int_0^2 \sqrt{x + \frac{1}{4}} dx = \frac{2\delta}{3} \left[\left(x + \frac{1}{4}\right)^{3/2} \right]_0^2$
 $= \frac{2\delta}{3} \left[\left(2 + \frac{1}{4}\right)^{3/2} - \left(\frac{1}{4}\right)^{3/2} \right] = \frac{2\delta}{3} \left[\left(\frac{9}{4}\right)^{3/2} - \left(\frac{1}{4}\right)^{3/2} \right] = \frac{2\delta}{3} \left(\frac{27}{8} - \frac{1}{8} \right) = \frac{13\delta}{6}$

26. $y = x^3 \Rightarrow dy = 3x^2 dx \Rightarrow dx = \sqrt{(dx)^2 + (3x^2 dx)^2} = \sqrt{1 + 9x^4} dx$;
 $M_x = \delta \int_0^1 x^3 \sqrt{1 + 9x^4} dx$;
 $[u = 1 + 9x^4 \Rightarrow du = 36x^3 dx \Rightarrow \frac{1}{36} du = x^3 dx$;
 $x = 0 \Rightarrow u = 1, x = 1 \Rightarrow u = 10] \rightarrow M_x = \delta \int_1^{10} \frac{1}{36} u^{1/2} du = \frac{\delta}{36} \left[\frac{2}{3} u^{3/2} \right]_1^{10} = \frac{\delta}{54} (10^{3/2} - 1)$

27. From Example 4 we have $M_x = \int_0^\pi a(a \sin \theta)(k \sin \theta) d\theta = a^2 k \int_0^\pi \sin^2 \theta d\theta = \frac{a^2 k}{2} \int_0^\pi (1 - \cos 2\theta) d\theta$
 $= \frac{a^2 k}{2} \left[\theta - \frac{\sin 2\theta}{2} \right]_0^\pi = \frac{a^2 k \pi}{2}$; $M_y = \int_0^\pi a(a \cos \theta)(k \sin \theta) d\theta = a^2 k \int_0^\pi \sin \theta \cos \theta d\theta = \frac{a^2 k}{2} \left[\sin^2 \theta \right]_0^\pi = 0$;
 $M = \int_0^\pi ak \sin \theta d\theta = ak [-\cos \theta]_0^\pi = 2ak$. Therefore, $\bar{x} = \frac{M_y}{M} = 0$ and $\bar{y} = \frac{M_x}{M} = \left(\frac{a^2 k \pi}{2} \right) \left(\frac{1}{2ak} \right) = \frac{a\pi}{4} \Rightarrow (0, \frac{a\pi}{4})$ is the center of mass.

28. $M_x = \int \tilde{y} dm = \int_0^\pi (a \sin \theta) \cdot \delta \cdot a d\theta = \int_0^\pi (a^2 \sin \theta)(1 + k |\cos \theta|) d\theta$

$$= a^2 \int_0^{\pi/2} (\sin \theta)(1 + k \cos \theta) d\theta + a^2 \int_{\pi/2}^\pi (\sin \theta)(1 - k \cos \theta) d\theta$$

$$= a^2 \int_0^{\pi/2} \sin \theta d\theta + a^2 k \int_0^{\pi/2} \sin \theta \cos \theta d\theta + a^2 \int_{\pi/2}^\pi \sin \theta d\theta - a^2 k \int_{\pi/2}^\pi \sin \theta \cos \theta d\theta$$

$$= a^2 [0 - (-1)] + a^2 k \left(\frac{1}{2} - 0 \right) + a^2 [(-1) - 0] - a^2 k \left(0 - \frac{1}{2} \right) = a^2 + \frac{a^2 k}{2} + a^2 + \frac{a^2 k}{2} = 2a^2 + a^2 k = a^2(2 + k);$$

$$M_y = \int \tilde{x} dm = \int_0^\pi (a \cos \theta) \cdot \delta \cdot a d\theta = \int_0^\pi (a^2 \cos \theta)(1 + k |\cos \theta|) d\theta$$

$$= a^2 \int_0^{\pi/2} (\cos \theta)(1 + k \cos \theta) d\theta + a^2 \int_{\pi/2}^\pi (\cos \theta)(1 - k \cos \theta) d\theta$$

 is the center of mass.

33. Consider the curve as an infinite number of line segments joined together. From the derivation of arc length we have that the length of a particular segment is $ds = \sqrt{(dx)^2 + (dy)^2}$. This implies that $M_x = \int \delta y ds, M_y = \int \delta x ds$ and $M = \int \delta ds$. If δ is constant, then $\bar{x} = \frac{M_y}{M} = \frac{\int x ds}{\int ds} = \frac{\int x ds}{\text{length}}$ and $\bar{y} = \frac{M_x}{M} = \frac{\int y ds}{\int ds} = \frac{\int y ds}{\text{length}}$.

34. Applying the symmetry argument analogous to the one used in Exercise 1, we find that $\bar{x} = 0$. The typical vertical

strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{a+x^2}{2} \right)$, length: $a - \frac{x^2}{4p}$, width: dx , area: $dA = \left(a - \frac{x^2}{4p} \right) dx$,

mass: $dm = \delta dA = \delta \left(a - \frac{x^2}{4p} \right) dx$. Thus, $M_x = \int \tilde{y} dm = \int_{-2\sqrt{pa}}^{2\sqrt{pa}} \frac{1}{2} \left(a + \frac{x^2}{4p} \right) \left(a - \frac{x^2}{4p} \right) \delta dx$

$$= \frac{\delta}{2} \int_{-2\sqrt{pa}}^{2\sqrt{pa}} \left(a^2 - \frac{x^4}{16p^2} \right) dx = \frac{\delta}{2} \left[a^2 x - \frac{x^5}{80p^2} \right]_{-2\sqrt{pa}}^{2\sqrt{pa}} = 2 \cdot \frac{\delta}{2} \left[a^2 x - \frac{x^5}{80p^2} \right]_0^{2\sqrt{pa}} = \delta \left(2a^2 \sqrt{pa} - \frac{2^5 p^2 a^2 \sqrt{pa}}{80p^2} \right)$$

$$\begin{aligned}
 &= 2a^2 \delta \sqrt{pa} \left(1 - \frac{16}{80}\right) = 2a^2 \delta \sqrt{pa} \left(\frac{80-16}{80}\right) = 2a^2 \delta \sqrt{pa} \left(\frac{64}{80}\right) = \frac{8a^2 \delta \sqrt{pa}}{5}; \quad M = \int dm = \int_{-2\sqrt{pa}}^{2\sqrt{pa}} \delta \left(a - \frac{x^2}{4p}\right) dx \\
 &= \delta \left[ax - \frac{x^3}{12p} \right]_{-2\sqrt{pa}}^{2\sqrt{pa}} = 2 \cdot \delta \left[ax - \frac{x^3}{12p} \right]_0^{2\sqrt{pa}} = 2\delta \left(2a\sqrt{pa} - \frac{2^3 pa \sqrt{pa}}{12p} \right) = 4a\delta \sqrt{pa} \left(1 - \frac{4}{12}\right) = 4a\delta \sqrt{pa} \left(\frac{12-4}{12}\right) \\
 &= \frac{8a\delta \sqrt{pa}}{3}. \text{ So } \bar{y} = \frac{M_x}{M} = \left(\frac{8a^2 \delta \sqrt{pa}}{5}\right) \left(\frac{3}{8a\delta \sqrt{pa}}\right) = \frac{3}{5} a, \text{ as claimed}
 \end{aligned}$$

35. The centroid of the square is located at (2, 2). The volume is $V = (2\pi)(\bar{y})(A) = (2\pi)(2)(8) = 32\pi$ and the surface area is $S = (2\pi)(\bar{y})(L) = (2\pi)(2)(4\sqrt{8}) = 32\sqrt{2}\pi$ (where $\sqrt{8}$ is the length of a side).

36. The midpoint of the hypotenuse of the triangle is $\left(\frac{3}{2}, 3\right) \Rightarrow y = 2x$ is an equation of the median \Rightarrow the line $y = 2x$ contains the centroid. The point $\left(\frac{3}{2}, 3\right)$ is $\frac{3\sqrt{5}}{2}$ units from the origin \Rightarrow the x -coordinate of the centroid

solves the equation $\sqrt{\left(x - \frac{3}{2}\right)^2 + (2x - 3)^2} = \frac{\sqrt{5}}{2}$

$$\Rightarrow \left(x^2 - 3x + \frac{9}{4}\right) + (4x^2 - 12x + 9) = \frac{5}{4}$$

$$\Rightarrow 5x^2 - 15x + 9 = -1 \Rightarrow x^2 - 3x + 2 = (x - 2)(x - 1) = 0 \Rightarrow \bar{x} = 1 \text{ since the centroid must lie inside the triangle}$$

$$\Rightarrow \bar{y} = 2. \text{ By the Theorem of Pappus, the volume is } V = (\text{distance traveled by the centroid})(\text{area of the region})$$

$$= 2\pi(5 - \bar{x}) \left[\frac{1}{2}(3)(6) \right] = (2\pi)(4)(9) = 72\pi$$

37. The centroid is located at (2, 0) $\Rightarrow V = (2\pi)(\bar{x})(A) = (2\pi)(2)(\pi) = 4\pi^2$

38. We create the cone by revolving the triangle with vertices (0, 0), (h, r) and (h, 0) about the x -axis (see the accompanying figure). Thus, the cone has height h and base radius r . By Theorem of Pappus, the lateral surface area swept out by the hypotenuse L is given by $S = 2\pi \bar{y} L = 2\pi \left(\frac{r}{2}\right) \sqrt{h^2 + r^2} = \pi r \sqrt{r^2 + h^2}$. To calculate the volume we need the position of the centroid of the triangle. From the diagram we see that the centroid lies on the

line $y = \frac{r}{2h}x$. The x -coordinate of the centroid solves the equation $\sqrt{(x-h)^2 + \left(\frac{r}{2h}x - \frac{r}{2}\right)^2} = \frac{1}{3} \sqrt{h^2 + \frac{r^2}{4}}$

$$\Rightarrow \left(\frac{4h^2+r^2}{4h^2}\right)x^2 - \left(\frac{4h^2+r^2}{2h}\right)x + \frac{r^2}{4} + \frac{2(r^2+4h^2)}{9} = 0 \Rightarrow x = \frac{2h}{3} \text{ or } \frac{4h}{3} \Rightarrow \bar{x} = \frac{2h}{3}, \text{ since the centroid must lie inside the}$$

$$\text{triangle } \Rightarrow \bar{y} = \frac{r}{2h} \bar{x} = \frac{r}{3}. \text{ By the Theorem of Pappus, } V = \left[2\pi \left(\frac{r}{3}\right) \right] \left(\frac{1}{2}hr\right) = \frac{1}{3} \pi r^2 h.$$

39. $S = 2\pi \bar{y} L \Rightarrow 4\pi a^2 = (2\pi \bar{y})(\pi a) \Rightarrow \bar{y} = \frac{2a}{\pi}$, and by symmetry $\bar{x} = 0$

40. $S = 2\pi \rho L \Rightarrow \left[2\pi \left(a - \frac{2a}{\pi}\right) \right] (\pi a) = 2\pi a^2 (\pi - 2)$

41. $V = 2\pi \bar{y} A \Rightarrow \frac{4}{3} \pi ab^2 = (2\pi \bar{y}) \left(\frac{\pi ab}{2}\right) \Rightarrow \bar{y} = \frac{4b}{3\pi}$ and by symmetry $\bar{x} = 0$

42. $V = 2\pi \rho A \Rightarrow V = \left[2\pi \left(a + \frac{4a}{3\pi} \right) \right] \left(\frac{\pi a^2}{2} \right) = \frac{\pi a^3 (3\pi + 4)}{3}$

43. $V = 2\pi \rho A = (2\pi)$ (area of the region) (distance from the centroid to the line $y = x - a$). We must find the distance from $\left(0, \frac{4a}{3\pi} \right)$ to $y = x - a$. The line containing the centroid and perpendicular to $y = x - a$ has slope -1 and contains the point $\left(0, \frac{4a}{3\pi} \right)$. This line is $y = -x + \frac{4a}{3\pi}$. The intersection of $y = x - a$ and $y = -x + \frac{4a}{3\pi}$ is the point $\left(\frac{4a+3a\pi}{6\pi}, \frac{4a-3a\pi}{6\pi} \right)$. Thus, the distance from the centroid to the line $y = x - a$ is

$$\sqrt{\left(\frac{4a+3a\pi}{6\pi} \right)^2 + \left(\frac{4a}{3\pi} - \frac{4a-3a\pi}{6\pi} \right)^2} = \frac{\sqrt{2}(4a+3a\pi)}{6\pi} \Rightarrow V = (2\pi) \left(\frac{\sqrt{2}(4a+3a\pi)}{6\pi} \right) \left(\frac{\pi a^2}{2} \right) = \frac{\sqrt{2}\pi a^3 (4+3\pi)}{6}$$

44. The line perpendicular to $y = x - a$ and passing through the centroid $\left(0, \frac{2a}{\pi} \right)$ has equation $y = -x + \frac{2a}{\pi}$. The intersection of the two perpendicular lines occurs when $x - a = -x + \frac{2a}{\pi} \Rightarrow x = \frac{2a+a\pi}{2\pi} \Rightarrow x = \frac{2a+a\pi}{2\pi}$

$$\Rightarrow y = \frac{2a-a\pi}{2\pi}. \text{ Thus the distance from the centroid to the line } y = x - a \text{ is } \sqrt{\left(\frac{2a+a\pi}{2} - 0 \right)^2 + \left(\frac{2a-a\pi}{2} - \frac{2a}{2} \right)^2} = \frac{a(2+\pi)}{\sqrt{2}\pi}. \text{ Therefore, by the Theorem of Pappus the surface area is } S = 2\pi \left[\frac{a(2+\pi)}{\sqrt{2}\pi} \right] (\pi a) = \sqrt{2}\pi a^2 (2+\pi).$$

45. If we revolve the region about the y -axis: $r = a, h = b \Rightarrow A = \frac{1}{2}ab, V = \frac{1}{3}\pi a^2 b$, and $\rho = \bar{x}$. By the Theorem of Pappus: $\frac{1}{3}\pi a^2 b = 2\pi \bar{x} \left(\frac{1}{2}ab \right) \Rightarrow \bar{x} = \frac{a}{3}$; If we revolve the region about the x -axis:

$r = b, h = a \Rightarrow A = \frac{1}{2}ab, V = \frac{1}{3}\pi b^2 a$, and $\rho = \bar{y}$. By the Theorem of Pappus:

$$\frac{1}{3}\pi b^2 a = 2\pi \bar{y} \left(\frac{1}{2}ab \right) \Rightarrow \bar{y} = \frac{b}{3} \Rightarrow \left(\frac{a}{3}, \frac{b}{3} \right) \text{ is the center of mass.}$$

46. Let $O(0, 0), P(a, c)$, and $Q(a, b)$ be the vertices of the given triangle. If we revolve the region about the x -axis: Let R be the point $R(a, 0)$. The volume is given by the volume of the outer cone, radius = $RP = c$, minus the volume of the inner cone, radius = $RQ = b$, thus $V = \frac{1}{3}\pi c^2 a - \frac{1}{3}\pi b^2 a = \frac{1}{3}\pi a(c^2 - b^2)$, the area is given by the area of triangle OPR minus area of triangle OQR , $A = \frac{1}{2}ac - \frac{1}{2}ab = \frac{1}{2}a(c - b)$, and $\rho = \bar{y}$. By the Theorem of Pappus: $\frac{1}{3}\pi a(c^2 - b^2) = 2\pi \bar{y} \left[\frac{1}{2}a(c - b) \right] \Rightarrow \bar{y} = \frac{c+b}{3}$; If we revolve the region about the y -axis: Let S and T be the points $S(0, c)$ and $T(0, b)$, respectively. Then the volume is the volume of the cylinder with radius $OR = a$ and height $RP = c$, minus the sum of the volumes of the cone with radius = $SP = a$ and height = $OS = c$ and the portion of the cylinder with height = $OT = b$ and radius = $TQ = a$ with a cone of height = $OT = b$ and radius = $TQ = a$ removed. Thus

$$V = \pi a^2 c - \left[\frac{1}{3}\pi a^2 c + \left(\pi a^2 b - \frac{1}{3}\pi a^2 b \right) \right] = \frac{2}{3}\pi a^2 c - \frac{2}{3}\pi a^2 b = \frac{2}{3}\pi a^2 (a - b). \text{ The area of the triangle is the same as before, } A = \frac{1}{2}ac - \frac{1}{2}ab = \frac{1}{2}a(c - b), \text{ and } \rho = \bar{x}. \text{ By the Theorem of Pappus:}$$

$$\frac{2}{3}\pi a^2 (a - b) = 2\pi \bar{x} \left[\frac{1}{2}a(c - b) \right] \Rightarrow \bar{x} = \frac{2a(a-b)}{3(c-b)} \Rightarrow \left(\frac{2a(a-b)}{3(c-b)}, \frac{c+b}{2} \right) \text{ is the center of mass.}$$

27. Using a proportionality constant of 1, the work in lifting the weight of $w \text{ lb}$ from $r-a$ to a is $\int_{r-a}^a wt dt = w \left[\frac{t^2}{2}\right]_{r-a}^a = \frac{w}{2} (r^2 - (r-a)^2) = \frac{w}{2} (2ar - a^2)$.

28. Force constant: $F = kx \Rightarrow 200 = k(0.8) \Rightarrow k = 250 \text{ N/m}$; the 300 N force stretches the spring

$$x = \frac{F}{k} = \frac{300}{250} = 1.2 \text{ m}; \text{ the work required to stretch the spring that far is then } W = \int_0^{1.2} F(x) dx = \int_0^{1.2} 250x dx$$

$$= \int_0^{1.2} 250x dx = \left[125x^2 \right]_0^{1.2} = 125(1.2)^2 = 180 \text{ J}$$

29. We imagine the water divided into thin slabs by planes perpendicular to the y -axis at the points of a partition of the interval $[0, 8]$. The typical slab between the planes at y and $y + \Delta y$ has a volume of about

$$\Delta V = \pi(\text{radius})^2(\text{thickness}) = \pi\left(\frac{5}{4}y\right)^2 \Delta y = \frac{25\pi}{16} y^2 \Delta y \text{ ft}^3.$$

The force $F(y)$ required to lift this slab is equal to its weight: $F(y) = 62.4\Delta V$

$= \frac{(62.4)(25)}{16} \pi y^2 \Delta y \text{ lb}$. The distance through which $F(y)$ must act to lift this slab to the level 6 ft above the top is about $(6 + 8 - y)$ ft, so the work done lifting the slab is about $\Delta W = \frac{(62.4)(25)}{16} \pi y^2 (14 - y) \Delta y \text{ ft} \cdot \text{lb}$. The work done lifting all the slabs from $y = 0$ to $y = 8$ to the level 6 ft above the top is approximately

$$W \approx \sum_0^8 \frac{(62.4)(25)}{16} \pi y^2 (14 - y) \Delta y \text{ ft} \cdot \text{lb} \text{ so the work to pump the water is the limit of these Riemann sums as}$$

$$\text{the norm of the partition goes to zero: } W = \int_0^8 \frac{(62.4)(25)}{16} \pi y^2 (14 - y) dy = \frac{(62.4)(25)\pi}{16} \int_0^8 (14y^2 - y^3) dy$$

$$= (62.4) \left(\frac{25\pi}{16} \right) \left[\frac{14}{3} y^3 - \frac{y^4}{4} \right]_0^8 = (62.4) \left(\frac{25\pi}{16} \right) \left(\frac{14}{3} \cdot 8^3 - \frac{8^4}{4} \right) \approx 418,208.81 \text{ ft} \cdot \text{lb}$$

30. The same as in Exercise 29, but change the distance through which $F(y)$ must act to $(8 - y)$ rather than $(6 + 8 - y)$. Also change the upper limit of integration from 8 to 5. The integral is:

$$W = \int_0^5 \frac{(62.4)(25)\pi}{16} y^2 (8 - y) dy = (62.4) \left(\frac{25\pi}{16} \right) \int_0^5 (8y^2 - y^3) dy = (62.4) \left(\frac{25\pi}{16} \right) \left[\frac{8}{3} y^3 - \frac{y^4}{4} \right]_0^5$$

$$= (62.4) \left(\frac{25\pi}{16} \right) \left(\frac{8}{3} \cdot 5^3 - \frac{5^4}{4} \right) \approx 54,241.56 \text{ ft} \cdot \text{lb}$$

31. The tank's cross section looks like the figure in Exercise 29 with right edge given by $x = \frac{5}{10}y = \frac{y}{2}$. A typical horizontal slab has volume $\Delta V = \pi(\text{radius})^2(\text{thickness}) = \pi\left(\frac{y}{2}\right)^2 \Delta y = \frac{\pi}{4} y^2 \Delta y$. The force required to lift this slab is its weight: $F(y) = 60 \cdot \frac{\pi}{4} y^2 \Delta y$. The distance through which $F(y)$ must act is $(2 + 10 - y)$ ft, so the

$$\text{work to pump the liquid is } W = 60 \int_0^{10} \pi(12 - y) \left(\frac{y^2}{4} \right) dy = 15\pi \left[\frac{12y^3}{3} - \frac{y^4}{4} \right]_0^{10} = 22,500\pi \text{ ft} \cdot \text{lb}; \text{ the time needed}$$

$$\text{to empty the tank is } \frac{22,500\pi \text{ ft} \cdot \text{lb}}{275 \text{ ft} \cdot \text{lb}/\text{sec}} \approx 257 \text{ sec}$$

32. A typical horizontal slab has volume about $\Delta V = (20)(2x)\Delta y = (20)\left(2\sqrt{16 - y^2}\right)\Delta y$ and the force required to lift this slab is its weight $F(y) = (57)(20)\left(2\sqrt{16 - y^2}\right)\Delta y$. The distance through which $F(y)$ must act is $(6 + 4 - y)$ ft, so the work to pump the olive oil from the half-full tank is

$$\begin{aligned}
 W &= 57 \int_{-4}^0 (10-y)(20) \left(2\sqrt{16-y^2} \right) dy = 2880 \int_{-4}^0 10\sqrt{16-y^2} dy + 1140 \int_{-4}^0 (16-y^2)^{1/2} (-2y) dy \\

34. Symmetry suggests that $\bar{x} = 0$. The typical vertical strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{x^2}{2} \right)$, length: x^2 , width: dx ,

$$= \frac{\delta}{2} x^4 dx \Rightarrow M_x = \int \tilde{y} dm = \frac{\delta}{2} \int_{-2}^2 x^4 dx = \frac{\delta}{10} [x^5]_{-2}^2$$

35. The typical vertical strip has: center of mass: (\tilde{x}, \tilde{y})

$= \left(x, \frac{4 + \frac{x^2}{4}}{2} \right)$, length: $4 - \frac{x^2}{4}$, width: dx ,

Thus, $M_x = \int \tilde{y} dm = \frac{\delta}{2} \int_0^4 \left(16 - \frac{x^4}{16} \right) dx = \frac{\delta}{2} \left[16x - \frac{x^5}{5 \cdot 16} \right]_0^4 = \frac{\delta}{2} \left[64 - \frac{64}{5} \right] = \frac{128\delta}{5}$; $M_y = \int \tilde{x} dm$

Centroid is $(\bar{x}, \bar{y}) = \left(\frac{3}{2}, \frac{12}{5} \right)$.

36. A typical horizontal strip has: center of mass:

38. A typical vertical strip has: center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{3}{2x^{3/2}}\right)$, length: $\frac{3}{x^{3/2}}$, width: dx , area: $dA = \frac{3}{x^{3/2}} dx$,

42. Place the origin at the bottom of the tank. Then $F = \int_0^h W \cdot \left(\frac{\text{strip}}{\text{depth}} \right) \cdot L(y) dy$, h = the height of the mercury column, strip depth = $h - y$, $L(y) = 1 \Rightarrow F = \int_0^h 849(h-y) \cdot 1 dy = 849 \int_0^h (h-y) dy = 849 \left[hy - \frac{y^2}{2} \right]_0^h = 849 \left(h^2 - \frac{h^2}{2} \right) = \frac{849}{2} h^2$. Now solve $\frac{849}{2} h^2 = 40000$ to get $h \approx 9.707$ ft. The volume of the mercury is $s^2 h = 1^2 \cdot 9.707 = 9.707 \text{ ft}^3$.

CHAPTER 6 ADDITIONAL AND ADVANCED EXERCISES

$$1. \quad V = \pi \int_a^b [f(x)]^2 dx = b^2 - ab \Rightarrow \pi \int_a^x [f(t)]^2 dt = x^2 - ax \quad \text{for all } x > a \Rightarrow \pi [f(x)]^2 = 2x - a \Rightarrow f(x) = \sqrt{\frac{2x-a}{\pi}}$$

$$2. \quad V = \pi \int_0^a [f(x)]^2 dx = a^2 + a \Rightarrow \pi \int_a^x [f(t)]^2 dt = x^2 + x \quad \text{for all } x > a \Rightarrow \pi [f(x)]^2 = 2x + 1 \Rightarrow f(x) = \frac{\sqrt{2x+1}}{\pi}$$

$$3. \quad s(x) = Cx \Rightarrow \int_0^x \sqrt{1+[f'(t)]^2} dt = Cx \Rightarrow \sqrt{1+[f'(x)]^2} = C \Rightarrow f'(x) = \sqrt{C^2-1} \quad \text{for } C \geq 1 \Rightarrow f(x) = \int_0^x \sqrt{C^2-1} dt + k. \quad \text{Then } f(0) = a \Rightarrow a = 0 + k \Rightarrow f(x) = \int_0^x \sqrt{C^2-1} dt + a \Rightarrow f(x) = x\sqrt{C^2-1} + a, \quad \text{where } C \geq 1.$$

4. (a) The graph of $f(x) = \sin x$ traces out a path from $(0, 0)$ to $(\alpha, \sin \alpha)$ whose length is

$$L = \int_0^\alpha \sqrt{1 + \cos^2 \theta} d\theta. \text{ The line segment from } (0, 0) \text{ to } (\alpha, \sin \alpha) \text{ has length}$$

$\sqrt{(\alpha - 0)^2 + (\sin \alpha - 0)^2} = \sqrt{\alpha^2 + \sin^2 \alpha}$. Since the shortest distance between two points is the length of the straight line segment joining them, we have immediately that

$$\int_0^\alpha \sqrt{1 + \cos^2 \theta} d\theta > \sqrt{\alpha^2 + \sin^2 \alpha} \text{ if } 0 < \alpha \leq \frac{\pi}{2}.$$

- (b) In general, if $y = f(x)$ is continuously differentiable and $f(0) = 0$, then

$$\int_0^\alpha \sqrt{1 + [f'(t)]^2} dt > \sqrt{\alpha^2 + f^2(\alpha)} \text{ for } \alpha > 0.$$

5. We can find the centroid and then use Pappus' Theorem to calculate the volume. $f(x) = x$, $g(x) = x^2$,

$$f(x) = g(x) \Rightarrow x = x^2 \Rightarrow x^2 - x = 0 \Rightarrow x = 0, x = 1; \delta = 1; M = \int_0^1 (x - x^2) dx = \left[\frac{1}{2}x^2 - \frac{1}{3}x^3 \right]_0^1$$

$$= \left(\frac{1}{2} - \frac{1}{3} \right) - 0 = \frac{1}{6}; \bar{x} = \frac{1}{1/6} \int_0^1 x(x - x^2) dx = 6 \int_0^1 (x^2 - x^3) dx = 6 \left[\frac{1}{3}x^3 - \frac{1}{4}x^4 \right]_0^1 = 6 \left(\frac{1}{3} - \frac{1}{4} \right) - 0 = \frac{1}{2};$$

$$\bar{y} = \frac{1}{1/6} \int_0^1 \frac{1}{2} \left[x^2 - (x^2)^2 \right] dx = 3 \int_0^1 (x^2 - x^4) dx = 3 \left[\frac{1}{3}x^3 - \frac{1}{5}x^5 \right]_0^1 = 3 \left(\frac{1}{3} - \frac{1}{5} \right) - 0 = \frac{2}{3} \Rightarrow \text{The centroid is } \left(\frac{1}{2}, \frac{2}{3} \right).$$

ρ is the distance from $\left(\frac{1}{2}, \frac{2}{3} \right)$ to the axis of rotation, $y = x$. To calculate this distance we must find the point on $y = x$ that also lies on the line perpendicular to $y = x$ that passes through $\left(\frac{1}{2}, \frac{2}{3} \right)$. The equation of this line is $y - \frac{2}{3} = -1 \left(x - \frac{1}{2} \right) \Rightarrow x + y = \frac{9}{10}$. The point of intersection of the lines $x + y = \frac{9}{10}$ and $y = x$ is $\left(\frac{9}{20}, \frac{9}{20} \right)$.

$$\text{Thus, } \rho = \sqrt{\left(\frac{9}{10} - \frac{1}{2} \right)^2 + \left(\frac{9}{20} - \frac{2}{3} \right)^2} = \frac{1}{10\sqrt{2}}. \text{ Thus } V = 2\pi \left(\frac{1}{10\sqrt{2}} \right) \left(\frac{1}{6} \right) = \frac{\pi}{30\sqrt{2}}.$$

6. Since the slice is made at an angle of 45° , the volume of the wedge is half the volume of the cylinder of radius

$$\frac{1}{2} \text{ and height 1. Thus, } V = \frac{1}{2} \left[\pi \left(\frac{1}{2} \right)^2 (1) \right] = \frac{\pi}{8}.$$

$$7. y = 2\sqrt{x} \Rightarrow ds = \sqrt{\frac{1}{x} + 1} dx \Rightarrow A = \int_0^3 2\sqrt{x} \sqrt{\frac{1}{x} + 1} dx = \frac{4}{3} \left[(1+x)^{3/2} \right]_0^3 = \frac{28}{3}$$

8. This surface is a triangle having a base of $2\pi a$ and a height of $2\pi ak$. Therefore the surface area is

$$\frac{1}{2} (2\pi a)(2\pi ak) = 2\pi^2 a^2 k.$$

$$9. F = ma = t^2 \Rightarrow \frac{d^2}{dt^2} = a = \frac{t^2}{m} \Rightarrow v = \frac{dx}{dt} = \frac{t^3}{3m} + C; v = 0 \text{ when } t = 0 \Rightarrow C = 0 \Rightarrow \frac{dx}{dt} = \frac{t^2}{3m} \Rightarrow x = \frac{t^4}{12m} + C_1;$$

$x = 0$ when $t = 0 \Rightarrow C_1 = 0 \Rightarrow x = \frac{t^4}{12m}$. Then $x = h \Rightarrow t = (12mh)^{1/4}$. The work done is

$$W = \int F dx = \int_0^{(12mh)^{1/4}} F(t) \cdot \frac{dx}{dt} dt = \int_0^{(12mh)^{1/4}} t^2 \cdot \frac{t^3}{3m} dt = \frac{1}{3m} \left[\frac{t^6}{6} \right]_0^{(12mh)^{1/4}} = \left(\frac{1}{18m} \right) (12mh)^{6/4} = \frac{(12mh)^{3/2}}{18m}$$

$$= \frac{12mh \cdot \sqrt{12mh}}{18m} = \frac{2h}{3} \cdot 2\sqrt{3mh} = \frac{4h}{3} \sqrt{3mh}$$

10. Converting to pounds and feet, $2 \text{ lb/in} = \frac{2 \text{ lb}}{1 \text{ in}} \cdot \frac{12 \text{ in}}{1 \text{ ft}} = 24 \text{ lb/ft}$. Thus, $F = 24x \Rightarrow W = \int_0^{1/2} 24x \, dx = \left[12x^2 \right]_0^{1/2} = 3 \text{ ft} \cdot \text{lb}$. Since $W = \frac{1}{2}mv_0^2 - \frac{1}{2}mv_1^2$, where $W = 3 \text{ ft} \cdot \text{lb}$, $m = \left(\frac{1}{10} \text{ lb}\right) \left(\frac{1}{32 \text{ ft/sec}^2}\right) = \frac{1}{320}$ slugs, and $v_1 = 0 \text{ ft/sec}$, we have $3 = \left(\frac{1}{2}\right) \left(\frac{1}{320} v_0^2\right) \Rightarrow v_0^2 = 3 \cdot 640$. For the projectile height, $s = -16t^2 + v_0 t$ (since $s = 0$ at $t = 0$) $\Rightarrow \frac{ds}{dt} = v = -32t + v_0$. At the top of the ball's path, $v = 0 \Rightarrow t = \frac{v_0}{32}$ and the height is $s = -16 \left(\frac{v_0}{32}\right)^2 + v_0 \left(\frac{v_0}{32}\right) = \frac{v_0^2}{64} = \frac{3 \cdot 640}{64} = 30 \text{ ft}$.

11. From the symmetry of $y = 1 - x^n$, n even, about the y -axis for $-1 \leq x \leq 1$, we have $\bar{x} = 0$. To find $\bar{y} = \frac{M_x}{M}$, we use the vertical strips technique. The typical strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{1-x^n}{2}\right)$, length: $1 - x^n$, width: dx , area: $dA = (1 - x^n) dx$, mass: $dm = 1 \cdot dA = (1 - x^n) dx$. The moment of the strip about the x -axis is $\tilde{y} dm = \frac{(1-x^n)^2}{2} dx \Rightarrow M_x = \int_{-1}^1 \frac{(1-x^n)^2}{2} dx = 2 \int_0^1 \frac{1}{2} (1 - 2x^n + x^{2n}) dx = \left[x - \frac{2x^{n+1}}{n+1} + \frac{x^{2n+1}}{2n+1} \right]_0^1 = 1 - \frac{2}{n+1} + \frac{1}{2n+1} = \frac{(n+1)(2n+1) - 2(2n+1) + (n+1)}{(n+1)(2n+1)} = \frac{2n^2 + 3n + 1 - 4n - 2 + n + 1}{(n+1)(2n+1)} = \frac{2n^2}{(n+1)(2n+1)}$. Also, $M = \int_{-1}^1 dA = \int_{-1}^1 (1 - x^n) dx = 2 \int_0^1 (1 - x^n) dx = 2 \left[x - \frac{x^{n+1}}{n+1} \right]_0^1 = 2 \left(1 - \frac{1}{n+1}\right) = \frac{2n}{n+1}$. Therefore, $\bar{y} = \frac{M_x}{M} = \frac{2n^2}{(n+1)(2n+1)} \cdot \frac{(n+1)}{2n} = \frac{n}{2n+1} \Rightarrow \left(0, \frac{n}{2n+1}\right)$ is the location of the centroid. As $n \rightarrow \infty$, $\bar{y} \rightarrow \frac{1}{2}$ so the limiting position of the centroid is $\left(0, \frac{1}{2}\right)$.

12. Align the telephone pole along the x -axis as shown in the accompanying figure. The slope of the top

length of pole is $\frac{\left(\frac{14.5}{8\pi} - \frac{9}{8\pi}\right)}{40} = \frac{1}{8\pi} \cdot \frac{1}{40} \cdot (14.5 - 9) = \frac{5.5}{8\pi \cdot 40} = \frac{11}{8\pi \cdot 80}$. Thus, $y = \frac{9}{8\pi} + \frac{11}{8\pi \cdot 80} x$ is an equation of the line

representing the top of the pole. Then

$$M_y = \int_a^b x \cdot \pi y^2 \, dx = \pi \int_0^{40} x \left[\frac{1}{8\pi} \left(9 + \frac{11}{80} x\right) \right]^2 dx = \frac{1}{64\pi} \int_0^{40} x \left(9 + \frac{11}{80} x\right)^2 dx;$$

$$M = \int_a^b \pi y^2 \, dx = \pi \int_0^{40} \left[\frac{1}{8\pi} \left(9 + \frac{11}{80} x\right) \right]^2 dx = \frac{1}{64\pi} \int_0^{40} \left(9 + \frac{11}{80} x\right)^2 dx. \text{ Thus, } \bar{x} = \frac{M_y}{M} \approx \frac{129,700}{5623.3} \approx 23.06 \text{ (using a calculator to compute the integrals).}$$

By symmetry about the x -axis, $\bar{y} = 0$ so the center of mass is about 23 ft from the top of the pole.

13. (a) Consider a single vertical strip with center of mass (\tilde{x}, \tilde{y}) . If the plate lies to the right of the line, then the moment of this strip about the line $x = b$ is $(\tilde{x} - b) dm = (\tilde{x} - b) \delta \, dA \Rightarrow$ the plate's first moment about $x = b$ is the integral $\int (x - b) \delta \, dA = \int \delta x \, dA - \int \delta b \, dA = M_y - b \delta A$.
- (b) If the plate lies to the left of the line, the moment of a vertical strip about the line $x = b$ is $(b - \tilde{x}) dm = (b - \tilde{x}) \delta \, dA \Rightarrow$ the plate's first moment about $x = b$ is $\int (b - x) \delta \, dA = \int b \delta \, dA - \int \delta x \, dA = b \delta A - M_y$.

14. (a) By symmetry of the plate about the x -axis, $\bar{y} = 0$. A typical vertical strip has center of mass: $(\tilde{x}, \tilde{y}) = (x, 0)$, length: $4\sqrt{ax}$, width: dx , area: $4\sqrt{ax} dx$, mass: $dm = \delta dA = kx \cdot 4\sqrt{ax} dx$, for some proportionality constant k . The moment of the strip about the y -axis is $M_y = \int \tilde{x} dm = \int_0^a 4kx^2\sqrt{ax} dx$
 $= 4k\sqrt{a} \int_0^a x^{5/2} dx = 4k\sqrt{a} \left[\frac{2}{7} x^{7/2} \right]_0^a = 4k a^{1/2} \cdot \frac{2}{7} a^{7/2} = \frac{8ka^4}{7}$. Also, $M = \int dm = \int_0^a 4kx\sqrt{ax} dx$
 $= 4k\sqrt{a} \int_0^a x^{3/2} dx = 4k\sqrt{a} \left[\frac{2}{5} x^{5/2} \right]_0^a = 4k a^{1/2} \cdot \frac{2}{5} a^{5/2} = \frac{8ka^3}{5}$. Thus, $\bar{x} = \frac{M_y}{M} = \frac{8ka^4}{7} \cdot \frac{5}{8ka^3} = \frac{5}{7}a$
 $\Rightarrow (\bar{x}, \bar{y}) = \left(\frac{5a}{7}, 0\right)$ is the center of mass.

(b) A typical horizontal strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(\frac{\frac{y^2}{4a} + a}{2}, y\right) = \left(\frac{y^2 + 4a^2}{8a}, y\right)$, length: $a - \frac{y^2}{4a}$, width: dy , area: $\left(a - \frac{y^2}{4a}\right) dy$, mass: $dm = \delta dA = |y| \left(a - \frac{y^2}{4a}\right) dy$. Thus,
 $M_x = \int \tilde{y} dm = \int_{-2a}^{2a} y |y| \left(a - \frac{y^2}{4a}\right) dy = \int_{-2a}^0 -y^2 \left(a - \frac{y^2}{4a}\right) dy + \int_0^{2a} y^2 \left(a - \frac{y^2}{4a}\right) dy$
 $= \int_{-2a}^0 \left(-ay^2 + \frac{y^4}{4a}\right) dy + \int_0^{2a} \left(ay^2 - \frac{y^4}{4a}\right) dy = \left[-\frac{a}{3}y^3 + \frac{y^5}{20a}\right]_{-2a}^0 + \left[\frac{a}{3}y^3 - \frac{y^5}{20a}\right]_0^{2a} = -\frac{8a^4}{3} + \frac{32a^5}{20a} + \frac{8a^4}{3} - \frac{32a^5}{20a} = 0$;
 $M_y = \int \tilde{x} dm = \int_{-2a}^{2a} \left(\frac{y^2 + 4a^2}{8a}\right) |y| \left(a - \frac{y^2}{4a}\right) dy = \frac{1}{8a} \int_{-2a}^{2a} |y| (y^2 + 4a^2) \left(\frac{4a^2 - y^2}{4a}\right) dy = \frac{1}{32a^2} \int_{-2a}^{2a} |y| (16a^4 - y^4) dy$
 $= \frac{1}{32a^2} \int_{-2a}^0 (-16a^4 y + y^5) dy + \frac{1}{32a^2} \int_0^{2a} (16a^4 y - y^5) dy = \frac{1}{32a^2} \left[-8a^4 y^2 + \frac{y^6}{6}\right]_{-2a}^0 + \frac{1}{32a^2} \left[8a^4 y^2 - \frac{y^6}{6}\right]_0^{2a}$
 $= \frac{1}{32a^2} \left[8a^4 \cdot 4a^2 - \frac{64a^6}{6}\right] + \frac{1}{32a^2} \left[8a^4 \cdot 4a^2 - \frac{64a^6}{6}\right] = \frac{1}{16a^2} \left(32a^6 - \frac{32a^6}{3}\right) = \frac{1}{16a^2} \cdot \frac{2}{3} (32a^6) = \frac{4}{3} a^4$;
 $M = \int dm = \int_{-2a}^{2a} |y| \left(\frac{4a^2 - y^2}{4a}\right) dy = \frac{1}{4a} \int_{-2a}^{2a} |y| (4a^2 - y^2) dy = \frac{1}{4a} \int_{-2a}^0 (-4a^2 y + y^3) dy + \frac{1}{4a} \int_0^{2a} (4a^2 y - y^3) dy$
 $= \frac{1}{4a} \left[-2a^2 y^2 + \frac{y^4}{4}\right]_{-2a}^0 + \frac{1}{4a} \left[2a^2 y^2 - \frac{y^4}{4}\right]_0^{2a} = 2 \cdot \frac{1}{4a} \left(2a^2 \cdot 4a^2 - \frac{16a^4}{4}\right) = \frac{1}{2a} (8a^4 - 4a^4) = 2a^3$. Therefore,
 $\bar{x} = \frac{M_y}{M} = \left(\frac{4}{3}a^4\right) \left(\frac{1}{2a^3}\right) = \frac{2a}{3}$ and $\bar{y} = \frac{M_x}{M} = 0$ is the center of mass.

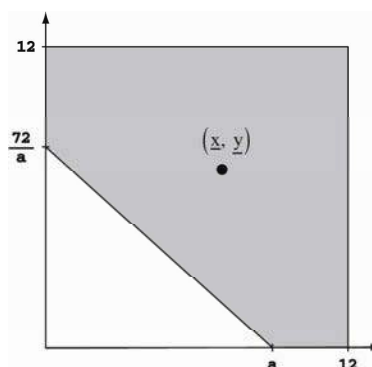

15. (a) On $[0, a]$ a typical vertical strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{\sqrt{b^2 - x^2} + \sqrt{a^2 - x^2}}{2}\right)$, length: $\sqrt{b^2 - x^2} - \sqrt{a^2 - x^2}$, width: dx , area: $dA = \left(\sqrt{b^2 - x^2} - \sqrt{a^2 - x^2}\right) dx$, mass: $dm = \delta dA = \delta \left(\sqrt{b^2 - x^2} - \sqrt{a^2 - x^2}\right) dx$. On $[a, b]$ a typical vertical strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{\sqrt{b^2 - x^2}}{2}\right)$, length: $\sqrt{b^2 - x^2}$, width: dx , area: $dA = \sqrt{b^2 - x^2} dx$, mass: $dm = \delta dA = \delta \sqrt{b^2 - x^2} dx$. Thus,
 $M_x = \int \tilde{y} dm = \int_0^a \frac{1}{2} \left(\sqrt{b^2 - x^2} + \sqrt{a^2 - x^2}\right) \delta \left(\sqrt{b^2 - x^2} - \sqrt{a^2 - x^2}\right) dx + \int_a^b \frac{1}{2} \sqrt{b^2 - x^2} \delta \sqrt{b^2 - x^2} dx$
 $= \frac{\delta}{2} \int_0^a \left[(b^2 - x^2) - (a^2 - x^2)\right] dx + \frac{\delta}{2} \int_a^b (b^2 - x^2) dx = \frac{\delta}{2} \int_0^a (b^2 - a^2) dx + \frac{\delta}{2} \int_a^b (b^2 - x^2) dx$
 $= \frac{\delta}{2} \left[(b^2 - a^2)x\right]_0^a + \frac{\delta}{2} \left[b^2 x - \frac{x^3}{3}\right]_a^b = \frac{\delta}{2} \left[(b^2 - a^2)a\right] + \frac{\delta}{2} \left[\left(b^3 - \frac{b^3}{3}\right) - \left(b^2 a - \frac{a^3}{3}\right)\right]$

$$\begin{aligned}
 &= \frac{\delta}{2}(ab^2 - a^3) + \frac{\delta}{2}\left(\frac{2}{3}b^3 - ab^2 + \frac{a^3}{3}\right) = \frac{\delta b^3}{3} - \frac{\delta a^3}{3} = \delta\left(\frac{b^3 - a^3}{3}\right); \\
 M_y &= \int \tilde{x} \, dm = \int_0^a x \delta(\sqrt{b^2 - x^2} - \sqrt{a^2 - x^2}) \, dx + \int_a^b x \delta \sqrt{b^2 - x^2} \, dx \\
 &= \delta \int_0^a x(b^2 - x^2)^{1/2} \, dx - \delta \int_0^a x(a^2 - x^2)^{1/2} \, dx + \delta \int_a^b x(b^2 - x^2)^{1/2} \, dx \\
 &= -\frac{\delta}{2} \left[\frac{2(b^2 - x^2)^{3/2}}{3} \right]_0^a + \frac{\delta}{2} \left[\frac{2(a^2 - x^2)^{3/2}}{3} \right]_0^a - \frac{\delta}{2} \left[\frac{2(b^2 - x^2)^{3/2}}{3} \right]_a^b \\
 &= -\frac{\delta}{3} \left[(b^2 - a^2)^{3/2} - (b^2)^{3/2} \right] + \frac{\delta}{3} \left[0 - (a^2)^{3/2} \right] - \frac{\delta}{3} \left[0 - (b^2 - a^2)^{3/2} \right] = \frac{\delta b^3}{3} - \frac{\delta a^3}{3} = \frac{\delta(b^3 - a^3)}{3} = M_x;
 \end{aligned}$$

We calculate the mass geometrically: $M = \delta A = \delta\left(\frac{\pi b^2}{4}\right) - \delta\left(\frac{\pi a^2}{4}\right) = \frac{\delta\pi}{4}(b^2 - a^2)$. Thus, $\bar{x} = \frac{M_y}{M}$
 $= \frac{\delta(b^3 - a^3)}{3} \cdot \frac{4}{\delta\pi(b^2 - a^2)} = \frac{4}{3\pi} \left(\frac{b^3 - a^3}{b^2 - a^2} \right) = \frac{4}{3\pi} \frac{(b-a)(a^2 + ab + b^2)}{(b-a)(b+a)} = \frac{4(a^2 + ab + b^2)}{3\pi(a+b)}$; likewise $\bar{y} = \frac{M_x}{M} = \frac{4(a^2 + ab + b^2)}{3\pi(a+b)}$.

- (b) $\lim_{b \rightarrow a} \frac{4}{3\pi} \left(\frac{a^2 + ab + b^2}{a+b} \right) = \left(\frac{4}{3\pi} \right) \left(\frac{a^2 + a^2 + a^2}{a+a} \right) = \left(\frac{4}{3\pi} \right) \left(\frac{3a^2}{2a} \right) = \frac{2a}{\pi} \Rightarrow (\bar{x}, \bar{y}) = \left(\frac{2a}{\pi}, \frac{2a}{\pi} \right)$ is the limiting position of the centroid as $b \rightarrow a$. This is the centroid of a circle of radius a (and we note the two circles coincide when $b = a$).

16. Since the area of the triangle is 36, the diagram may be labeled as shown at the right. The centroid of the triangle is $\left(\frac{a}{3}, \frac{24}{a}\right)$. The shaded portion is $144 - 36 = 108$. Write $(\underline{x}, \underline{y})$ for the centroid of the remaining region. The centroid of the whole square is obviously $(6, 6)$. Think of the square as a sheet of uniform density, so that the centroid of the square is the average of the centroids of the two regions,

weighted by area: $6 = \frac{36\left(\frac{a}{3}\right) + 108(\underline{x})}{144}$ and

$$6 = \frac{36\left(\frac{24}{a}\right) + 108(\underline{y})}{144} \text{ which we solve to get } \underline{x} = 8 - \frac{a}{9}$$

and $\underline{y} = \frac{8(a-1)}{a}$. Set $\underline{x} = 7$ in. (Given). It follows that $a = 9$, whence $\underline{y} = \frac{64}{9} = 7\frac{1}{9}$ in. The distances of the centroid $(\underline{x}, \underline{y})$ from the other sides are easily computed. (Note that if we set $\underline{y} = 7$ in. above, we will find $\underline{x} = 7\frac{1}{9}$.)

17. The submerged triangular plate is depicted in the figure at the right. The hypotenuse of the triangle has slope $-1 \Rightarrow y - (-2) = -(x - 0) \Rightarrow x = -(y + 2)$ is an equation of the hypotenuse. Using a typical horizontal strip, the fluid pressure is

$$\begin{aligned} F &= \int (62.4) \cdot \left(\frac{\text{strip}}{\text{depth}}\right) \cdot \left(\frac{\text{strip}}{\text{length}}\right) dy \\ &= \int_{-6}^{-2} (62.4)(-y)[-y+2] dy \\ &= 62.4 \int_{-6}^{-2} (y^2 + 2y) dy = 62.4 \left[\frac{y^3}{3} + y^2 \right]_{-6}^{-2} \\ &= (62.4) \left[\left(-\frac{8}{3} + 4\right) - \left(-\frac{216}{3} + 36\right) \right] \\ &= (62.4) \left(\frac{208}{3} - 32 \right) = \frac{(62.4)(112)}{3} \approx 2329.6 \text{ lb} \end{aligned}$$

18. Consider a rectangular plate of length ℓ and width w . The length is parallel with the surface of the fluid of weight density ω . The force on one side of the plate is $F = \omega \int_{-w}^0 (-y)(\ell) dy = -\omega \ell \left[\frac{y^2}{2} \right]_{-w}^0 = \frac{\omega \ell w^2}{2}$.

The average force on one side of the plate is

$$\begin{aligned} F_{av} &= \frac{\omega}{w} \int_{-w}^0 (-y) dy = \frac{\omega}{w} \left[-\frac{y^2}{2} \right]_{-w}^0 = \frac{\omega w}{2}. \text{ Therefore the force } \frac{\omega \ell w^2}{2} = \left(\frac{\omega w}{2} \right) (\ell w) \\ &= (\text{the average pressure up and down}) \cdot (\text{the area of the plate}). \end{aligned}$$

 $= 8 + 2 \ln 3 = 8 + \ln 9$
57. (a) $L(x) = f(0) + f'(0) \cdot x$, and $f(x) = \ln(1+x) \Rightarrow f'(x)|_{x=0} = \frac{1}{1+x}|_{x=0} = 1 \Rightarrow L(x) = \ln 1 + 1 \cdot x \Rightarrow L(x) = x$
(b) Let $f(x) = \ln(x+1)$. Since $f''(x) = -\frac{1}{(x+1)^2} < 0$ on $[0, 0.1]$, the graph of f is concave down on this interval and the largest error in the linear approximation will occur when $x = 0.1$. This error is $0.1 - \ln(1.1) \approx 0.00469$ to five decimal places.

- (c) The approximation $y = x$ for $\ln(1 + x)$ is best for smaller positive values of x ; in particular for $0 \leq x \leq 0.1$ in the graph. As x increases, so does the error $x - \ln(1 + x)$. From the graph an upper bound for the error is $0.5 - \ln(1 + 0.5) \approx 0.095$; i.e., $|E(x)| \leq 0.095$ for $0 \leq x \leq 0.5$. Note from the graph that $0.1 - \ln(1 + 0.1) \approx 0.00469$ estimates the error in replacing $\ln(1 + x)$ by x over $0 \leq x \leq 0.1$. This is consistent with the estimate given in part (b) above.

58. (a) $f(x) = e^x \Rightarrow f'(x) = e^x$; $L(x) = f(0) + f'(0)(x - 0) \Rightarrow L(x) = 1 + x$
 (b) $f(0) = 1$ and $L(0) = 1 \Rightarrow$ error $= 0$; $f(0.2) = e^{0.2} \approx 1.22140$ and $L(0.2) = 1.2 \Rightarrow$ error ≈ 0.02140
 (c) Since $y'' = e^x > 0$, the tangent line approximation always lies below the curve $y = e^x$. Thus $L(x) = x + 1$ never overestimates e^x .

59. Note that $y = \ln x$ and $e^y = x$ are the same curve; $\int_1^a \ln x \, dx$ = area under the curve between 1 and a ;
 $\int_0^{\ln a} e^y \, dy$ = area to the left of the curve between 0 and $\ln a$. The sum of these areas is equal to the area of the rectangle $\Rightarrow \int_1^a \ln x \, dx + \int_0^{\ln a} e^y \, dy = a \ln a$.

60. (a) $y = e^x \Rightarrow y'' = e^x > 0$ for all $x \Rightarrow$ the graph of $y = e^x$ is always concave upward
 (b) area of the trapezoid $ABCD < \int_{\ln a}^{\ln b} e^x \, dx < \text{area of the trapezoid } AEF D \Rightarrow \frac{1}{2}(AB + CD)(\ln b - \ln a) < \int_{\ln a}^{\ln b} e^x \, dx < \left(\frac{e^{\ln a} + e^{\ln b}}{2}\right)(\ln b - \ln a)$. Now $\frac{1}{2}(AB + CD)$ is the height of the midpoint $M = e^{(\ln a + \ln b)/2}$ since the curve containing the points B and C is linear
 $\Rightarrow e^{(\ln a + \ln b)/2}(\ln b - \ln a) < \int_{\ln a}^{\ln b} e^x \, dx < \left(\frac{e^{\ln a} + e^{\ln b}}{2}\right)(\ln b - \ln a)$
 (c) $\int_{\ln a}^{\ln b} e^x \, dx = \left[e^x \right]_{\ln a}^{\ln b} = e^{\ln b} - e^{\ln a} = b - a$, so part (b) implies that
 $e^{(\ln a + \ln b)/2}(\ln b - \ln a) < b - a < \left(\frac{e^{\ln a} + e^{\ln b}}{2}\right)(\ln b - \ln a) \Rightarrow e^{(\ln a + \ln b)/2} < \frac{b - a}{\ln b - \ln a} < \frac{a + b}{2}$
 $\Rightarrow e^{\ln a/2} \cdot e^{\ln b/2} < \frac{b - a}{\ln b - \ln a} < \frac{a + b}{2} \Rightarrow \sqrt{e^{\ln a}} \sqrt{e^{\ln b}} < \frac{b - a}{\ln b - \ln a} < \frac{a + b}{2} \Rightarrow \sqrt{ab} < \frac{b - a}{\ln b - \ln a} < \frac{a + b}{2}$

61. $y = \ln kx \Rightarrow y = \ln x + \ln k$; thus the graph of $y = \ln kx$ is the graph of $y = \ln x$ shifted vertically by $\ln k$, $k > 0$.

62. To turn the arches upside down we would use the formula $y = -\ln|\sin x| = \ln \frac{1}{|\sin x|}$.

- (b) $y' = \frac{\cos x}{a + \sin x}$. Since $|\sin x|$ and $|\cos x|$ are less than or equal to 1, we have for $a > 1$, $\frac{-1}{a-1} \leq y' \leq \frac{1}{a-1}$ for all x . Thus, $\lim_{a \rightarrow +\infty} y' = 0$ for all $x \Rightarrow$ the graph of $y \rightarrow +\infty$ looks more and more horizontal as $a \rightarrow +\infty$.

64. (a) The graph of $y = \sqrt{x} - \ln x$ appears to be concave upward for all $x > 0$.

- (b) $y = \sqrt{x} - \ln x \Rightarrow y' = \frac{1}{2\sqrt{x}} - \frac{1}{x} \Rightarrow y'' = -\frac{1}{4x^{3/2}} + \frac{1}{x^2} = \frac{1}{x^2} \left(-\frac{\sqrt{x}}{4} + 1 \right) = 0 \Rightarrow \sqrt{x} = 4 \Rightarrow x = 16$
 Thus, $y'' > 0$ if $0 < x < 16$ and $y'' < 0$ if $x > 16$ so a point of inflection exists at $x = 16$. The graph of $y = \sqrt{x} - \ln x$ closely resembles a straight line for $x \geq 10$ and it is impossible to discuss the point of inflection visually from the graph.

65. From zooming in on the graph at the right, we estimate the third root to be $x \approx -0.76666$

66. The functions $f(x) = x^{\ln 2}$ and $g(x) = 2^{\ln x}$ appear to have identical graphs for $x > 0$. This is no accident, because $x^{\ln 2} = e^{\ln 2 \cdot \ln x} = (e^{\ln 2})^{\ln x} = 2^{\ln x}$.

67. (a) The point of tangency is $(p, \ln p)$ and $m_{\text{tangent}} = \frac{1}{p}$ since $\frac{dy}{dx} = \frac{1}{x}$. The tangent line passes through $(0, 0) \Rightarrow$ the equation of the tangent line is $y = \frac{1}{p}x$. The tangent line also passes through $(p, \ln p) \Rightarrow \ln p = \frac{1}{p}p = 1 \Rightarrow p = e$, and the tangent line equation is $y = \frac{1}{e}x$.
- (b) $\frac{d^2y}{dx^2} = -\frac{1}{x^2}$ for $x \neq 0 \Rightarrow y = \ln x$ is concave downward over its domain. Therefore, $y = \ln x$ lies below the graph of $y = \frac{1}{e}x$ for all $x > 0, x \neq e$, and $\ln x < \frac{x}{e}$ for $x > 0, x \neq e$.
- (c) Multiplying by $e, e \ln x < x$ or $\ln x^e < x$.
- (d) Exponentiating both sides of $\ln x^e < x$, we have $e^{\ln x^e} < e^x$, or $x^e < e^x$ for all positive $x \neq e$.
- (e) Let $x = \pi$ to see that $\pi^e < e^\pi$. Therefore, e^π is bigger.

68. Using Newton's Method: $f(x) = \ln(x) - 1 \Rightarrow f'(x) = \frac{1}{x} \Rightarrow x_{n+1} = x_n - \frac{\ln(x_n) - 1}{\frac{1}{x_n}} \Rightarrow x_{n+1} = x_n[2 - \ln(x_n)]$.
Then $x_1 = 2, x_2 = 2.61370564, x_3 = 2.71624393$, and $x_5 = 2.71828183$. Many other methods may be used. For example, graph $y = \ln x - 1$ and determine the zero of y .

69. (a) $\log_3 8 = \frac{\ln 8}{\ln 3} \approx 1.89279$ (b) $\log_7 0.5 = \frac{\ln 0.5}{\ln 7} \approx -0.35621$
(c) $\log_{20} 17 = \frac{\ln 17}{\ln 20} \approx 0.94575$ (d) $\log_{0.5} 7 = \frac{\ln 7}{\ln 0.5} \approx -2.80735$
(e) $\ln x = (\log_{10} x)(\ln 10) = 2.3 \ln 10 \approx 5.29595$ (f) $\ln x = (\log_2 x)(\ln 2) = 1.4 \ln 2 \approx 0.97041$
(g) $\ln x = (\log_2 x)(\ln 2) = -1.5 \ln 2 \approx -1.03972$ (h) $\ln x = (\log_{10} x)(\ln 10) = -0.7 \ln 10 \approx -1.61181$

70. (a) $\frac{\ln 10}{\ln 2} \cdot \log_{10} x = \frac{\ln 10}{\ln 2} \cdot \frac{\ln x}{\ln 10} = \frac{\ln x}{\ln 2} = \log_2 x$ (b) $\frac{\ln a}{\ln b} \cdot \log_4 x = \frac{\ln a}{\ln b} \cdot \frac{\ln x}{\ln a} = \frac{\ln x}{\ln b} = \log_b x$

7.2 EXPONENTIAL CHANGE AND SEPARABLE DIFFERENTIAL EQUATIONS

1. (a) $y = e^{-x} \Rightarrow y' = -e^{-x} \Rightarrow 2y' + 3y = 2(-e^{-x}) + 3e^{-x} = e^{-x}$
 (b) $y = e^{-x} + e^{-3x/2} \Rightarrow y' = -e^{-x} - \frac{3}{2}e^{-3x/2} \Rightarrow 2y' + 3y = 2(-e^{-x} - \frac{3}{2}e^{-3x/2}) + 3(e^{-x} + e^{-3x/2}) = e^{-x}$
 (c) $y = e^{-x} + Ce^{-3x/2} \Rightarrow y' = -e^{-x} - \frac{3}{2}Ce^{-3x/2} \Rightarrow 2y' + 3y = 2(-e^{-x} - \frac{3}{2}Ce^{-3x/2}) + 3(e^{-x} + Ce^{-3x/2}) = e^{-x}$

 $\Rightarrow x^2 y' + xy = e^x$
4. $y = \frac{1}{\sqrt{1+x^4}} \int_1^x \sqrt{1+t^4} dt \Rightarrow y' = -\frac{1}{2} \left[\frac{4x^3}{(\sqrt{1+x^4})^3} \right] \int_1^x \sqrt{1+t^4} dt + \frac{1}{\sqrt{1+x}} (\sqrt{1+x^4})$
 $\Rightarrow y' = \left(\frac{-2x^3}{1+x^4}\right) \left(\frac{1}{\sqrt{1+x^4}} \int_1^x \sqrt{1+t^4} dt\right) + 1 \Rightarrow y' = \left(\frac{-2x^3}{1+x^4}\right) y + 1 \Rightarrow y' + \frac{2x^3}{1+x^4} \cdot y = 1$
5. $y = e^{-x} \tan^{-1}(2e^x) \Rightarrow y' = -e^{-x} \tan^{-1}(2e^x) + e^{-x} \left[\frac{1}{1+(2e^x)^2} \right] (2e^x) = -e^{-x} \tan^{-1}(2e^x) + \frac{2}{1+4e^{2x}}$
 $\Rightarrow y' = -y + \frac{2}{1+4e^{2x}} \Rightarrow y' + y = \frac{2}{1+4e^{2x}}; y(-\ln 2) = e^{-(-\ln 2)} \tan^{-1}(2e^{-\ln 2}) = 2 \tan^{-1} 1 = 2\left(\frac{\pi}{4}\right) = \frac{\pi}{2}$
6. $y = (x-2)e^{-x^2} \Rightarrow y' = e^{-x^2} + (-2xe^{-x^2})(x-2) \Rightarrow y' = e^{-x^2} - 2xy; y(2) = (2-2)e^{-2^2} = 0$
7. $y = \frac{\cos x}{x} \Rightarrow y' = \frac{-x \sin x - \cos x}{x^2} \Rightarrow y' = -\frac{\sin x}{x} - \frac{1}{x} \left(\frac{\cos x}{x}\right) \Rightarrow y' = -\frac{\sin x}{x} - \frac{y}{x} \Rightarrow xy' = -\sin x - y$
 $\Rightarrow xy' + y = -\sin x; y\left(\frac{\pi}{2}\right) = \frac{\cos(\pi/2)}{(\pi/2)} = 0$
8. $y = \frac{x}{\ln x} \Rightarrow y' = \frac{\ln x - x(\frac{1}{x})}{(\ln x)^2} \Rightarrow y' = \frac{1}{\ln x} - \frac{1}{(\ln x)^2} \Rightarrow x^2 y' = \frac{x^2}{\ln x} - \frac{x^2}{(\ln x)^2} \Rightarrow x^2 y' = xy - y^2; y(e) = \frac{e}{\ln e} = e.$
9. $2\sqrt{xy} \frac{dy}{dx} = 1 \Rightarrow 2x^{1/2} y^{1/2} dy = dx \Rightarrow 2y^{1/2} dy = x^{-1/2} dx \Rightarrow \int 2y^{1/2} dy = \int x^{-1/2} dx$
 $\Rightarrow 2\left(\frac{2}{3}y^{3/2}\right) = 2x^{1/2} + C_1 \Rightarrow \frac{2}{3}y^{3/2} - x^{1/2} = C, \text{ where } C = \frac{1}{2}C_1$
10. $\frac{dy}{dx} = x^2 \sqrt{y} \Rightarrow dy = x^2 y^{1/2} dx \Rightarrow y^{-1/2} dy = x^2 dx \Rightarrow \int y^{-1/2} dy = \int x^2 dx \Rightarrow 2y^{1/2} = \frac{x^3}{3} + C \Rightarrow 2y^{1/2} - \frac{1}{3}x^3 = C$

11. $\frac{dy}{dx} = e^{x-y} \Rightarrow dy = e^x e^{-y} dx \Rightarrow e^y dy = e^x dx \Rightarrow \int e^y dy = \int e^x dx \Rightarrow e^y = e^x + C \Rightarrow e^y - e^x = C$
12. $\frac{dy}{dx} = 3x^2 e^{-y} \Rightarrow dy = 3x^2 e^{-y} dx \Rightarrow e^y dy = 3x^2 dx \Rightarrow \int e^y dy = \int 3x^2 dx \Rightarrow e^y = x^3 + C \Rightarrow e^y - x^3 = C$
13. $\frac{dy}{dx} = \sqrt{y} \cos^2 \sqrt{y} \Rightarrow dy = (\sqrt{y} \cos^2 \sqrt{y}) dx \Rightarrow \frac{\sec^2 \sqrt{y}}{\sqrt{y}} dy = dx \Rightarrow \int \frac{\sec^2 \sqrt{y}}{\sqrt{y}} dy = \int dx$. In the integral on the left-hand side, substitute $u = \sqrt{y} \Rightarrow du = \frac{1}{2\sqrt{y}} dy \Rightarrow 2 du = \frac{1}{\sqrt{y}} dy$, and we have
 $\int \sec^2 u du = \int dx \Rightarrow 2 \tan u = x + C \Rightarrow -x + 2 \tan \sqrt{y} = C$
14. $\sqrt{2xy} \frac{dy}{dx} = 1 \Rightarrow dy = \frac{1}{\sqrt{2xy}} dx \Rightarrow \sqrt{2} \sqrt{y} dy = \frac{1}{\sqrt{x}} dx \Rightarrow \sqrt{2} y^{1/2} dy = x^{-1/2} dx \Rightarrow \sqrt{2} \int y^{1/2} dy = \int x^{-1/2} dx$
 $\Rightarrow \sqrt{2} \frac{y^{3/2}}{3/2} dy = \frac{x^{1/2}}{1/2} + C_1 \Rightarrow \sqrt{2} y^{3/2} = 3\sqrt{x} + \frac{3}{2} C_1 \Rightarrow \sqrt{2} (\sqrt{y})^3 - 3\sqrt{x} = C$, where $C = \frac{3}{2} C_1$
15. $\sqrt{x} \frac{dy}{dx} = e^{y+\sqrt{x}} \Rightarrow \frac{dy}{dx} = \frac{e^y e^{\sqrt{x}}}{\sqrt{x}} \Rightarrow dy = \frac{e^y e^{\sqrt{x}}}{\sqrt{x}} dx \Rightarrow e^{-y} dy = \frac{e^{\sqrt{x}}}{\sqrt{x}} dx \Rightarrow \int e^{-y} dy = \int \frac{e^{\sqrt{x}}}{\sqrt{x}} dx$. In the integral on the right-hand side, substitute $u = \sqrt{x} \Rightarrow du = \frac{1}{2\sqrt{x}} dx \Rightarrow 2 du = \frac{1}{\sqrt{x}} dx$, and we have
 $\int e^{-y} dy = 2 \int e^u du \Rightarrow -e^{-y} = 2e^u + C_1 \Rightarrow -e^{-y} = 2e^{\sqrt{x}} + C$, where $C = -C_1$
16. $(\sec x) \frac{dy}{dx} = e^{y+\sin x} \Rightarrow \frac{dy}{dx} = e^{y+\sin x} \cos x \Rightarrow dy = (e^y e^{\sin x} \cos x) dx \Rightarrow e^{-y} dy = e^{\sin x} \cos x dx$
 $\Rightarrow \int e^{-y} dy = \int e^{\sin x} \cos x dx \Rightarrow -e^{-y} = e^{\sin x} + C_1 \Rightarrow e^{-y} + e^{\sin x} = C$, where $C = -C_1$
17. $\frac{dy}{dx} = 2x\sqrt{1-y^2} \Rightarrow dy = 2x\sqrt{1-y^2} dx \Rightarrow \frac{dy}{\sqrt{1-y^2}} = 2x dx \Rightarrow \int \frac{dy}{\sqrt{1-y^2}} = \int 2x dx \Rightarrow \sin^{-1} y = x^2 + C$ since
 $|y| < 1 \Rightarrow y = \sin(x^2 + C)$
18. $\frac{dy}{dx} = \frac{e^{2x-y}}{e^{x+y}} \Rightarrow dy = \frac{e^{2x-y}}{e^{x+y}} dx \Rightarrow dy = \frac{e^{2x} e^{-y}}{e^x e^y} dx = \frac{e^x}{e^{2y}} dx \Rightarrow e^{2y} dy = e^x dx \Rightarrow \int e^{2y} dy = \int e^x dx \Rightarrow \frac{e^{2y}}{2} = e^x + C_1$
 $\Rightarrow e^{2y} - 2e^x = C$ where $C = 2C_1$
19. $y^2 \frac{dy}{dx} = 3x^2 y^3 - 6x^2 \Rightarrow y^2 dy = 3x^2 (y^3 - 2) dx \Rightarrow \frac{y^2}{y^3 - 2} dy = 3x^2 dx \Rightarrow \int \frac{y^2}{y^3 - 2} dy = \int 3x^2 dx$
 $\Rightarrow \frac{1}{3} \ln |y^3 - 2| = x^3 + C$
20. $\frac{dy}{dx} = xy + 3x - 2y - 6 = (y+3)(x-2) \Rightarrow \frac{1}{y+3} dy = (x-2) dx \Rightarrow \int \frac{1}{y+3} dy = \int (x-2) dx$
 $\Rightarrow \ln |y+3| = \frac{1}{2} x^2 - 2x + C$

21. $\frac{1}{x} \frac{dy}{dx} = ye^{x^2} + 2\sqrt{y}e^{x^2} = e^{x^2}(y + 2\sqrt{y}) \Rightarrow \frac{1}{y+2\sqrt{y}} dy = xe^{x^2} dx \Rightarrow \int \frac{1}{y+2\sqrt{y}} dy = \int xe^{x^2} dx$
 $\Rightarrow \int \frac{1}{\sqrt{y}(\sqrt{y}+2)} dy = \int xe^{x^2} dx \Rightarrow 2 \ln|\sqrt{y}+2| = \frac{1}{2}e^{x^2} + C \Rightarrow 4 \ln|\sqrt{y}+2| = e^{x^2} + C \Rightarrow 4 \ln(\sqrt{y}+2) = e^{x^2} + C$
22. $\frac{dy}{dx} = e^{x-y} + e^x + e^{-y} + 1 = (e^{-y} + 1)(e^x + 1) \Rightarrow \frac{1}{e^{-y}+1} dy = (e^x + 1) dx \Rightarrow \int \frac{1}{e^{-y}+1} dy = \int (e^x + 1) dx$
 $\Rightarrow \int \frac{e^y}{1+e^y} dy = \int (e^x + 1) dx \Rightarrow \ln|1+e^y| = e^x + x + C \Rightarrow \ln(1+e^y) = e^x + x + C$
23. (a) $y = y_0 e^{kt} \Rightarrow 0.99y_0 = y_0 e^{1000k} \Rightarrow k = \frac{\ln 0.99}{1000} \approx -0.00001$
 (b) $0.9 = e^{(-0.00001)t} \Rightarrow (-0.00001)t = \ln(0.9) \Rightarrow t = \frac{\ln(0.9)}{-0.00001} \approx 10,536$ years
 (c) $y = y_0 e^{(20,000)k} \approx y_0 e^{-0.2} = y_0(0.82) \Rightarrow 82\%$
24. (a) $\frac{dp}{dh} = kp \Rightarrow p = p_0 e^{kh}$ where $p_0 = 1013$; $90 = 1013e^{20k} \Rightarrow k = \frac{\ln(90) - \ln(1013)}{20} \approx -0.121$
 (b) $p = 1013e^{-6.05} \approx 2.389$ millibars
 (c) $900 = 1013e^{(-0.121)h} \Rightarrow -0.121h = \ln\left(\frac{900}{1013}\right) \Rightarrow h = \frac{\ln(1013) - \ln(900)}{0.121} \approx 0.9777$ km
25. $\frac{dy}{dt} = -0.6y \Rightarrow y = y_0 e^{-0.6t}$; $y_0 = 100 \Rightarrow y = 100e^{-0.6t} \Rightarrow y = 100e^{-0.6} \approx 54.88$ grams when $t = 1$ hr
26. $A = A_0 e^{kt} \Rightarrow 800 = 1000e^{10k} \Rightarrow k = \frac{\ln(0.8)}{10} \Rightarrow A = 1000e^{(\ln(0.8)/10)t}$, where A represents the amount of sugar that remains after time t . Thus after another 14 hrs, $A = 1000e^{(\ln(0.8)/10)24} \approx 585.35$ kg
27. $L(x) = L_0 e^{-kx} \Rightarrow \frac{L_0}{2} = L_0 e^{-18k} \Rightarrow \ln \frac{1}{2} = -18k \Rightarrow k = \frac{\ln 2}{18} \approx 0.0385 \Rightarrow L(x) = L_0 e^{-0.0385x}$; when the intensity is one-tenth of the surface value, $\frac{L_0}{10} = L_0 e^{-0.0385x} \Rightarrow \ln 10 = 0.0385x \Rightarrow x \approx 59.8$ ft
28. $V(t) = V_0 e^{-t/40} \Rightarrow 0.1V_0 = V_0 e^{-t/40}$ when the voltage is 10% of its original value $\Rightarrow t = -40 \ln(0.1) \approx 92.1$ sec
29. $y = y_0 e^{kt}$ and $y_0 = 1 \Rightarrow y = e^{kt} \Rightarrow$ at $y = 2$ and $t = 0.5$ we have $2 = e^{0.5k} \Rightarrow \ln 2 = 0.5k \Rightarrow k = \frac{\ln 2}{0.5} = \ln 4$.
 Therefore, $y = e^{(\ln 4)t} \Rightarrow y = e^{24 \ln 4} = 4^{24} = 2.81474978 \times 10^{14}$ at the end of 24 hrs
30. $y = y_0 e^{kt}$ and $y(3) = 10,000 \Rightarrow 10,000 = y_0 e^{3k}$; also $y(5) = 40,000 = y_0 e^{5k}$. Therefore $y_0 e^{5k} = 4y_0 e^{3k} \Rightarrow e^{5k} = 4e^{3k} \Rightarrow e^{2k} = 4 \Rightarrow k = \ln 2$. Thus, $y = y_0 e^{(\ln 2)t} \Rightarrow 10,000 = y_0 e^{3 \ln 2} = y_0 e^{\ln 8} \Rightarrow 10,000 = 8y_0 \Rightarrow y_0 = \frac{10,000}{8} = 1250$
31. (a) $10,000e^{k(1)} = 7500 \Rightarrow e^k = 0.75 \Rightarrow k = \ln 0.75$ and $y = 10,000e^{(\ln 0.75)t}$. Now $1000 = 10,000e^{(\ln 0.75)t} \Rightarrow \ln 0.1 = (\ln 0.75)t \Rightarrow t = \frac{\ln 0.1}{\ln 0.75} \approx 8.00$ years (to the nearest hundredth of a year)
 (b) $1 = 10,000e^{(\ln 0.75)t} \Rightarrow \ln 0.0001 = (\ln 0.75)t \Rightarrow t = \frac{\ln 0.0001}{\ln 0.75} \approx 32.02$ years (to the nearest hundredth of a year)

32. Let $z = r - ky$. Then $\frac{dz}{dt} = -k \frac{dy}{dt} = -k(r - ky) = -kz$. The equation $dz/dt = -kz$ has solution $z = ce^{-kt}$, so

$$r - ky = ce^{-kt} \text{ and } y = \frac{1}{k}(r - ce^{-kt}).$$

(a) Since $y(0) = y_0$, we have $y_0 = \frac{1}{k}(r - c)$ and thus $c = r - ky_0$. So

$$y = \frac{1}{k}(r - [r - ky_0]e^{-kt}) = \left(y_0 - \frac{r}{k}\right)e^{-kt} + \frac{r}{k}.$$

(b) Since $k > 0$, $\lim_{t \rightarrow \infty} \left[\left(y_0 - \frac{r}{k}\right)e^{-kt} + \frac{r}{k} \right] = \frac{r}{k}$.

33. Let $y(t)$ be the population at time t , so $t(0) = 1147$ and we are interested in $t(20)$. If the population continues to decline at 39% per year, the population in 20 years would be $1147 \cdot (0.61)^{20} \approx 0.06 < 1$, so the species would be extinct.

34. (a) We will ignore leap years. There are $(60)(60)(24)(365) = 31,536,000$ seconds in a year. Thus, assuming exponential growth, $P = 314,419,198e^{kt}$, with t in years, and

$$314,419,199 = 314,419,198e^{12k/31,536,000} \Rightarrow k = \frac{31,536,000}{12} \ln \left(\frac{314,419,199}{314,419,198} \right) \approx 0.0083583.$$

(You don't really need to compute that logarithm: it will be very nearly equal to 1 over the denominator of the fraction.)

(b) In seven years, $P = 314,419,198e^{(0.0083583)(7)} \approx 333,664,000$. (We certainly can't estimate this population to better than six significant digits.)

35. $0.9P_0 = P_0e^k \Rightarrow k = \ln 0.9$; when the well's output falls to one-fifth of its present value $P = 0.2P_0$
 $\Rightarrow 0.2P_0 = P_0e^{(\ln 0.9)t} \Rightarrow 0.2 = e^{(\ln 0.9)t} \Rightarrow \ln(0.2) = (\ln 0.9)t \Rightarrow t = \frac{\ln 0.2}{\ln 0.9} \approx 15.28$ yr

36. (a) $\frac{dp}{dx} = -\frac{1}{100}p \Rightarrow \frac{dp}{p} = -\frac{1}{100}dx \Rightarrow \ln p = -\frac{1}{100}x + C \Rightarrow p = e^{(-0.01x+C)} = e^C e^{-0.01x} = C_1 e^{-0.01x}$;

$$p(100) = 20.09 \Rightarrow 20.09 = C_1 e^{(-0.01)(100)} \Rightarrow C_1 = 20.09e \approx 54.61 \Rightarrow p(x) = 54.61e^{-0.01x} \text{ (in dollars)}$$

(b) $p(10) = 54.61e^{(-0.01)(10)} = \49.41 , and $p(90) = 54.61e^{(-0.01)(90)} = \22.20

(c) $r(x) = xp(x) \Rightarrow r'(x) = p(x) + xp'(x)$;

$$p'(x) = -0.5461e^{-0.01x}$$

$$\Rightarrow r'(x) = (54.61 - .5461x)e^{-0.01x}. \text{ Thus,}$$

$$r'(x) = 0 \Rightarrow 54.61 = .5461x \Rightarrow x = 100. \text{ Since}$$

$r' > 0$ for any $x < 100$ and $r' < 0$ for $x > 100$,

then $r(x)$ must be a maximum at $x = 100$.

37. $A = A_0 e^{kt}$ and $A_0 = 10 \Rightarrow A = 10e^{kt}$, $5 = 10e^{k(24360)} \Rightarrow k = \frac{\ln(0.5)}{24360} \approx -0.000028454 \Rightarrow A = 10e^{-0.000028454t}$,
 then $0.2(10) = 10e^{-0.000028454t} \Rightarrow t = \frac{\ln 0.2}{-0.000028454} \approx 56563$ years
38. $A = A_0 e^{kt}$ and $\frac{1}{2}A_0 = A_0 e^{139k} \Rightarrow \frac{1}{2} = e^{139k} \Rightarrow k = \frac{\ln(0.5)}{139} \approx -0.00499$; then

75. Let $E(x) = \frac{f(x)+f(-x)}{2}$ and $O(x) = \frac{f(x)-f(-x)}{2}$. Then $E(x) + O(x) = \frac{f(x)+f(-x)}{2} + \frac{f(x)-f(-x)}{2} = \frac{2f(x)}{2} = f(x)$.

Also, $E(-x) = \frac{f(-x)+f(-(-x))}{2} = \frac{f(-x)+f(x)}{2} = E(x) \Rightarrow E(x)$ is even, and $O(-x) = \frac{f(-x)-f(-(-x))}{2} = -\frac{f(x)-f(-x)}{2} = -O(x) \Rightarrow O(x)$ is odd. Consequently, $f(x)$ can be written as a sum of an even and an odd function. $f(x) = \frac{f(x)+f(-x)}{2}$ because $\frac{f(x)-f(-x)}{2} = 0$ if f is even, and $f(x) = \frac{f(x)-f(-x)}{2}$ because $\frac{f(x)+f(-x)}{2} = 0$ if f is odd. Thus, if f is even $f(x) = \frac{2f(x)}{2} + 0$ and if f is odd, $f(x) = 0 + \frac{2f(x)}{2}$

85. To find the length of the curve: $y = \frac{1}{a} \cosh ax \Rightarrow y' = \sinh ax \Rightarrow L = \int_0^b \sqrt{1 + (\sinh ax)^2} dx \Rightarrow L = \int_0^b \cosh ax dx$
 $= \left[\frac{1}{a} \sinh ax \right]_0^b = \frac{1}{a} \sinh ab$. The area under the curve is $A = \int_0^b \frac{1}{a} \cosh ax dx = \left[\frac{1}{a^2} \sinh ax \right]_0^b = \frac{1}{a^2} \sinh ab$
 $= \left(\frac{1}{a}\right)\left(\frac{1}{a} \sinh ab\right)$ which is the area of the rectangle of height $\frac{1}{a}$ and length L as claimed, and which is illustrated below.

86. (a) Let the point located at $(\cosh u, 0)$ be called T . Then $A(u) =$ area of the triangle $\triangle OATP$ minus the area under the curve $y = \sqrt{x^2 - 1}$ from A to $T \Rightarrow A(u) = \frac{1}{2} \cosh u \sinh u - \int_1^{\cosh u} \sqrt{x^2 - 1} dx$.
 (b) $A(u) = \frac{1}{2} \cosh u \sinh u - \int_1^{\cosh u} \sqrt{x^2 - 1} dx \Rightarrow A'(u) = \frac{1}{2}(\cosh^2 u + \sinh^2 u) - (\sqrt{\cosh^2 u - 1})(\sinh u)$
 $= \frac{1}{2} \cosh^2 u + \frac{1}{2} \sinh^2 u - \sinh^2 u = \frac{1}{2}(\cosh^2 u - \sinh^2 u) = \left(\frac{1}{2}\right)(1) = \frac{1}{2}$
 (c) $A'(u) = \frac{1}{2} \Rightarrow A(u) = \frac{u}{2} + C$, and from part (a) we have $A(0) = 0 \Rightarrow C = 0 \Rightarrow A(u) = \frac{u}{2} \Rightarrow u = 2A$

11. If $f(x)$ and $g(x)$ grow at the same rate, then $\lim_{x \rightarrow \infty} \frac{f(x)}{g(x)} = L \neq 0 \Rightarrow \lim_{x \rightarrow \infty} \frac{g(x)}{f(x)} = \frac{1}{L} \neq 0$. Then $\left| \frac{f(x)}{g(x)} - L \right| < 1$ if x is sufficiently large $\Rightarrow L - 1 < \frac{f(x)}{g(x)} < L + 1 \Rightarrow \frac{f(x)}{g(x)} \leq |L| + 1$ if x is sufficiently large $\Rightarrow f = O(g)$. Similarly, $\frac{g(x)}{f(x)} \leq \left| \frac{1}{L} \right| + 1 \Rightarrow g = O(f)$.
12. When the degree of f is less than the degree of g since in that case $\lim_{x \rightarrow \infty} \frac{f(x)}{g(x)} = 0$.

13. When the degree of f is less than or equal to the degree of g since $\lim_{x \rightarrow \infty} \frac{f(x)}{g(x)} = 0$ when the degree of f is smaller than the degree of g , and $\lim_{x \rightarrow \infty} \frac{f(x)}{g(x)} = \frac{a}{b}$ (the ratio of the leading coefficients) when the degrees are the same.

14. Polynomials of a greater degree grow at a greater rate than polynomials of a lesser degree. Polynomials of the same degree grow at the same rate.

17. $\lim_{x \rightarrow \infty} \frac{\sqrt{10x+1}}{\sqrt{x}} = \sqrt{\lim_{x \rightarrow \infty} \frac{10x+1}{x}} = \sqrt{10}$ and $\lim_{x \rightarrow \infty} \frac{\sqrt{x+1}}{\sqrt{x}} = \sqrt{\lim_{x \rightarrow \infty} \frac{x+1}{x}} = \sqrt{1} = 1$. Since the growth rate is transitive, we conclude that $\sqrt{10x+1}$ and $\sqrt{x+1}$ have the same growth rate (that of \sqrt{x}).

18. $\lim_{x \rightarrow \infty} \frac{\sqrt{x^4+x}}{x^2} = \sqrt{\lim_{x \rightarrow \infty} \frac{x^4+x}{x^4}} = 1$ and $\lim_{x \rightarrow \infty} \frac{\sqrt{x^4-x^3}}{x^2} = \sqrt{\lim_{x \rightarrow \infty} \frac{x^4-x^3}{x^4}} = 1$. Since the growth rate is transitive, we conclude that $\sqrt{x^4+x}$ and $\sqrt{x^4-x^3}$ have the same growth rate (that of x^2).

19. $\lim_{x \rightarrow \infty} \frac{x^n}{e^x} = \lim_{x \rightarrow \infty} \frac{nx^{n-1}}{e^x} = \dots = \lim_{x \rightarrow \infty} \frac{n!}{e^x} = 0 \Rightarrow x^n = o(e^x)$ for any non-negative integer n

20. If $p(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0$, then

$\lim_{x \rightarrow \infty} \frac{p(x)}{e^x} = a_n \lim_{x \rightarrow \infty} \frac{x^n}{e^x} + a_{n-1} \lim_{x \rightarrow \infty} \frac{x^{n-1}}{e^x} + \dots + a_1 \lim_{x \rightarrow \infty} \frac{x}{e^x} + a_0 \lim_{x \rightarrow \infty} \frac{1}{e^x}$ where each limit is zero (from Exercise

19). Therefore, $\lim_{x \rightarrow \infty} \frac{p(x)}{e^x} = 0 \Rightarrow e^x$ grows faster than any polynomial.

21. (a) $\lim_{x \rightarrow \infty} \frac{x^{1/n}}{\ln x} = \lim_{x \rightarrow \infty} \frac{x(1-n)/n}{n\left(\frac{1}{x}\right)} = \left(\frac{1}{n}\right) \lim_{x \rightarrow \infty} x^{1/n} = \infty \Rightarrow \ln x = o(x^{1/n})$ for any positive integer n

(b) $\ln(e^{17,000,000}) = 17,000,000 < (e^{17 \times 10^6})^{1/10^6} = e^{17} \approx 24,154,952.75$

(c) $x \approx 3.430631121 \times 10^{15}$

(d) In the interval $[3.41 \times 10^{15}, 3.45 \times 10^{15}]$ we have $\ln x = 10 \ln(\ln x)$. The graphs cross at about 3.4306311×10^{15} .

22. $\lim_{x \rightarrow \infty} \frac{\ln x}{a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x + a_0} = \frac{\lim_{x \rightarrow \infty} \left(\frac{\ln x}{x^n}\right)}{\lim_{x \rightarrow \infty} \left(a_n + \frac{a_{n-1}}{x} + \dots + \frac{a_1}{x^{n-1}} + \frac{a_0}{x^n}\right)} = \frac{\lim_{x \rightarrow \infty} \left[\frac{1/x}{nx^{n-1}}\right]}{a_n} = \lim_{x \rightarrow \infty} \frac{1}{(a_n)(nx^n)} = 0 \Rightarrow \ln x$ grows slower

than any non-constant polynomial ($n \geq 1$)

23. (a) $\lim_{n \rightarrow \infty} \frac{n \log_2 n}{n(\log_2 n)^2} = \lim_{n \rightarrow \infty} \frac{1}{\log_2 n} = 0 \Rightarrow n \log_2 n$
grows slower than $n(\log_2 n)^2$;

$$\lim_{n \rightarrow \infty} \frac{n \log_2 n}{n^{3/2}} = \lim_{n \rightarrow \infty} \frac{\left(\frac{\ln n}{\ln 2}\right)}{n^{1/2}} = \frac{1}{\ln 2} \lim_{n \rightarrow \infty} \frac{\left(\frac{1}{n}\right)}{\left(\frac{1}{2}\right)n^{-1/2}}$$

$$= \frac{2}{\ln 2} \lim_{n \rightarrow \infty} \frac{1}{n^{1/2}} = 0 \Rightarrow n \log_2 n \text{ grows slower}$$

than $n^{3/2}$. Therefore, $n \log_2 n$ grows at the slowest rate \Rightarrow the algorithm that takes $O(n \log_2 n)$ steps is the most efficient in the long run.

24. (a) $\lim_{n \rightarrow \infty} \frac{(\log_2 n)^2}{n} = \lim_{n \rightarrow \infty} \frac{\left(\frac{\ln n}{\ln 2}\right)^2}{n} = \lim_{n \rightarrow \infty} \frac{(\ln n)^2}{n(\ln 2)^2} = \lim_{n \rightarrow \infty} \frac{2(\ln n)\left(\frac{1}{n}\right)}{(\ln 2)^2} = \frac{2}{(\ln 2)^2} \lim_{n \rightarrow \infty} \frac{\ln n}{n} = \frac{2}{(\ln 2)^2} \lim_{n \rightarrow \infty} \frac{\left(\frac{1}{n}\right)}{1} = 0$

$$\Rightarrow (\log_2 n)^2 \text{ grows slower than } n; \lim_{n \rightarrow \infty} \frac{(\log_2 n)^2}{\sqrt{n} \log_2 n} = \lim_{n \rightarrow \infty} \frac{\log_2 n}{\sqrt{n}} = \lim_{n \rightarrow \infty} \frac{\left(\frac{\ln n}{\ln 2}\right)}{n^{1/2}} = \frac{1}{\ln 2} \lim_{n \rightarrow \infty} \frac{\ln n}{n^{1/2}}$$

$$= \frac{1}{\ln 2} \lim_{x \rightarrow \infty} \frac{\left(\frac{1}{x}\right)}{\left(\frac{1}{2}\right)x^{-1/2}} = \frac{2}{\ln 2} \lim_{x \rightarrow \infty} \frac{1}{x^{1/2}} = 0$$

$\Rightarrow (\log_2 n)^2$ grows slower than $\sqrt{n} \log_2 n$.

Therefore $(\log_2 n)^2$ grows at the slowest rate \Rightarrow the algorithm that takes $O((\log_2 n)^2)$ steps is the most efficient in the long run.

25. It could take one million steps for a sequential search, but at most 20 steps for a binary search because $2^{19} = 524,288 < 1,000,000 < 1,048,576 = 2^{20}$.

26. It could take 450,000 steps for a sequential search, but at most 19 steps for a binary search because $2^{18} = 262,144 < 450,000 < 524,288 = 2^{19}$.

37. $x dy - (y + \sqrt{y}) dx = 0 \Rightarrow \frac{dy}{(y + \sqrt{y})} = \frac{dx}{x} \Rightarrow 2 \ln(\sqrt{y} + 1) = \ln x + C$. We have $y(1) = 1 \Rightarrow 2 \ln(\sqrt{1} + 1) = \ln 1 + C \Rightarrow 2 \ln 2 = C = \ln 2^2 = \ln 4$. So $2 \ln(\sqrt{y} + 1) = \ln x + \ln 4 = \ln(4x) \Rightarrow \ln(\sqrt{y} + 1) = \frac{1}{2} \ln(4x) = \ln(4x)^{1/2} \Rightarrow e^{\ln(\sqrt{y} + 1)} = e^{\ln(4x)^{1/2}} \Rightarrow \sqrt{y} + 1 = 2\sqrt{x} \Rightarrow y = (2\sqrt{x} - 1)^2$

38. $y^{-2} \frac{dx}{dy} = \frac{e^x}{e^{2x+1}} \Rightarrow \frac{e^{2x+1}}{e^x} dx = \frac{dy}{y^{-2}} \Rightarrow \frac{y^3}{3} = e^x - e^{-x} + C$. We have $y(0) = 1 \Rightarrow \frac{(1)^3}{3} = e^0 - e^0 + C \Rightarrow C = \frac{1}{3}$. So $\frac{y^3}{3} = e^x - e^{-x} + \frac{1}{3} \Rightarrow y^3 = 3(e^x - e^{-x}) + 1 \Rightarrow y = \left[3(e^x - e^{-x}) + 1 \right]^{1/3}$

39. Since the half life is 5730 years and $A(t) = A_0 e^{kt}$ we have $\frac{A_0}{2} = A_0 e^{5730k} \Rightarrow \frac{1}{2} = e^{5730k} \Rightarrow \ln(0.5) = 5730k$

$$\Rightarrow k = \frac{\ln(0.5)}{5730}. \text{ With 10\% of the original carbon-14 remaining we have } 0.1A_0 = A_0 e^{\frac{\ln(0.5)}{5730}t} \Rightarrow 0.1 = e^{\frac{\ln(0.5)}{5730}t}$$

$$\Rightarrow \ln(0.1) = \frac{\ln(0.5)}{5730}t \Rightarrow t = \frac{(5730)\ln(0.1)}{\ln(0.5)} \approx 19,035 \text{ years (rounded to the nearest year).}$$

40. $T - T_s = (T_o - T_s)e^{-kt} \Rightarrow 180 - 40 = (220 - 40)e^{-k/4}$, time in hours, $\Rightarrow k = -4 \ln\left(\frac{7}{9}\right) = 4 \ln\left(\frac{9}{7}\right)$

$$\Rightarrow 70 - 40 = (220 - 40)e^{-4 \ln(9/7)t} \Rightarrow t = \frac{\ln 6}{4 \ln(\frac{9}{7})} \approx 1.78 \text{ hr} \approx 107 \text{ min, the total time} \Rightarrow \text{the time it took to cool}$$

from 180° F to 70° F was 107 - 15 = 92 min

 $\Rightarrow g(0)[g^2(0)+1] = 0 \Rightarrow g(0) = 0$

 $= \lim_{h \rightarrow 0} \left[\frac{g(h)}{h}\right] \left[\frac{1+g^2(x)}{1-g(x)g(h)}\right] = 1 \cdot [1+g^2(x)] = 1+g^2(x) = 1+[g(x)]^2$

(c) $\frac{dy}{dx} = 1+y^2 \Rightarrow \frac{dy}{1+y^2} = dx \Rightarrow \tan^{-1} y = x+C \Rightarrow \tan^{-1}(g(x)) = x+C; g(0) = 0 \Rightarrow \tan^{-1} 0 = 0+C$
 $\Rightarrow C = 0 \Rightarrow \tan^{-1}(g(x)) = x \Rightarrow g(x) = \tan x$

7. $M = \int_0^1 \frac{2}{1+x^2} dx = 2 \left[\tan^{-1} x \right]_0^1 = \frac{\pi}{2}$ and $M_y = \int_0^1 \frac{2x}{1+x^2} dx = \left[\ln(1+x^2) \right]_0^1 = \ln 2 \Rightarrow \bar{x} = \frac{M_y}{M} = \frac{\ln 2}{\frac{\pi}{2}} = \frac{\ln 4}{\pi}; \bar{y} = 0$ by symmetry

8. (a) $V = \pi \int_{1/4}^4 \left(\frac{1}{2\sqrt{x}}\right)^2 dx = \frac{\pi}{4} \int_{1/4}^4 \frac{1}{x} dx = \frac{\pi}{4} [\ln|x|]_{1/4}^4 = \frac{\pi}{4} (\ln 4 - \ln \frac{1}{4}) = \frac{\pi}{4} \ln 16 = \frac{\pi}{4} \ln(2^4) = \pi \ln 2$

(b) $M_y = \int_{1/4}^4 x \left(\frac{1}{2\sqrt{x}}\right) dx = \frac{1}{2} \int_{1/4}^4 x^{1/2} dx = \left[\frac{1}{3} x^{3/2}\right]_{1/4}^4 = \left(\frac{8}{3} - \frac{1}{24}\right) = \frac{64-1}{24} = \frac{63}{24};$

$M_x = \int_{1/4}^4 \frac{1}{2} \left(\frac{1}{2\sqrt{x}}\right) \left(\frac{1}{2\sqrt{x}}\right) dx = \frac{1}{8} \int_{1/4}^4 \frac{1}{x} dx = \left[\frac{1}{8} \ln|x|\right]_{1/4}^4 = \frac{1}{8} \ln 16 = \frac{1}{2} \ln 2;$

$M = \int_{1/4}^4 \frac{1}{2\sqrt{x}} dx = \int_{1/4}^4 \frac{1}{2} x^{-1/2} dx = \left[x^{1/2}\right]_{1/4}^4 = 2 - \frac{1}{2} = \frac{3}{2};$ therefore, $\bar{x} = \frac{M_y}{M} = \left(\frac{63}{24}\right)\left(\frac{2}{3}\right) = \frac{21}{12} = \frac{7}{4}$ and

$\bar{y} = \frac{M_x}{M} = \left(\frac{1}{2} \ln 2\right)\left(\frac{2}{3}\right) = \frac{\ln 2}{3}$

9. $A(t) = A_0 e^{rt}; A(t) = 2A_0 \Rightarrow 2A_0 = A_0 e^{rt} \Rightarrow e^{rt} = 2 \Rightarrow rt = \ln 2 \Rightarrow t = \frac{\ln 2}{r} \Rightarrow t \approx \frac{7}{r} = \frac{70}{100r} = \frac{70}{(r\%)}$

10. In order to maximize the amount of sunlight, we need to maximize the angle θ formed by extending the two red line segments to their vertex. The angle between the two lines is given by $\theta = \pi - (\theta_1 + (\pi - \theta_2))$. From trig we

have $\tan \theta_1 = \frac{350}{450-x} \Rightarrow \theta_1 = \tan^{-1}\left(\frac{350}{450-x}\right)$ and $\tan(\pi - \theta_2) = \frac{200}{x} \Rightarrow (\pi - \theta_2) = \tan^{-1}\left(\frac{200}{x}\right)$

$\Rightarrow \theta = \pi - (\theta_1 + (\pi - \theta_2)) = \pi - \tan^{-1}\left(\frac{350}{450-x}\right) - \tan^{-1}\left(\frac{200}{x}\right)$

$\Rightarrow \frac{d\theta}{dx} = -\frac{1}{1+\left(\frac{350}{450-x}\right)^2} \cdot \frac{350}{(450-x)^2} - \frac{1}{1+\left(\frac{200}{x}\right)^2} \cdot \left(-\frac{200}{x^2}\right) = \frac{-350}{(450-x)^2+122500} + \frac{200}{x^2+40000}$

$\frac{d\theta}{dx} = 0 \Rightarrow \frac{-350}{(450-x)^2+122500} + \frac{200}{x^2+40000} = 0 \Rightarrow 200((450-x)^2+122500) = 350(x^2+40000)$

$\Rightarrow 3x^2 + 3600x - 1020000 = 0 \Rightarrow x = -600 \pm 100\sqrt{70}$. Since $x > 0$, consider only $x = -600 + 100\sqrt{70}$. Using the first derivative test, $\left.\frac{d\theta}{dx}\right|_{x=100} = \frac{9}{3500} > 0$ and $\left.\frac{d\theta}{dx}\right|_{x=400} = \frac{-9}{5000} < 0 \Rightarrow$ local max when

$x = -600 + 100\sqrt{70} \approx 236.67$ ft.

CHAPTER 8 TECHNIQUES OF INTEGRATION

8.1 USING BASIC INTEGRATION FORMULAS

1. $\int_0^1 \frac{16x}{8x^2+2} dx$

$$u = 8x^2 + 2 \quad du = 16x dx$$

$$u = 2 \text{ when } x = 0, \quad u = 10 \text{ when } x = 1$$

$$\begin{aligned} \int_0^1 \frac{16x}{8x^2+2} dx &= \int_2^{10} \frac{1}{u} du = \ln|u| \Big|_2^{10} \\ &= \ln 10 - \ln 2 = \ln 5 \end{aligned}$$

2. $\int \frac{x^2}{x^2+1} dx$

Use long division to write the integrand as $1 - \frac{1}{x^2+1}$.

$$\begin{aligned} \int \frac{x^2}{x^2+1} dx &= \int 1 dx - \int \frac{1}{x^2+1} dx \\ &= x - \tan^{-1} x + C \end{aligned}$$

3. $\int (\sec x - \tan x)^2 dx$

$$\begin{aligned} \text{Expand the integrand: } (\sec x - \tan x)^2 &= \sec^2 x - 2\sec x \tan x + \tan^2 x \\ &= \sec^2 x - 2\sec x \tan x + (\sec^2 x - 1) \\ &= 2\sec^2 x - 2\sec x \tan x - 1 \end{aligned}$$

$$\begin{aligned} \int (\sec x - \tan x)^2 dx &= 2 \int \sec^2 x dx - 2 \int \sec x \tan x dx - \int 1 dx \\ &= 2 \tan x - 2 \sec x - x + C \end{aligned}$$

We have used Formulas 8 and 10 from Table 8.1.

4. $\int_{\pi/4}^{\pi/3} \frac{1}{\cos^2 x \tan x} dx$

$$u = \tan x \quad du = \sec^2 x dx = \frac{1}{\cos^2 x} dx$$

$$u = 1 \text{ when } x = \pi/4, \quad u = \sqrt{3} \text{ when } x = \pi/3$$

$$\begin{aligned} \int_{\pi/4}^{\pi/3} \frac{1}{\cos^2 x \tan x} dx &= \int_1^{\sqrt{3}} \frac{1}{u} du = \ln|u| \Big|_1^{\sqrt{3}} \\ &= \ln \sqrt{3} - \ln 1 = \frac{1}{2} \ln 3 \end{aligned}$$

$$5. \int \frac{1-x}{\sqrt{1-x^2}} dx$$

Write as the sum of two integrals:

$$\int \frac{1-x}{\sqrt{1-x^2}} dx = \int \frac{1}{\sqrt{1-x^2}} dx - \int \frac{x}{\sqrt{1-x^2}} dx$$

For the first integral use Formula 18 in Table 8.1 with $a = 1$.

For the second:

$$u = 1-x^2 \quad du = -2x dx$$

$$\begin{aligned} \int \frac{x}{\sqrt{1-x^2}} dx &= -\frac{1}{2} \int \frac{1}{u^{1/2}} du \\ &= -\sqrt{u} = -\sqrt{1-x^2} \end{aligned}$$

$$\text{So } \int \frac{1-x}{\sqrt{1-x^2}} dx = \sin^{-1} x + \sqrt{1-x^2} + C$$

$$6. \int \frac{1}{x-\sqrt{x}} dx$$

$$u = \sqrt{x} - 1 \quad du = \frac{1}{2\sqrt{x}} dx$$

$$\begin{aligned} \int \frac{1}{x-\sqrt{x}} dx &= 2 \int \frac{1}{u} du \\ &= 2 \ln |u| + C = 2 \ln |\sqrt{x} - 1| + C \end{aligned}$$

$$7. \int \frac{e^{-\cot z}}{\sin^2 z} dz$$

$$u = -\cot z \quad du = -\csc^2 z dz = \frac{1}{\sin^2 z} dz$$

$$\begin{aligned} \int \frac{e^{-\cot z}}{\sin^2 z} dz &= \int e^{-u} du \\ &= e^{-u} + C = e^{-\cot z} + C \end{aligned}$$

$$8. \int \frac{2^{\ln z^3}}{16z} dz$$

$$u = \ln z^3 = 3 \ln z \quad du = \frac{3}{z} dz$$

Using Formula 5 in Table 8.1,

$$\begin{aligned} \int \frac{2^{\ln z^3}}{16z} dz &= \frac{1}{48} \int 2^u du \\ &= \frac{2^u}{48 \ln 2} + C = \frac{2^{\ln z^3}}{48 \ln 2} + C \end{aligned}$$

$$9. \int \frac{1}{e^z + e^{-z}} dz$$

Multiply the integrand by $\frac{e^z}{e^z}$.

$$\int \frac{1}{e^z + e^{-z}} dz = \int \frac{e^z}{e^{2z} + 1} dx$$

$$u = e^z \quad du = e^z dx$$

$$\begin{aligned} \int \frac{e^z}{e^{2z} + 1} dx &= \int \frac{1}{u^2 + 1} du \\ &= \tan^{-1} u + C = \tan^{-1} e^z + C \end{aligned}$$

$$10. \int_1^2 \frac{8}{x^2 - 2x + 2} dx$$

$$u = x - 1 \quad du = dx$$

$$u = 0 \text{ when } x = 1, \quad u = 1 \text{ when } x = 2$$

$$\begin{aligned} \int_1^2 \frac{8}{x^2 - 2x + 2} dx &= 8 \int_0^1 \frac{1}{u^2 + 1} du \\ &= 8 \tan^{-1} u \Big|_0^1 = 8 \left(\frac{\pi}{4} - 0 \right) = 2\pi \end{aligned}$$

$$11. \int_{-1}^0 \frac{4}{1 + (2x + 1)^2} dx$$

$$u = 2x + 1 \quad du = 2dx$$

$$u = -1 \text{ when } x = -1, \quad u = 1 \text{ when } x = 0$$

$$\begin{aligned} \int_{-1}^0 \frac{4}{1 + (2x + 1)^2} dx &= 2 \int_{-1}^1 \frac{1}{1 + u^2} du \\ &= 2 \tan^{-1} u \Big|_{-1}^1 = 2 \left(\frac{\pi}{4} - \left(-\frac{\pi}{4} \right) \right) = \pi \end{aligned}$$

$$12. \int_{-1}^3 \frac{4x^2 - 7}{2x + 3} dx$$

Use long division to write the integrand as $2x - 3 + \frac{2}{2x + 3}$.

$$\int_{-1}^3 \frac{4x^2 - 7}{2x + 3} dx = \int_{-1}^3 2x dx - \int_{-1}^3 3 dx + \int_{-1}^3 \frac{2}{2x + 3} dx$$

$$\int_{-1}^3 2x dx - \int_{-1}^3 3 dx = x^2 \Big|_{-1}^3 - 3x \Big|_{-1}^3 = 8 - 12 = -4$$

For the last integral,

$$u = 2x + 3 \quad du = 2 dx$$

$$u = 1 \text{ when } x = -1, \quad u = 9 \text{ when } x = 3$$

$$\int_{-1}^3 \frac{2}{2x+3} dx = \int_1^9 \frac{1}{u} du$$

$$= |\ln u|_1^9 = \ln 9 - \ln 1 = 2 \ln 3$$

$$\text{So } \int_{-1}^3 \frac{4x^2-7}{2x+3} dx = -4 + 2 \ln 3$$

$$13. \int \frac{1}{1-\sec t} dt$$

Multiply the integrand by $\frac{1+\sec t}{1+\sec t}$.

$$\frac{1}{1-\sec t} \cdot \frac{1+\sec t}{1+\sec t} = \frac{-1-\sec t}{\tan^2 t} = -\cot^2 t - \frac{\cos t}{\sin^2 t} = 1 - \csc^2 t - \frac{\cos t}{\sin^2 t}$$

$$\int \frac{1}{1-\sec t} dt = \int 1 dt - \int \csc^2 t dt - \int \frac{\cos t}{\sin^2 t} dt$$

$$= t + \cot t + \csc t + C$$

Here we have used Formula 9 in Table 8.1 for the second integral, and the substitution $u = \sin t$, $du = \cos t dt$

for the third integral, which gives it the form $\int \frac{1}{u^2} du = -\frac{1}{u} = -\frac{1}{\sin t}$.

$$14. \int \csc t \sin 3t dt$$

Write $\sin 3t$ as $\sin(2t+t)$ and expand.

$$\csc t \sin 3t = \frac{\cos 2t \sin t + (2 \sin t \cos t) \cos t}{\sin t}$$

$$= \cos 2t + 2 \cos^2 t = 2 \cos 2t + 1$$

$$\int \csc t \sin 3t dt = \int 2 \cos 2t dt + \int 1 dt$$

$$= \sin 2t + t + C$$

$$15. \int_0^{\pi/4} \frac{1+\sin \theta}{\cos^2 \theta} d\theta$$

Split into two integrals.

$$\int_0^{\pi/4} \frac{1+\sin \theta}{\cos^2 \theta} d\theta = \int_0^{\pi/4} \frac{1}{\cos^2 \theta} d\theta + \int_0^{\pi/4} \frac{\sin \theta}{\cos^2 \theta} d\theta$$

$$= \int_0^{\pi/4} \sec^2 \theta d\theta + \int_0^{\pi/4} \frac{\sin \theta}{\cos^2 \theta} d\theta$$

$$= [\tan \theta + \sec \theta]_0^{\pi/4} = (1 + \sqrt{2}) - (0 + 1) = \sqrt{2}$$

The second integral is evaluated with the substitution $u = \cos \theta$ $du = -\sin \theta d\theta$, which gives

$$\int \frac{\sin \theta}{\cos^2 \theta} d\theta = -\int \frac{1}{u^2} du = \frac{1}{u} = \frac{1}{\cos \theta}$$

$$16. \int \frac{1}{\sqrt{2\theta - \theta^2}} d\theta$$

Write the integrand as $\frac{1}{\sqrt{1 - (\theta - 1)^2}}$. With $u = \theta - 1$, $du = d\theta$,

$$\begin{aligned} \int \frac{1}{\sqrt{2\theta - \theta^2}} d\theta &= \int \frac{1}{\sqrt{1 - (\theta - 1)^2}} d\theta \\ &= \int \frac{1}{\sqrt{1 - u^2}} du = \sin^{-1} u + C = \sin^{-1}(\theta - 1) + C \end{aligned}$$

We have used Formula 18 in Table 8.1 with $a = 1$.

$$17. \int \frac{\ln y}{y + 4 \ln^2 y} dy$$

Write the integrand as $\frac{\ln y}{y} \cdot \frac{1}{1 + 4 \ln^2 y}$.

$$u = 1 + 4 \ln^2 y \quad du = \frac{8 \ln y}{y} dy$$

$$\begin{aligned} \int \frac{\ln y}{y + 4 \ln^2 y} dy &= \int \frac{\ln y}{y} \cdot \frac{1}{1 + 4 \ln^2 y} dy \\ &= \frac{1}{8} \int \frac{1}{u} du = \frac{1}{8} \ln |u| + C = \frac{1}{8} \ln(1 + 4 \ln^2 y) + C \end{aligned}$$

Note that the argument of the logarithm is positive, so we don't need absolute value bars.

$$18. \int \frac{2\sqrt{y}}{2\sqrt{y}} dy$$

$$u = \sqrt{y} \quad du = \frac{1}{2\sqrt{y}} dy$$

Using Formula 5 in Table 8.1,

$$\begin{aligned} \int \frac{2\sqrt{y}}{2\sqrt{y}} dy &= \int 2^u du \\ &= \frac{1}{\ln 2} 2^u + C = \frac{1}{\ln 2} 2\sqrt{y} + C \end{aligned}$$

$$19. \int \frac{1}{\sec \theta + \tan \theta} d\theta$$

Multiply the integrand by $\frac{\cos \theta}{\cos \theta}$.

$$\int \frac{1}{\sec \theta + \tan \theta} \cdot \frac{\cos \theta}{\cos \theta} d\theta = \int \frac{\cos \theta}{1 + \sin \theta} d\theta$$

$$u = 1 + \sin \theta \quad du = \cos \theta d\theta$$

$$\begin{aligned}\int \frac{\cos \theta}{1 + \sin \theta} d\theta &= \int \frac{1}{u} du = \ln|u| + C \\ &= \ln(1 + \sin \theta) + C\end{aligned}$$

We can discard the absolute value because $1 + \sin \theta$ is never negative.

$$20. \int \frac{1}{t\sqrt{3+t^2}} dt$$

Use Formula 5 in Table 7.10, with $a = \sqrt{3}$.

$$\int \frac{1}{t\sqrt{3+t^2}} dt = -\frac{1}{\sqrt{3}} \operatorname{csch}^{-1} \left| \frac{t}{\sqrt{3}} \right| + C$$

$$21. \int \frac{4t^3 - t^2 + 16t}{t^2 + 4} dt$$

Use long division to write the integrand as $4t - 1 + \frac{4}{t^2 + 4}$.

$$\begin{aligned}\int \frac{4t^3 - t^2 + 16t}{t^2 + 4} dt &= \int 4t dt - \int 1 dt + 4 \int \frac{1}{t^2 + 4} dt \\ &= 2t^2 - t + 2 \tan^{-1} \left(\frac{t}{2} \right) + C\end{aligned}$$

To evaluate the third integral we used Formula 19 in Table 8.1 with $a = 2$.

$$22. \int \frac{x + 2\sqrt{x-1}}{2x\sqrt{x-1}} dx$$

Split into two integrals.

$$\begin{aligned}\int \frac{x + 2\sqrt{x-1}}{2x\sqrt{x-1}} dx &= \int \frac{1}{2\sqrt{x-1}} dx + \int \frac{1}{x} dx \\ &= \sqrt{x-1} + \ln|x| + C\end{aligned}$$

For the first integral we used $u = \sqrt{x-1}$, $du = \frac{1}{2\sqrt{x-1}} dx$, $\int du = u + C$

$$23. \int_0^{\pi/2} \sqrt{1 - \cos \theta} d\theta$$

Multiply the integrand by $\frac{\sqrt{1 + \cos \theta}}{\sqrt{1 + \cos \theta}}$.

$$\int_0^{\pi/2} \sqrt{1 - \cos \theta} d\theta = \int_0^{\pi/2} \frac{\sqrt{1 - \cos^2 \theta}}{\sqrt{1 + \cos \theta}} d\theta = \int_0^{\pi/2} \frac{\sin \theta}{\sqrt{1 + \cos \theta}} d\theta.$$

(Note that when $0 \leq \theta \leq \pi/2$, $\sin \theta \geq 0$ so $\sqrt{\sin^2 \theta} = \sin \theta$.)

$$u = 1 + \cos \theta \quad du = -\sin \theta d\theta$$

$$u = 2 \text{ when } \theta = 0, \quad u = 1 \text{ when } \theta = \pi/2$$

$$\int_0^{\pi/2} \frac{\sin \theta}{\sqrt{1 + \cos \theta}} d\theta = -\int_2^1 \frac{1}{\sqrt{u}} du = \int_1^2 \frac{1}{\sqrt{u}} du = 2\sqrt{u} \Big|_1^2 = 2\sqrt{2} - 2$$

$$24. \int (\sec t + \cot t)^2 dt$$

Expand the integrand:

$$\begin{aligned} (\sec t + \cot t)^2 &= \sec^2 t + 2\sec t \cot t + \cot^2 t \\ &= \sec^2 t + 2\sec t \cot t + \csc^2 t - 1 \end{aligned}$$

$$\begin{aligned} \int (\sec t + \cot t)^2 dt &= \int \sec^2 t dt + 2 \int \csc t dt + \int \csc^2 t dt - \int 1 dt \\ &= \tan t - 2 \ln |\csc t + \cot t| - \cot t - t + C \end{aligned}$$

We have used Formulas 8, 9 and 15 from Table 8.1.

$$25. \int \frac{1}{\sqrt{e^{2y} - 1}} dy$$

Multiply the integrand by $\frac{e^y}{e^y}$.

$$\int \frac{1}{\sqrt{e^{2y} - 1}} dy = \int \frac{e^y}{e^y \sqrt{e^{2y} - 1}} dy; \quad u = e^y \quad du = e^y dy$$

$$\begin{aligned} \int \frac{e^y}{e^y \sqrt{e^{2y} - 1}} dy &= \int \frac{1}{u \sqrt{u^2 - 1}} du \\ &= \sec^{-1} |u| + C = \sec^{-1} e^y + C \end{aligned}$$

We have used Formula 20 in Table 8.1.

$$26. \int \frac{6}{\sqrt{y}(1+y)} dy$$

$$u = \sqrt{y} \quad du = \frac{1}{2\sqrt{y}} dy$$

$$\begin{aligned} \int \frac{6}{\sqrt{y}(1+y)} dy &= 12 \int \frac{1}{1+u^2} du \\ &= 12 \tan^{-1} \sqrt{y} + C \end{aligned}$$

$$27. \int \frac{2}{x\sqrt{1-4 \ln^2 x}} dx$$

$$u = 2 \ln x \quad du = \frac{2}{x} dx$$

$$\begin{aligned} \int \frac{2}{x\sqrt{1-4 \ln^2 x}} dx &= \int \frac{1}{\sqrt{1-u^2}} du \\ &= \sin^{-1} u + C = \sin^{-1} (2 \ln x) + C \end{aligned}$$

$$28. \int \frac{1}{(x-2)\sqrt{x^2-4x+3}} dx$$

$$u = x-2 \quad du = dx$$

$$\begin{aligned} \int \frac{1}{(x-2)\sqrt{x^2-4x+3}} dx &= \int \frac{1}{u\sqrt{u^2-1}} du \\ &= \sec^{-1}|u| + C = \sec^{-1}|x-2| + C \end{aligned}$$

We have used Formula 20 in Table 8.1 with $a=1$.

$$29. \int (\csc x - \sec x)(\sin x + \cos x) dx$$

Expand the integrand and separate into two integrals.

$$(\csc x - \sec x)(\sin x + \cos x) = 1 + \cot x - \tan x - 1 = \cot x - \tan x$$

$$\begin{aligned} \int (\csc x - \sec x)(\sin x + \cos x) dx &= \int \cot x dx - \int \tan x dx \\ &= \ln|\sin x| - \ln|\sec x| + C = \ln|\sin x| + \ln|\cos x| + C \end{aligned}$$

We have used Formulas 12 and 13 from Table 8.1.

$$30. \int 3 \sinh\left(\frac{x}{2} + \ln 5\right) dx$$

$$u = \frac{x}{2} + \ln 5 \quad du = \frac{1}{2} dx$$

$$\begin{aligned} \int 3 \sinh\left(\frac{x}{2} + \ln 5\right) dx &= 6 \int \sinh u du \\ &= 6 \cosh u + C = 6 \cosh\left(\frac{x}{2} + \ln 5\right) + C \end{aligned}$$

$$31. \int_{\sqrt{2}}^3 \frac{2x^3}{x^2-1} dx$$

Use long division to write the integrand as $2x + \frac{2x}{x^2-1}$.

$$\int_{\sqrt{2}}^3 \frac{2x^3}{x^2-1} dx = \int_{\sqrt{2}}^3 \left(2x + \frac{2x}{x^2-1}\right) dx = \int_{\sqrt{2}}^3 2x dx + \int_{\sqrt{2}}^3 \frac{2x}{x^2-1} dx$$

For the second integral we use $u = x^2$, $du = 2x dx$.

$$\begin{aligned} \int_{\sqrt{2}}^3 2x dx + \int_{\sqrt{2}}^3 \frac{2x}{x^2-1} dx &= x^2 \Big|_{\sqrt{2}}^3 + \ln|x^2-1| \Big|_{\sqrt{2}}^3 \\ &= (9-2) + (\ln 8 - \ln 1) \\ &= 7 + \ln 8 \approx 9.079 \end{aligned}$$

32. $\int_{-1}^1 \sqrt{1+x^2} \sin x \, dx$ is the integral of an odd function over an interval symmetric to 0, so its value is 0.

33. $\int_{-1}^0 \sqrt{\frac{1+y}{1-y}} \, dy$

Multiply the integrand by $\frac{\sqrt{1+y}}{\sqrt{1+y}}$ and split the indefinite integral into a sum.

$$\begin{aligned} \int \sqrt{\frac{1+y}{1-y}} \, dy &= \int \frac{1+y}{\sqrt{1-y^2}} \, dy = \int \frac{1}{\sqrt{1-y^2}} \, dy + \int \frac{y}{\sqrt{1-y^2}} \, dy \\ &= \sin^{-1} y - \sqrt{1-y^2} + C \end{aligned}$$

The first integral is Formula 18 in Section 8.1, and for the second we use the substitution $u = 1 - y^2$, $du = -2y \, dy$. So

$$\begin{aligned} \int_{-1}^0 \sqrt{\frac{1+y}{1-y}} \, dy &= \left[\sin^{-1} y - \sqrt{1-y^2} \right]_{-1}^0 \\ &= (0-1) - \left(-\frac{\pi}{2} - 0 \right) = \frac{\pi}{2} - 1 \end{aligned}$$

34. $\int e^{z+e^z} \, dz$

Write the integrand as $e^z e^{e^z}$ and use the substitution $u = e^z$, $du = e^z \, dz$.

$$\begin{aligned} \int e^{z+e^z} \, dz &= \int e^z e^{e^z} \, dz = \int e^u \, du \\ &= e^u + C = e^{e^z} + C \end{aligned}$$

35. $\int \frac{7}{(x-1)\sqrt{x^2-2x-48}} \, dx$

$$u = x-1, \quad du = dx; \quad x^2 - 2x - 48 = u^2 - 7^2$$

We use Formula 20 in Table 8.1.

$$\begin{aligned} \int \frac{7}{(x-1)\sqrt{x^2-2x-48}} \, dx &= \int \frac{7}{u\sqrt{u^2-7^2}} \, du \\ &= \frac{1}{7} \left(7 \sec^{-1} \left| \frac{u}{7} \right| \right) + C = \sec^{-1} \left| \frac{x-1}{7} \right| + C \end{aligned}$$

$$36. \int \frac{1}{(2x+1)\sqrt{4x+4x^2}} dx$$

$$u = 2x+1, \quad du = 2dx; \quad 4x+4x^2 = u^2 - 1^2$$

We use Formula 20 in Table 8.1.

$$\begin{aligned} \int \frac{1}{(2x+1)\sqrt{4x+4x^2}} dx &= \frac{1}{2} \int \frac{1}{u\sqrt{u^2-1^2}} du \\ &= \frac{1}{2} \sec^{-1}|u| + C = \frac{1}{2} \sec^{-1}|2x+1| + C \end{aligned}$$

$$37. \int \frac{2\theta^3 - 7\theta^2 + 7\theta}{2\theta - 5} d\theta$$

Use long division to write the integrand as $\theta^2 - \theta + 1 + \frac{5}{2\theta - 5}$.

$$\begin{aligned} \int \frac{2\theta^3 - 7\theta^2 + 7\theta}{2\theta - 5} d\theta &= \int \theta^2 d\theta - \int \theta d\theta + \int 1 d\theta + \int \frac{5}{2\theta - 5} d\theta \\ &= \frac{1}{3}\theta^3 - \frac{1}{2}\theta^2 + \theta + \frac{5}{2} \ln|2\theta - 5| + C \end{aligned}$$

In the last integral we have used the substitution $u = 2\theta - 5$, $du = 2d\theta$.

$$38. \int \frac{1}{\cos \theta - 1} d\theta$$

Multiply the integrand by $\frac{\cos \theta + 1}{\cos \theta + 1}$.

$$\frac{1}{\cos \theta - 1} \frac{\cos \theta + 1}{\cos \theta + 1} = \frac{\cos \theta + 1}{\cos^2 \theta - 1} = -\frac{1 + \cos \theta}{\sin^2 \theta} = -\csc^2 \theta - \csc \theta \cot \theta$$

$$\begin{aligned} \int (-\csc^2 \theta - \csc \theta \cot \theta) d\theta &= -\int \csc^2 \theta d\theta - \int \csc \theta \cot \theta d\theta \\ &= \cot \theta + \csc \theta + C \end{aligned}$$

We have used Formulas 9 and 11 from Table 8.1.

$$39. \int \frac{1}{1+e^x} dx$$

Use one step of long division to write the integrand as $1 - \frac{e^x}{1+e^x}$.

$$\int \frac{1}{1+e^x} dx = \int 1 dx - \int \frac{e^x}{1+e^x} dx = x - \ln(1+e^x) + C$$

For the second integral we have used the substitution $u = 1 + e^x$, $du = e^x dx$. Note that $1 + e^x$ is always positive.

$$40. \int \frac{\sqrt{x}}{1+x^3} dx$$

$$u = x^{3/2}, \quad du = \frac{3}{2} x^{1/2} dx$$

$$\begin{aligned} \int \frac{\sqrt{x}}{1+x^3} dx &= \frac{2}{3} \int \frac{1}{1+u^2} du \\ &= \frac{2}{3} \tan^{-1} u + C = \frac{2}{3} \tan^{-1} x^{3/2} + C \end{aligned}$$

$$\begin{aligned} 41. \text{ The area is } \int_{-\pi/4}^{\pi/4} (2 \cos x - \sec x) dx &= [2 \sin x - \ln |\sec x + \tan x|]_{-\pi/4}^{\pi/4} \\ &= (\sqrt{2} - \ln |\sqrt{2} + 1|) - (-\sqrt{2} - \ln |\sqrt{2} - 1|) \\ &= 2\sqrt{2} + \ln \left(\frac{\sqrt{2} - 1}{\sqrt{2} + 1} \right) = 2\sqrt{2} - \ln(3 + 2\sqrt{2}) \approx 1.066 \end{aligned}$$

$$42. \text{ The volume using the washer method is } \pi \int_{-\pi/4}^{\pi/4} (4 \cos^2 x - \sec^2 x) dx.$$

Split into two integrals; for the first write $4 \cos^2 x$ as $2(1 + \cos 2x)$ and for the second use Formula 8 in Table 8.1.

$$\begin{aligned} \pi \int_{-\pi/4}^{\pi/4} (4 \cos^2 x - \sec^2 x) dx &= \pi \int_{-\pi/4}^{\pi/4} 4 \cos^2 x dx - \pi \int_{-\pi/4}^{\pi/4} \sec^2 x dx \\ &= \pi \int_{-\pi/4}^{\pi/4} 2(1 + \cos 2x) dx - \pi \int_{-\pi/4}^{\pi/4} \sec^2 x dx \\ &= \pi [2x + \sin 2x]_{-\pi/4}^{\pi/4} - \pi \tan x \Big|_{-\pi/4}^{\pi/4} \\ &= \pi \left(\left(\frac{\pi}{2} + 1 \right) - \left(-\frac{\pi}{2} - 1 \right) \right) - \pi(1 - (-1)) = \pi^2 \end{aligned}$$

43. For $y = \ln(\cos x)$, $dy/dx = -\tan x$. The arc length is given by

$$\int_0^{\pi/3} \sqrt{1 + (-\tan x)^2} dx = \int_0^{\pi/3} \sec x dx \text{ since } \sec x \text{ is positive on the interval of integration.}$$

$$\begin{aligned} \int_0^{\pi/3} \sec x dx &= \ln |\sec x + \tan x| \Big|_0^{\pi/3} \\ &= \ln(2 + \sqrt{3}) - \ln(1 + 0) = \ln(2 + \sqrt{3}) \end{aligned}$$

44. For $y = \ln(\sec x)$, $dy/dx = \tan x$. The arc length is given by

$$\int_0^{\pi/4} \sqrt{1 + (\tan x)^2} dx = \int_0^{\pi/4} \sec x dx \text{ since } \sec x \text{ is positive on the interval of integration.}$$

$$\begin{aligned} \int_0^{\pi/4} \sec x dx &= \ln |\sec x + \tan x| \Big|_0^{\pi/4} \\ &= \ln(\sqrt{2} + 1) - \ln(1 + 0) = \ln(\sqrt{2} + 1) \end{aligned}$$

45. Since secant is an even function and the domain is symmetric to 0,
- $\bar{x} = 0$
- .

For the y-coordinate:

$$\begin{aligned}\bar{y} &= \frac{\frac{1}{2} \int_{-\pi/4}^{\pi/4} \sec^2 x \, dx}{\int_{-\pi/4}^{\pi/4} \sec x \, dx} = \frac{\frac{1}{2} \tan x \Big|_{-\pi/4}^{\pi/4}}{\ln|\sec x + \tan x| \Big|_{-\pi/4}^{\pi/4}} \\ &= \frac{1}{\left(\ln(\sqrt{2} + 1) - \ln(\sqrt{2} - 1)\right)} \\ &= \frac{1}{\ln\left(\frac{\sqrt{2} + 1}{\sqrt{2} - 1}\right)} = \frac{1}{\ln(3 + 2\sqrt{2})} \approx 0.567\end{aligned}$$

46. Since both cosecant and the domain are symmetric around
- $\pi/2$
- ,
- $\bar{x} = \pi/2$
- .

$$\begin{aligned}\bar{y} &= \frac{\frac{1}{2} \int_{\pi/6}^{5\pi/6} \csc^2 x \, dx}{\int_{\pi/6}^{5\pi/6} \csc x \, dx} = \frac{-\frac{1}{2} \cot x \Big|_{\pi/6}^{5\pi/6}}{-\ln|\csc x + \cot x| \Big|_{\pi/6}^{5\pi/6}} \\ &= \frac{-\frac{1}{2}(\sqrt{3} - (-\sqrt{3}))}{-\left(\ln(2 + \sqrt{3}) - \ln(2 - \sqrt{3})\right)} \\ &= \frac{\sqrt{3}}{\ln\left(\frac{2 + \sqrt{3}}{2 - \sqrt{3}}\right)} = \frac{\sqrt{3}}{\ln(7 + 4\sqrt{3})} \approx 0.658\end{aligned}$$

47. $\int (1 + 3x^3) e^{x^3} dx = x e^{x^3} + C$

48. $\int \frac{1}{1 + \sin^2 x} dx$

Multiply the integrand by $\frac{\sec^2 x}{\sec^2 x}$.

$$\int \frac{1}{1 + \sin^2 x} dx = \int \frac{\sec^2 x}{\sec^2 x + \tan^2 x} dx = \int \frac{\sec^2 x}{1 + 2 \tan^2 x} dx$$

$$u = \tan x, \quad du = \sec^2 x \, dx$$

$$\int \frac{\sec^2 x}{1 + 2 \tan^2 x} dx = \int \frac{1}{1 + 2u^2} du$$

$$v = \sqrt{2}u, \quad dv = \sqrt{2} \, du$$

$$\begin{aligned}\int \frac{1}{1 + 2u^2} du &= \frac{1}{\sqrt{2}} \int \frac{1}{1 + v^2} dv \\ &= \frac{1}{\sqrt{2}} \tan^{-1} v + C \\ &= \frac{1}{\sqrt{2}} \tan^{-1}(\sqrt{2} \tan x) + C\end{aligned}$$

$$49. \int x^7 \sqrt{x^4 + 1} dx$$

$$u = x^4 + 1, \quad du = 4x^3 dx; \quad x^7 dx = \frac{u-1}{4} du$$

$$\begin{aligned} \int x^7 \sqrt{x^4 + 1} dx &= \frac{1}{4} \int (u-1) \sqrt{u} du \\ &= \frac{1}{4} \int u^{3/2} du - \frac{1}{4} \int u^{1/2} du \\ &= \frac{1}{10} u^{5/2} - \frac{1}{6} u^{3/2} + C \\ &= \frac{1}{30} u^{3/2} (3u-5) + C = \frac{1}{30} (x^4 + 1)^{3/2} (3x^4 - 2) + C \end{aligned}$$

$$50. \int \left((x^2 - 1)(x+1) \right)^{-2/3} dx$$

The easiest substitution to use is probably $u = \frac{x-1}{x+1}$, $du = \frac{2}{(1+x)^2} dx$.

The integral can be written as

$$\begin{aligned} \int \frac{1}{\left(\frac{x-1}{x+1} \right)^{2/3} (x+1)^2} dx &= \frac{1}{2} \int u^{-2/3} du \\ &= \frac{3}{2} u^{1/3} + C = \frac{3}{2} \left(\frac{x-1}{x+1} \right)^{1/3} + C \end{aligned}$$

Each iteration of the reduction formula in Example 5 for the definite integral produces an expression like

$$\left. \frac{(\cos^{n-1} x)(\sin x)}{n} \right|_0^{\pi/2} + \frac{n-1}{n} \int_0^{\pi/2} \cos^{n-2} x \, dx$$

The evaluation on the left will be 0 as long as $n \geq 2$, and factors of the form $\frac{n}{n-1}$ accumulate in front of the integral on the right. When the initial n is even, the last iteration will have $n = 2$ and the remaining integral will be $\frac{n-1}{n} \cdot \frac{n-3}{n-2} \cdots \frac{1}{2} \int_0^{\pi/2} 1 \, dx = \frac{\pi}{2} \cdot \frac{1 \cdot 3 \cdots (n-1)}{2 \cdot 4 \cdots n}$. When the initial n is odd the last iteration will have

$n = 3$ and the remaining integral will be $\frac{n-1}{n} \cdot \frac{n-3}{n-2} \cdots \frac{2}{3} \int_0^{\pi/2} \cos x \, dx = 1 \cdot \frac{2 \cdot 4 \cdots (n-1)}{3 \cdots n}$.

Mathematica: (functions may vary)

In Mathematica, the natural log is denoted by Log rather than Ln, Log base 10 is Log[x, 10]

Mathematica does not include an arbitrary constant when computing an indefinite integral,

```
Clear[x, f, n]
```

```
f[x_]:=Log[x]/x^n
```

```
Integrate[f[x], x]
```

For exercise 67, Mathematica cannot evaluate the integral with arbitrary n . It does evaluate the integral (value is $\pi/4$ in each case) for small values of n , but for large values of n , it identifies this integral as Indeterminate

65. (e) $\int x^n \ln x \, dx = \frac{x^{n+1} \ln x}{n+1} - \frac{1}{n+1} \int x^n \, dx, n \neq -1$

 $= \frac{x^{n+1} \ln x}{n+1} - \frac{x^{n+1}}{(n+1)^2} + C = \frac{x^{n+1}}{n+1} \left(\ln x - \frac{1}{n+1} \right) + C$

66. (e) $\int x^{-n} \ln x \, dx = \frac{x^{-n+1} \ln x}{-n+1} - \frac{1}{(-n+1)} \int x^{-n} \, dx, n \neq 1$

24. Use the conversion 30 mph = 44 fps (ft per sec) since time is measured in seconds. The distance traveled as the car accelerates from, say, 40 mph = 58.67 fps to 50 mph = 73.33 fps in $(4.5 - 3.2) = 1.3$ sec is the area of the trapezoid (see figure) associated with that time interval: $\frac{1}{2}(58.67 + 73.33)(1.3) = 85.8$ ft. The total distance traveled by the Ford Mustang Cobra is the sum of all these eleven trapezoids (using $\frac{\Delta t}{2}$ and the table below):

 $= \frac{2}{30\sqrt{\pi}} (e^0 + 4e^{-0.01} + 2e^{-0.04} + 4e^{-0.09} + \dots + 4e^{-0.81} + e^{-1}) \approx 0.843$

(b) $|E_s| \leq \frac{1-0}{180} (0.1)^4 (12) \approx 6.7 \times 10^{-6}$

29. $T = \frac{\Delta x}{2} (y_0 + 2y_1 + 2y_2 + 2y_3 + \dots + 2y_{n-1} + y_n)$ where $\Delta x = \frac{b-a}{n}$ and f is continuous on $[a, b]$. So $T = \frac{b-a}{n} \frac{(y_0 + y_1 + y_1 + y_2 + y_2 + \dots + y_{n-1} + y_{n-1} + y_n)}{2} = \frac{b-a}{n} \left(\frac{f(x_0) + f(x_1)}{2} + \frac{f(x_1) + f(x_2)}{2} + \dots + \frac{f(x_{n-1}) + f(x_n)}{2} \right)$. Since f is continuous on each interval $[x_{k-1}, x_k]$, and $\frac{f(x_{k-1}) + f(x_k)}{2}$ is always between $f(x_{k-1})$ and $f(x_k)$, there is a point c_k in $[x_{k-1}, x_k]$ with $f(c_k) = \frac{f(x_{k-1}) + f(x_k)}{2}$; this is a consequence of the Intermediate Value Theorem. Thus our sum is $\sum_{k=1}^n \left(\frac{b-a}{n}\right) f(c_k)$ which has the form $\sum_{k=1}^n \Delta x_k f(c_k)$ with $\Delta x_k = \frac{b-a}{n}$ for all k . This a Riemann Sum for f on $[a, b]$.

30. $S = \frac{\Delta x}{3} (y_0 + 4y_1 + 2y_2 + 4y_3 + \dots + 2y_{n-2} + 4y_{n-1} + y_n)$ where n is even, $\Delta x = \frac{b-a}{n}$ and f is continuous on $[a, b]$. So $S = \frac{b-a}{n} \left(\frac{y_0 + 4y_1 + y_2}{3} + \frac{y_2 + 4y_3 + y_4}{3} + \frac{y_4 + 4y_5 + y_6}{3} + \dots + \frac{y_{n-2} + 4y_{n-1} + y_n}{3} \right)$
 $= \frac{b-a}{\frac{n}{2}} \left(\frac{f(x_0) + 4f(x_1) + f(x_2)}{6} + \frac{f(x_2) + 4f(x_3) + f(x_4)}{6} + \frac{f(x_4) + 4f(x_5) + f(x_6)}{6} + \dots + \frac{f(x_{n-2}) + 4f(x_{n-1}) + f(x_n)}{6} \right)$
 $\frac{f(x_{2k}) + 4f(x_{2k+1}) + f(x_{2k+2})}{6}$ is the average of the six values of the continuous function on the interval $[x_{2k}, x_{2k+2}]$, so it is between the minimum and maximum of f on this interval. By the Extreme Value Theorem for continuous functions, f takes on its maximum and minimum in this interval, so there are x_a and x_b with $x_{2k} \leq x_a, x_b \leq x_{2k+2}$ and $f(x_a) \leq \frac{f(x_{2k}) + 4f(x_{2k+1}) + f(x_{2k+2})}{6} \leq f(x_b)$.
 By the Intermediate Value Theorem, there is c_k in $[x_{2k}, x_{2k+2}]$ with $f(c_k) = \frac{f(x_{2k}) + 4f(x_{2k+1}) + f(x_{2k+2})}{6}$.
 So our sum has the form $\sum_{k=1}^{n/2} \Delta x_k f(c_k)$ with $\Delta x_k = \frac{b-a}{(n/2)}$, a Riemann sum for f on $[a, b]$.

31. (a) $a = 1, e = \frac{1}{2} \Rightarrow \text{Length} = 4 \int_0^{\pi/2} \sqrt{1 - \frac{1}{4} \cos^2 t} dt$

 $\Rightarrow \Delta t = \frac{b-a}{n} = \frac{(\frac{\pi}{2}) - 0}{10} = \frac{\pi}{20}$.
 $\int_0^{\pi/2} \sqrt{4 - \cos^2 t} dt \approx \sum_{n=0}^{10} mf(x_n) = 37.3686183$

33. The length of the curve $y = \sin\left(\frac{3\pi}{20}x\right)$ from 0 to 20 is: $L = \int_0^{20} \sqrt{1 + \left(\frac{dy}{dx}\right)^2} dx$; $\frac{dy}{dx} = \frac{3\pi}{20} \cos\left(\frac{3\pi}{20}x\right)$

 $L \approx 21.07$ in

34. First, we'll find the length of the cosine curve: $L = \int_{-25}^{25} \sqrt{1 + \left(\frac{dy}{dx}\right)^2} dx$; $\frac{dy}{dx} = -\frac{25\pi}{50} \sin\left(\frac{\pi x}{50}\right)$

 Surface area is: $A = \text{length} \cdot \text{width} \approx (73.1848)(300) = 21,955.44$ ft. $\text{Cost} = 2.35A = (2.35)(21,955.44) =$

39. The amount of medication absorbed over a 12-hr period is given by $\int_0^{12} (6 - \ln(2t^2 - 3t + 3)) dt$. A numerical integrator yields a value of 28.684 for this integral, so the amount of medication absorbed over a 12-hr period is approximately 28.7 milligrams.
40. The average concentration of antihistamine over a 6-hr period is given by $\frac{1}{6} \int_0^1 (12.5 - 4 \ln(t^2 - 3t + 4)) dt$. A numerical integrator yields a value of 6.078 for this integral, so the average concentration is approximately 6.1 grams per liter.

$$37. \int_0^1 \frac{\ln x}{x^2} \, dx$$

$$\int_{1/3}^1 \frac{\ln x}{x^2} \, dx \text{ is bounded, so convergence is determined by } \int_0^{1/3} \frac{\ln x}{x^2} \, dx.$$

On $(0, 1/3]$, $\ln x < -1$ and $\frac{\ln x}{x^2} < -\frac{1}{x^2}$. Since $\int_0^{1/3} -\frac{1}{x^2} \, dx$ diverges to $-\infty$, so does $\int_0^{1/3} \frac{\ln x}{x^2} \, dx$ and

hence $\int_0^1 \frac{\ln x}{x^2} \, dx$ diverges.

38. Since $\int \frac{1}{x \ln x} dx = \ln(\ln x)$, $\int_1^2 \frac{1}{x \ln x} dx = \lim_{a \rightarrow 1^+} (\ln(\ln 2) - \ln(\ln a)) = \infty$; the integral diverges. (In this case we don't need a comparison test.)
39. $\int_0^{\ln 2} x^{-2} e^{-1/x} dx$; $[\frac{1}{x} = y] \rightarrow \int_{\infty}^{1/\ln 2} \frac{y^2 e^{-y} dy}{-y^3} = \int_{1/\ln 2}^{\infty} e^{-y} dy = \lim_{b \rightarrow \infty} [-e^{-y}]_{1/\ln 2}^b = \lim_{b \rightarrow \infty} [-e^{-b} - (-e^{-1/\ln 2})]$
 $= 0 + e^{-1/\ln 2} = e^{-1/\ln 2}$, so the integral converges.
40. $\int_0^1 \frac{e^{-\sqrt{x}}}{\sqrt{x}} dx$; $[y = \sqrt{x}] \rightarrow 2 \int_0^1 e^{-y} dy = 2 - \frac{2}{e}$, so the integral converges.
41. $\int_0^{\pi} \frac{dt}{\sqrt{t+\sin t}}$. Since for $0 \leq t \leq \pi$, $0 \leq \frac{1}{\sqrt{t+\sin t}} \leq \frac{1}{\sqrt{t}}$ and $\int_0^{\pi} \frac{dt}{\sqrt{t}}$ converges, then the original integral converges as well by the Direct Comparison Test.
42. $\int_0^1 \frac{dt}{t-\sin t}$; Let $f(t) = \frac{1}{t-\sin t}$ and $g(t) = \frac{1}{t^3}$, then $\lim_{t \rightarrow 0} \frac{f(t)}{g(t)} = \lim_{t \rightarrow 0} \frac{t^3}{t-\sin t} = \lim_{t \rightarrow 0} \frac{3t^2}{1-\cos t} = \lim_{t \rightarrow 0} \frac{6t}{\sin t} = \lim_{t \rightarrow 0} \frac{6}{\cos t} = 6$.
 Now, $\int_0^1 \frac{dt}{t^3} = \lim_{b \rightarrow 0^+} \left[-\frac{1}{2t^2} \right]_b^1 = \lim_{b \rightarrow 0^+} \left[-\frac{1}{2} - \left(-\frac{1}{2b^2} \right) \right] = +\infty$, which diverges $\Rightarrow \int_0^1 \frac{dt}{t-\sin t}$ diverges by the Limit Comparison Test.
43. $\int_0^2 \frac{dx}{1-x^2} = \int_0^1 \frac{dx}{1-x^2} + \int_1^2 \frac{dx}{1-x^2}$ and $\int_0^1 \frac{dx}{1-x^2} = \lim_{b \rightarrow 1^-} \left[\frac{1}{2} \ln \left| \frac{1+x}{1-x} \right| \right]_0^b = \lim_{b \rightarrow 1^-} \left[\frac{1}{2} \ln \left| \frac{1+b}{1-b} \right| - 0 \right] = \infty$, which diverges
 $\Rightarrow \int_0^2 \frac{dx}{1-x^2}$ diverges as well.
44. $\int_0^2 \frac{dx}{1-x} = \int_0^1 \frac{dx}{1-x} + \int_1^2 \frac{dx}{1-x}$ and $\int_0^1 \frac{dx}{1-x} = \lim_{b \rightarrow 1^-} [-\ln(1-x)]_0^b = \lim_{b \rightarrow 1^-} [-\ln(1-b) - 0] = \infty$, which diverges
 $\Rightarrow \int_0^2 \frac{dx}{1-x}$ diverges as well.
45. $\int_{-1}^1 \ln|x| dx = \int_{-1}^0 \ln(-x) dx + \int_0^1 \ln x dx$; $\int_0^1 \ln x dx = \lim_{b \rightarrow 0^+} [x \ln x - x]_b^1 = \lim_{b \rightarrow 0^+} [(1 \cdot 0 - 1) - (b \ln b - b)]$
 $= -1 - 0 = -1$; $\int_{-1}^0 \ln(-x) dx = -1 \Rightarrow \int_{-1}^1 \ln|x| dx = -2$ converges.
46. $\int_{-1}^1 (-x \ln|x|) dx = \int_{-1}^0 [-x \ln(-x)] dx + \int_0^1 (-x \ln x) dx = \lim_{b \rightarrow 0^+} \left[\frac{x^2}{2} \ln x - \frac{x^2}{4} \right]_b^1 - \lim_{c \rightarrow 0^+} \left[\frac{x^2}{2} \ln x - \frac{x^2}{4} \right]_c^1$
 $= \lim_{b \rightarrow 0^+} \left[\left(\frac{1}{2} \ln 1 - \frac{1}{4} \right) - \left(\frac{b^2}{2} \ln b - \frac{b^2}{4} \right) \right] - \lim_{c \rightarrow 0^+} \left[\left(\frac{1}{2} \ln 1 - \frac{1}{4} \right) - \left(\frac{c^2}{2} \ln c - \frac{c^2}{4} \right) \right] = -\frac{1}{4} - 0 + \frac{1}{4} + 0 = 0 \Rightarrow$ the integral converges (see Exercise 25 for the limit calculations).
47. $\int_1^{\infty} \frac{dx}{1+x^3}$; $0 \leq \frac{1}{x^3+1} \leq \frac{1}{x^3}$ for $1 \leq x < \infty$ and $\int_1^{\infty} \frac{dx}{x^3}$ converges $\Rightarrow \int_1^{\infty} \frac{dx}{1+x^3}$ converges by the Direct Comparison Test.

48. $\int_4^{\infty} \frac{dx}{\sqrt{x-1}}$; $\lim_{x \rightarrow \infty} \frac{\left(\frac{1}{\sqrt{x-1}}\right)}{\left(\frac{1}{\sqrt{x}}\right)} = \lim_{x \rightarrow \infty} \frac{\sqrt{x}}{\sqrt{x-1}} = \lim_{x \rightarrow \infty} \frac{1}{1-\frac{1}{\sqrt{x}}} = \frac{1}{1-0} = 1$ and $\int_4^{\infty} \frac{dx}{\sqrt{x}} = \lim_{b \rightarrow \infty} \left[2\sqrt{x}\right]_4^b = \infty$, which diverges
 $\Rightarrow \int_4^{\infty} \frac{dx}{\sqrt{x-1}}$ diverges by the Limit Comparison Test.

$$\text{(b) } \int_0^\infty \frac{1}{\sqrt{t}(1+t)} dt$$

With $u = \sqrt{t}$ and $du = \frac{1}{2\sqrt{t}} dt$ the limits of integration are unchanged. We split the integral into two integrals, the first of which was evaluated in (a).

$$\begin{aligned} \int_0^\infty \frac{1}{\sqrt{t}(1+t)} dt &= \int_0^1 \frac{2}{1+u^2} du + \int_1^\infty \frac{2}{1+u^2} du \\ &= \frac{\pi}{2} + 2 \lim_{b \rightarrow \infty} \left(\tan^{-1} b - \tan^{-1} 1 \right) \\ &= \frac{\pi}{2} + 2 \left(\frac{\pi}{2} - \frac{\pi}{4} \right) = \pi \end{aligned}$$

74. Let c be any number in $(3, \infty)$.

$$\int_3^\infty \frac{1}{x\sqrt{x^2-9}} dx = \int_3^c \frac{1}{x\sqrt{x^2-9}} dx + \int_c^\infty \frac{1}{x\sqrt{x^2-9}} dx \text{ provided both integrals on the right converge.}$$

Formula 20 in Table 8.1 gives $\int \frac{1}{x\sqrt{x^2-9}} dx = \frac{1}{3} \sec^{-1} \left| \frac{x}{3} \right|$. (The definition of the inverse secant is given in Section 3.9.) Both integrals do converge:

$$\int_3^c \frac{1}{x\sqrt{x^2-9}} dx = \lim_{a \rightarrow 3^+} \left(\frac{1}{3} \sec^{-1} \left| \frac{c}{3} \right| - \frac{1}{3} \sec^{-1} \left| \frac{a}{3} \right| \right) = \frac{1}{3} \sec^{-1} \frac{c}{3}$$

$$\int_c^\infty \frac{1}{x\sqrt{x^2-9}} dx = \lim_{b \rightarrow \infty} \left(\frac{1}{3} \sec^{-1} \left| \frac{b}{3} \right| - \frac{1}{3} \sec^{-1} \left| \frac{c}{3} \right| \right) = \frac{\pi}{6} - \frac{1}{3} \sec^{-1} \frac{c}{3}$$

$$\text{Thus } \int_3^\infty \frac{1}{x\sqrt{x^2-9}} dx = \frac{\pi}{6}.$$

 < 0.000042 . Since $e^{-x^2} \leq e^{-3x}$ for $x > 3$, then $\int_3^\infty e^{-x^2} dx < 0.000042$ and therefore $\int_0^\infty e^{-x^2} dx$ can be replaced by $\int_0^3 e^{-x^2} dx$ without introducing an error greater than 0.000042.

78. (a)

(b) `> f:=2*exp(-t^2)/sqrt(Pi);`
`> int(f, t=0..infinity);` (answer is 1)

79. (a) $f(x) = \frac{1}{\sqrt{2\pi}} e^{-x^2/2}$
 f is increasing on $(-\infty, 0]$,
 f is decreasing on $[0, \infty)$,
 f has a local maximum at $(0, f(0)) = \left(0, \frac{1}{\sqrt{2\pi}} \right)$

(b) Maple commands:
`>f:=exp(-x^2/2)(sqrt(2*pi));`
`>int(f, x = -1..1);` ≈ 0.683
`>int(f, x = -2..2);` ≈ 0.954
`>int(f, x = -3..3);` ≈ 0.997

- (c) Part (b) suggests that as n increases, the integral approaches 1. We can take $\int_{-n}^n f(x) dx$ as close to 1 as we want by choosing $n > 1$ large enough. Also, we can make $\int_n^\infty f(x) dx$ and $\int_{-\infty}^{-n} f(x) dx$ as small as we want by choosing n large enough. This is because $0 < f(x) < e^{-x/2}$ for $x > 1$. (Likewise, $0 < f(x) < e^{x/2}$ for $x < -1$.) Thus, $\int_n^\infty f(x) dx < \int_n^\infty e^{-x/2} dx$.

$$\int_n^\infty e^{-x/2} dx = \lim_{c \rightarrow \infty} \int_n^c e^{-x/2} dx = \lim_{c \rightarrow \infty} \left[-2e^{-x/2} \right]_n^c = \lim_{c \rightarrow \infty} \left[-2e^{-c/2} + 2e^{-n/2} \right] = 2e^{-n/2}$$

As $n \rightarrow \infty$, $2e^{-n/2} \rightarrow 0$, for large enough n , $\int_n^\infty f(x) dx$ is as small as we want.

Likewise for large enough n , $\int_{-\infty}^{-n} f(x) dx$ is as small as we want.

80. (a) The statement is true since $\int_{-\infty}^b f(x) dx = \int_{-\infty}^a f(x) dx + \int_a^b f(x) dx$, $\int_b^\infty f(x) dx = \int_a^\infty f(x) dx - \int_a^b f(x) dx$ and $\int_a^b f(x) dx$ exists since $f(x)$ is integrable on every interval $[a, b]$.
- (b) $\int_{-\infty}^a f(x) dx + \int_a^\infty f(x) dx = \int_{-\infty}^a f(x) dx + \int_a^b f(x) dx - \int_a^b f(x) dx + \int_a^\infty f(x) dx$
 $= \int_{-\infty}^b f(x) dx + \int_b^a f(x) dx + \int_a^\infty f(x) dx = \int_{-\infty}^b f(x) dx + \int_b^\infty f(x) dx$

81-84. Example CAS commands:

Mathematica: (functions and domains may vary)

```

Clear[x, f, p]
f[x_]:= x^P Log[Abs[x]]
int = Integrate[f[x], {x, e, 100}]
int /. p -> 2.5

```

In order to plot the function, a value for p must be selected.

$$p = 3;$$

$$\text{Plot}[f[x], \{x, 2.72, 10\}]$$

85. Maple gives $\int_0^{2/\pi} \sin\left(\frac{1}{x}\right) dx = \frac{1}{\pi} \left(2 - \pi \cdot \text{Ci}\left(\frac{\pi}{2}\right) \right) \approx 0.16462$, where Ci is the cosine integral function defined

$$\text{by } \text{Ci}(t) = -\int_t^\infty \frac{\cos x}{x} dx.$$

86. Maple gives $\int_0^{2/\pi} x \sin\left(\frac{1}{x}\right) dx = \frac{2}{\pi^2} + \frac{1}{2} \text{Si}\left(\frac{\pi}{2}\right) - \frac{\pi}{4} \approx 0.10276$, where Si is the sine integral function defined by

$$\text{Si}(t) = \int_0^t \frac{\sin x}{x} dx.$$

8.9 PROBABILITY

1. $\int_4^8 \frac{1}{18} x dx = \frac{4}{3} \neq 1$; not a probability density.

2. $\int_0^2 \frac{1}{2} (2-x) dx = 1$; a probability density.

3. $\int_0^{\ln(1+\ln 2)/\ln 2} 2^x dx = \frac{2^x}{\ln 2} \Big|_0^{\ln(1+\ln 2)/\ln 2}$
 $= \left(\frac{1+\ln 2}{\ln 2} - \frac{1}{\ln 2} \right) = 1$

This is a probability density.

4. $x-1$ is not nonnegative on $[0, 1+\sqrt{3}]$, so not a probability density.

5. $\int_1^\infty \frac{1}{x^2} dx = 1$; a probability density.

6. $\int_0^\infty \frac{8}{\pi(4+x^2)} dx = \lim_{b \rightarrow \infty} \left(\frac{4}{\pi} \tan^{-1}\left(\frac{x}{2}\right) \Big|_0^b \right)$
 $= \frac{4}{\pi} \cdot \frac{\pi}{2} = 2$

This is not a probability density.

7. $\int_0^{\pi/4} 2 \cos 2x dx = 1$; a probability density.

8. $\int_0^e \frac{1}{x} dx$ diverges; not a probability density.
9. (a) The probability that a tire lasts between 25,000 and 32,000 miles
 (b) The probability that a tire lasts more than 30,000 miles
 (c) The probability that a tire lasts less than 20,000 miles
 (d) The probability that a tire lasts less than 15,000 miles
10. (a) $\int_{\pi}^{3\pi/2} \frac{1}{2\pi} dx + \int_{\pi/2}^{\pi} \frac{1}{2\pi} dx = 0.5$
 (b) $\int_2^{2\pi} \frac{1}{2\pi} dx = 1 - \frac{1}{\pi} \approx 0.682$
11. $\int_1^3 xe^{-x} dx = -(x+1)e^{-x} \Big|_1^3 = -4e^{-3} + 2e^{-1} \approx 0.537$
12. $\int_2^{15} \frac{\ln x}{x^2} dx = -\frac{\ln x + 1}{x} \Big|_2^{15} = -\frac{\ln 15}{15} - \frac{1}{15} + \frac{\ln 2}{2} + \frac{1}{2} \approx 0.599$
13. $\int_0^1 \frac{3}{2} x(2-x) dx = -\frac{1}{2} x^2(x-3) \Big|_{1/2}^1 = \frac{11}{16} \approx 0.688$
14. Using software to evaluate the Sine Integral we find $\int_{\frac{200}{1059}}^{\infty} \frac{\sin^2 \pi x}{\pi x^2} dx \approx 1.00004780741$ so the given function is very nearly a probability density over the given interval. Again using software we find that
- $$\int_{\frac{200}{1059}}^{\pi/6} \frac{\sin^2 \pi x}{\pi x^2} dx \approx 0.6732.$$
15. $\int_4^9 \frac{2}{x^3} dx = \frac{65}{1296} \approx 0.0502$
16. $\int_{\pi/6}^{\pi/4} \sin x dx = -\cos x \Big|_{\pi/6}^{\pi/4} = -\frac{\sqrt{2}}{2} + \frac{\sqrt{3}}{2} \approx 0.159$
17. $\int_3^c \frac{1}{6} x dx = \frac{1}{12} c^2 - \frac{3}{4}$. Solving $\frac{1}{12} c^2 - \frac{3}{4} = 1$, we find $c = \sqrt{21}$.
18. $\int_c^{c+1} \frac{1}{x} dx = \ln(c+1) - \ln c = \ln\left(\frac{c+1}{c}\right)$. Solving $\ln\left(\frac{c+1}{c}\right) = 1$, we find $\frac{c+1}{c} = e$ and thus $c = \frac{1}{e-1}$.
19. $\int_0^c 4e^{-2x} dx = -2e^{-2c} + 2$. Solving $-2e^{-2c} + 2 = 1$, we find $c = \frac{1}{2} \ln 2$.

$$20. \int_0^5 cx\sqrt{25-x^2} dx = -\frac{1}{3}c(25-x^2)^{3/2} \Big|_0^5 = \frac{125}{3}c, \text{ so } c = \frac{3}{125}.$$

21. We will assume that the given function is to be a probability density over the whole real line.

$$\int_{-\infty}^{\infty} \frac{c}{1+x^2} dx = c\pi \text{ so we take } c = \frac{1}{\pi}. \text{ Then } \int_1^2 \frac{1}{\pi(1+x^2)} dx = \frac{\tan^{-1} x}{\pi} \Big|_1^2 = \frac{\tan^{-1} 2}{\pi} - \frac{1}{4} \approx 0.10242.$$

$$22. \int_0^1 c\sqrt{x}(1-x) dx = c\left(\frac{2}{3}x^{3/2} - \frac{2}{5}x^{5/2}\right) \Big|_0^1 = \frac{4}{15}c, \text{ so } c = \frac{15}{4}. \text{ Then } \int_{1/4}^{1/2} \frac{15}{4}\sqrt{x}(1-x) dx = \frac{7}{16}\sqrt{2} - \frac{17}{64} \approx 0.353$$

$$23. \int_0^{\infty} e^{-cx} dx = \frac{1}{c} \lim_{b \rightarrow \infty} (-e^{-bcx} + 1) = \frac{1}{c}. \text{ Thus multiplying } e^{-cx} \text{ by } c \text{ produces a probability density on } [0, \infty).$$

$$24. \text{Var}(X) = \int_{-\infty}^{\infty} (X - \mu)^2 f(X) dX \\ = \int_{-\infty}^{\infty} X^2 f(X) dX + \int_{-\infty}^{\infty} (-2X\mu) f(X) dX + \int_{-\infty}^{\infty} \mu^2 f(X) dX$$

$$\int_{-\infty}^{\infty} (-2X\mu) f(X) dX = -2\mu \int_{-\infty}^{\infty} X f(X) dX = -2\mu^2$$

$$\int_{-\infty}^{\infty} \mu^2 f(X) dX = \mu^2 \int_{-\infty}^{\infty} f(X) dX = \mu^2(1) = \mu^2$$

$$\text{Thus } \text{Var}(X) = \int_{-\infty}^{\infty} X^2 f(X) dX - \mu^2.$$

$$25. \text{mean} = \int_0^4 x\left(\frac{1}{8}x\right) dx = \frac{8}{3}$$

To find the median we need to solve $\int_0^c \frac{1}{8}x dx = \frac{1}{16}c^2 = \frac{1}{2}$ for c . Thus the median is $\sqrt{8}$.

$$26. \text{mean} = \int_0^3 x\left(\frac{1}{9}x^2\right) dx = \frac{9}{4}$$

To find the median we need to solve $\int_0^c \frac{1}{9}x^2 dx = \frac{1}{27}c^3 = \frac{1}{2}$ for c . Thus the median is $\frac{3}{2}2^{2/3} \approx 2.381$.

$$27. \text{mean} = \int_1^{\infty} x\left(\frac{2}{x^3}\right) dx = \lim_{b \rightarrow \infty} \left(-\frac{2}{x}\right) \Big|_1^b = 2$$

To find the median we need to solve $\int_1^c \frac{2}{x^3} dx = -\frac{1}{c^2} + 1 = \frac{1}{2}$ for c . Thus the median is $\sqrt{2}$.

$$28. \text{mean} = \int_1^e x\left(\frac{1}{x}\right) dx = e - 1 \approx 1.718$$

To find the median we need to solve $\int_1^c \frac{1}{x} dx = \ln c = \frac{1}{2}$ for c . Thus the median is $\sqrt{e} \approx 1.649$.

29. The exponential density with mean 1 is e^{-X} . The probability that the food is digested in less than 30 minutes is $\int_0^{1/2} e^{-X} dX = -e^{-1/2} + 1 \approx 0.3935$.
30. The exponential density with mean 4 is $(1/4)e^{-X/4}$. The probability that a flower is pollinated within 5 minutes is $\int_0^5 (1/4)e^{-X/4} dX = -e^{-5/4} + 1 \approx 0.7135$. Out of 1000 flowers we would expect 713 or 714 to be pollinated within 5 minutes.
31. The exponential density with mean 1200 is $(1/1200)e^{-X/1200}$.
- (a) The probability that a bulb will last less than 1000 hours is $\int_0^{1000} (1/1200)e^{-X/1200} dX = -e^{-5/6} + 1 \approx 0.5654$.
- (b) By Example 9 the median lifetime is $1200 \ln 2 \approx 831.8$ so the expected time until half the bulbs in a batch fail is 832 hr.
32. To find the density, solve $\int_0^3 (1/c)e^{-X/c} dX = -e^{-3/c} + 1 = \frac{1}{3}$. Then $c = \frac{3}{\ln(3/2)} \approx 7.3989$, so the mean lifetime of the components is 7.4 years. The probability of failure within 1 year is $\int_0^1 \frac{\ln(3/2)}{3} e^{-\frac{X \ln(3/2)}{3}} dX = -\left(\frac{2}{3}\right)^{1/3} + 1 \approx 0.1264$.
33. To find the density, solve $\int_0^2 (1/c)e^{-X/c} dX = -e^{-2/c} + 1 = \frac{2}{5}$; $c = \frac{2}{\ln(5/3)}$. The probability that a hydra dies within 6 months, or half a year, is $\int_0^{1/2} \frac{\ln(5/3)}{2} e^{-\frac{X \ln(5/3)}{2}} dX = -\left(\frac{3}{5}\right)^{1/4} + 1 \approx 0.1199$, so we would expect $(0.12)(500) = 60$ hydra to die within the first six months.
34. To find the density, solve $\int_0^{50} (1/c)e^{-X/c} dX = -e^{-50/c} + 1 = \frac{3}{10}$; $c = \frac{50}{\ln(10/7)}$. The probability that a high-risk driver is involved in an accident in the first 80 days is $\int_0^{80} \frac{\ln(10/7)}{50} e^{-\frac{X \ln(10/7)}{50}} dX = -\left(\frac{7}{10}\right)^{8/5} + 1 \approx 0.4349$, so we would expect 43 or 44 out of 100 high-risk drivers to be involved in an accident in the first 80 days.
35. Using seconds as the time unit, the density is $(1/30)e^{-X/30}$.
- (a) $\int_0^{15} (1/30)e^{-X/30} dX = -e^{-1/2} + 1 \approx 0.393$
- (b) $\int_{60}^{\infty} (1/30)e^{-X/30} dX = e^{-2} \approx 0.135$
- (c) In a continuous distribution the probability of a particular number is 0.
- (d) The probability that a single customer waits less than 3 minutes is $-e^{-6} + 1 \approx 0.997521$. The probability that at least one customer out of 200 waits longer than 3 minutes is $1 - (0.997521)^{200} \approx 0.391 < 0.5$, so the most likely outcome is that all 200 are served within 3 minutes.

36. For parts (a) and (b) the density is $(1/16)e^{-X/16}$. For parts (c) and (d) the density is $(1/32)e^{-X/32}$.

$$(a) \int_{10}^{30} (1/16)e^{-X/16} dX = -e^{-15/8} + e^{-5/8} \approx 0.382$$

$$(b) \int_{25}^{\infty} (1/16)e^{-X/16} dX = e^{-25/16} \approx 0.210$$

$$(c) \int_{35}^{50} (1/32)e^{-X/32} dX = -e^{-25/16} + e^{-35/32} \approx 0.125$$

$$(d) \int_0^{20} (1/32)e^{-X/32} dX = -e^{-5/8} + 1 \approx 0.465$$

37. The expected payout per printer is $200 \int_0^1 (1/2)e^{-X/2} dX + 100 \int_1^2 (1/2)e^{-X/2} dX \approx \102.56 . Thus the expected refund total for 100 machines is \$10,256.

38. To find the density, solve $\int_0^2 \frac{1}{c} e^{-X/c} dX = -e^{-2/c} + 1 = \frac{1}{2}$, which gives $c = \frac{2}{\ln(2)}$. The probability of failure in the first year is $\int_0^1 \frac{\ln 2}{2} e^{-\frac{X \ln 2}{2}} dX = -\frac{\sqrt{2}}{2} + 1 \approx 0.293$. We expect $(150)(0.293) = 43.934$ or about 44 copiers to fail during the first year.

For Exercises 39–52, the density function is $f(X) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{X-\mu}{\sigma}\right)^2}$ with μ and σ as given in the solution.

39. $\mu = 162$, $\sigma = 28$

$$\int_{165}^{193} f(X) dX \approx 0.323; \text{ about 323 children}$$

$$\int_{148}^{167} f(X) dX \approx 0.262; \text{ about 262 children}$$

40. $\mu = 20.11$, $\sigma = 4.7$

$$\int_{17}^{\infty} f(X) dX = \frac{1}{2} + \int_{17}^{\mu} f(X) dX \approx 0.74593$$

41. $\mu = 55$, $\sigma = 4$

$$\int_0^{60} f(X) dX \approx 0.89435$$

42. $\mu = 22,000$, $\sigma = 4000$

$$(a) \int_{18,000}^{\infty} f(X) dX = \frac{1}{2} + \int_{18,000}^{\mu} f(X) dX \approx 0.84134; (4000)(0.84134) \approx 3365 \text{ tires}$$

(b) We want to find L such that $\int_L^{\infty} f(X) dX = 0.9$. A CAS gives $L \approx 16,874$, so 90% of tires will have a lifetime of at least 16,874 miles.

43. $\mu = 65.5$, $\sigma = 2.5$

$$(a) \int_{68}^{\infty} f(X) dX = \frac{1}{2} - \int_{\mu}^{68} f(X) dX \approx 0.159, \text{ or } 16\%.$$

$$(b) \int_{61}^{64} f(X) dX \approx 0.23832$$

44. $\mu = 81, \sigma = 7$

$\int_{75}^{85} f(X) dX \approx 0.520$; one would expect 52 of the babies to live to between 75 and 85.

45. $\mu = 266, \sigma = 16$; $(36)(7) = 252, (40)(7) = 280$

$\int_{252}^{280} f(X) dX \approx 0.6184$; we would expect 618 of the women to have pregnancies lasting between 36 and 40 weeks.

46. $\mu = 1400, \sigma = 100$

(a) $\int_{1325}^{1450} f(X) dX \approx 0.46484$

(b) $\int_{1480}^{\infty} f(X) dX = \frac{1}{2} - \int_{\mu}^{1480} f(X) dX \approx 0.21186$

$(500)(0.21186) \approx 106$; we would expect about 106 males to have a brain weight exceeding 1480 gm.

47. $\mu = 80, \sigma = 12$

$\int_0^{70} f(X) dX \approx 0.20233$

$(300)(0.20233) \approx 61$; about 61 adults.

48. $\mu = 4.4, \sigma = 0.2$

$\int_{4.3}^{4.45} f(X) dX \approx 0.29017$

49. $\mu = 35, \sigma = 9$

$\int_{40}^{\infty} f(X) dX = \frac{1}{2} - \int_{\mu}^{40} f(X) dX \approx 0.28926$

About 289 shafts would need more than 45 grams of added weight.

50. $\mu = 200, \sigma = 30$

$\int_{260}^{\infty} f(X) dX = \frac{1}{2} - \int_{\mu}^{260} f(X) dX \approx 0.02275$

$\int_0^{170} f(X) dX \approx 0.15866$

$0.02275 + 0.15866 = 0.18141$ or about 18%

51. $\mu = (0.8)(2500) = 2000, \sigma = (0.4)(50) = 20$

(a) $\int_{1960}^{\infty} f(X) dX = \frac{1}{2} + \int_{1960}^{\mu} f(X) dX \approx 0.977$

(b) $\int_0^{1980} f(X) dX \approx 0.159$

(c) $\int_{1940}^{2020} f(X) dX \approx 0.840$

52. $\mu = (0.5)(400) = 200, \sigma = \frac{20}{2} = 10$

To improve the approximation to the binomial distribution we will modify the interval of integration. We give the true binomial values for comparison.

(a) $\int_{189.5}^{209.5} f(X) dX \approx 0.68208$; correct to 5 places

(b) $\int_0^{169.5} f(X) dX \approx 0.00114$; true value ≈ 0.00112

(c) $\int_{220.5}^{\infty} f(X) dX = \frac{1}{2} - \int_{\mu}^{220.5} f(X) dX \approx 0.02018$; true value ≈ 0.02012

(d) The value is very close to 0, in fact about 10^{-24} .

(c) $P(\text{at least two L}) = \frac{1+3+3}{27} = \frac{7}{27} \approx 0.26$

(d) $P(\text{no more than one D}) = 1 - P(\text{at least two D})$
 $= 1 - \frac{7}{27} = \frac{20}{27} \approx 0.74$

56. The probability that both systems fail is 0.0148. Since the two systems have the same performance distribution, the failure probability for a single system is $\sqrt{0.0148} = 0.121655$. The success probability for a single system is $1 - \sqrt{0.0148}$ so the probability that both succeed is $(1 - \sqrt{0.0148})^2 = 0.771489$. The probability that one fails and one succeeds is $1 - 0.0148 - 0.771489 = 0.213711$. Since the events “main fails, backup succeeds” and “main succeeds, backup fails” have the same probability, the probability that only the main fails is $0.213711 / 2 = 0.106856$. Thus the probability that the main fails, either along with the backup or by itself, is $0.0148 + 0.106856 = 0.121656$.

29. $A = \int_1^\infty \frac{dx}{x^p}$ converges if $p > 1$ and diverges if $p \leq 1$. Thus, $p \leq 1$ for infinite area. The volume of the solid of revolution about the x -axis is $V = \int_1^\infty \pi \left(\frac{1}{x^p} \right)^2 dx = \pi \int_1^\infty \frac{dx}{x^{2p}}$ which converges if $2p > 1$ and diverges if $2p \leq 1$. Thus we want $p > \frac{1}{2}$ for finite volume. In conclusion, the curve $y = x^{-p}$ gives infinite area and finite volume for values of p satisfying $\frac{1}{2} < p \leq 1$.

30. The area is given by the integral $A = \int_0^1 \frac{dx}{x^p}$;

$$p = 1: A = \lim_{b \rightarrow 0^+} [\ln x]_b^1 = -\lim_{b \rightarrow 0^+} \ln b = \infty, \text{ diverges;}$$

$$p > 1: A = \lim_{b \rightarrow 0^+} [x^{1-p}]_b^1 = 1 - \lim_{b \rightarrow 0^+} b^{1-p} = -\infty, \text{ diverges;}$$

$$p < 1: A = \lim_{b \rightarrow 0^+} [x^{1-p}]_b^1 = 1 - \lim_{b \rightarrow 0^+} b^{1-p} = 1 - 0, \text{ converges; thus, } p \geq 1 \text{ for infinite area.}$$

The volume of the solid of revolution about the x -axis is $V_x = \pi \int_0^1 \frac{dx}{x^{2p}}$ which converges if $2p < 1$ or $p < \frac{1}{2}$, and diverges if $p \geq \frac{1}{2}$. Thus, V_x is infinite whenever the area is infinite ($p \geq 1$). The volume of the solid of

revolution about the y -axis is $V_y = \pi \int_1^\infty [R(y)]^2 dy = \pi \int_1^\infty \frac{dy}{y^{2/p}}$ which converges if $\frac{2}{p} > 1 \Leftrightarrow p < 2$ (see

Exercise 29). In conclusion, the curve $y = x^{-p}$ gives infinite area and finite volume for values of p satisfying $1 \leq p < 2$, as described above.

CHAPTER 9 FIRST-ORDER DIFFERENTIAL EQUATIONS

9.1 SOLUTIONS, SLOPE FIELDS AND EULER'S METHOD

- $y' = x + y \Rightarrow$ slope of 0 for the line $y = -x$.
 For $x, y > 0$, $y' = x + y \Rightarrow$ slope > 0 in Quadrant I.
 For $x, y < 0$, $y' = x + y \Rightarrow$ slope < 0 in Quadrant III.
 For $|y| > |x|$, $y > 0, x < 0$, $y' = x + y \Rightarrow$ slope > 0 in Quadrant II above $y = -x$.
 For $|y| < |x|$, $y > 0, x < 0$, $y' = x + y \Rightarrow$ slope < 0 in Quadrant II below $y = -x$.
 For $|y| < |x|$, $x > 0, y < 0$, $y' = x + y \Rightarrow$ slope > 0 in Quadrant IV above $y = -x$.
 For $|y| > |x|$, $x > 0, y < 0$, $y' = x + y \Rightarrow$ slope < 0 in Quadrant IV below $y = -x$.
 All of the conditions are seen in slope field (d).

- $y' = y + 1 \Rightarrow$ slope is constant for a given value of y , slope is 0 for $y = -1$, slope is positive for $y > -1$ and negative for $y < -1$. These characteristics are evident in slope field (c)

- $y' = -\frac{x}{y} \Rightarrow$ slope = 1 on $y = -x$ and -1 on $y = x$. $y' = -\frac{x}{y} \Rightarrow$ slope = 0 on the y -axis, excluding $(0, 0)$, and is undefined on the x -axis. Slopes are positive for $x > 0, y < 0$ and $x < 0, y > 0$ (Quadrants II and IV), otherwise negative. Field (a) is consistent with these conditions.

- $y' = y^2 - x^2 \Rightarrow$ slope is 0 for $y = x$ and for $y = -x$. For $|y| > |x|$ slope is positive and for $|y| < |x|$ slope is negative. Field (b) has these characteristics.

23-34. Example CAS commands:

Maple:

```
ode := diff( y(x), x ) = y(x);
```

```
icA := [0,1];
```

```
icB := [0, 2];
```

```
icC := [0, -1];
```

```
DEplot( ode, y(x), x=0..2, [icA,icB,icC], arrows=slim, linecolor=blue, title="#23 (Section 9.1)");
```

Mathematica:

To plot vector fields, you must begin by loading a graphics package.

```
<<Graphics`PlotField`
```

To control lengths and appearance of vectors, select the Help browser, type PlotVectorField and select Go.

```
Clear[x, y, f]
```

```
yprime = y (2 - y);
```

```
pv = PlotVectorField[{1, yprime}, {x, -5, 5}, {y, -4, 6}, Axes -> True, AxesLabel -> {x, y}];
```

To draw solution curves with Mathematica, you must first solve the differential equation. This will be done with the DSolve command. The $y[x]$ and x at the end of the command specify the dependent and independent variables. The command will not work unless the y in the differential equation is referenced as $y[x]$.

```
equation = y'[x]==y[x] (2 - y[x]);
initcond = y[a] == b;
sols = DSolve[{equation, initcond}, y[x], x]
vals = {{0, 1/2}, {0, 3/2}, {0, 2}, {0, 3}}
f[{a_, b_}] = sols[[1, 1, 2]];
solnset = Map[f, vals]
ps = Plot[Evaluate[solnset, {x, -5, 5}];
Show[pv, ps, PlotRange -> {-4, 6}];
```

The code for problems such as 31 & 32 is similar for the direction field, but the analytical solutions involve complicated inverse functions, so the numerical solver NDSolve is used. Note that a domain interval is specified.

```
equation = y'[x] == Cos[2x - y[x]];
initcond = y[0] == 2;
sol = NDSolve[{equation, initcond}, y[x], {x, 0, 5}]
ps = Plot[Evaluate[y[x]/.sol, {x, 0, 5}];
N[y[x] /. sol/.x -> 2]
Show[pv, ps, PlotRange -> {0, 5}];
```

Solutions for 33 can be found one at a time and plots named and shown together. No direction fields here. For 34, the direction field code is similar, but the solution is found implicitly using integrations. The plot requires loading another special graphics package.

```
<<Graphics`ImplicitPlot`
Clear[x,y]
solution[c_] = Integrate[2 (y - 1), y] == Integrate[3x^2 + 4x + 2, x] + c
values = {-6, -4, -2, 0, 2, 4, 6};
solns = Map[solution, values];
ps = ImplicitPlot[solns, {x, -3, 3}, {y, -3, 3}]
Show[pv, ps]
```

9.3 APPLICATIONS

1. Note that the total mass is $66 + 7 = 73$ kg, therefore, $v = v_0 e^{-(k/m)t} \Rightarrow v = 9e^{-3.9t/73}$

(a) $s(t) = \int 9e^{-3.9t/73} dt = -\frac{2190}{13} e^{-3.9t/73} + C$

Since $s(0) = 0$ we have $C = \frac{2190}{13}$ and $\lim_{t \rightarrow \infty} s(t) = \lim_{t \rightarrow \infty} \frac{2190}{13} (1 - e^{-3.9t/73}) = \frac{2190}{13} \approx 168.5$

The cyclist will coast about 168.5 meters.

(b) $1 = 9e^{-3.9t/73} \Rightarrow \frac{3.9t}{73} = \ln 9 \Rightarrow t = \frac{73 \ln 9}{3.9} \approx 41.13$ sec

It will take about 41.13 seconds.

2. $v = v_0 e^{-(k/m)t} \Rightarrow v = 9e^{-(59,000/51,000,000)t} \Rightarrow v = 9e^{-59t/51,000}$

(a) $s(t) = \int 9e^{-59t/51,000} dt = -\frac{459,000}{59} e^{-59t/51,000} + C$

Since $s(0) = 0$ we have $C = \frac{459,000}{59}$ and $\lim_{t \rightarrow \infty} s(t) = \lim_{t \rightarrow \infty} \frac{459,000}{59} (1 - e^{-59t/51,000}) = \frac{459,000}{59} \approx 7780$ m

The ship will coast about 7780 m, or 7.78 km.

(b) $1 = 9e^{-59t/51,000} \Rightarrow \frac{59t}{51,000} = \ln 9 \Rightarrow t = \frac{51,000 \ln 9}{59} \approx 1899.3$ sec

It will take about 31.65 minutes.

3. The total distance traveled $= \frac{v_0 m}{k} \Rightarrow \frac{(2.75)(39.92)}{k} = 4.91 \Rightarrow k = 22.36$. Therefore, the distance traveled is given by the function $s(t) = 4.91(1 - e^{-(22.36/39.92)t})$. The graph shows $s(t)$ and the data points.

4. $\frac{v_0 m}{k} = \text{coasting distance} \Rightarrow \frac{(0.80)(49.90)}{k} = 1.32 \Rightarrow k = \frac{998}{33}$

We know that $\frac{v_0 m}{k} = 1.32$ and $\frac{k}{m} = \frac{998}{33(49.9)} = \frac{20}{33}$.

Using Equation 2, we have: $s(t) = \frac{v_0 m}{k} (1 - e^{-(k/m)t}) = 1.32(1 - e^{-20t/33}) \approx 1.32(1 - e^{-0.606t})$

5. $y = mx \Rightarrow \frac{y}{x} = m \Rightarrow \frac{xy' - y}{x^2} = 0 \Rightarrow y' = \frac{y}{x}$. So for

orthogonals: $\frac{dy}{dx} = -\frac{x}{y} \Rightarrow y dy = -x dx \Rightarrow \frac{y^2}{2} + \frac{x^2}{2} = C$

$\Rightarrow x^2 + y^2 = C_1$

$$\begin{aligned}
 6. \quad y = cx^2 &\Rightarrow \frac{y}{x^2} = c \Rightarrow \frac{x^2 y' - 2xy}{x^4} = 0 \Rightarrow x^2 y' = 2xy \\
 &\Rightarrow y' = \frac{2y}{x}. \text{ So for the orthogonals: } \frac{dy}{dx} = -\frac{x}{2y} \\
 &\Rightarrow 2y dy = -x dx \Rightarrow y^2 = -\frac{x^2}{2} + C \Rightarrow y = \pm \sqrt{-\frac{x^2}{2} + C}, \\
 &C > 0
 \end{aligned}$$

$$\begin{aligned}
 7. \quad kx^2 + y^2 = 1 &\Rightarrow 1 - y^2 = kx^2 \Rightarrow \frac{1-y^2}{x^2} = k \\
 &\Rightarrow \frac{x^2(2y)y' - (1-y^2)2x}{x^4} = 0 \Rightarrow -2yx^2 y' = (1-y^2)(2x) \\
 &\Rightarrow y' = \frac{(1-y^2)(2x)}{-2xy^2} = \frac{(1-y^2)}{-xy}. \text{ So for the orthogonals:} \\
 &\frac{dy}{dx} = \frac{xy}{1-y^2} \Rightarrow \frac{(1-y^2)}{y} dy = x dx \Rightarrow \ln y - \frac{y^2}{2} = \frac{x^2}{2} + C
 \end{aligned}$$

$$\begin{aligned}
 8. \quad 2x^2 + y^2 = c^2 &\Rightarrow 4x + 2yy' = 0 \Rightarrow y' = -\frac{4x}{2y} = -\frac{2x}{y}. \text{ For} \\
 \text{orthogonals: } \frac{dy}{dx} &= \frac{y}{2x} \Rightarrow \frac{dy}{y} = \frac{dx}{2x} \Rightarrow \ln y = \frac{1}{2} \ln x + C \\
 &\Rightarrow \ln y = \ln x^{1/2} + \ln C_1 \Rightarrow y = C_1 |x|^{1/2}
 \end{aligned}$$

$$\begin{aligned}
 9. \quad y = ce^{-x} &\Rightarrow \frac{y}{e^{-x}} = c \Rightarrow \frac{e^{-x}y' - y(e^{-x})(-1)}{(e^{-x})^2} = 0 \\
 &\Rightarrow e^{-x}y' = -ye^{-x} \Rightarrow y' = -y. \text{ So for the orthogonals:} \\
 &\frac{dy}{dx} = \frac{1}{y} \Rightarrow y dy = dx \Rightarrow \frac{y^2}{2} = x + C \Rightarrow y^2 = 2x + C_1 \\
 &\Rightarrow y = \pm \sqrt{2x + C_1}
 \end{aligned}$$

$$\begin{aligned}
 10. \quad y = e^{kx} &\Rightarrow \ln y = kx \Rightarrow \frac{\ln y}{x} = k \Rightarrow \frac{x(\frac{1}{y})y' - \ln y}{x^2} = 0 \\
 &\Rightarrow \left(\frac{x}{y}\right)y' - \ln y = 0 \Rightarrow y' = \frac{y \ln y}{x}. \text{ So for the} \\
 \text{orthogonals: } \frac{dy}{dx} &= \frac{-x}{y \ln y} \Rightarrow y \ln y dy = -x dx \\
 &\Rightarrow \frac{1}{2} y^2 \ln y - \frac{1}{4} (y^2)^2 = \left(-\frac{1}{2} x^2\right) + C \\
 &\Rightarrow y^2 \ln y - \frac{y^2}{2} = -x^2 + C_1
 \end{aligned}$$

11. $2x^2 + 3y^2 = 5$ and $y^2 = x^3$ intersect at $(1, 1)$. Also, $2x^2 + 3y^2 = 5 \Rightarrow 4x + 6y y' = 0 \Rightarrow y' = -\frac{4x}{6y}$
 $\Rightarrow y'(1, 1) = -\frac{2}{3}$ and $y_1^2 = x^3 \Rightarrow 2y_1 y_1' = 3x^2 \Rightarrow y_1' = \frac{3x^2}{2y_1} \Rightarrow y_1'(1, 1) = \frac{3}{2}$. Since $y' \cdot y_1' = \left(-\frac{2}{3}\right)\left(\frac{3}{2}\right) = -1$, the curves are orthogonal.

12. (a) $x dx + y dy = 0 \Rightarrow \frac{x^2}{2} + \frac{y^2}{2} = C$ the general equation of the family with slope $y' = -\frac{x}{y}$.
 For the orthogonals: $y' = \frac{y}{x} \Rightarrow \frac{dy}{y} = \frac{dx}{x}$
 $\Rightarrow \ln y = \ln x + C$ or $y = C_1 x$ (where $C_1 = e^C$) is the general equation of the orthogonals.

- (b) $x dy - 2y dx = 0 \Rightarrow 2y dx = x dy \Rightarrow \frac{dy}{y} = \frac{dx}{2x}$
 $\Rightarrow \frac{1}{2} \left(\frac{dy}{y}\right) = \frac{dx}{x} \Rightarrow \frac{1}{2} \ln y = \ln x + C \Rightarrow y = C_1 x^2$
 is the equation for the solution family.
 $\frac{1}{2} \ln y - \ln x = C \Rightarrow \frac{1}{2} \frac{y'}{y} - \frac{1}{x} = 0 \Rightarrow y' = \frac{2y}{x}$
 \Rightarrow slope of orthogonals is $\frac{dy}{dx} = -\frac{x}{2y}$
 $\Rightarrow 2y dy = -x dx \Rightarrow y^2 = -\frac{x^2}{2} + C$ is the general equation of the orthogonals.

13. Let $y(t)$ = the amount of salt in the container and $V(t)$ = the total volume of liquid in the tank at time t . Then, the departure rate is $\frac{y(t)}{V(t)}$ (the outflow rate).

(a) Rate entering = $2 \frac{\text{lb}}{\text{gal}} \cdot 5 \frac{\text{gal}}{\text{min}} = 10 \frac{\text{lb}}{\text{min}}$

(b) Volume = $V(t) = 100 \text{ gal} + (5t \text{ gal} - 4t \text{ gal}) = (100 + t) \text{ gal}$

(c) The volume at time t is $(100 + t)$ gal. The amount of salt in the tank at time t is y lbs. So the concentration at any time t is $\frac{y}{100+t} \frac{\text{lb}}{\text{gal}}$. Then, the rate leaving = $\frac{y}{100+t} \left(\frac{\text{lb}}{\text{gal}}\right) \cdot 4 \left(\frac{\text{gal}}{\text{min}}\right) = \frac{4y}{100+t} \left(\frac{\text{lb}}{\text{min}}\right)$

(d) $\frac{dy}{dt} = 10 - \frac{4y}{100+t} \Rightarrow \frac{dy}{dt} + \left(\frac{4}{100+t}\right)y = 10 \Rightarrow P(t) = \frac{4}{100+t}, Q(t) = 10 \Rightarrow \int P(t) dt = \int \frac{4}{100+t} dt = 4 \ln(100+t)$
 $\Rightarrow v(t) = e^{4 \ln(100+t)} = (100+t)^4 \Rightarrow y = \frac{1}{(100+t)^4} \int (100+t)^4 (10 dt) = \frac{10}{(100+t)^4} \left(\frac{(100+t)^5}{5} + C\right)$
 $= 2(100+t) + \frac{C}{(100+t)^4}; y(0) = 50 \Rightarrow 2(100+0) + \frac{C}{(100+0)^4} = 50 \Rightarrow C = -(150)(100)^4$
 $\Rightarrow y = 2(100+t) - \frac{(150)(100)^4}{(100+t)^4} \Rightarrow y = 2(100+t) - \frac{150}{\left(1+\frac{t}{100}\right)^4}$

(e) $y(25) = 2(100+25) - \frac{(150)(100)^4}{(100+25)^4} \approx 188.56 \text{ lbs} \Rightarrow \text{concentration} = \frac{y(25)}{\text{volume}} \approx \frac{188.6}{125} \approx 1.5 \frac{\text{lb}}{\text{gal}}$

14. (a) $\frac{dV}{dt} = (5-3) = 2 \Rightarrow V = 100 + 2t$

The tank is full when $V = 200 = 100 + 2t \Rightarrow t = 50$ min

(b) Let $y(t)$ be the amount of concentrate in the tank at time t .

$$\frac{dy}{dt} = \left(\frac{1}{2} \frac{\text{lb}}{\text{gal}}\right) \left(5 \frac{\text{gal}}{\text{min}}\right) - \left(\frac{y}{100+2t} \frac{\text{lb}}{\text{gal}}\right) \left(3 \frac{\text{gal}}{\text{min}}\right) \Rightarrow \frac{dy}{dt} = \frac{5}{2} - \frac{3}{2} \left(\frac{y}{50+t}\right) \Rightarrow \frac{dy}{dt} + \frac{3}{2(t+50)} y = \frac{5}{2}; \quad Q(t) = \frac{5}{2};$$

$$P(t) = \frac{3}{2} \left(\frac{1}{t+50}\right) \Rightarrow \int P(t) dt = \frac{3}{2} \int \frac{1}{t+50} dt = \frac{3}{2} \ln(t+50) \text{ since } t+50 > 0 \Rightarrow v(t) = e^{\int P(t) dt} = e^{\frac{3}{2} \ln(t+50)}$$

$$= (t+50)^{3/2} \Rightarrow y(t) = \frac{1}{(t+50)^{3/2}} \int \frac{5}{2} (t+50)^{3/2} dt = (t+50)^{-3/2} \left[(t+50)^{5/2} + C \right] \Rightarrow y(t) = t + 50 + \frac{C}{(t+50)^{3/2}}$$

Apply the initial condition (i.e., distilled water in the tank at $t = 0$):

$$y(0) = 0 = 50 + \frac{C}{50^{3/2}} \Rightarrow C = -50^{5/2} \Rightarrow y(t) = t + 50 - \frac{50^{5/2}}{(t+50)^{3/2}}. \text{ When the tank is full at } t = 50,$$

$$y(50) = 100 - \frac{50^{5/2}}{100^{3/2}} \approx 83.22 \text{ pounds of concentrate.}$$

15. Let y be the amount of fertilizer in the tank at time t . Then rate entering $= 1 \frac{\text{lb}}{\text{gal}} \cdot 1 \frac{\text{gal}}{\text{min}} = 1 \frac{\text{lb}}{\text{min}}$ and the volume

in the tank at time t is $V(t) = 100 \text{ (gal)} + \left[1 \left(\frac{\text{gal}}{\text{min}}\right) - 3 \left(\frac{\text{gal}}{\text{min}}\right) \right] t \text{ min} = (100 - 2t) \text{ gal}$. Hence rate out

$$= \left(\frac{y}{100-2t}\right) 3 = \frac{3y}{100-2t} \frac{\text{lb}}{\text{min}} \Rightarrow \frac{dy}{dt} = \left(1 - \frac{3y}{100-2t}\right) \frac{\text{lb}}{\text{min}} \Rightarrow \frac{dy}{dt} + \left(\frac{3}{100-2t}\right) y = 1 \Rightarrow P(t) = \frac{3}{100-2t}, \quad Q(t) = 1$$

$$\Rightarrow \int P(t) dt = \int \frac{3}{100-2t} dt = \frac{3 \ln(100-2t)}{-2} \Rightarrow v(t) = e^{(-3 \ln(100-2t))/2} = (100-2t)^{-3/2}$$

$$\Rightarrow y = \frac{1}{(100-2t)^{-3/2}} \int (100-2t)^{-3/2} dt = (100-2t)^{-3/2} \left[\frac{-2(100-2t)^{-1/2}}{-2} + C \right] = (100-2t) + C(100-2t)^{3/2};$$

$$y(0) = 0 \Rightarrow [100 - 2(0)] + C[100 - 2(0)]^{3/2} \Rightarrow C(100)^{3/2} = -100 \Rightarrow C = -(100)^{-1/2} = -\frac{1}{10}$$

$$\Rightarrow y = (100 - 2t) - \frac{(100 - 2t)^{3/2}}{10}. \text{ Let } \frac{dy}{dt} = 0 \Rightarrow \frac{dy}{dt} = -2 - \frac{(\frac{3}{2})(100-2t)^{1/2}(-2)}{10} = -2 + \frac{3\sqrt{100-2t}}{10} = 0$$

$$\Rightarrow 20 = 3\sqrt{100-2t} \Rightarrow 400 = 9(100-2t) \Rightarrow 400 = 900 - 18t \Rightarrow -500 = -18t \Rightarrow t \approx 27.8 \text{ min, the time to}$$

reach the maximum. The maximum amount is then $y(27.8) = [100 - 2(27.8)] - \frac{[100 - 2(27.8)]^{3/2}}{10} \approx 14.8 \text{ lb}$

16. Let $y = y(t)$ be the amount of carbon monoxide (CO) in the room at time t . The amount of CO entering the

room is $\left(\frac{4}{100} \times \frac{3}{10}\right) = \frac{12}{1000} \frac{\text{ft}^3}{\text{min}}$, and the amount of CO leaving the room is $\left(\frac{y}{4500}\right) \left(\frac{3}{10}\right) = \frac{y}{15,000} \frac{\text{ft}^3}{\text{min}}$.

$$\text{Thus, } \frac{dy}{dt} = \frac{12}{1000} - \frac{y}{15,000} \Rightarrow \frac{dy}{dt} + \frac{1}{15,000} y = \frac{12}{1000} \Rightarrow P(t) = \frac{1}{15,000}, \quad Q(t) = \frac{12}{1000} \Rightarrow v(t) = e^{t/15,000}$$

$$\Rightarrow y = \frac{1}{e^{t/15,000}} \int \frac{12}{1000} e^{t/15,000} dt \Rightarrow y = e^{-t/15,000} \left(\frac{12 \cdot 15,000}{1000} e^{t/15,000} + C \right) = e^{-t/15,000} (180 e^{t/15,000} + C);$$

$$y(0) = 0 \Rightarrow 0 = 1(180 + C) \Rightarrow C = -180 \Rightarrow y = 180 - 180 e^{-t/15,000}. \text{ When the concentration of CO is } 0.01\%$$

in the room, the amount of CO satisfies $\frac{y}{4500} = \frac{0.01}{100} \Rightarrow y = 0.45 \text{ ft}^3$. When the room contains this amount

we have $0.45 = 180 - 180 e^{-t/15,000} \Rightarrow \frac{179.55}{180} = e^{-t/15,000} \Rightarrow t = -15,000 \ln\left(\frac{179.55}{180}\right) \approx 37.55 \text{ min}$.

(c)

7. $y' = (y-1)(y-2)(y-3)$

(a) $y = 1$ and $y = 3$ are unstable equilibria and $y = 2$ is a stable equilibrium value.

(b) $y'' = (3y^2 - 12y + 11)(y-1)(y-2)(y-3) = 3(y-1)\left(y - \frac{6-\sqrt{3}}{3}\right)(y-2)\left(y - \frac{6+\sqrt{3}}{3}\right)(y-3)$

(c)

8. $y' = y^3 - y^2 = y^2(y-1)$

(a) $y = 0$ and $y = 1$ are unstable equilibria.

(b) $y'' = (3y^2 - 2y)(y^3 - y^2) = y^3(3y-2)(y-1)$

(c)

9. $\frac{dp}{dt} = 1 - 2P$ has a stable equilibrium at $P = \frac{1}{2}$. $\frac{d^2P}{dt^2} = -2\frac{dp}{dt} = -2(1 - 2P)$

10. $\frac{dP}{dt} = P(1 - 2P)$ has an unstable equilibrium at $P = 0$ and a stable equilibrium at $P = \frac{1}{2}$.
 $\frac{d^2P}{dt^2} = (1 - 4P)\frac{dP}{dt} = P(1 - 4P)(1 - 2P)$

11. $\frac{dP}{dt} = 2P(P - 3)$ has a stable equilibrium at $P = 0$ and an unstable equilibrium at $P = 3$.
 $\frac{d^2P}{dt^2} = 2(2P - 3)\frac{dP}{dt} = 4P(2P - 3)(P - 3)$

12. $\frac{dP}{dt} = 3P(1-P)\left(P - \frac{1}{2}\right)$ has a stable equilibria at $P = 0$ and $P = 1$ and an unstable equilibrium at $P = \frac{1}{2}$.

$$\frac{d^2P}{dt^2} = -\frac{3}{2}(6P^2 - 6P + 1)\frac{dP}{dt} = \frac{3}{2}P\left(P - \frac{3-\sqrt{3}}{6}\right)\left(P - \frac{1}{2}\right)\left(P - \frac{3+\sqrt{3}}{6}\right)(P-1)$$

13.

Before the catastrophe, the population exhibits logistic growth and $P(t) \rightarrow M_0$, the stable equilibrium. After the catastrophe, the population declines logistically and $P(t) \rightarrow M_1$, the new stable equilibrium.

14. $\frac{dP}{dt} = rP(M - P)(P - m)$, $r, M, m > 0$

The model has 3 equilibrium points. The rest point $P = 0$, $P = M$ are asymptotically stable while $P = m$ is unstable. For initial populations greater than m , the model predicts P approaches M for large t . For initial populations less than m , the model predicts extinction. Points of inflection occur at $P = a$ and $P = b$ where

$$a = \frac{1}{3}\left[M + m - \sqrt{M^2 - mM + m^2}\right] \text{ and } b = \frac{1}{3}\left[M + m + \sqrt{M^2 - mM + m^2}\right].$$

(a) The model is reasonable in the sense that if $P < m$, then $P \rightarrow 0$ as $t \rightarrow \infty$; if $m < P < M$, then $P \rightarrow M$ as $t \rightarrow \infty$; if $P > M$, then $P \rightarrow M$ as $t \rightarrow \infty$.

- (b) It is different if the population falls below m , for then $P \rightarrow 0$ as $t \rightarrow \infty$ (extinction). It is probably a more realistic model for that reason because we know some populations have become extinct after the population level became too low.
- (c) For $P > M$ we see that $\frac{dP}{dt} = rP(M - P)(P - m)$ is negative. Thus the curve is everywhere decreasing. Moreover, $P \equiv M$ is a solution to the differential equation. Since the equation satisfies the existence and uniqueness conditions, solution trajectories cannot cross. Thus, $P \rightarrow M$ as $t \rightarrow \infty$.
- (d) See the initial discussion above.
- (e) See the initial discussion above.

15. $\frac{dv}{dt} = g - \frac{k}{m}v^2, g, k, m > 0$ and $v(t) \geq 0$

Equilibrium: $\frac{dv}{dt} = g - \frac{k}{m}v^2 = 0 \Rightarrow v = \sqrt{\frac{mg}{k}}$

Concavity: $\frac{d^2v}{dt^2} = -2\left(\frac{k}{m}v\right)\frac{dv}{dt} = -2\left(\frac{k}{m}v\right)\left(g - \frac{k}{m}v^2\right)$

(a)

(b)

(c) $V_{\text{terminal}} = \sqrt{\frac{160}{0.005}} = 178.9 \frac{\text{ft}}{\text{s}} = 122 \text{ mph}$

16. $F = F_p - F_r$

$ma = mg - k\sqrt{v}$

$\frac{dv}{dt} = g - \frac{k}{m}\sqrt{v}, v(0) = v_0$

Thus, $\frac{dv}{dt} = 0$ implies $v = \left(\frac{mg}{k}\right)^2$, the terminal velocity. If $v_0 < \left(\frac{mg}{k}\right)^2$, the object will fall faster and faster, approaching the terminal velocity; if $v_0 > \left(\frac{mg}{k}\right)^2$, the object will slow down to the terminal velocity.

17. $F = F_p - F_r$

$ma = 50 - 5|v|$

$\frac{dv}{dt} = \frac{1}{m}(50 - 5|v|)$

The maximum velocity occurs when $\frac{dv}{dt} = 0$ or $v = 10 \frac{\text{ft}}{\text{sec}}$.

18. (a) The model seems reasonable because the rate of spread of a piece of information, an innovation, or a cultural fad is proportional to the product of the number of individuals who have it (X) and those who do not ($N - X$). When X is small, there are only a few individuals to spread the item so the rate of spread is slow. On the other hand, when $(N - X)$ is small the rate of spread will be slow because there are only a few individuals who can receive it during the interval of time. The rate of spread will be fastest when both X and $(N - X)$ are large because then there are a lot of individuals to spread the item and a lot of individuals to receive it.

(b) There is a stable equilibrium at $X = N$ and an unstable equilibrium at $X = 0$.

$$\frac{d^2x}{dt^2} = k \frac{dx}{dt} (N - X) - kX \frac{dx}{dt} = k^2 X(N - X)(N - 2X) \Rightarrow \text{inflection point at } X = 0, X = \frac{N}{2}, \text{ and } X = N.$$

(c)

(d) The spread rate is most rapid when $x = \frac{N}{2}$. Eventually all of the people will receive the item.

19. $L \frac{di}{dt} + Ri = V \Rightarrow \frac{di}{dt} = \frac{V}{L} - \frac{R}{L}i = \frac{R}{L} \left(\frac{V}{R} - i \right), V, L, R > 0$

Equilibrium: $\frac{di}{dt} = \frac{R}{L} \left(\frac{V}{R} - i \right) = 0 \Rightarrow i = \frac{V}{R}$

Concavity: $\frac{d^2i}{dt^2} = -\left(\frac{R}{L}\right) \frac{di}{dt} = -\left(\frac{R}{L}\right)^2 \left(\frac{V}{R} - i \right)$

Phase Line:

If the switch is closed at $t = 0$, then $i(0) = 0$, and the graph of the solution looks like this:

As $t \rightarrow \infty$, $i \rightarrow i_{\text{steady state}} = \frac{V}{R}$. (In the steady state condition, the self-inductance acts like a simple wire connector and, as a result, the current through the resistor can be calculated using the familiar version of Ohm's Law.)

20. (a) Free body diagram of the pearl:

(b) Use Newton's Second Law, summing forces in the direction of the acceleration:

$$mg - Pg - kv = ma \Rightarrow \frac{dv}{dt} = \left(\frac{m-P}{m}\right)g - \frac{k}{m}v.$$

(c) Equilibrium: $\frac{dv}{dt} = \frac{k}{m} \left(\frac{(m-P)g}{k} - v\right) = 0$

$$\Rightarrow v_{\text{terminal}} = \frac{(m-P)g}{k}$$

$$\text{Concavity: } \frac{d^2v}{dt^2} = -\frac{k}{m} \frac{dv}{dt} = -\left(\frac{k}{m}\right)^2 \left(\frac{(m-P)g}{k} - v\right)$$

(d)

(e) The terminal velocity of the pearl is $\frac{(m-P)g}{k}$.

9.5 SYSTEMS OF EQUATIONS AND PHASE PLANES

1. Seasonal variations, nonconformity of the environments, effects of other interactions, unexpected disasters, etc.

$$2. \quad x = r \cos \theta \Rightarrow \frac{dx}{dt} = -r \sin \theta \frac{d\theta}{dt} + \cos \theta \frac{dr}{dt} = y + x - x(x^2 + y^2) = r \sin \theta + r \cos \theta - r^3 \cos \theta$$

$$y = r \sin \theta \Rightarrow \frac{dy}{dt} = r \cos \theta \frac{d\theta}{dt} + \sin \theta \frac{dr}{dt} = -x + y - y(x^2 + y^2) = -r \cos \theta + r \sin \theta - r^3 \sin \theta$$

Solve for $\frac{dr}{dt}$ by adding $\cos \theta \times \text{eq}(1)$ to $\sin \theta \times \text{eq}(2)$:

$$\cos^2 \theta \frac{dr}{dt} + \sin^2 \theta \frac{dr}{dt} = \cos \theta (r \sin \theta + r \cos \theta - r^3 \cos \theta) + \sin \theta (-r \cos \theta + r \sin \theta - r^3 \sin \theta)$$

$$\Rightarrow \frac{dr}{dt} = r \sin \theta \cos \theta + r \cos^2 \theta - r^3 \cos^2 \theta - r \sin \theta \cos \theta + r \sin^2 \theta - r^3 \sin^2 \theta = r - r^3 = r(1 - r^2)$$

Solve for $\frac{d\theta}{dt}$ by adding $(-\sin \theta) \times \text{eq}(1)$ to $\cos \theta \times \text{eq}(2)$: $\text{eq}(1)$ to $\cos \theta \times \text{eq}(2)$:

$$r \sin^2 \theta \frac{d\theta}{dt} + r \cos^2 \theta \frac{d\theta}{dt} = -\sin \theta (r \sin \theta + r \cos \theta - r^3 \cos \theta) + \cos \theta (-r \cos \theta + r \sin \theta - r^3 \sin \theta)$$

$$\Rightarrow r \frac{d\theta}{dt} = -r \sin^2 \theta - r \sin \theta \cos \theta + r^3 \sin \theta \cos \theta - r \cos^2 \theta + r \sin \theta \cos \theta - r^3 \sin \theta \cos \theta = -r \Rightarrow \frac{d\theta}{dt} = -1$$

If $r = 1$ (that is, the trajectory starts on the circle $x^2 + y^2 = 1$), then $\frac{dr}{dt}|_{r=1} = (1)(1 - (1)^2) = 0$, thus the trajectory remains on the circle, and rotates around the circle in a clockwise direction, since $\frac{d\theta}{dt} = -1$. The solution is periodic since at any point (x, y) on the trajectory, $(x, y) = (r \cos \theta, r \sin \theta) = (1 \cos \theta, 1 \sin \theta) = (\cos \theta, \sin \theta) \Rightarrow$ both x and y are periodic.

3. This model assumes that the number of interactions is proportional to the product of x and y :

$$\frac{dx}{dt} = (a - b y) x, \quad a < 0,$$

$$\frac{dy}{dt} = m \left(1 - \frac{y}{M}\right) y - n x y = y \left(m - \frac{m}{M} y - n x\right).$$

To find the equilibrium points:

$$\frac{dx}{dt} = 0 \Rightarrow (a - b y)x = 0 \Rightarrow x = 0 \text{ or } y = \frac{a}{b}$$

(remember $\frac{a}{b} < 0$);

$$\frac{dy}{dt} = 0 \Rightarrow y \left(m - \frac{m}{M} y - n x\right) \Rightarrow y = 0 \text{ or } y = -\frac{Mn}{m} x + M;$$

$$y = -\frac{Mn}{m} x + M;$$

Thus there are two equilibrium points, both occur when $x = 0$, $(0, 0)$ and $(0, M)$.

Implies coexistence is not possible because eventually trout die out and bass reach their population limit.

4. The coefficients $a, b, m,$ and n need to be determined by sampling or by analyzing historical data. Then, more specific graphical predictions can be made. These predictions would then have to be compared to actual population growth patterns. If the predictions match actual results, we have partially validated our model. If necessary, more tests could be run. However, it should be remembered that the primary purpose of a graphical analysis is to analyze the behavior qualitatively. With reference to Figure 9.29, attempt to maintain the fish populations in Region B through stocking and regulation (open and closed seasons). For example, should Regions A or D be entered, restocking the appropriate species can cause a return to Region B .

5. (a) Logistic growth occurs in the absence of the competitor, and simple interaction of the species: growth dominates the competition when either population is small so it is difficult to drive either species to extinction.

- (b) a = per capita growth rate for trout
 m = per capita growth rate for bass
 b = intensity of competition to the trout
 n = intensity of competition to the bass
 k_1 = environmental carrying capacity for the trout
 k_2 = environmental carrying capacity for the bass

(c) $\frac{dx}{dt} = 0 \Rightarrow a \left(1 - \frac{x}{k_1}\right) x - bxy = \left[a \left(1 - \frac{x}{k_1}\right) - by \right] x = 0 \Rightarrow x = 0$ or $a \left(1 - \frac{x}{k_1}\right) - by = 0 \Rightarrow x = 0$ or $y = \frac{a}{b} - \frac{a}{bk_1} x$;
 $\frac{dy}{dt} = 0 \Rightarrow m \left(1 - \frac{y}{k_2}\right) y - nxy = \left[m \left(1 - \frac{y}{k_2}\right) - nx \right] y = 0 \Rightarrow y = 0$ or $m \left(1 - \frac{y}{k_2}\right) - nx = 0 \Rightarrow y = 0$ or $y = k_2 - \frac{nk_2}{m} x$. There are five cases to consider.

Case I: $\frac{a}{b} > k_2$ and $\frac{m}{n} > k_1$.

By picking $\frac{a}{b} > k_2$ and $\frac{m}{n} > k_1$ we ensure an equilibrium point exists inside the first quadrant.

Graphical analysis implies four equilibrium points exist: $(0, 0), (k_1, 0), (0, k_2)$, and $\left(\frac{a m k_1 - b m k_1 k_2}{a m - b n k_1 k_2}, \frac{a m k_2 - a n k_1 k_2}{a m - b n k_1 k_2}\right)$ (the point of intersection of the two boundaries in the first quadrant).

All of these equilibrium points are unstable except for the point of intersection. The possibility of coexistence is predicted by this model.

Case II: $\frac{a}{b} > k_2$ and $\frac{m}{n} < k_1$.

- $(0, k_2)$: unstable
- $(k_1, 0)$: stable
- $(0, 0)$: unstable
- Trout wins: $(k_1, 0)$
- Not sensitive
- No coexistence

Case III: $\frac{a}{b} < k_2$ and $\frac{m}{n} > k_1$.

- $(0, k_2)$: stable
- $(k_1, 0)$: unstable
- $(0, 0)$: unstable
- Bass wins: $(0, k_2)$
- Not sensitive
- No coexistence

Case IV: $\frac{a}{b} < k_2$ and $\frac{m}{n} < k_1$.

- $(0, k_2)$: stable
- $(k_1, 0)$: stable
- $(0, 0)$: unstable
- $\left(\frac{a m k_1 - b m k_1 k_2}{a m - b n k_1 k_2}, \frac{a m k_2 - a n k_1 k_2}{a m - b n k_1 k_2}\right)$: unstable
- Bass or trout: $(0, k_2)$ or $(k_1, 0)$
- Very sensitive
- Coexistence is possible but not predicted

If we assume $\frac{a}{b} < k_2$ and $\frac{m}{n} < k_1$ then graphical analysis implies four equilibrium points exist:

$(0, k_2), (k_1, 0), (0, 0)$, and $\left(\frac{a m k_1 - b m k_1 k_2}{a m - b n k_1 k_2}, \frac{a m k_2 - a n k_1 k_2}{a m - b n k_1 k_2}\right)$ (the point of intersection of the two boundaries in the first quadrant).

Case V: $\frac{a}{b} = k_2$ and $\frac{a}{b k_1} = \frac{n k_2}{m}$ (lines coincide).

- $(0, k_2)$: stable
- $(k_1, 0)$: stable
- $(0, 0)$: unstable
- Line segment joining $(0, k_2)$ and $(k_1, 0)$: stable
- Bass wins: $(0, k_2)$
- Not sensitive
- Coexistence is likely outcome

Note that all points on the line segment joining $(0, k_2)$ and $(k_1, 0)$ are rest points.

6. For a fixed price, as Q increases, $\frac{dP}{dt}$ gets smaller and, possibly, becomes negative. This observation implies that as the quantity supplied increases, the price will not rise as fast. If Q gets high enough, then the price will decrease. Next, consider $\frac{dQ}{dt}$: For a fixed quantity, as P increases, $\frac{dQ}{dt}$ gets larger. Thus, as the market price increases, the quantity supplied will increase at a faster rate. If P is too small, $\frac{dQ}{dt}$ will be negative and the quantity supplied will decrease. This observation is the traditional explanation of the effect of market price levels on the quantity supplied.

- (a) $\frac{dP}{dt} = 0$ and $\frac{dQ}{dt} = 0$ gives the equilibrium points $(P, Q): (0, 0)$ and $(25.8, 775)$. Now $\frac{dP}{dt} > 0$ when $PQ < 20,000$ and $P > 0$; $\frac{dP}{dt} < 0$ otherwise. $\frac{dQ}{dt} > 0$ when $P > \frac{Q}{30}$ and $Q > 0$; $\frac{dQ}{dt} < 0$ otherwise.
- (b) These considerations give the following graphical analysis:

Region	$\frac{dP}{dt}$	$\frac{dQ}{dt}$
I	> 0	< 0
II	> 0	> 0
III	< 0	< 0
IV	< 0	> 0

The equilibrium point $(0, 0)$ is unstable. The graphical analysis for the point $(25.8, 775)$ is inconclusive: trajectories near the point may be periodic, or may spiral toward or away from the point.

- (c) The curve $\frac{dP}{dt} = 0$ or $PQ = 20000$ can be thought of as the demand curve; $\frac{dQ}{dt} = 0$ or $Q = 30P$ can be viewed as the supply curve.
7. (a) $\frac{dx}{dt} = ax - bxy = (a - by)x$ and $\frac{dy}{dt} = my - nxy = (m - nx)y \Rightarrow \frac{dy}{dt} = \frac{dy}{dx} \frac{dx}{dt} \Rightarrow \frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{(m-nx)y}{(a-by)x}$
- (b) $\frac{dy}{dx} = \frac{(m-nx)y}{(a-by)x} \Rightarrow \left(\frac{a}{y} - b\right) dy = \left(\frac{m}{x} - n\right) dx \Rightarrow \int \left(\frac{a}{y} - b\right) dy = \int \left(\frac{m}{x} - n\right) dx \Rightarrow a \ln|y| - by = m \ln|x| - nx + C$
 $\Rightarrow \ln|y^a| + \ln e^{-by} = \ln|x^m| + \ln e^{-nx} + \ln e^C \Rightarrow \ln|y^a e^{-by}| = \ln|x^m e^{-nx} e^C| \Rightarrow y^a e^{-by} = x^m e^{-nx} e^C,$
 let $K = e^C \Rightarrow y^a e^{-by} = Kx^m e^{-nx}$
- (c) $f(y) = y^a e^{-by} \Rightarrow f'(y) = ay^{a-1} e^{-by} - by^a e^{-by} = y^{a-1} e^{-by} (a - by)$ and $f'(y) = 0 \Rightarrow y = 0$ or $y = \frac{a}{b}$;
 $f''\left(\frac{a}{b}\right) = -b \left(\frac{a}{b}\right)^{a-1} e^{-a} < 0 \Rightarrow f(y)$ has a unique max of $M_y = \left(\frac{a}{eb}\right)^a$ when $y = \frac{a}{b}$.
 $g(x) = x^m e^{-nx} \Rightarrow g'(x) = mx^{m-1} e^{-nx} - nx^m e^{-nx} = x^{m-1} e^{-nx} (m - nx)$ and $g'(x) = 0 \Rightarrow x = 0$ or $x = \frac{m}{n}$;
 $g''\left(\frac{m}{n}\right) = -n \left(\frac{m}{n}\right)^{m-1} e^{-m} < 0 \Rightarrow g(x)$ has a unique max of $M_x = \left(\frac{m}{en}\right)^m$ when $x = \frac{m}{n}$.

(d) Consider trajectory $(x, y) \rightarrow (\frac{m}{n}, \frac{a}{b})$. For $y^a e^{-by} = Kx^m e^{-nx} \Rightarrow \frac{y^a}{e^{by}} \cdot \frac{e^{nx}}{x^m} = K$, taking the limit of both sides $\Rightarrow \lim_{\substack{x \rightarrow m/n \\ y \rightarrow a/b}} \left(\frac{y^a}{e^{by}} \cdot \frac{e^{nx}}{x^m} \right) = \lim_{\substack{x \rightarrow m/n \\ y \rightarrow a/b}} K \Rightarrow \frac{M_y}{M_x} = K$. Thus, $\frac{y^a}{e^{by}} = \frac{M_y}{M_x} \frac{x^m}{e^{nx}}$ represents the equation any solution trajectory must satisfy if the trajectory approaches the rest point asymptotically.

(e) Pick initial condition $y_0 < \frac{a}{b}$. Then, from the figure at right,

$f(y_0) < M_y$ implies $\frac{M_y}{M_x} \frac{x^m}{e^{nx}} = \frac{y_0^a}{e^{by_0}} < M_y$ and thus

$\frac{x^m}{e^{nx}} < M_x$. From the figure for $g(x)$, there exists a unique

$x_0 < \frac{m}{n}$ satisfying $\frac{x^m}{e^{nx}} < M_x$. That is, for each $y < \frac{a}{b}$ there

is a unique x satisfying $\frac{y^a}{e^{by}} = \frac{M_y}{M_x} \frac{x^m}{e^{nx}}$. Thus, there can exist

only one trajectory solution approaching $(\frac{m}{n}, \frac{a}{b})$. (You can think of the point (x_0, y_0) as the initial condition for that trajectory.)

(f) Likewise there exists a unique trajectory when $y_0 > \frac{a}{b}$. Again, $f(y_0) < M_y$ implies $\frac{M_y}{M_x} \frac{x^m}{e^{nx}} = \frac{y_0^a}{e^{by_0}} < M_y$ and thus $\frac{x^m}{e^{nx}} < M_x$. From the figure for $g(x)$, there exists a unique $x_0 > \frac{m}{n}$ satisfying $\frac{x^m}{e^{nx}} < M_x$. That is, for each $y > \frac{a}{b}$ there is a unique x satisfying $\frac{y^a}{e^{by}} = \frac{M_y}{M_x} \frac{x^m}{e^{nx}}$. Thus, there can exist only one trajectory solution approaching $(\frac{m}{n}, \frac{a}{b})$.

8. Let $z = y' = \frac{dy}{dx} \Rightarrow \frac{dz}{dx} = z' = y''$, then given the differential equation $y'' = F(x, y, y')$, we can write it as the following system of first order differential equations: $\frac{dy}{dx} = z$

$$\frac{dz}{dx} = F(x, y, z)$$

In general, for the n th order differential equation given by $y^{(n)} = F(x, y, y', y'', \dots, y^{(n-1)})$, let $z_1 = y' = \frac{dy}{dx}$

$\Rightarrow \frac{dz_1}{dx} = z_1' = y''$, let $z_2 = z_1' = y'' \Rightarrow \frac{dz_2}{dx} = z_2' = y'''$, ..., let $z_{n-1} = z_{n-2}' = y^{(n-1)} \Rightarrow z_{n-1}' = y^{(n)}$. This gives us

the following system of first order differential equations: $\frac{dy}{dx} = z_1$

$$\frac{dz_1}{dx} = z_2$$

$$\frac{dz_2}{dx} = z_3$$

⋮

$$\frac{dz_{n-2}}{dx} = z_{n-1}$$

$$\frac{dz_{n-1}}{dx} = F(x, y, z_1, z_2, \dots, z_{n-1})$$

9. In the absence of foxes $\Rightarrow b = 0 \Rightarrow \frac{dx}{dt} = ax$ and the population of rabbits grows at a rate proportional to the number of rabbits.
10. In the absence of rabbits $\Rightarrow d = 0 \Rightarrow \frac{dy}{dt} = -cy$ and the population of foxes decays (since the foxes have no food source) at a rate proportional to the number of foxes.
11. $\frac{dx}{dt} = (a - by)x = 0 \Rightarrow y = \frac{a}{b}$ or $x = 0$; $\frac{dy}{dt} = (-c + dx)y = 0 \Rightarrow x = \frac{c}{d}$ or $y = 0 \Rightarrow$ equilibrium points at $(0, 0)$ or $(\frac{c}{d}, \frac{a}{b})$. For the point $(0, 0)$, there are no rabbits and no foxes. It is an unstable equilibrium point, if there are no foxes, but a few rabbits are introduced, then $\frac{dx}{dt} = a \Rightarrow$ the rabbit population will grow exponentially away from $(0, 0)$.
12. Let $x(t)$ and $y(t)$ both be positive and suppose that they satisfy the differential equations $\frac{dx}{dt} = (a - by)x$ and $\frac{dy}{dt} = (-c + dx)y$. Let $C(t) = a \ln y(t) - b \cdot y(t) - d \cdot x(t) + c \ln x(t) \Rightarrow C'(t) = a \frac{y'(t)}{y(t)} - b \cdot y'(t) - d \cdot x'(t) + c \frac{x'(t)}{x(t)}$
 $= \left(\frac{a}{y(t)} - b\right)y'(t) + \left(\frac{c}{x(t)} - d\right)x'(t) = \left(\frac{a}{y(t)} - b\right)(-c + dx(t))x(t) + \left(\frac{c}{x(t)} - d\right)(a - b \cdot y(t))y(t) = 0$
 Since $C'(t) = 0 \Rightarrow C(t) = \text{constant}$.
13. Consider a particular trajectory and suppose that (x_0, y_0) is such that $x_0 < \frac{c}{d}$ and $y_0 < \frac{a}{b}$, then $\frac{dx}{dt} > 0$ and $\frac{dy}{dt} < 0 \Rightarrow$ the rabbit population is increasing while the fox population is decreasing, points on the trajectory are moving down and to the right; if $x_0 > \frac{c}{d}$ and $y_0 < \frac{a}{b}$, then $\frac{dx}{dt} > 0$ and $\frac{dy}{dt} > 0 \Rightarrow$ both the rabbit and fox populations are increasing, points on the trajectory are moving up and to the right; if $x_0 > \frac{c}{d}$ and $y_0 > \frac{a}{b}$, then $\frac{dx}{dt} < 0$ and $\frac{dy}{dt} > 0 \Rightarrow$ the rabbit population is decreasing while the fox population is increasing, points on the trajectory are moving up and to the left; and finally if $x_0 < \frac{c}{d}$ and $y_0 > \frac{a}{b}$, then $\frac{dx}{dt} < 0$ and $\frac{dy}{dt} < 0 \Rightarrow$ both the rabbit and fox populations are decreasing, points on the trajectory are moving down and to the left. Thus, points travel around the trajectory in a counterclockwise direction. Note that we will follow the same trajectory if (x_0, y_0) starts at a different point on the trajectory.
14. There are three possible cases: If the rabbit population begins (before the wolf) and ends (after the wolf) at a value larger than the equilibrium level of $x = \frac{c}{d}$, then the trajectory moves closer to the equilibrium and the maximum value of the foxes is smaller. If the rabbit population begins (before the wolf) and ends (after the wolf) at a value smaller than the equilibrium level of $x = \frac{c}{d}$, but greater than 0, then the trajectory moves further from the equilibrium and the maximum value of the foxes is greater. If the rabbit population begins and ends very near the equilibrium value, then the trajectory will stay near the equilibrium value, since it is a stable equilibrium, and the fox population will remain roughly the same.

CHAPTER 9 PRACTICE EXERCISES

1. $y' = xe^y \sqrt{x-2} \Rightarrow e^{-y} dy = x\sqrt{x-2} dx \Rightarrow -e^{-y} = \frac{2(x-2)^{3/2}(3x+4)}{15} + C \Rightarrow e^{-y} = \frac{-2(x-2)^{3/2}(3x+4)}{15} - C$
 $\Rightarrow -y = \ln \left[\frac{-2(x-2)^{3/2}(3x+4)}{15} - C \right] \Rightarrow y = -\ln \left[\frac{-2(x-2)^{3/2}(3x+4)}{15} - C \right]$
2. $y' = xy e^{x^2} \Rightarrow \frac{dy}{y} = e^{x^2} x dx \Rightarrow \ln y = \frac{1}{2} e^{x^2} + C$
3. $\sec x dy + x \cos^2 y dx = 0 \Rightarrow \frac{dy}{\cos^2 y} = -\frac{x dx}{\sec x} \Rightarrow \tan y = -\cos x - x \sin x + C$
4. $2x^2 dx - 3\sqrt{y} \csc x dy = 0 \Rightarrow 3\sqrt{y} dy = \frac{2x^2}{\csc x} dx \Rightarrow 2y^{3/2} = 2(2-x^2)\cos x + 4x \sin x + C$
 $\Rightarrow y^{3/2} = (2-x^2)\cos x + 2x \sin x + C_1$
5. $y' = \frac{e^y}{xy} \Rightarrow ye^{-y} dy = \frac{dx}{x} \Rightarrow (y+1)e^{-y} = -\ln|x| + C$
6. $y' = xe^{x-y} \csc y \Rightarrow y' = \frac{xe^x}{e^y} \csc y \Rightarrow \frac{e^y}{\csc y} dy = xe^x dx \Rightarrow \frac{e^y}{2}(\sin y - \cos y) = (x-1)e^x + C$
7. $x(x-1)dy - y dx = 0 \Rightarrow x(x-1)dy = y dx \Rightarrow \frac{dy}{y} = \frac{dx}{x(x-1)} \Rightarrow \ln y = \ln(x-1) - \ln(x) + C$
 $\Rightarrow \ln y = \ln(x-1) - \ln(x) + \ln C_1 \Rightarrow \ln y = \ln \left(\frac{C_1(x-1)}{x} \right) \Rightarrow y = \frac{C_1(x-1)}{x}$
8. $y' = (y^2 - 1)(x^{-1}) \Rightarrow \frac{dy}{y^2 - 1} = \frac{dx}{x} \Rightarrow \frac{\ln \left(\frac{y-1}{y+1} \right)}{2} = \ln x + C \Rightarrow \ln \left(\frac{y-1}{y+1} \right) = 2 \ln x + \ln C_1 \Rightarrow \frac{y-1}{y+1} = C_1 x^2 = C_1 x$
9. $2y' - y = xe^{x/2} \Rightarrow y' - \frac{1}{2}y = \frac{x}{2}e^{x/2}$.
 $P(x) = -\frac{1}{2}, v(x) = e^{\int (-\frac{1}{2})dx} = e^{-x/2}$.
 $e^{-x/2}y' - \frac{1}{2}e^{-x/2}y = \left(e^{-x/2} \right) \left(\frac{x}{2} \right) \left(e^{x/2} \right) = \frac{x}{2} \Rightarrow \frac{d}{dx} \left(e^{-x/2}y \right) = \frac{x}{2} \Rightarrow e^{-x/2}y = \frac{x^2}{4} + C \Rightarrow y = e^{x/2} \left(\frac{x^2}{4} + C \right)$
10. $\frac{y'}{2} + y = e^{-x} \sin x \Rightarrow y' + 2y = 2e^{-x} \sin x$.
 $P(x) = 2, v(x) = e^{\int 2dx} = e^{2x}$.
 $e^{2x}y' + 2e^{2x}y = 2e^{2x}e^{-x} \sin x = 2e^x \sin x \Rightarrow \frac{d}{dx} \left(e^{2x}y \right) = 2e^x \sin x \Rightarrow e^{2x}y = e^x (\sin x - \cos x) + C$
 $\Rightarrow y = e^{-x} (\sin x - \cos x) + Ce^{-2x}$

$$11. \quad xy' + 2y = 1 - x^{-1} \Rightarrow y' + \left(\frac{2}{x}\right)y = \frac{1}{x} - \frac{1}{x^2}.$$

$$v(x) = e^{2\int \frac{dx}{x}} = e^{2\ln x} = e^{\ln x^2} = x^2.$$

$$x^2 y' + 2xy = x - 1 \Rightarrow \frac{d}{dx}(x^2 y) = x - 1 \Rightarrow x^2 y = \frac{x^2}{2} - x + C \Rightarrow y = \frac{1}{2} - \frac{1}{x} + \frac{C}{x^2}$$

$$12. \quad xy' - y = 2x \ln x \Rightarrow y' - \left(\frac{1}{x}\right)y = 2 \ln x.$$

$$v(x) = e^{-\int \frac{dx}{x}} = e^{-\ln x} = \frac{1}{x}.$$

$$\left(\frac{1}{x}\right)y' - \left(\frac{1}{x}\right)^2 y = \frac{2}{x} \ln x \Rightarrow \frac{d}{dx}\left(\frac{1}{x} \cdot y\right) = \frac{2}{x} \ln x \Rightarrow \frac{1}{x} \cdot y = [\ln x]^2 + C \Rightarrow y = x[\ln x]^2 + Cx$$

$$13. \quad (1 + e^x)dy + (ye^x + e^{-x})dx = 0 \Rightarrow (1 + e^x)y' + e^x y = -e^{-x} \Rightarrow y' = \frac{-e^{-x}}{1 + e^x} y = \frac{-e^{-x}}{1 + e^x}.$$

$$v(x) = e^{\int \frac{e^x dx}{1 + e^x}} = e^{\ln(e^x + 1)} = e^x + 1.$$

$$(e^x + 1)y' + (e^x + 1)\left(\frac{e^x}{1 + e^x}\right)y = \frac{-e^{-x}}{1 + e^x}(e^x + 1) \Rightarrow \frac{d}{dx}[(e^x + 1)y] = -e^{-x} \Rightarrow (e^x + 1)y = e^{-x} + C$$

$$\Rightarrow y = \frac{e^{-x} + C}{e^x + 1} = \frac{e^{-x} + C}{1 + e^x}$$

$$14. \quad e^{-x}dy + (e^{-x}y - 4x)dx = 0 \Rightarrow \frac{dy}{dx} + y = 4xe^x \Rightarrow p(x) = 1, \quad v(x) = e^{\int 1 dx} = e^x \Rightarrow e^x \frac{dy}{dx} + ye^x = 4xe^{2x}$$

$$\Rightarrow \frac{d}{dx}(ye^x) = 4xe^{2x} \Rightarrow ye^x = \int 4xe^{2x} dx \Rightarrow ye^x = 2xe^{2x} - e^{2x} + C \Rightarrow y = 2xe^x - e^x + Ce^{-x}$$

$$15. \quad (x + 3y^2)dy + y dx = 0 \Rightarrow x dy + y dx = -3y^2 dy \Rightarrow \frac{d}{dx}(xy) = -3y^2 dy \Rightarrow xy = -y^3 + C$$

$$16. \quad x dy + (3y - x^{-2} \cos x)dx = 0 \Rightarrow y' + \left(\frac{3}{x}\right)y = x^{-3} \cos x. \text{ Let } v(y) = e^{\int \frac{3dx}{x}} = e^{3 \ln x} = e^{\ln x^3} = x^3.$$

$$\text{Then } x^3 y' + 3x^2 y = \cos x \text{ and } x^3 y = \int \cos x dx = \sin x + C. \text{ So } y = x^{-3}(\sin x + C)$$

$$17. \quad (x+1)\frac{dy}{dx} + 2y = x \Rightarrow y' + \left(\frac{2}{x+1}\right)y = \frac{x}{x+1}. \text{ Let } v(x) = e^{\int \frac{2}{x+1} dx} = e^{2 \ln(x+1)} = e^{\ln(x+1)^2} = (x+1)^2.$$

$$\text{So } y'(x+1)^2 + \frac{2}{(x+1)}(x+1)^2 y = \frac{x}{(x+1)}(x+1)^2 \Rightarrow \frac{d}{dx}[y(x+1)^2] = x(x+1) \Rightarrow y(x+1)^2 = \int x(x+1) dx$$

$$\Rightarrow y(x+1)^2 = \frac{x^3}{3} + \frac{x^2}{2} + C \Rightarrow y = (x+1)^{-2} \left(\frac{x^3}{3} + \frac{x^2}{2} + C \right). \text{ We have } y(0) = 1 \Rightarrow 1 = C. \text{ So}$$

$$y = (x+1)^{-2} \left(\frac{x^3}{3} + \frac{x^2}{2} + 1 \right)$$

$$18. \quad x \frac{dy}{dx} + 2y = x^2 + 1 \Rightarrow y' + \left(\frac{2}{x}\right)y = x + \frac{1}{x}. \text{ Let } v(x) = e^{\int \left(\frac{2}{x}\right) dx} = e^{\ln x^2} = x^2. \text{ So } x^2 y' + 2xy = x^3 + x$$

$$\Rightarrow \frac{d}{dx}(x^2 y) = x^3 + x \Rightarrow x^2 y = \frac{x^4}{4} + \frac{x^2}{2} + C \Rightarrow y = \frac{x^2}{4} + \frac{C}{x^2} + \frac{1}{2}. \text{ We have } y(1) = 1 \Rightarrow 1 = \frac{1}{4} + C + \frac{1}{2} \Rightarrow C = \frac{1}{4}.$$

$$\text{So } y = \frac{x^2}{4} + \frac{1}{4x^2} + \frac{1}{2} = \frac{x^4 + 2x^2 + 1}{4x^2}$$

19. $\frac{dy}{dx} + 3x^2y = x^2$. Let $v(x) = e^{\int 3x^2 dx} = e^{x^3}$. So $e^{x^3}y' + 3x^2e^{x^3}y = x^2e^{x^3} \Rightarrow \frac{d}{dx}(e^{x^3}y) = x^2e^{x^3}$
 $\Rightarrow e^{x^3}y = \frac{1}{3}e^{x^3} + C$. We have $y(0) = -1 \Rightarrow e^{0^3}(-1) = \frac{1}{3}e^{0^3} + C \Rightarrow -1 = \frac{1}{3} + C \Rightarrow C = -\frac{4}{3}$ and $e^{x^3}y = \frac{1}{3}e^{x^3} - \frac{4}{3}$
 $\Rightarrow y = \frac{1}{3} - \frac{4}{3}e^{-x^3}$
20. $xy' + (y - \cos x)dx = 0 \Rightarrow xy' + y - \cos x = 0 \Rightarrow y' + \left(\frac{1}{x}\right)y = \frac{\cos x}{x}$. Let $v(x) = e^{\int \frac{1}{x} dx} = e^{\ln x} = x$.
 So $xy' + x\left(\frac{1}{x}\right)y = \cos x \Rightarrow \frac{d}{dx}(xy) = \cos x \Rightarrow xy = \int \cos x dx \Rightarrow xy = \sin x + C$.
 We have $y\left(\frac{\pi}{2}\right) = 0 \Rightarrow \left(\frac{\pi}{2}\right)0 = 1 + C \Rightarrow C = -1$. So $xy = -1 + \sin x \Rightarrow y = \frac{-1 + \sin x}{x}$
21. $xy' + (x-2)y = 3x^3e^{-x} \Rightarrow y' + \left(\frac{x-2}{x}\right)y = 3x^2e^{-x}$. Let $v(x) = e^{\int \left(\frac{x-2}{x}\right) dx} = e^{x-2\ln x} = \frac{e^x}{x^2}$.
 So $\frac{e^x}{x^2}y' + \frac{e^x}{x^2}\left(\frac{x-2}{x}\right)y = 3 \Rightarrow \frac{d}{dx}\left(y \cdot \frac{e^x}{x^2}\right) = 3 \Rightarrow y \cdot \frac{e^x}{x^2} = 3x + C$. We have $y(1) = 0 \Rightarrow 0 = 3(1) + C \Rightarrow C = -3$
 $\Rightarrow y \cdot \frac{e^x}{x^2} = 3x - 3 \Rightarrow y = x^2e^{-x}(3x - 3)$
22. $y dx + (3x - xy + 2) dy = 0 \Rightarrow \frac{dx}{dy} + \frac{3x - xy + 2}{y} = 0 \Rightarrow \frac{dx}{dy} + \frac{3x}{y} - x = -\frac{2}{y} \Rightarrow \frac{dx}{dy} + \left(\frac{3}{y} - 1\right)x = -\frac{2}{y}$.
 $P(y) = \frac{3}{y} - 1 \Rightarrow \int P(y) dy = 3 \ln y - y \Rightarrow v(y) = e^{3 \ln y - y} = y^3 e^{-y}$
 $y^3 e^{-y} x' + y^3 e^{-y} \left(\frac{3}{y} - 1\right)x = -2y^2 e^{-y} \Rightarrow y^3 e^{-y} x = \int -2y^2 e^{-y} dy = 2e^{-y} (y^2 + 2y + 2) + C$
 $\Rightarrow y^3 = \frac{2(y^2 + 2y + 2) + Ce^y}{x}$. We have $y(2) = -1 \Rightarrow -1 = \frac{2(1 - 2 + 2) + Ce^{-1}}{2} \Rightarrow C = -4e$ and $\Rightarrow y^3 = \frac{2(y^2 + 2y + 2) - 4e^{y+1}}{x}$
23. To find the approximate values let $y_n = y_{n-1} + (y_{n-1} + \cos x_{n-1})(0.1)$ with $x_0 = 0, y_0 = 0$, and 20 steps. Use a spreadsheet, graphing calculator, or CAS to obtain the values in the following table.

24. To find the approximate values let $y_n = y_{n-1} + (2 - y_{n-1})(2x_{n-1} + 3)(0.1)$ with $x_0 = -3, y_0 = 1$, and 20 steps. Use a spreadsheet, graphing calculator, or CAS to obtain the values in the following table.

25. To estimate $y(3)$, let $y = y_{n-1} + \left(\frac{x_{n-1} - 2y_{n-1}}{x_{n-1} + 1}\right)(0.05)$ with initial values $x_0 = 0, y_0 = 1$, and 60 steps. Use a spreadsheet, graphing calculator, or CAS to obtain $y(3) \approx 0.8981$.
26. To estimate $y(4)$, let $z_n = y_{n-1} + \left(\frac{x_{n-1}^2 - 2y_{n-1} + 1}{x_{n-1}}\right)(0.05)$ with initial values $x_0 = 1, y_0 = 1$, and 60 steps. Use a spreadsheet, graphing calculator, or CAS to obtain $y(4) \approx 4.4974$.
27. Let $y_n = y_{n-1} + \left(\frac{1}{e^{x_{n-1} + y_{n-1} + 2}}\right)(dx)$ with starting values $x_0 = 0$ and $y_0 = 2$, and steps of 0.1 and -0.1 . Use a spreadsheet, programmable calculator, or CAS to generate the following graphs.

(a)

- (b) Note that we choose a small interval of x -values because the y -values decrease very rapidly and our calculator cannot handle the calculations for $x \leq -1$. (This occurs because the analytic solution is $y = -2 + \ln(2 - e^{-x})$, which has an asymptote at $x = -\ln 2 \approx 0.69$. Obviously, the Euler approximations are misleading for $x \leq -0.7$.)

28. Let $y_n = y_{n-1} - \left(\frac{x_{n-1}^2 + y_{n-1}}{e^{y_{n-1} + x_{n-1}}} \right) (\Delta x)$ with starting values $x_0 = 0$ and $y_0 = 0$, and steps of 0.1 and -0.1 . Use a spreadsheet, programmable calculator, or CAS to generate the following graphs.

33. $\frac{dy}{dx} = y^2 - 1 \Rightarrow y' = (y+1)(y-1)$. We have $y' = 0 \Rightarrow (y+1) = 0, (y-1) = 0 \Rightarrow y = -1, 1$.

(a) Equilibrium points are -1 (stable) and 1 (unstable)

(b) $y' = y^2 - 1 \Rightarrow y'' = 2yy' \Rightarrow y'' = 2y(y^2 - 1) = 2y(y+1)(y-1)$. So $y'' = 0 \Rightarrow y = 0, y = -1, y = 1$.

(c)

34. $\frac{dy}{dx} = y - y^2 \Rightarrow y' = y(1 - y)$. We have $y' = 0 \Rightarrow y(1 - y) = 0 \Rightarrow y = 0, 1 - y = 0 \Rightarrow y = 0, 1$.

(a) The equilibrium points are 0 and 1 . So, 0 is unstable and 1 is stable.

(b) Let \rightarrow = increasing. \leftarrow = decreasing.

$$y' = y - y^2 \Rightarrow y'' = y' - 2yy' \Rightarrow y'' = (y - y^2) - 2y(y - y^2) = y - y^2 - 2y^2 + 2y^3 \Rightarrow y'' = 2y^3 - 3y^2 + y$$

$$= y(2y^2 - 3y + 1) \Rightarrow y'' = y(2y - 1)(y - 1)$$

So, $y'' = 0 \Rightarrow y = 0, 2y - 1 = 0, y - 1 = 0 \Rightarrow y = 0, y = \frac{1}{2}, y = 1$.

$$\Rightarrow \frac{v^2}{2} = \frac{gR^2}{s} + C_1 \Rightarrow v^2 = \frac{2gR^2}{s} + 2C_1 = \frac{2gR^2}{s} + C$$

When $t = 0, v = v_0$ and $s = R \Rightarrow v_0^2 = \frac{2gR^2}{R} + C$

$$\Rightarrow C = v_0^2 - 2gR \Rightarrow v^2 = \frac{2gR^2}{s} + v_0^2 - 2gR$$

(b) If $v_0 = \sqrt{2gR}$, the $v^2 = \frac{2gR^2}{s} \Rightarrow v = \sqrt{\frac{2gR^2}{s}}$, since $v \geq 0$ if $v_0 \geq \sqrt{2gR}$. Then $\frac{ds}{dt} = \frac{\sqrt{2gR^2}}{\sqrt{s}}$
 $\Rightarrow \sqrt{s} ds = \sqrt{2gR^2} dt \Rightarrow \int s^{1/2} ds = \int \sqrt{2gR^2} dt \Rightarrow \frac{2}{3}s^{3/2} = \sqrt{2gR^2}t + C_1 \Rightarrow s^{3/2} = \left(\frac{3}{2}\sqrt{2gR^2}\right)t + C$; $t = 0$

36. $\frac{v_0 m}{k} = \text{coasting distance} \Rightarrow \frac{(0.86)(30.84)}{k} = 0.97 \Rightarrow k \approx 27.343$. $s(t) = \frac{v_0 m}{k} (1 - e^{-(k/m)t})$
 $\Rightarrow s(t) = 0.97 (1 - e^{-(27.343/30.84)t}) \Rightarrow s(t) = 0.97 (1 - e^{-0.8866t})$. A graph of the model is shown superimposed on a graph of the data.

CHAPTER 9 ADDITIONAL AND ADVANCED EXERCISES

1. (a) $\frac{dy}{dt} = k \frac{A}{V} (c - y) \Rightarrow dy = -k \frac{A}{V} (y - c) dt \Rightarrow \frac{dy}{y - c} = -k \frac{A}{V} dt \Rightarrow \int \frac{dy}{y - c} = -\int k \frac{A}{V} dt \Rightarrow \ln|y - c| = -k \frac{A}{V} t + C_1$
 $\Rightarrow y - c = \pm e^{C_1} e^{-k \frac{A}{V} t}$. Apply the initial condition, $y(0) = y_0 \Rightarrow y_0 = c + C \Rightarrow C = y_0 - c$
 $\Rightarrow y = c + (y_0 - c) e^{-k \frac{A}{V} t}$.

(b) Steady state solution: $y_\infty = \lim_{t \rightarrow \infty} y(t) = \lim_{t \rightarrow \infty} \left[c + (y_0 - c) e^{-k \frac{A}{V} t} \right] = c + (y_0 - c)(0) = c$

2. $\frac{d(mv)}{dt} = F + (v + u) \frac{dm}{dt} \Rightarrow F = \frac{d(mv)}{dt} - (v + u) \frac{dm}{dt} \Rightarrow F = m \frac{dv}{dt} + v \frac{dm}{dt} - v \frac{dm}{dt} - u \frac{dm}{dt} \Rightarrow F = m \frac{dv}{dt} - u \frac{dm}{dt}$.
 $\frac{dm}{dt} = -b \Rightarrow m = -|b|t + C$. At $t = 0, m = m_0$, so $C = m_0$ and $m = m_0 - |b|t$.

Thus $F = (m_0 - |b|t) \frac{dv}{dt} - u|b| = -(m_0 - |b|t)|g| \Rightarrow \frac{dv}{dt} = -g + \frac{u|b|}{m_0 - |b|t} \Rightarrow v = -gt - u \ln \left(\frac{m_0 - |b|t}{m_0} \right) + C_1$

$v = 0$ at $t = 0 \Rightarrow C_1 = 0$. So $v = -gt - u \ln \left(\frac{m_0 - |b|t}{m_0} \right) = \frac{dy}{dt} \Rightarrow y = \int \left[-gt - u \ln \left(\frac{m_0 - |b|t}{m_0} \right) \right] dt$ and $u = c, y = 0$ at

$t = 0 \Rightarrow y = -\frac{1}{2}gt^2 + c \left[t + \left(\frac{m_0 - |b|t}{|b|} \right) \ln \left(\frac{m_0 - |b|t}{m_0} \right) \right]$

3. (a) Let y be any function such that $v(x)y = \int v(x)Q(x)dx + C$, $v(x) = e^{\int P(x)dx}$. Then
- $$\frac{d}{dx}(v(x) \cdot y) = v(x) \cdot y' + y \cdot v'(x) = v(x)Q(x). \text{ We have } v(x) = e^{\int P(x)dx}$$
- $$\Rightarrow v'(x) = e^{\int P(x)dx} P(x) = v(x)P(x). \text{ Thus } v(x) \cdot y' + y \cdot v(x)P(x) = v(x)Q(x) \Rightarrow y' + yP(x) = Q(x) \Rightarrow \text{ the given } y \text{ is a solution.}$$
- (b) If v and Q are continuous on $[a, b]$ and $x \in (a, b)$, then $\frac{d}{dx} \left[\int_{x_0}^x v(t)Q(t)dt \right] = v(x)Q(x)$
- $$\Rightarrow \int_{x_0}^x v(t)Q(t)dt = \int v(x)Q(x)dx. \text{ So } C = y_0v(x_0) - \int v(x)Q(x)dx. \text{ From part (a),}$$
- $$v(x)y = \int v(x)Q(x)dx + C. \text{ Substituting for } C: v(x)y = \int v(x)Q(x)dx + y_0v(x_0) - \int v(x)Q(x)dx$$
- $$\Rightarrow v(x)y = y_0v(x_0) \text{ when } x = x_0.$$
4. (a) $y' + P(x)y = 0, y(x_0) = 0$. Use $v(x) = e^{\int P(x)dx}$ as an integrating factor. Then $\frac{d}{dx}(v(x)y) = 0$
- $$\Rightarrow v(x)y = C \Rightarrow y = Ce^{-\int P(x)dx} \text{ and } y_1 = C_1e^{-\int P(x)dx}, y_2 = C_2e^{-\int P(x)dx}, y_1(x_0) = y_2(x_0) = 0,$$
- $$y_1 - y_2 = (C_1 - C_2)e^{-\int P(x)dx} = C_3e^{-\int P(x)dx} \text{ and } y_1 - y_2 = 0 - 0 = 0. \text{ So } y_1 - y_2 \text{ is a solution to}$$
- $$y' + P(x)y = 0 \text{ with } y(x_0) = 0.$$
- (b) $\frac{d}{dx}(v(x)[y_1(x) - y_2(x)]) = \frac{d}{dx} \left(e^{\int P(x)dx} \left[e^{-\int P(x)dx} (C_1 - C_2) \right] \right) = \frac{d}{dx}(C_1 - C_2) = \frac{d}{dx}(C_3) = 0.$
- $$\int \frac{d}{dx}(v(x)[y_1(x) - y_2(x)]) dx = (v(x)[y_1(x) - y_2(x)]) = \int 0 dx = C$$
- (c) $y_1 = C_1e^{-\int P(x)dx}, y_2 = C_2e^{-\int P(x)dx}, y = y_1 - y_2$. So $y(x_0) = 0 \Rightarrow C_1e^{-\int P(x)dx} - C_2e^{-\int P(x)dx} = 0$
- $$\Rightarrow C_1 - C_2 = 0 \Rightarrow C_1 = C_2 \Rightarrow y_1(x) = y_2(x) \text{ for } a < x < b.$$
5. $(x^2 + y^2)dx + xydy = 0 \Rightarrow \frac{dy}{dx} = \frac{-(x^2 + y^2)}{xy} = -\frac{x}{y} - \frac{y}{x} = -\frac{1}{y/x} - \frac{y}{x} = F\left(\frac{y}{x}\right) \Rightarrow F(v) = \frac{1}{v} - v \Rightarrow \frac{dx}{x} + \frac{dv}{v - F(v)} = 0$
- $$\Rightarrow \frac{dx}{x} + \frac{dv}{v - \left(\frac{1}{v} - v\right)} = 0 \Rightarrow \int \frac{dx}{x} + \int \frac{v dv}{2v^2 + 1} = C \Rightarrow \ln|x| + \frac{1}{4} \ln|2v^2 + 1| = C \Rightarrow 4 \ln|x| + \ln\left|2\left(\frac{y}{x}\right)^2 + 1\right| = C$$
- $$\Rightarrow \ln|x^4| + \ln\left|\frac{2y^2 + x^2}{x^2}\right| = C \Rightarrow \ln|x^2(2y^2 + x^2)| = C \Rightarrow x^2(2y^2 + x^2) = e^C \Rightarrow x^2(2y^2 + x^2) = C$$
6. $x^2dy + (y^2 - xy)dx = 0 \Rightarrow \frac{dy}{dx} = \frac{-(y^2 - xy)}{x^2} \Rightarrow \frac{dy}{dx} = -\left(\frac{y}{x}\right)^2 + \frac{y}{x} = F\left(\frac{y}{x}\right) \Rightarrow F(v) = -v^2 + v \Rightarrow \frac{dx}{x} + \frac{dv}{v - (-v^2 + v)} = 0$

- $$\Rightarrow \int \frac{dx}{x} - \int \frac{dv}{e^v} = C \Rightarrow \ln|x| + e^{-v} = C \Rightarrow \ln|x| + e^{-y/x} = C$$

8. $(x+y)dy + (x-y)dx = 0 \Rightarrow \frac{dy}{dx} = \frac{-(x-y)}{x+y} = \frac{\frac{y}{x}-1}{1+\frac{y}{x}} = F\left(\frac{y}{x}\right) \Rightarrow F(v) = \frac{v-1}{1+v} \Rightarrow \frac{dx}{x} + \frac{dv}{v-\left(\frac{v-1}{1+v}\right)} = 0 \Rightarrow \int \frac{dx}{x} + \int \frac{(1+v)dv}{v^2+1} = 0$
- $$\Rightarrow \int \frac{dx}{x} + \int \frac{dv}{v^2+1} + \int \frac{v dv}{v^2+1} = 0 \Rightarrow \ln|x| + \tan^{-1} v + \frac{1}{2} \ln|v^2+1| = C \Rightarrow 2 \ln|x| + 2 \tan^{-1} v + \ln\left|\left(\frac{y}{x}\right)^2 + 1\right| = C$$
- $$\Rightarrow \ln|x^2| + 2 \tan^{-1}\left(\frac{y}{x}\right) + \ln\left|\frac{y^2+x^2}{x^2}\right| = C \Rightarrow 2 \tan^{-1}\left(\frac{y}{x}\right) + \ln|y^2+x^2| = C$$
9. $y' = \frac{y}{x} + \cos\left(\frac{y-x}{x}\right) = \frac{y}{x} + \cos\left(\frac{y}{x}-1\right) = F\left(\frac{y}{x}\right) \Rightarrow F(v) = v + \cos(v-1) \Rightarrow \frac{dx}{x} + \frac{dv}{v-(v+\cos(v-1))} = 0$

10. $\left(x \sin \frac{y}{x} - y \cos \frac{y}{x}\right) dx + x \cos \frac{y}{x} dy = 0 \Rightarrow \frac{dy}{dx} = \frac{-(x \sin \frac{y}{x} - y \cos \frac{y}{x})}{x \cos \frac{y}{x}} = \frac{y}{x} - \tan \frac{y}{x} = F\left(\frac{y}{x}\right) \Rightarrow F(v) = v - \tan v$

112. $a_{n+1} \geq a_n \Rightarrow \frac{(2(n+1)+3)!}{((n+1)+1)!} > \frac{(2n+3)!}{(n+1)!} \Rightarrow \frac{(2n+5)!}{(n+2)!} > \frac{(2n+3)!}{(n+1)!} \Rightarrow \frac{(2n+5)!}{(2n+3)!} > \frac{(n+2)!}{(n+1)!} \Rightarrow (2n+5)(2n+4) > n+2$;
 the steps are reversible so the sequence is nondecreasing; the sequence is not bounded since
 $\frac{(2n+3)!}{(n+1)!} = (2n+3)(2n+2)\cdots(n+2)$ can become as large as we please
113. $a_{n+1} \leq a_n \Rightarrow \frac{2^{n+1}3^{n+1}}{(n+1)!} \leq \frac{2^n 3^n}{n!} \Rightarrow \frac{2^{n+1}3^{n+1}}{2^n 3^n} \leq \frac{(n+1)!}{n!} \Rightarrow 2 \cdot 3 \leq n+1$ which is true for $n \geq 5$; the steps are reversible so
 the sequence is decreasing after a_5 , but it is not nondecreasing for all its terms; $a_1 = 6$, $a_2 = 18$, $a_3 = 36$,
 $a_4 = 54$, $a_5 = \frac{324}{5} = 64.8 \Rightarrow$ the sequence is bounded from above by 64.8
114. $a_{n+1} \geq a_n \Rightarrow 2 - \frac{2}{n+1} - \frac{1}{2^{n+1}} \geq 2 - \frac{2}{n} - \frac{1}{2^n} \Rightarrow \frac{2}{n} - \frac{2}{n+1} \geq \frac{1}{2^{n+1}} - \frac{1}{2^n} \Rightarrow \frac{2}{n(n+1)} \geq -\frac{1}{2^{n+1}}$; the steps are reversible so the
 sequence is nondecreasing; $2 - \frac{2}{n} - \frac{1}{2^n} \leq 2 \Rightarrow$ the sequence is bounded from above
115. $a_n = 1 - \frac{1}{n}$ converges because $\frac{1}{n} \rightarrow 0$ by Example 1; also it is a nondecreasing sequence bounded above by 1
116. $a_n = n - \frac{1}{n}$ diverges because $n \rightarrow \infty$ and $\frac{1}{n} \rightarrow 0$ by Example 1, so the sequence is unbounded
117. $a_n = \frac{2^n - 1}{2^n} = 1 - \frac{1}{2^n}$ and $0 < \frac{1}{2^n} < \frac{1}{n}$; since $\frac{1}{n} \rightarrow 0$ (by Example 1) $\Rightarrow \frac{1}{2^n} \rightarrow 0$, the sequence converges; also it is
 a nondecreasing sequence bounded above by 1
118. $a_n = \frac{2^n - 1}{3^n} = \left(\frac{2}{3}\right)^n - \frac{1}{3^n}$; the sequence converges to 0 by Theorem 5, #4
119. $a_n = \left((-1)^n + 1\right)\left(\frac{n+1}{n}\right)$ diverges because $a_n = 0$ for n odd, while for n even $a_n = 2\left(1 + \frac{1}{n}\right)$ converges to 2; it
 diverges by definition of divergence
120. $x_n = \max \{\cos 1, \cos 2, \cos 3, \dots, \cos n\}$ and $x_{n+1} = \max \{\cos 1, \cos 2, \cos 3, \dots, \cos (n+1)\} \geq x_n$ with $x_n \leq 1$
 so the sequence is nondecreasing and bounded above by 1 \Rightarrow the sequence converges.
121. $a_n \geq a_{n+1} \Leftrightarrow \frac{1+\sqrt{2n}}{\sqrt{n}} \geq \frac{1+\sqrt{2(n+1)}}{\sqrt{n+1}} \Leftrightarrow \sqrt{n+1} + \sqrt{2n^2 + 2n} \geq \sqrt{n} + \sqrt{2n^2 + 2n} \Leftrightarrow \sqrt{n+1} \geq \sqrt{n}$ and $\frac{1+\sqrt{2n}}{\sqrt{n}} \geq \sqrt{2}$;
 thus the sequence is nonincreasing and bounded below by $\sqrt{2} \Rightarrow$ it converges
122. $a_n \geq a_{n+1} \Leftrightarrow \frac{n+1}{n} \geq \frac{(n+1)+1}{n+1} \Leftrightarrow n^2 + 2n + 1 \geq n^2 + 2n \Leftrightarrow 1 \geq 0$ and $\frac{n+1}{n} \geq 1$; thus the sequence is nonincreasing
 and bounded below by 1 \Rightarrow it converges

123. $\frac{4^{n+1}+3^n}{4^n} = 4 + \left(\frac{3}{4}\right)^n$ so $a_n \geq a_{n+1} \Leftrightarrow 4 + \left(\frac{3}{4}\right)^n \geq 4 + \left(\frac{3}{4}\right)^{n+1} \Leftrightarrow \left(\frac{3}{4}\right)^n \geq \left(\frac{3}{4}\right)^{n+1} \Leftrightarrow 1 \geq \frac{3}{4}$ and $4 + \left(\frac{3}{4}\right)^n \geq 4$; thus the sequence is nonincreasing and bounded below by 4 \Rightarrow it converges

124. $a_1 = 1$, $a_2 = 2 - 3$, $a_3 = 2(2 - 3) - 3 = 2^2 - (2^2 - 1) \cdot 3$, $a_4 = 2(2^2 - (2^2 - 1) \cdot 3) - 3 = 2^3 - (2^3 - 1) \cdot 3$,
 $a_5 = 2[2^3 - (2^3 - 1) \cdot 3] - 3 = 2^4 - (2^4 - 1) \cdot 3$, ..., $a_n = 2^{n-1} - (2^{n-1} - 1) \cdot 3 = 2^{n-1} - 3 \cdot 2^{n-1} + 3$
 $= 2^{n-1}(1 - 3) + 3 = -2^{n-1} + 3$; $a_n \geq a_{n+1} \Leftrightarrow -2^{n-1} + 3 \geq -2^n + 3 \Leftrightarrow -2^{n-1} \geq -2^n \Leftrightarrow 1 \leq 2$ so the sequence is nonincreasing but not bounded below and therefore diverges

125. For a given ε , choose N to be any integer greater than $1/\varepsilon$. Then for $n > N$,

$$\left| \frac{\sin n}{n} - 0 \right| = \frac{|\sin n|}{n} \leq \frac{1}{n} < \frac{1}{N} < \varepsilon.$$

126. For a given ε , choose N to be any integer greater than $1/\sqrt{\varepsilon}$. Then for $n > N$, $\left| 1 - \frac{1}{n^2} - 1 \right| = \frac{1}{n^2} < \frac{1}{N^2} < \varepsilon$.

127. Let $0 < M < 1$ and let N be an integer greater than $\frac{M}{1-M}$. Then $n > N \Rightarrow n > \frac{M}{1-M} \Rightarrow n - nM > M$
 $\Rightarrow n > M + nM \Rightarrow n > M(n+1) \Rightarrow \frac{n}{n+1} > M$.

128. Since M_1 is a least upper bound and M_2 is an upper bound, $M_1 \leq M_2$. Since M_2 is a least upper bound and M_1 is an upper bound, $M_2 \leq M_1$. We conclude that $M_1 = M_2$ so the least upper bound is unique.

129. The sequence $a_n = 1 + \frac{(-1)^n}{2}$ is the sequence $\frac{1}{2}, \frac{3}{2}, \frac{1}{2}, \frac{3}{2}, \dots$. This sequence is bounded above by $\frac{3}{2}$, but it clearly does not converge, by definition of convergence.

130. Let L be the limit of the convergent sequence $\{a_n\}$. Then by definition of convergence, for $\frac{\varepsilon}{2}$ there corresponds an N such that for all m and n , $m > N \Rightarrow |a_m - L| < \frac{\varepsilon}{2}$ and $n > N \Rightarrow |a_n - L| < \frac{\varepsilon}{2}$. Now
 $|a_m - a_n| = |a_m - L + L - a_n| \leq |a_m - L| + |L - a_n| < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon$ whenever $m > N$ and $n > N$.

131. Given an $\varepsilon > 0$, by definition of convergence there corresponds an N such that for all $n > N$, $|L_1 - a_n| < \varepsilon$ and $|L_2 - a_n| < \varepsilon$. Now $|L_2 - L_1| = |L_2 - a_n + a_n - L_1| \leq |L_2 - a_n| + |a_n - L_1| < \varepsilon + \varepsilon = 2\varepsilon$. $|L_2 - L_1| < 2\varepsilon$ says that the difference between two fixed values is smaller than any positive number 2ε . The only nonnegative number smaller than every positive number is 0, so $|L_1 - L_2| = 0$ or $L_1 = L_2$.

132. Let $k(n)$ and $i(n)$ be two order-preserving functions whose domains are the set of positive integers and whose ranges are a subset of the positive integers. Consider the two subsequences $a_{k(n)}$ and $a_{i(n)}$, where

$a_{k(n)} \rightarrow L_1$, $a_{i(n)} \rightarrow L_2$ and $L_1 \neq L_2$. Thus $|a_{k(n)} - a_{i(n)}| \rightarrow |L_1 - L_2| > 0$. So there does not exist N such that for all m , $n > N \Rightarrow |a_m - a_n| < \varepsilon$. So by Exercise 128, the sequence $\{a_n\}$ is not convergent and hence diverges.

133. $a_{2k} \rightarrow L \Leftrightarrow$ given an $\epsilon > 0$ there corresponds an N_1 such that $[2k > N_1 \Rightarrow |a_{2k} - L| < \epsilon]$. Similarly, $a_{2k+1} \rightarrow L \Leftrightarrow [2k+1 > N_2 \Rightarrow |a_{2k+1} - L| < \epsilon]$. Let $N = \max\{N_1, N_2\}$. Then $n > N \Rightarrow |a_n - L| < \epsilon$ whether n is even or odd, and hence $a_n \rightarrow L$.

134. Assume $a_n \rightarrow 0$. This implies that given an $\epsilon > 0$ there corresponds an N such that $n > N \Rightarrow |a_n - 0| < \epsilon \Rightarrow |a_n| < \epsilon \Rightarrow \|a_n\| < \epsilon \Rightarrow \|a_n - 0\| < \epsilon \Rightarrow |a_n| \rightarrow 0$. On the other hand, assume $|a_n| \rightarrow 0$. This implies that given an $\epsilon > 0$ there corresponds an N such that for $n > N$, $\|a_n - 0\| < \epsilon \Rightarrow \|a_n\| < \epsilon \Rightarrow |a_n| < \epsilon \Rightarrow |a_n - 0| < \epsilon \Rightarrow a_n \rightarrow 0$.

135. (a) $f(x) = x^2 - a \Rightarrow f'(x) = 2x \Rightarrow x_{n+1} = x_n - \frac{x_n^2 - a}{2x_n} \Rightarrow x_{n+1} = \frac{2x_n^2 - (x_n^2 - a)}{2x_n} = \frac{x_n^2 + a}{2x_n} = \frac{x_n + \frac{a}{x_n}}{2}$

(b) $x_1 = 2$, $x_2 = 1.75$, $x_3 = 1.732142857$, $x_4 = 1.73205081$, $x_5 = 1.732050808$; we are finding the positive number where $x^2 - 3 = 0$; that is, where $x^2 = 3$, $x > 0$, or where $x = \sqrt{3}$.

136. $x_1 = 1$, $x_2 = 1 + \cos(1) = 1.540302306$, $x_3 = 1.540302306 + \cos(1 + \cos(1)) = 1.570791601$,
 $x_4 = 1.570791601 + \cos(1.570791601) = 1.570796327 = \frac{\pi}{2}$ to 9 decimal places. After a few steps, the arc (x_{n-1}) and line segment $\cos(x_{n-1})$ are nearly the same as the quarter circle.

137-148. Example CAS Commands:

Mathematica: (sequence functions may vary):

```
Clear[a, n]
a[n_] := n1/n
first25 = Table[N[a[n]], {n, 1, 25}]
Limit[a[n], n → 8]
```

The last command (Limit) will not always work in Mathematica. You could also explore the limit by enlarging your table to more than the first 25 values.

If you know the limit (1 in the above example), to determine how far to go to have all further terms within 0.01 of the limit, do the following.

```
Clear[minN, lim]
lim = 1
Do[{diff = Abs[a[n] - lim], If[diff < .01, {minN = n, Abort[]}]}, {n, 2, 1000}]
minN
```

For sequences that are given recursively, the following code is suggested. The portion of the command $a[n_]:=a[n]$ stores the elements of the sequence and helps to streamline computation.

```
Clear[a, n]
a[1] = 1;
a[n_] := a[n] = a[n-1] + (1/5)n-1
first25 = Table[N[a[n]], {n, 1, 25}]
```

The limit command does not work in this case, but the limit can be observed as 1.25.

Clear[minN, lim]

lim=1.25

Do[{diff=Abs[a[n]-lim], If[diff<.01, {minN=n, Abort[]}]}, {n, 2, 1000}]

minN

93. (a) After 24 hours, before the second pill: $300e^{(-0.12)(24)} \approx 16.840$ mg; after 48 hours, the amount present after 24 hours continues to decay and the dose taken at 24 hours has 24 hours to decay, so the amount present is $300e^{(-0.12)(48)} + 300e^{(-0.12)(24)} \approx 0.945 + 16.840 = 17.785$ mg.

(b) The long-run quantity of the drug is $300 \sum_1^{\infty} \left(e^{(-0.12)(24)}\right)^n = 300 \frac{e^{(-0.12)(24)}}{1 - e^{(-0.12)(24)}} \approx 17.84$ mg.

95. (a) The endpoint of any closed interval remaining at any stage of the construction will remain in the Cantor set, so some points in the set include $0, \frac{1}{27}, \frac{2}{27}, \frac{1}{9}, \frac{2}{9}, \frac{7}{27}, \frac{8}{27}, \frac{1}{3}, \frac{2}{3}, \frac{7}{9}, \frac{8}{9}, 1$.

(b) The lengths of the intervals removed are:

Stage 1: $\frac{1}{3}$

Stage 3: $\frac{1}{3}\left(1 - \frac{1}{3} - \frac{2}{9}\right) = \frac{4}{27}$ and so on.

Thus the sum of the lengths of the intervals removed is $\sum_{n=1}^{\infty} \frac{1}{3}\left(\frac{2}{3}\right)^{n-1} = \frac{1}{3} \cdot \frac{1}{1-(2/3)} = 1$.

43. (a)

(b) There are $(13)(365)(24)(60)(60) (10^9)$ seconds in 13 billion years; by part (a) $s_n \leq 1 + \ln n$ where $n = (13)(365)(24)(60)(60) (10^9) \Rightarrow s_n \leq 1 + \ln((13)(365)(24)(60)(60) (10^9)) = 1 + \ln(13) + \ln(365) + \ln(24) + 2 \ln(60) + 9 \ln(10) \approx 41.55$

44. No, because $\sum_{n=1}^\infty \frac{1}{nx} = \frac{1}{x} \sum_{n=1}^\infty \frac{1}{n}$ and $\sum_{n=1}^\infty \frac{1}{n}$ diverges

45. Yes. If $\sum_{n=1}^\infty a_n$ is a divergent series of positive numbers, then $\left(\frac{1}{2}\right) \sum_{n=1}^\infty a_n = \sum_{n=1}^\infty \left(\frac{a_n}{2}\right)$ also diverges and $\frac{a_n}{2} < a_n$.

There is no “smallest” divergent series of positive number: for any divergent series $\sum_{n=1}^\infty a_n$ of positive

numbers $\sum_{n=1}^\infty \left(\frac{a_n}{2}\right)$ has smaller terms and still diverges.

46. No, if $\sum_{n=1}^{\infty} a_n$ is a convergent series of positive numbers, then $2\sum_{n=1}^{\infty} a_n = \sum_{n=1}^{\infty} 2a_n$ also converges, and $2a_n \geq a_n$. There is no “largest” convergent series of positive numbers.

47. (a) Both integrals can represent the area under the curve $f(x) = \frac{1}{\sqrt{x+1}}$, and the sum s_{50} can be considered an approximation of either integral using rectangles with $\Delta x = 1$. The sum $s_{50} = \sum_{n=1}^{50} \frac{1}{\sqrt{n+1}}$ is an overestimate

of the integral $\int_1^{51} \frac{1}{\sqrt{x+1}} dx$. The sum s_{50} represents a left-hand sum (that is, the we are choosing the left-hand endpoint of each subinterval for c_i) and because f is a decreasing function, the value of f is a maximum at the left-hand endpoint of each subinterval. The area of each rectangle overestimates the true area, thus $\int_1^{51} \frac{1}{\sqrt{x+1}} dx < \sum_{n=1}^{50} \frac{1}{\sqrt{n+1}}$. In a similar manner, s_{50} underestimates the integral $\int_0^{50} \frac{1}{\sqrt{x+1}} dx$. In

this case, the sum s_{50} represents a right-hand sum and because f is a decreasing function, the value of f is a minimum at the right-hand endpoint of each subinterval. The area of each rectangle underestimates the true area, thus $\sum_{n=1}^{50} \frac{1}{\sqrt{n+1}} < \int_0^{50} \frac{1}{\sqrt{x+1}} dx$. Evaluating the integrals we find $\int_1^{51} \frac{1}{\sqrt{x+1}} dx = [2\sqrt{x+1}]_1^{51}$

$$= 2\sqrt{52} - 2\sqrt{2} \approx 11.6 \text{ and } \int_0^{50} \frac{1}{\sqrt{x+1}} dx = [2\sqrt{x+1}]_0^{50} = 2\sqrt{51} - 2\sqrt{1} \approx 12.3. \text{ Thus, } 11.6 < \sum_{n=1}^{50} \frac{1}{\sqrt{n+1}} < 12.3.$$

(b) $s_n > 1000 \Rightarrow \int_1^{n+1} \frac{1}{\sqrt{x+1}} dx = [2\sqrt{x+1}]_1^{n+1} = 2\sqrt{n+1} - 2\sqrt{2} > 1000 \Rightarrow n > (500 + \sqrt{2})^2 - 1 \approx 251414.2$
 $\Rightarrow n \geq 251415.$

48. (a) Since we are using $s_{30} = \sum_{n=1}^{30} \frac{1}{n^4}$ to estimate $\sum_{n=1}^{\infty} \frac{1}{n^4}$, the error is given by $\sum_{n=31}^{\infty} \frac{1}{n^4}$. We can consider this sum as an estimate of the area under the curve $f(x) = \frac{1}{x^4}$ when $x \geq 30$ using rectangles with $\Delta x = 1$ and c_i is the right-hand endpoint of each subinterval. Since f is a decreasing function, the value of f is a

minimum at the right-hand endpoint of each subinterval, thus $\sum_{n=31}^{\infty} \frac{1}{n^4} < \int_{30}^{\infty} \frac{1}{x^4} dx = \lim_{b \rightarrow \infty} \int_{30}^b \frac{1}{x^4} dx$
 $= \lim_{b \rightarrow \infty} \left[-\frac{1}{3x^3} \right]_{30}^b = \lim_{b \rightarrow \infty} \left(-\frac{1}{3b^3} + \frac{1}{3(30)^3} \right) \approx 1.23 \times 10^{-5}$. Thus the error $< 1.23 \times 10^{-5}$.

(b) We want $S - s_n < 0.000001 \Rightarrow \int_n^{\infty} \frac{1}{x^4} dx < 0.000001 \Rightarrow \int_n^{\infty} \frac{1}{x^4} dx = \lim_{b \rightarrow \infty} \int_n^b \frac{1}{x^4} dx = \lim_{b \rightarrow \infty} \left[-\frac{1}{3x^3} \right]_n^b$

53. Let $A_n = \sum_{k=1}^n a_k$ and $B_n = \sum_{k=1}^n 2^k a_{(2^k)}$, where $\{a_k\}$ is a nonincreasing sequence of positive terms converging to 0. Note that $\{A_n\}$ and $\{B_n\}$ are nondecreasing sequences of positive terms. Now,

$$\begin{aligned}

 & = 2a_2 + (2a_4 + 2a_4) + (2a_8 + 2a_8 + 2a_8 + 2a_8) + \dots + \underbrace{(2a_{(2^n)} + 2a_{(2^n)} + \dots + 2a_{(2^n)})}_{2^{n-1} \text{ terms}} \\

 & \leq 2 \sum_{k=1}^\infty a_k. \text{ Therefore if } \sum a_k \text{ converges, then } \{B_n\} \text{ is bounded above } \Rightarrow \sum 2^k a_{(2^k)} \text{ converges. Conversely,}
 \end{aligned}$$

$$A_n = a_1 + (a_2 + a_3) + (a_4 + a_5 + a_6 + a_7) + \dots + a_n < a_1 + 2a_2 + 4a_4 + \dots + 2^n a_{(2^n)} = a_1 + B_n < a_1 + \sum_{k=1}^\infty 2^k a_{(2^k)}.$$

Therefore, if $\sum_{k=1}^\infty 2^k a_{(2^k)}$ converges, then $\{A_n\}$ is bounded above and hence converges.

$$= \begin{cases} \frac{1}{p-1} (\ln 2)^{-p+1} & p > 1 \\ \infty, & p < 1 \end{cases} \Rightarrow \text{the improper integral converges if } p > 1 \text{ and diverges if } p < 1. \text{ For } p = 1:$$

$$\int_2^{\infty} \frac{dx}{x \ln x} = \lim_{b \rightarrow \infty} [\ln(\ln x)]_2^b = \lim_{b \rightarrow \infty} [\ln(\ln b) - \ln(\ln 2)] = \infty, \text{ so the improper integral diverges if } p = 1.$$

(b) Since the series and the integral converge or diverge together, $\sum_{n=2}^{\infty} \frac{1}{n(\ln n)^p}$ converges if and only if $p > 1$.

56. (a) $p = 1 \Rightarrow$ the series diverges

(b) $p = 1.01 \Rightarrow$ the series converges

(c) $\sum_{n=2}^{\infty} \frac{1}{n(\ln n^3)} = \frac{1}{3} \sum_{n=2}^{\infty} \frac{1}{n(\ln n)}$; $p = 1 \Rightarrow$ the series diverges

(d) $p = 3 \Rightarrow$ the series converges

57. (a) From Fig. 10.11 (a) in the text with $f(x) = \frac{1}{x}$ and $a_k = \frac{1}{k}$, we have $\int_1^{n+1} \frac{1}{x} dx \leq 1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n}$
 $\leq 1 + \int_1^n f(x) dx \Rightarrow \ln(n+1) \leq 1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n} \leq 1 + \ln n \Rightarrow 0 \leq \ln(n+1) - \ln n \leq \left(1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n}\right) - \ln n \leq 1.$

Therefore the sequence $\left\{ \left(1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n}\right) - \ln n \right\}$ is bounded above by 1 and below by 0.

(b) From the graph in Fig. 10.11 (b) with $f(x) = \frac{1}{x}$, $\frac{1}{n+1} < \int_n^{n+1} \frac{1}{x} dx = \ln(n+1) - \ln n$

$$\Rightarrow 0 > \frac{1}{n+1} - [\ln(n+1) - \ln n] = \left(1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n+1} - \ln(n+1)\right) - \left(1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n} - \ln n\right).$$

If we define $a_n = 1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n} - \ln n$, then $0 > a_{n+1} - a_n \Rightarrow a_{n+1} < a_n \Rightarrow \{a_n\}$ is a decreasing sequence of nonnegative terms.

58. $e^{-x^2} \leq e^{-x}$ for $x \geq 1$, and $\int_1^{\infty} e^{-x} dx = \lim_{b \rightarrow \infty} [-e^{-x}]_1^b = \lim_{b \rightarrow \infty} (-e^{-b} + e^{-1}) = e^{-1} \Rightarrow \int_1^{\infty} e^{-x^2} dx$ converges by the

(b) $s = \sum_{n=1}^{\infty} \frac{1}{n^3} \approx \frac{1.20166 + 1.20253}{2} = 1.202095$; error $\leq \frac{1.20253 - 1.20166}{2} = 0.000435$

$$60. \text{ (a) } s_{10} = \sum_{n=1}^{10} \frac{1}{n^4} = 1.082036583; \int_{11}^{\infty} \frac{1}{x^4} dx = \lim_{b \rightarrow \infty} \int_{11}^b x^{-4} dx = \lim_{b \rightarrow \infty} \left[-\frac{x^{-3}}{3} \right]_{11}^b = \lim_{b \rightarrow \infty} \left(-\frac{1}{3b^3} + \frac{1}{3993} \right) = \frac{1}{3993}$$

$$\Rightarrow 1.082036583 + \frac{1}{3993} < s < 1.082036583 + \frac{1}{3000} \Rightarrow 1.08229 < s < 1.08237$$

$$\text{(b) } s = \sum_{n=1}^{\infty} \frac{1}{n^4} \approx \frac{1.08229 + 1.08237}{2} = 1.08233; \text{ error} \leq \frac{1.08237 - 1.08229}{2} = 0.00004$$

61. The total area will be $\sum_{n=1}^{\infty} \frac{1}{n} \left(\frac{1}{n} - \frac{1}{n+1} \right) = \sum_{n=1}^{\infty} \left(\frac{1}{n^2} - \frac{1}{n(n+1)} \right)$. The p -series $\sum_{n=1}^{\infty} \frac{1}{n^2}$ converges to $\frac{\pi^2}{6}$ and

$\sum_{n=1}^{\infty} \frac{1}{n(n+1)}$ converges to 1 (see Example 5). Thus we can write the area as the difference of these two values,

$$\text{or } \frac{\pi^2}{6} - 1 \approx 0.64493.$$

62. The area of the n th trapezoid is $\frac{1}{2} \left(\frac{1}{n} + \frac{1}{n+1} \right) \left(\frac{1}{n} - \frac{1}{n+1} \right) = \frac{1}{2} \left(\frac{1}{n^2} - \frac{1}{(n+1)^2} \right)$. The total area will be

$$\frac{1}{2} \sum_{n=1}^{\infty} \left(\frac{1}{n^2} - \frac{1}{(n+1)^2} \right) = \frac{1}{2}, \text{ since the series telescopes and has a value of 1.}$$

10.4 COMPARISON TESTS

1. Compare with $\sum_{n=1}^{\infty} \frac{1}{n^2}$, which is a convergent p -series since $p = 2 > 1$. Both series have nonnegative terms for

$n \geq 1$. For $n \geq 1$, we have $n^2 \leq n^2 + 30 \Rightarrow \frac{1}{n^2} \geq \frac{1}{n^2 + 30}$. Then by Comparison Test, $\sum_{n=1}^{\infty} \frac{1}{n^2 + 30}$ converges.

2. Compare with $\sum_{n=1}^{\infty} \frac{1}{n^3}$, which is a convergent p -series since $p = 3 > 1$. Both series have nonnegative terms for

$n \geq 1$. For $n \geq 1$, we have $n^4 \leq n^4 + 2 \Rightarrow \frac{1}{n^4} \geq \frac{1}{n^4 + 2} \Rightarrow \frac{n}{n^4} \geq \frac{n}{n^4 + 2} \Rightarrow \frac{1}{n^3} \geq \frac{n}{n^4 + 2} \geq \frac{n-1}{n^4 + 2}$. Then by Comparison

Test, $\sum_{n=1}^{\infty} \frac{n-1}{n^4 + 2}$ converges.

3. Compare with $\sum_{n=2}^{\infty} \frac{1}{\sqrt{n}}$, which is a divergent p -series since $p = \frac{1}{2} \leq 1$. Both series have nonnegative terms for

$n \geq 2$. For $n \geq 2$, we have $\sqrt{n} - 1 \leq \sqrt{n} \Rightarrow \frac{1}{\sqrt{n-1}} \geq \frac{1}{\sqrt{n}}$. Then by Comparison Test, $\sum_{n=2}^{\infty} \frac{1}{\sqrt{n-1}}$ diverges.

4. Compare with $\sum_{n=2}^{\infty} \frac{1}{n}$, which is a divergent p -series since $p = 1 \leq 1$. Both series have nonnegative terms for $n \geq 2$. For $n \geq 2$, we have $n^2 - n \leq n^2 \Rightarrow \frac{1}{n^2 - n} \geq \frac{1}{n^2} \Rightarrow \frac{n}{n^2 - n} \geq \frac{n}{n^2} = \frac{1}{n} \Rightarrow \frac{n+2}{n^2 - n} \geq \frac{n}{n^2 - n} \geq \frac{1}{n}$. Thus $\sum_{n=2}^{\infty} \frac{n+2}{n^2 - n}$ diverges.
5. Compare with $\sum_{n=1}^{\infty} \frac{1}{n^{3/2}}$, which is a convergent p -series since $p = \frac{3}{2} > 1$. Both series have nonnegative terms for $n \geq 1$. For $n \geq 1$, we have $0 \leq \cos^2 n \leq 1 \Rightarrow \frac{\cos^2 n}{n^{3/2}} \leq \frac{1}{n^{3/2}}$. Then by Comparison Test, $\sum_{n=1}^{\infty} \frac{\cos^2 n}{n^{3/2}}$ converges.
6. Compare with $\sum_{n=1}^{\infty} \frac{1}{3^n}$, which is a convergent geometric series, since $|r| = \left|\frac{1}{3}\right| < 1$. Both series have nonnegative terms for $n \geq 1$. For $n \geq 1$, we have $n \cdot 3^n \geq 3^n \Rightarrow \frac{1}{n \cdot 3^n} \leq \frac{1}{3^n}$. Then by Comparison Test, $\sum_{n=1}^{\infty} \frac{1}{n \cdot 3^n}$ converges.
7. Compare with $\sum_{n=1}^{\infty} \frac{\sqrt{5}}{n^{3/2}}$. The series $\sum_{n=1}^{\infty} \frac{1}{n^{3/2}}$ is a convergent p -series since $p = \frac{3}{2} > 1$, and the series $\sum_{n=1}^{\infty} \frac{\sqrt{5}}{n^{3/2}} = \sqrt{5} \sum_{n=1}^{\infty} \frac{1}{n^{3/2}}$ converges by Theorem 8 part 3. Both series have nonnegative terms for $n \geq 1$. For $n \geq 1$, we have $n^3 \leq n^4 \Rightarrow 4n^3 \leq 4n^4 \Rightarrow n^4 + 4n^3 \leq n^4 + 4n^4 = 5n^4 \Rightarrow n^4 + 4n^3 \leq 5n^4 + 20 = 5(n^4 + 4) \Rightarrow \frac{n^4 + 4n^3}{n^4 + 4} \leq 5 \Rightarrow \frac{n^3(n+4)}{n^4 + 4} \leq 5 \Rightarrow \frac{n+4}{n^4 + 4} \leq \frac{5}{n^3} \Rightarrow \sqrt{\frac{n+4}{n^4 + 4}} \leq \sqrt{\frac{5}{n^3}} = \frac{\sqrt{5}}{n^{3/2}}$. Then by Comparison Test, $\sum_{n=1}^{\infty} \sqrt{\frac{n+4}{n^4 + 4}}$ converges.
8. Compare with $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}}$, which is a divergent p -series since $p = \frac{1}{2} \leq 1$. Both series have nonnegative terms for $n \geq 1$. For $n \geq 1$, we have $\sqrt{n} \geq 1 \Rightarrow 2\sqrt{n} \geq 2 \Rightarrow 2\sqrt{n} + 1 \geq 3 \Rightarrow n(2\sqrt{n} + 1) \geq 3n \geq 3 \Rightarrow 2n\sqrt{n} + n \geq 3 \Rightarrow n^2 + 2n\sqrt{n} + n \geq n^2 + 3 \Rightarrow \frac{n(n+2\sqrt{n}+1)}{n^2+3} \geq 1 \Rightarrow \frac{n+2\sqrt{n}+1}{n^2+3} \geq \frac{1}{n} \Rightarrow \frac{(\sqrt{n}+1)^2}{n^2+3} \geq \frac{1}{n} \Rightarrow \sqrt{\frac{(\sqrt{n}+1)^2}{n^2+3}} \geq \sqrt{\frac{1}{n}} \Rightarrow \frac{\sqrt{n}+1}{\sqrt{n^2+3}} \geq \frac{1}{\sqrt{n}}$. Then by Comparison Test, $\sum_{n=1}^{\infty} \frac{\sqrt{n}+1}{\sqrt{n^2+3}}$ diverges.
9. Compare with $\sum_{n=1}^{\infty} \frac{1}{n^2}$, which is a convergent p -series since $p = 2 > 1$. Both series have positive terms for $n \geq 1$. $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{n-2}{n^3-n^2+3}}{\frac{1}{n^2}} = \lim_{n \rightarrow \infty} \frac{n^3-2n^2}{n^3-n^2+3} = \lim_{n \rightarrow \infty} \frac{3n^2-4n}{3n^2-2n} = \lim_{n \rightarrow \infty} \frac{6n-4}{6n-2} = \lim_{n \rightarrow \infty} \frac{6}{6} = 1 > 0$. Then by Limit Comparison Test, $\sum_{n=1}^{\infty} \frac{n-2}{n^3-n^2+3}$ converges.

54. $\frac{1}{1+2^2+3^2+\dots+n^2} = \frac{1}{\frac{n(n+1)(2n+1)}{6}} = \frac{6}{n(n+1)(2n+1)} \leq \frac{6}{n^3} \Rightarrow$ the series converges by the Direct Comparison Test

55. (a) If $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = 0$, then there exists an integer N such that for all $n > N$, $\left|\frac{a_n}{b_n} - 0\right| < 1 \Rightarrow -1 < \frac{a_n}{b_n} < 1 \Rightarrow a_n < b_n$. Thus, if $\sum b_n$ converges, then $\sum a_n$ converges by the Direct Comparison Test.

(b) If $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \infty$, then there exists an integer N such that for all $n > N$, $\frac{a_n}{b_n} > 1 \Rightarrow a_n > b_n$. Thus, if $\sum b_n$ diverges, then $\sum a_n$ diverges by the Direct Comparison Test.

56. Yes, $\sum_{n=1}^{\infty} \frac{a_n}{n}$ converges by the Direct Comparison Test because $\frac{a_n}{n} < a_n$

57. $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \infty \Rightarrow$ there exists an integer N such that for all $n > N$, $\frac{a_n}{b_n} > 1 \Rightarrow a_n > b_n$. If $\sum a_n$ converges, then $\sum b_n$ converges by the Direct Comparison Test

58. $\sum a_n$ converges $\Rightarrow \lim_{n \rightarrow \infty} a_n = 0 \Rightarrow$ there exists an integer N such that for all $n > N$, $0 \leq a_n < 1 \Rightarrow a_n^2 < a_n \Rightarrow \sum a_n^2$ converges by the Direct Comparison Test

59. Since $a_n > 0$ and $\lim_{n \rightarrow \infty} a_n = \infty \neq 0$, by n^{th} term test for divergence, $\sum a_n$ diverges.

60. Since $a_n > 0$ and $\lim_{n \rightarrow \infty} (n^2 \cdot a_n) = 0$, compare $\sum a_n$ with $\sum \frac{1}{n^2}$, which is a convergent p -series

$$\lim_{n \rightarrow \infty} \frac{a_n}{1/n^2} = \lim_{n \rightarrow \infty} (n^2 \cdot a_n) = 0 \Rightarrow \sum a_n \text{ converges by Limit Comparison Test}$$

61. Let $-\infty < q < \infty$ and $p > 1$. If $q = 0$, then $\sum_{n=2}^{\infty} \frac{(\ln n)^q}{n^p} = \sum_{n=2}^{\infty} \frac{1}{n^p}$, which is a convergent p -series. If $q \neq 0$,

compare with $\sum_{n=2}^{\infty} \frac{1}{n^r}$ where $1 < r < p$, then $\lim_{n \rightarrow \infty} \frac{\frac{(\ln n)^q}{n^p}}{1/n^r} = \lim_{n \rightarrow \infty} \frac{(\ln n)^q}{n^{p-r}}$, and $p-r > 0$. If $q < 0 \Rightarrow -q > 0$ and

$q-1 \leq 0 \Rightarrow 1-q \geq 0$ and $\lim_{n \rightarrow \infty} \frac{q(\ln n)^{q-1}}{(p-r)n^{p-r}} = \lim_{n \rightarrow \infty} \frac{q}{(p-r)n^{p-r}(\ln n)^{1-q}} = 0$, otherwise, we apply L'Hopital's Rule

again. $\lim_{n \rightarrow \infty} \frac{q(q-1)(\ln n)^{q-2} \left(\frac{1}{n}\right)}{(p-r)^2 n^{p-r-1}} = \lim_{n \rightarrow \infty} \frac{q(q-1)(\ln n)^{q-2}}{(p-r)^2 n^{p-r}}$. If $q-2 \leq 0 \Rightarrow 2-q \geq 0$ and

$\lim_{n \rightarrow \infty} \frac{q(q-1)(\ln n)^{q-2}}{(p-r)^2 n^{p-r}} = \lim_{n \rightarrow \infty} \frac{q(q-1)}{(p-r)^2 n^{p-r} (\ln n)^{2-q}} = 0$; otherwise, we apply L'Hopital's Rule again. Since q is finite, there is a positive integer k such that $q - k \leq 0 \Rightarrow k - q \geq 0$. Thus, after k applications of L'Hopital's Rule we obtain $\lim_{n \rightarrow \infty} \frac{q(q-1) \cdots (q-k+1)(\ln n)^{q-k}}{(p-r)^k n^{p-r}} = \lim_{n \rightarrow \infty} \frac{q(q-1) \cdots (q-k+1)}{(p-r)^k n^{p-r} (\ln n)^{k-q}} = 0$. Since the limit is 0 in every case, by Limit Comparison Test, the series $\sum_{n=1}^{\infty} \frac{(\ln n)^q}{n^p}$ converges.

62. Let $-\infty < q < \infty$ and $p \leq 1$. If $q = 0$, then $\sum_{n=2}^{\infty} \frac{(\ln n)^q}{n^p} = \sum_{n=2}^{\infty} \frac{1}{n^p}$, which is a divergent p -series. If $q > 0$, compare with $\sum_{n=2}^{\infty} \frac{1}{n^p}$, which is a divergent p -series. Then $\lim_{n \rightarrow \infty} \frac{\frac{(\ln n)^q}{n^p}}{1/n^p} = \lim_{n \rightarrow \infty} (\ln n)^q = \infty$. If $q < 0 \Rightarrow -q > 0$, compare with $\sum_{n=2}^{\infty} \frac{1}{n^r}$, where $0 < p < r < 1$. $\lim_{n \rightarrow \infty} \frac{\frac{(\ln n)^q}{n^p}}{1/n^r} = \lim_{n \rightarrow \infty} \frac{(\ln n)^q}{n^{p-r}} = \lim_{n \rightarrow \infty} \frac{n^{r-p}}{(\ln n)^{-q}}$ since $r - p > 0$. Apply L'Hopital's to obtain $\lim_{n \rightarrow \infty} \frac{(r-p)n^{r-p-1}}{(-q)(\ln n)^{-q-1}(\frac{1}{n})} = \lim_{n \rightarrow \infty} \frac{(r-p)n^{r-p}}{(-q)(\ln n)^{-q-1}}$. If $-q - 1 \leq 0 \Rightarrow q + 1 \geq 0$ and $\lim_{n \rightarrow \infty} \frac{(r-p)n^{r-p}(\ln n)^{q+1}}{(-q)} = \infty$, otherwise, we apply L'Hopital's Rule again to obtain $\lim_{n \rightarrow \infty} \frac{(r-p)^2 n^{r-p-1}}{(-q)(-q-1)(\ln n)^{-q-2}(\frac{1}{n})} = \lim_{n \rightarrow \infty} \frac{(r-p)^2 n^{r-p}}{(-q)(-q-1)(\ln n)^{-q-2}}$. If $-q - 2 \leq 0 \Rightarrow q + 2 \geq 0$ and $\lim_{n \rightarrow \infty} \frac{(r-p)^2 n^{r-p}}{(-q)(-q-1)(\ln n)^{-q-2}} = \lim_{n \rightarrow \infty} \frac{(r-p)^2 n^{r-p} (\ln n)^{q+2}}{(-q)(-q-1)} = \infty$, otherwise, we apply L'Hopital's Rule again. Since q is finite, there is a positive integer k such that $-q - k \leq 0 \Rightarrow q + k \geq 0$. Thus, after k applications of L'Hopital's Rule we obtain $\lim_{n \rightarrow \infty} \frac{(r-p)^k n^{r-p}}{(-q)(-q-1) \cdots (-q-k+1)(\ln n)^{-q-k}} = \lim_{n \rightarrow \infty} \frac{(r-p)^k n^{r-p} (\ln n)^{q+k}}{(-q)(-q-1) \cdots (-q-k+1)} = \infty$. Since the limit is ∞ if $q > 0$ or if $q < 0$ and $p < 1$, by Limit comparison test, the series $\sum_{n=1}^{\infty} \frac{(\ln n)^q}{n^{p-r}}$ diverges. Finally if $q < 0$ and $p = 1$ then $\sum_{n=2}^{\infty} \frac{(\ln n)^q}{n^p} = \sum_{n=2}^{\infty} \frac{(\ln n)^q}{n}$. Compare with $\sum_{n=2}^{\infty} \frac{1}{n}$, which is a divergent p -series. For $n \geq 3$, $\ln n \geq 1 \Rightarrow (\ln n)^q \geq 1 \Rightarrow \frac{(\ln n)^q}{n} \geq \frac{1}{n}$. Thus $\sum_{n=2}^{\infty} \frac{(\ln n)^q}{n}$ diverges by Comparison Test. Thus, if $-\infty < q < \infty$ and $p \leq 1$, the series $\sum_{n=1}^{\infty} \frac{(\ln n)^q}{n^{p-r}}$ diverges.

63. Since $0 \leq d_n \leq 9$ for all n and the geometric series $\sum_{n=1}^{\infty} \frac{9}{10^n}$ converges to 1, $\sum_{n=1}^{\infty} \frac{d_n}{10^n}$ converges.

64. Since $\sum_{n=1}^{\infty} a_n$ converges, $a_n \rightarrow 0$ as $n \rightarrow \infty$. Thus for all n greater than some N we have $0 < a_n < \frac{\pi}{2}$ and thus $0 < \sin a_n < a_n$. Thus $\sum_{n=1}^{\infty} \sin a_n$ converges by Theorem 10.

65. Converges by Exercise 61 with $q = 3$ and $p = 4$.

66. Diverges by Exercise 62 with $q = \frac{1}{2}$ and $p = \frac{1}{2}$.
67. Converges by Exercise 61 with $q = 1000$ and $p = 1.001$.
68. Diverges by Exercise 62 with $q = \frac{1}{5}$ and $p = 0.99$.
69. Converges by Exercise 61 with $q = -3$ and $p = 1.1$.
70. Diverges by Exercise 62 with $q = -\frac{1}{2}$ and $p = \frac{1}{2}$.

72. (a) Let $S = \sum_{n=1}^{\infty} \frac{1}{n^2}$, which is a convergent p -series. By Example 5 in Section 10.2, $\sum_{n=1}^{\infty} \frac{1}{n(n+1)}$ converges to 1. By Theorem 8, $S = \sum_{n=1}^{\infty} \frac{1}{n^2} = \sum_{n=1}^{\infty} \frac{1}{n(n+1)} + \sum_{n=1}^{\infty} \frac{1}{n^2} - \sum_{n=1}^{\infty} \frac{1}{n(n+1)} = \sum_{n=1}^{\infty} \frac{1}{n(n+1)} + \sum_{n=1}^{\infty} \left(\frac{1}{n^2} - \frac{1}{n(n+1)} \right)$ also converges.
- (b) Since $\sum_{n=1}^{\infty} \frac{1}{n(n+1)}$ converges to 1 (from Example 5 in Section 10.2), $S = 1 + \sum_{n=1}^{\infty} \left(\frac{1}{n^2} - \frac{1}{n(n+1)} \right) = 1 + \sum_{n=1}^{\infty} \frac{1}{n^2(n+1)}$
- (c) The new series is comparable to $\sum_{n=1}^{\infty} \frac{1}{n^3}$, so it will converge faster because its terms $\rightarrow 0$ faster than the terms of $\sum_{n=1}^{\infty} \frac{1}{n^2}$.
- (d) The series $1 + \sum_{n=1}^{1000} \frac{1}{n^2(n+1)}$ gives a better approximation. Using Mathematica, $1 + \sum_{n=1}^{1000} \frac{1}{n^2(n+1)} = 1.644933568$, while $\sum_{n=1}^{1000000} \frac{1}{n^2} = 1.644933067$. Note that $\frac{\pi^2}{6} = 1.644934067$. The error is 4.99×10^{-7} compared with 1×10^{-6} .

59. (a) $a_n \geq a_{n+1}$ fails since $\frac{1}{3} < \frac{1}{2}$

- (b) Since $\sum_{n=1}^{\infty} |a_n| = \sum_{n=1}^{\infty} \left[\left(\frac{1}{3}\right)^n + \left(\frac{1}{2}\right)^n \right] = \sum_{n=1}^{\infty} \left(\frac{1}{3}\right)^n + \sum_{n=1}^{\infty} \left(\frac{1}{2}\right)^n$ is the sum of two absolutely convergent series, we can rearrange the terms of the original series to find its sum: $\left(\frac{1}{3} + \frac{1}{9} + \frac{1}{27} + \dots\right) - \left(\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots\right)$
- $$= \frac{\left(\frac{1}{3}\right)}{1 - \left(\frac{1}{3}\right)} - \frac{\left(\frac{1}{2}\right)}{1 - \left(\frac{1}{2}\right)} = \frac{1}{2} - 1 = -\frac{1}{2}$$

61. The unused terms are $\sum_{j=n+1}^{\infty} (-1)^{j+1} a_j = (-1)^{n+1} (a_{n+1} - a_{n+2}) + (-1)^{n+3} (a_{n+3} - a_{n+4}) + \dots$
 $= (-1)^{n+1} [(a_{n+1} - a_{n+2}) + (a_{n+3} - a_{n+4}) + \dots]$. Each grouped term is positive, so the remainder has the same sign as $(-1)^{n+1}$, which is the sign of the first unused term.

62. $s_n = \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \dots + \frac{1}{n(n+1)} = \sum_{k=1}^n \frac{1}{k(k+1)} = \sum_{k=1}^n \left(\frac{1}{k} - \frac{1}{k+1}\right) = \left(1 - \frac{1}{2}\right) + \left(\frac{1}{2} - \frac{1}{3}\right) + \left(\frac{1}{3} - \frac{1}{4}\right) + \left(\frac{1}{4} - \frac{1}{5}\right) + \dots + \left(\frac{1}{n} - \frac{1}{n+1}\right)$

which are the first $2n$ terms of the first series, hence the two series are the same. Yes, for $s_n = \sum_{k=1}^n \left(\frac{1}{k} - \frac{1}{k+1}\right)$

$$= \left(1 - \frac{1}{2}\right) + \left(\frac{1}{2} - \frac{1}{3}\right) + \left(\frac{1}{3} - \frac{1}{4}\right) + \left(\frac{1}{4} - \frac{1}{5}\right) + \dots + \left(\frac{1}{n-1} - \frac{1}{n}\right) + \left(\frac{1}{n} - \frac{1}{n+1}\right) = 1 - \frac{1}{n+1} \Rightarrow \lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(1 - \frac{1}{n+1}\right) = 1$$

\Rightarrow both series converge to 1. The sum of the first $2n+1$ terms of the first series is $\left(1 - \frac{1}{n+1}\right) + \frac{1}{n+1} = 1$.

Their sum is $\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(1 - \frac{1}{n+1}\right) = 1$.

63. Theorem 16 states that $\sum_{n=1}^{\infty} |a_n|$ converges $\Rightarrow \sum_{n=1}^{\infty} a_n$ converges. But this is equivalent to $\sum_{n=1}^{\infty} a_n$ diverges
 $\Rightarrow \sum_{n=1}^{\infty} |a_n|$ diverges

64. $|a_1 + a_2 + \dots + a_n| \leq |a_1| + |a_2| + \dots + |a_n|$ for all n ; then $\sum_{n=1}^{\infty} |a_n|$ converges $\Rightarrow \sum_{n=1}^{\infty} a_n$ converges and these imply

that $\left| \sum_{n=1}^{\infty} a_n \right| \leq \sum_{n=1}^{\infty} |a_n|$

65. (a) $\sum_{n=1}^{\infty} |a_n + b_n|$ converges by the Direct Comparison Test since $|a_n + b_n| \leq |a_n| + |b_n|$ and hence $\sum_{n=1}^{\infty} (|a_n| + |b_n|)$ converges absolutely

- (b) $\sum_{n=1}^{\infty} |b_n|$ converges $\Rightarrow \sum_{n=1}^{\infty} -b_n$ converges absolutely; since $\sum_{n=1}^{\infty} a_n$ converges absolutely and $\sum_{n=1}^{\infty} -b_n$

converges absolutely, we have $\sum_{n=1}^{\infty} [a_n + (-b_n)] = \sum_{n=1}^{\infty} (a_n - b_n)$ converges absolutely by part (a)

- (c) $\sum_{n=1}^{\infty} |a_n|$ converges $\Rightarrow |k| \sum_{n=1}^{\infty} |a_n| = \sum_{n=1}^{\infty} |ka_n|$ converges $\Rightarrow \sum_{n=1}^{\infty} ka_n$ converges absolutely

66. If $a_n = b_n = (-1)^n \frac{1}{\sqrt{n}}$, then $\sum_{n=1}^{\infty} (-1)^n \frac{1}{\sqrt{n}}$ converges, but $\sum_{n=1}^{\infty} a_n b_n = \sum_{n=1}^{\infty} \frac{1}{n}$ diverges
67. Since $\sum_{n=1}^{\infty} a_n$ converges, $a_n \rightarrow 0$ and for all n greater than some N , $|a_n| < 1$ and $(a_n)^2 < |a_n|$. Since $\sum_{n=1}^{\infty} a_n$ is absolutely convergent, $\sum_{n=1}^{\infty} |a_n|$ converges and thus $\sum_{n=1}^{\infty} (a_n)^2$ converges by the Direct Comparison Test.

68. For $n > 2$, $\frac{1}{n} - \frac{1}{n^2} > \frac{1}{2n}$. Thus $\sum_{n=1}^{\infty} \left(\frac{1}{n} - \frac{1}{n^2}\right)$ diverges by comparison with the divergent harmonic series.

69. $s_1 = -\frac{1}{2}, s_2 = -\frac{1}{2} + 1 = \frac{1}{2},$
 $s_3 = -\frac{1}{2} + 1 - \frac{1}{4} - \frac{1}{6} - \frac{1}{8} - \frac{1}{10} - \frac{1}{12} - \frac{1}{14} - \frac{1}{16} - \frac{1}{18} - \frac{1}{20} - \frac{1}{22} \approx -0.5099,$
 $s_4 = s_3 + \frac{1}{3} \approx -0.1766,$
 $s_5 = s_4 - \frac{1}{24} - \frac{1}{26} - \frac{1}{28} - \frac{1}{30} - \frac{1}{32} - \frac{1}{34} - \frac{1}{36} - \frac{1}{38} - \frac{1}{40} - \frac{1}{42} - \frac{1}{44} \approx -0.512,$
 $s_6 = s_5 + \frac{1}{5} \approx -0.312,$
 $s_7 = s_6 - \frac{1}{46} - \frac{1}{48} - \frac{1}{50} - \frac{1}{52} - \frac{1}{54} - \frac{1}{56} - \frac{1}{58} - \frac{1}{60} - \frac{1}{62} - \frac{1}{64} - \frac{1}{66} \approx -0.51106$

70. (a) Since $\sum |a_n|$ converges, say to M , for $\epsilon > 0$ there is an integer N_1 such that

$$\left| \sum_{n=1}^{N_1-1} |a_n| - M \right| < \frac{\epsilon}{2} \Leftrightarrow \left| \sum_{n=1}^{N_1-1} |a_n| - \left(\sum_{n=1}^{N_1-1} |a_n| + \sum_{n=N_1}^{\infty} |a_n| \right) \right| < \frac{\epsilon}{2} \Leftrightarrow \left| - \sum_{n=N_1}^{\infty} |a_n| \right| < \frac{\epsilon}{2} \Leftrightarrow \sum_{n=N_1}^{\infty} |a_n| < \frac{\epsilon}{2}.$$

Also, $\sum a_n$ converges to $L \Leftrightarrow$ for $\epsilon > 0$ there is an integer N_2 (which we can choose greater than or equal to N_1) such that $|s_{N_2} - L| < \frac{\epsilon}{2}$. Therefore, $\sum_{n=N_1}^{\infty} |a_n| < \frac{\epsilon}{2}$ and $|s_{N_2} - L| < \frac{\epsilon}{2}$.

(b) The series $\sum_{n=1}^{\infty} |a_n|$ converges absolutely, say to M . Thus, there exists N_1 such that $\left| \sum_{n=1}^k |a_n| - M \right| < \epsilon$ whenever $k > N_1$. Now all of the terms in the sequence $\{b_n\}$ appear in $\{a_n\}$. Sum together all of the terms in $\{b_n\}$, in order, until you include all of the terms $\{a_n\}_{n=1}^{N_1}$, and let N_2 be the largest index in the sum $\sum_{n=1}^{N_2} |b_n|$ so obtained. Then $\left| \sum_{n=1}^{N_2} |b_n| - M \right| < \epsilon$ as well $\Rightarrow \sum_{n=1}^{\infty} |b_n|$ converges to M .

49. Writing $\frac{2}{x}$ as $\frac{2}{1-[-(x-1)]}$ we see that it can be written as the power

series $\sum_{n=0}^{\infty} 2[-(x-1)]^n = \sum_{n=0}^{\infty} 2(-1)^n(x-1)^n$. Since this is a geometric series with ratio $-(x-1)$ it will converge

for

$$|-(x-1)| < 1 \text{ or } 0 < x < 2.$$

51. $g(x) = \frac{3}{x-2} = \frac{3}{3-[-(x-5)]} = \frac{1}{1-\left[-\left(\frac{x-5}{3}\right)\right]} = \sum_{n=0}^{\infty} \left(-\frac{1}{3}\right)^n (x-5)^n$, which converges for

52. (a) We can write the given series as $\frac{1}{2} \sum_{n=0}^{\infty} \left(\frac{x}{4}\right)^n$ which shows that the interval of convergence is $-4 < x < 4$.

(b) The function represented by the series in (a) is $\frac{2}{4-x}$ for $-4 < x < 4$. If we rewrite this function as

$$\frac{2}{1-(x-3)}$$

we can represent it by the geometric series $\sum_{n=0}^{\infty} 2(x-3)^n$ which will converge only for

$$|x-3| < 1 \text{ or } 2 < x < 4.$$

53. $\lim_{n \rightarrow \infty} \left| \frac{(x-3)^{n+1}}{2^{n+1}} \cdot \frac{2^n}{(x-3)^n} \right| < 1 \Rightarrow |x-3| < 2 \Rightarrow 1 < x < 5$; when $x=1$ we have $\sum_{n=0}^{\infty} (1)^n$ which diverges; when $x=5$

we have $\sum_{n=1}^{\infty} (-1)^n$ which also diverges; the interval of convergence is $1 < x < 5$; the sum of this convergent

geometric series is $\frac{1}{1+\left(\frac{x-3}{2}\right)} = \frac{2}{x-1}$. If $f(x) = 1 - \frac{1}{2}(x-3) + \frac{1}{4}(x-3)^2 + \dots + \left(-\frac{1}{2}\right)^n (x-3)^n + \dots = \frac{2}{x-1}$ then

$f'(x) = -\frac{1}{2} + \frac{1}{2}(x-3) + \dots + \left(-\frac{1}{2}\right)^n n(x-3)^{n-1} + \dots$ is convergent when $1 < x < 5$, and diverges when $x=1$ or

5. The sum for $f'(x)$ is $\frac{-2}{(x-1)^2}$, the derivative of $\frac{2}{x-1}$.

54. If $f(x) = 1 - \frac{1}{2}(x-3) + \frac{1}{4}(x-3)^2 + \dots + \left(-\frac{1}{2}\right)^n (x-3)^n + \dots = \frac{2}{x-1}$ then

$$\int f(x) dx = x - \frac{(x-3)^2}{4} + \frac{(x-3)^3}{12} + \dots + \left(-\frac{1}{2}\right)^n \frac{(x-3)^{n+1}}{n+1} + \dots$$

At $x=1$ the series $\sum_{n=1}^{\infty} \frac{-2}{n+1}$ diverges; at $x=5$ the

series $\sum_{n=1}^{\infty} \frac{(-1)^n 2}{n+1}$ converges. Therefore the interval of convergence is $1 < x \leq 5$ and the sum is

$$2 \ln|x-1| + (3 - \ln 4), \text{ since } \int \frac{2}{x-1} dx = 2 \ln|x-1| + C, \text{ where } C = 3 - \ln 4 \text{ when } x = 3.$$

55. (a) Differentiate the series for $\sin x$ to get $\cos x = 1 - \frac{3x^2}{3!} + \frac{5x^4}{5!} - \frac{7x^6}{7!} + \frac{9x^8}{9!} - \frac{11x^{10}}{11!} + \dots$

$= 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \frac{x^8}{8!} - \frac{x^{10}}{10!} + \dots$. The series converges for all values of x since

$$\lim_{n \rightarrow \infty} \left| \frac{x^{2n+2}}{(2n+2)!} \cdot \frac{(2n)!}{x^{2n}} \right| = x^2 \lim_{n \rightarrow \infty} \left(\frac{1}{(2n+1)(2n+2)} \right) = 0 < 1 \text{ for all } x.$$

35. Since $n = 3$, then $f^{(4)}(x) = \sin x$, $|f^{(4)}(x)| \leq M$ on $[0, 0.1] \Rightarrow |\sin x| \leq 1$ on $[0, 0.1] \Rightarrow M = 1$.
Then $|R_3(0.1)| \leq 1 \frac{|0.1-0|^4}{4!} = 4.2 \times 10^{-6} \Rightarrow \text{error} \leq 4.2 \times 10^{-6}$
36. Since $n = 4$, then $f^{(5)}(x) = e^x$, $|f^{(5)}(x)| \leq M$ on $[0, 0.5] \Rightarrow |e^x| \leq \sqrt{e}$ on $[0, 0.5] \Rightarrow M = 2.7$.
Then $|R_4(0.5)| \leq 2.7 \frac{|0.5-0|^5}{5!} = 7.03 \times 10^{-4} \Rightarrow \text{error} \leq 7.03 \times 10^{-4}$

 $\Rightarrow |x|^5 < 600 \times 10^{-4} \Rightarrow |x| < \sqrt[5]{6 \times 10^{-2}} \approx 0.56968$

38. If $\cos x = 1 - \frac{x^2}{2}$ and $|x| < 0.5$, then the error is less than $\left| \frac{(.5)^4}{24} \right| = 0.0026$, by Alternating Series Estimation Theorem; since the next term in the series is positive, the approximation $1 - \frac{x^2}{2}$ is too small, by the Alternating Series Estimation Theorem
39. If $\sin x = x$ and $|x| < 10^{-3}$, then the error is less than $\frac{(10^{-3})^3}{3!} \approx 1.67 \times 10^{-10}$, by Alternating Series Estimation Theorem; The Alternating Series Estimation Theorem says $R_2(x)$ has the same sign as $-\frac{x^3}{3!}$. Moreover, $x < \sin x \Rightarrow 0 < \sin x - x = R_2(x) \Rightarrow x < 0 \Rightarrow -10^{-3} < x < 0$.
40. $\sqrt{1+x} = 1 + \frac{x}{2} - \frac{x^2}{8} + \frac{x^3}{16} - \dots$. By the Alternating Series Estimation Theorem the $|\text{error}| < \left| \frac{-x^2}{8} \right| < \frac{(0.01)^2}{8} = 1.25 \times 10^{-5}$
41. $|R_2(x)| = \left| \frac{e^c x^3}{3!} \right| < \frac{3^{(0.1)}(0.1)^3}{3!} < 1.87 \times 10^{-4}$, where c is between 0 and x
42. $|R_2(x)| = \left| \frac{e^c x^3}{3!} \right| < \frac{(0.1)^3}{3!} = 1.67 \times 10^{-4}$, where c is between 0 and x
43. $\sin^2 x = \left(\frac{1 - \cos 2x}{2} \right) = \frac{1}{2} - \frac{1}{2} \cos 2x = \frac{1}{2} - \frac{1}{2} \left(1 - \frac{(2x)^2}{2!} + \frac{(2x)^4}{4!} - \frac{(2x)^6}{6!} + \dots \right) = \frac{2x^2}{2!} - \frac{2^3 x^4}{4!} + \frac{2^5 x^6}{6!} - \dots$

 $\Rightarrow 2 \sin x \cos x = 2x - \frac{(2x)^3}{3!} + \frac{(2x)^5}{5!} - \frac{(2x)^7}{7!} + \dots = \sin 2x$, which checks
44. $\cos^2 x = \cos 2x + \sin^2 x = \left(1 - \frac{(2x)^2}{2!} + \frac{(2x)^4}{4!} - \frac{(2x)^6}{6!} + \frac{(2x)^8}{8!} + \dots \right) + \left(\frac{2x^2}{2!} - \frac{2^3 x^4}{4!} + \frac{2^5 x^6}{6!} - \frac{2^7 x^8}{8!} + \dots \right)$
 $= 1 - \frac{2x^2}{2!} + \frac{2^3 x^4}{4!} - \frac{2^5 x^6}{6!} + \dots = 1 - x^2 + \frac{1}{3} x^4 - \frac{2}{45} x^6 + \frac{1}{315} x^8 - \dots$
45. A special case of Taylor's Theorem is $f(b) = f(a) + f'(c)(b-a)$, where c is between a and $b \Rightarrow f(b) - f(a) = f'(c)(b-a)$, the Mean Value Theorem.
46. If $f(x)$ is twice differentiable and at $x = a$ there is a point of inflection, then $f''(a) = 0$. Therefore, $L(x) = Q(x) = f(a) + f'(a)(x-a)$.
47. (a) $f'' \leq 0$, $f'(a) = 0$ and $x = a$ interior to the interval $I \Rightarrow f(x) - f(a) = \frac{f''(c_2)}{2}(x-a)^2 \leq 0$ throughout $I \Rightarrow f(x) \leq f(a)$ throughout $I \Rightarrow f$ has a local maximum at $x = a$
 (b) similar reasoning gives $f(x) - f(a) = \frac{f''(c_2)}{2}(x-a)^2 \geq 0$ throughout $I \Rightarrow f(x) \geq f(a)$ throughout $I \Rightarrow f$ has a local minimum at $x = a$

48. $f(x) = (1-x)^{-1} \Rightarrow f'(x) = (1-x)^{-2} \Rightarrow f''(x) = 2(1-x)^{-3} \Rightarrow f^{(3)}(x) = 6(1-x)^{-4} \Rightarrow f^{(4)}(x) = 24(1-x)^{-5}$;
 therefore $\frac{1}{1-x} \approx 1 + x + x^2 + x^3$. $|x| < 0.1 \Rightarrow \frac{10}{11} < \frac{1}{1-x} < \frac{10}{9} \Rightarrow \left| \frac{1}{(1-x)^5} \right| < \left(\frac{10}{9} \right)^5 \Rightarrow \left| \frac{x^4}{(1-x)^5} \right| < x^4 \left(\frac{10}{9} \right)^5 \Rightarrow$ the error
 $e_3 \leq \left| \frac{\max f^{(4)}(x)x^4}{4!} \right| < (0.1)^4 \left(\frac{10}{9} \right)^5 = 0.00016935 < 0.00017$, since $\left| \frac{f^{(4)}(x)}{4!} \right| = \left| \frac{1}{(1-x)^5} \right|$.
49. (a) $f(x) = (1+x)^k \Rightarrow f'(x) = k(1+x)^{k-1} \Rightarrow f''(x) = k(k-1)(1+x)^{k-2}$; $f(0) = 1$, $f'(0) = k$, and
 $f''(0) = k(k-1) \Rightarrow Q(x) = 1 + kx + \frac{k(k-1)}{2}x^2$
- (b) $|R_2(x)| = \left| \frac{3.21}{3!}x^3 \right| < \frac{1}{100} \Rightarrow |x^3| < \frac{1}{100} \Rightarrow 0 < x < \frac{1}{100^{1/3}}$ or $0 < x < .21544$
50. (a) Let $P = x + \pi \Rightarrow |x| = |P - \pi| < .5 \times 10^{-n}$ since P approximates π accurate to n decimals. Then,
 $P + \sin P = (\pi + x) + \sin(\pi + x) = (\pi + x) - \sin x = \pi + (x - \sin x)$
 $\Rightarrow |(P + \sin P) - \pi| = |x - \sin x| \leq \frac{|x|^3}{3!} < \frac{0.125}{3!} \times 10^{-3n} < 0.5 \times 10^{-3n} \Rightarrow P + \sin P$ gives an approximation to
 π correct to $3n$ decimals.
51. If $f(x) = \sum_{n=0}^{\infty} a_n x^n$, then $f^{(k)}(x) = \sum_{n=k}^{\infty} n(n-1)(n-2)\cdots(n-k+1)a_n x^{n-k}$ and $f^{(k)}(0) = k!a_k \Rightarrow a_k = \frac{f^{(k)}(0)}{k!}$
 for k a nonnegative integer. Therefore, the coefficients of $f(x)$ are identical with the corresponding
 coefficients in the Maclaurin series of $f(x)$ and the statement follows.
52. Note: f even $\Rightarrow f(-x) = f(x) \Rightarrow -f'(-x) = f'(x) \Rightarrow f'(-x) = -f'(x) \Rightarrow f'$ odd;
 f odd $\Rightarrow f(-x) = -f(x) \Rightarrow -f'(-x) = -f'(x) \Rightarrow f'(-x) = f'(x) \Rightarrow f'$ even;
 also, f odd $\Rightarrow f(-0) = f(0) \Rightarrow 2f(0) = 0 \Rightarrow f(0) = 0$
- (a) If $f(x)$ is even, then any odd-order derivative is odd and equal to 0 at $x = 0$.
 Therefore, $a_1 = a_3 = a_5 = \dots = 0$; that is, the Maclaurin series for f contains only even powers.
- (b) If $f(x)$ is odd, then any even-order derivative is odd and equal to 0 at $x = 0$.
 Therefore, $a_0 = a_2 = a_4 = \dots = 0$; that is, the Maclaurin series for f contains only odd powers.

Noting the upper bound for each of the above derivatives occurs at $x = a$, the upper bounds m_1 , m_2 , and m_3 can be defined and bounds for remainders viewed as functions of x .

A three dimensional look at the error functions, allowing both c and x to vary can also be viewed. Recall that c must be a value between 0 and x . so some points on the surfaces where c is not in that interval are meaningless.

At $n = 1929$ we obtain the first approximation accurate to 3 decimals: 3.141999845. At $n = 30,000$ we still do not obtain accuracy to 4 decimals: 3.141617732, so the convergence to π is very slow. Here is a Maple CAS procedure to produce these approximations:

```
pie :=
proc(n)
local i, j;
a(2) := evalf(8/9)
for i from 3 to n do a(i) := evalf(2*(2*i-2)*i/(2*i-1)^2*a(i-1))od;
[[j, 4*a(j)] $ (j = n-5 .. n)]
end
```

(b) See Exercise 68 in Section 8.2 and the corresponding solution in this manual which shows how the formulas for definite integrals of powers of sine and of cosine can be derived from repeated application of the reduction formulas 67 and 68. The given expression for K follows from substituting $k^2 \sin^2 \theta$ for x in the binomial series for $1/\sqrt{1-x}$ and then using the formula for integrals of even powers of sine in Exercise 68 of Section 8.2.

 $= ae^{ax}(\cos bx + i \sin bx) + bie^{ax}(\cos bx + i \sin bx) = ae^{(a+ib)x} + ibe^{(a+ib)x} = (a+ib)e^{(a+ib)x}$

73. (a) $e^{i\theta_1} e^{i\theta_2} = (\cos \theta_1 + i \sin \theta_1)(\cos \theta_2 + i \sin \theta_2)$
 $= (\cos \theta_1 \cos \theta_2 - \sin \theta_1 \sin \theta_2) + i(\sin \theta_1 \cos \theta_2 + \sin \theta_2 \cos \theta_1) = \cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2) = e^{i(\theta_1 + \theta_2)}$
 (b) $e^{-i\theta} = \cos(-\theta) + i \sin(-\theta) = \cos \theta - i \sin \theta = (\cos \theta - i \sin \theta) \left(\frac{\cos \theta + i \sin \theta}{\cos \theta + i \sin \theta}\right) = \frac{1}{\cos \theta + i \sin \theta} = \frac{1}{e^{i\theta}}$

 $= \frac{e^{ax}}{a^2+b^2} (a \cos bx + ia \sin bx - ib \cos bx + b \sin bx) + C_1 + iC_2$
 $= \frac{e^{ax}}{a^2+b^2} [(a \cos bx + b \sin bx) + (a \sin bx - b \cos bx)i] + C_1 + iC_2$
 $= \frac{e^{ax}(a \cos bx + b \sin bx)}{a^2+b^2} + C_1 + \frac{ie^{ax}(a \sin bx - b \cos bx)}{a^2+b^2} + iC_2;$
 $e^{(a+bi)x} = e^{ax} e^{ibx} = e^{ax} (\cos bx + i \sin bx) = e^{ax} \cos bx + ie^{ax} \sin bx$, so that given
 $\int e^{(a+bi)x} dx = \frac{a-bi}{a^2+b^2} e^{(a+bi)x} + C_1 + iC_2$ we conclude that $\int e^{ax} \cos bx dx = \frac{e^{ax}(a \cos bx + b \sin bx)}{a^2+b^2} + C_1$ and
 $\int e^{ax} \sin bx dx = \frac{e^{ax}(a \sin bx - b \cos bx)}{a^2+b^2} + C_2$

16. converges to 1, since $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \sqrt[n]{2n+1} = \lim_{n \rightarrow \infty} \exp\left(\frac{\ln(2n+1)}{n}\right) = \lim_{n \rightarrow \infty} \exp\left(\frac{\frac{2}{2n+1}}{1}\right) = e^0 = 1$

17. diverges, since $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{(n+1)!}{n!} = \lim_{n \rightarrow \infty} (n+1) = \infty$

18. converges to 0, since $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{(-4)^n}{n!} = 0$ by Theorem 5

19. $\frac{1}{(2n-3)(2n-1)} = \frac{\left(\frac{1}{2}\right)}{2n-3} - \frac{\left(\frac{1}{2}\right)}{2n-1} \Rightarrow s_n = \left[\frac{\left(\frac{1}{2}\right)}{3} - \frac{\left(\frac{1}{2}\right)}{5}\right] + \left[\frac{\left(\frac{1}{2}\right)}{5} - \frac{\left(\frac{1}{2}\right)}{7}\right] + \dots + \left[\frac{\left(\frac{1}{2}\right)}{2n-3} - \frac{\left(\frac{1}{2}\right)}{2n-1}\right] = \frac{\left(\frac{1}{2}\right)}{3} - \frac{\left(\frac{1}{2}\right)}{2n-1}$
 $\Rightarrow \lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left[\frac{1}{6} - \frac{\left(\frac{1}{2}\right)}{2n-1}\right] = \frac{1}{6}$

20. $\frac{-2}{n(n+1)} = \frac{-2}{n} + \frac{2}{n+1} \Rightarrow s_n = \left(\frac{-2}{2} + \frac{2}{3}\right) + \left(\frac{-2}{3} + \frac{2}{4}\right) + \dots + \left(\frac{-2}{n} + \frac{2}{n+1}\right) = -\frac{2}{2} + \frac{2}{n+1} \Rightarrow \lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(-1 + \frac{2}{n+1}\right) = -1$

21. $\frac{9}{(3n-1)(3n+2)} = \frac{3}{3n-1} - \frac{3}{3n+2} \Rightarrow s_n = \left(\frac{3}{2} - \frac{3}{5}\right) + \left(\frac{3}{5} - \frac{3}{8}\right) + \left(\frac{3}{8} - \frac{3}{11}\right) + \dots + \left(\frac{3}{3n-1} - \frac{3}{3n+2}\right) = \frac{3}{2} - \frac{3}{3n+2}$
 $\Rightarrow \lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(\frac{3}{2} - \frac{3}{3n+2}\right) = \frac{3}{2}$

22. $\frac{-8}{(4n-3)(4n+1)} = \frac{-2}{4n-3} + \frac{2}{4n+1} \Rightarrow s_n = \left(\frac{-2}{9} + \frac{2}{13}\right) + \left(\frac{-2}{13} + \frac{2}{17}\right) + \left(\frac{-2}{17} + \frac{2}{21}\right) + \dots + \left(\frac{-2}{4n-3} + \frac{2}{4n+1}\right) = -\frac{2}{9} + \frac{2}{4n+1}$
 $\Rightarrow \lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(-\frac{2}{9} + \frac{2}{4n+1}\right) = -\frac{2}{9}$

25. diverges, a p -series with $p = \frac{1}{2}$

26. $\sum_{n=1}^{\infty} \frac{-5}{n} = -5 \sum_{n=1}^{\infty} \frac{1}{n}$, diverges since it is a nonzero multiple of the divergent harmonic series

27. Since $f(x) = \frac{1}{x^{1/2}} \Rightarrow f'(x) = -\frac{1}{2x^{3/2}} < 0 \Rightarrow f(x)$ is decreasing $\Rightarrow a_{n+1} < a_n$, and $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{n}} = 0$, the series $\sum_{n=1}^{\infty} \frac{(-1)^n}{\sqrt{n}}$ converges by the Alternating Series Test. Since $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}}$ diverges, the given series converges conditionally.
28. converges absolutely by the Comparison Test since $\frac{1}{2n^3} < \frac{1}{n^3}$ for $n \geq 1$, which is the n th term of a convergent p -series
29. The given series does not converge absolutely by the Direct Comparison Test since $\frac{1}{\ln(n+1)} > \frac{1}{n+1}$, which is the n th term of a divergent series. Since $f(x) = \frac{1}{\ln(x+1)} \Rightarrow f'(x) = -\frac{1}{(\ln(x+1))^2(x+1)} < 0 \Rightarrow f(x)$ is decreasing $\Rightarrow a_{n+1} < a_n$, and $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{1}{\ln(n+1)} = 0$, the given series converges conditionally by the Alternating Series Test.
30. $\int_2^{\infty} \frac{1}{x(\ln x)^2} dx = \lim_{b \rightarrow \infty} \int_2^b \frac{1}{x(\ln x)^2} dx = \lim_{b \rightarrow \infty} \left[-(\ln x)^{-1} \right]_2^b = -\lim_{b \rightarrow \infty} \left(\frac{1}{\ln b} - \frac{1}{\ln 2} \right) = \frac{1}{\ln 2} \Rightarrow$ the series converges absolutely by the Integral Test
31. converges absolutely by the Direct Comparison Test since $\frac{\ln n}{n^3} < \frac{n}{n^3} = \frac{1}{n^2}$, the n th term of a convergent p -series

33. $\lim_{n \rightarrow \infty} \frac{\left(\frac{1}{n\sqrt{n^2+1}} \right)}{\left(\frac{1}{n^2} \right)} = \sqrt{\lim_{n \rightarrow \infty} \frac{n^2}{n^2+1}} = \sqrt{1} = 1 \Rightarrow$ converges absolutely by the Limit Comparison Test
34. Since $f(x) = \frac{3x^2}{x^3+1} \Rightarrow f'(x) = \frac{3x(2-x^3)}{(x^3+1)^2} < 0$ when $x \geq 2 \Rightarrow a_{n+1} < a_n$ for $n \geq 2$ and $\lim_{n \rightarrow \infty} \frac{3n^2}{n^3+1} = 0$, the series converges by the Alternating Series Test. The series does not converge absolutely: By the Limit Comparison Test, $\lim_{n \rightarrow \infty} \frac{\left(\frac{3n^2}{n^3+1} \right)}{\left(\frac{1}{n} \right)} = \lim_{n \rightarrow \infty} \frac{3n^3}{n^3+1} = 3$. Therefore the convergence is conditional.

37. converges absolutely by the Ratio Test since $\lim_{n \rightarrow \infty} \left[\frac{3^{n+1}}{(n+1)!} \cdot \frac{n!}{3^n} \right] = \lim_{n \rightarrow \infty} \frac{3}{n+1} = 0 < 1$

38. converges absolutely by the Root Test since $\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\frac{2^n 3^n}{n^n}} = \lim_{n \rightarrow \infty} \frac{6}{n} = 0 < 1$

39. converges absolutely by the Limit Comparison Test since $\lim_{n \rightarrow \infty} \frac{\left(\frac{1}{n^{3/2}}\right)}{\left(\frac{1}{\sqrt{n(n+1)(n+2)}}\right)} = \sqrt{\lim_{n \rightarrow \infty} \frac{n(n+1)(n+2)}{n^3}} = 1$

40. converges absolutely by the Limit Comparison Test since $\lim_{n \rightarrow \infty} \frac{\left(\frac{1}{n^2}\right)}{\left(\frac{1}{n\sqrt{n^2-1}}\right)} = \sqrt{\lim_{n \rightarrow \infty} \frac{n^2(n^2-1)}{n^4}} = 1$

41. $\lim_{n \rightarrow \infty} \left| \frac{u_{n+1}}{u_n} \right| < 1 \Rightarrow \lim_{n \rightarrow \infty} \left| \frac{(x+4)^{n+1}}{(n+1)3^{n+1}} \cdot \frac{n3^n}{(x+4)^n} \right| < 1 \Rightarrow \frac{|x+4|}{3} \lim_{n \rightarrow \infty} \left(\frac{n}{n+1} \right) < 1 \Rightarrow \frac{|x+4|}{3} < 1 \Rightarrow |x+4| < 3 \Rightarrow -3 < x+4 < 3$

$\Rightarrow -7 < x < -1$; at $x = -7$ we have $\sum_{n=1}^{\infty} \frac{(-1)^n 3^n}{n3^n} = \sum_{n=1}^{\infty} \frac{(-1)^n}{n}$, the alternating harmonic series, which converges

87. Yes, the series $\sum_{n=1}^{\infty} a_n b_n$ converges as we now show. Since $\sum_{n=1}^{\infty} a_n$ converges it follows that $a_n \rightarrow 0 \Rightarrow a_n < 1$ for $n > \text{some index } N \Rightarrow a_n b_n < b_n$ for $n > N \Rightarrow \sum_{n=1}^{\infty} a_n b_n$ converges by the Direct Comparison Test with $\sum_{n=1}^{\infty} b_n$
88. No, the series $\sum_{n=1}^{\infty} a_n b_n$ might diverge (as it would if a_n and b_n both equaled n) or it might converge (as it would if a_n and b_n both equaled $\frac{1}{n}$)

1. converges since $\frac{1}{(3n-2)^{(2n+1)/2}} < \frac{1}{(3n-2)^{3/2}}$ and $\sum_{n=1}^{\infty} \frac{1}{(3n-2)^{3/2}}$ converges by the Limit Comparison Test:

$$\lim_{n \rightarrow \infty} \frac{\left(\frac{1}{n^{3/2}}\right)}{\left(\frac{1}{(3n-2)^{3/2}}\right)} = \lim_{n \rightarrow \infty} \left(\frac{3n-2}{n}\right)^{3/2} = 3^{3/2}$$

 $= \left(\frac{\pi^3}{24} - \frac{\pi^3}{192} \right) = \frac{7\pi^3}{192}$

3. diverges by the n th-Term Test since $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} (-1)^n \tanh n = \lim_{b \rightarrow \infty} (-1)^n \left(\frac{1-e^{-2n}}{1+e^{-2n}} \right) = \lim_{n \rightarrow \infty} (-1)^n$ does not exist
4. converges by the Direct Comparison Test: $n! < n^n \Rightarrow \ln(n!) < n \ln(n) \Rightarrow \frac{\ln(n!)}{\ln(n)} < n \Rightarrow \log_n(n!) < n \Rightarrow \frac{\log_n(n!)}{n^3} < \frac{1}{n^2}$, which is the n th-term of a convergent p -series
5. converges by the Direct Comparison Test: $a_1 = 1 = \frac{12}{(1)(3)(2)^2}$, $a_2 = \frac{1 \cdot 2}{3 \cdot 4} = \frac{12}{(2)(4)(3)^2}$, $a_3 = \left(\frac{2 \cdot 3}{4 \cdot 5}\right) \left(\frac{1 \cdot 2}{3 \cdot 4}\right) = \frac{12}{(3)(5)(4)^2}$,
 $a_4 = \left(\frac{3 \cdot 4}{5 \cdot 6}\right) \left(\frac{2 \cdot 3}{4 \cdot 5}\right) \left(\frac{1 \cdot 2}{3 \cdot 4}\right) = \frac{12}{(4)(6)(5)^2}$, $\dots \Rightarrow 1 + \sum_{n=1}^{\infty} \frac{12}{(n+1)(n+3)(n+2)^2}$ represents the given series and
 $\frac{12}{(n+1)(n+3)(n+2)^2} < \frac{12}{n^4}$, which is the n th-term of a convergent p -series

7. diverges by the n th-Term Test since if $a_n \rightarrow L$ as $n \rightarrow \infty$, then $L = \frac{1}{1+L} \Rightarrow L^2 + L - 1 = 0 \Rightarrow L = \frac{-1 \pm \sqrt{5}}{2} \neq 0$
8. Split the given series into $\sum_{n=1}^{\infty} \frac{1}{3^{2n+1}}$ and $\sum_{n=1}^{\infty} \frac{2n}{3^{2n}}$; the first subseries is a convergent geometric series and the second converges by the Root Test: $\lim_{n \rightarrow \infty} \sqrt[n]{\frac{2n}{3^{2n}}} = \lim_{n \rightarrow \infty} \frac{\sqrt[n]{2} \sqrt[n]{n}}{9} = \frac{1 \cdot 1}{9} = \frac{1}{9} < 1$

 $\cos x = \frac{1}{2} - \frac{\sqrt{3}}{2}\left(x - \frac{\pi}{3}\right) - \frac{1}{4}\left(x - \frac{\pi}{3}\right)^2 + \frac{\sqrt{3}}{12}\left(x - \frac{\pi}{3}\right)^3 + \dots$

11. $e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots$ with $a = 0$
12. $f(x) = \ln x$ with $a = 1 \Rightarrow f(1) = 0$, $f'(1) = 1$, $f''(1) = -1$, $f'''(1) = 2$, $f^{(4)}(1) = -6$;
 $\ln x = (x - 1) - \frac{(x - 1)^2}{2} + \frac{(x - 1)^3}{3} - \frac{(x - 1)^4}{4} + \dots$
13. $f(x) = \cos x$ with $a = 22\pi \Rightarrow f(22\pi) = 1$, $f'(22\pi) = 0$, $f''(22\pi) = -1$, $f'''(22\pi) = 0$, $f^{(4)}(22\pi) = 1$,
 $f^{(5)}(22\pi) = 0$, $f^{(6)}(22\pi) = -1$; $\cos x = 1 - \frac{1}{2}(x - 22\pi)^2 + \frac{1}{4!}(x - 22\pi)^4 - \frac{1}{6!}(x - 22\pi)^6 + \dots$

14. $f(x) = \tan^{-1} x$ with $a = 1 \Rightarrow f(1) = \frac{\pi}{4}, f'(1) = \frac{1}{2}, f''(1) = -\frac{1}{2}, f'''(1) = \frac{1}{2};$

$$\tan^{-1} x = \frac{\pi}{4} + \frac{(x-1)}{2} - \frac{(x-1)^2}{4} + \frac{(x-1)^3}{12} + \dots$$

15. Yes, the sequence converges: $c_n = (a^n + b^n)^{1/n} \Rightarrow c_n = b \left(\left(\frac{a}{b}\right)^n + 1 \right)^{1/n} \Rightarrow \lim_{n \rightarrow \infty} c_n = \ln b + \lim_{n \rightarrow \infty} \frac{\ln \left(\left(\frac{a}{b}\right)^n + 1 \right)}{n}$
 $= \ln b + \lim_{n \rightarrow \infty} \frac{\left(\frac{a}{b}\right)^n \ln \left(\frac{a}{b}\right)}{\left(\frac{a}{b}\right)^n + 1} = \ln b + \frac{0 \cdot \ln \left(\frac{a}{b}\right)}{0+1} = \ln b$ since $0 < a < b$. Thus, $\lim_{n \rightarrow \infty} c_n = e^{\ln b} = b$.

16. $1 + \frac{2}{10} + \frac{3}{10^2} + \frac{7}{10^3} + \frac{2}{10^4} + \frac{3}{10^5} + \frac{7}{10^6} + \dots = 1 + \sum_{n=1}^{\infty} \frac{2}{10^{3n-2}} + \sum_{n=1}^{\infty} \frac{3}{10^{3n-1}} + \sum_{n=1}^{\infty} \frac{7}{10^{3n}}$
 $= 1 + \sum_{n=0}^{\infty} \frac{2}{10^{3n+1}} + \sum_{n=0}^{\infty} \frac{3}{10^{3n+2}} + \sum_{n=0}^{\infty} \frac{7}{10^{3n+3}} = 1 + \frac{\left(\frac{2}{10}\right)}{1 - \left(\frac{1}{10}\right)^3} + \frac{\left(\frac{3}{10^2}\right)}{1 - \left(\frac{1}{10}\right)^3} + \frac{\left(\frac{7}{10^3}\right)}{1 - \left(\frac{1}{10}\right)^3} = 1 + \frac{200}{999} + \frac{30}{999} + \frac{7}{999} = \frac{999+237}{999} = \frac{412}{333}$

17. $s_n = \sum_{k=0}^{n-1} \int_k^{k+1} \frac{dx}{1+x^2} \Rightarrow s_n = \int_0^1 \frac{dx}{1+x^2} + \int_1^2 \frac{dx}{1+x^2} + \dots + \int_{n-1}^n \frac{dx}{1+x^2} \Rightarrow s_n = \int_0^n \frac{dx}{1+x^2}$
 $\Rightarrow \lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \left(\tan^{-1} n - \tan^{-1} 0 \right) = \frac{\pi}{2}$

18. $\lim_{n \rightarrow \infty} \left| \frac{u_{n+1}}{u_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{(n+1)x^{n+1}}{(n+2)(2x+1)^{n+1}} \cdot \frac{(n+1)(2x+1)^n}{nx^n} \right| = \lim_{n \rightarrow \infty} \left| \frac{x}{2x+1} \cdot \frac{(n+1)^2}{n(n+2)} \right| = \left| \frac{x}{2x+1} \right| < 1 \Rightarrow |x| < |2x+1|;$

if $-\frac{1}{2} < x < 0, |x| < |2x+1| \Rightarrow -x < 2x+1 \Rightarrow 3x > -1 \Rightarrow x > -\frac{1}{3};$

if $x < -\frac{1}{2}, |x| < |2x+1| \Rightarrow -x < -2x-1 \Rightarrow x < -1.$

Therefore, the series converges absolutely for $x < -1$ and $x > -\frac{1}{3}$.

19. (a) No, the limit does not appear to depend on the value of the constant a

(b) Yes, the limit depends on the value of b

(c) $s = \left(1 - \frac{\cos \left(\frac{a}{n}\right)}{n} \right)^n \Rightarrow \ln s = \frac{\ln \left(1 - \frac{\cos \left(\frac{a}{n}\right)}{n} \right)}{\left(\frac{1}{n}\right)} \Rightarrow \lim_{n \rightarrow \infty} \ln s = \frac{\left(\frac{1}{1 - \frac{\cos \left(\frac{a}{n}\right)}{n}} \right) \left(\frac{-\frac{a}{n} \sin \left(\frac{a}{n}\right) + \cos \left(\frac{a}{n}\right)}{n^2} \right)}{\left(-\frac{1}{n^2}\right)} = \lim_{n \rightarrow \infty} \frac{\frac{a}{n} \sin \left(\frac{a}{n}\right) - \cos \left(\frac{a}{n}\right)}{1 - \frac{\cos \left(\frac{a}{n}\right)}{n}}$
 $= \frac{0-1}{1-0} = -1 \Rightarrow \lim_{n \rightarrow \infty} s = e^{-1} \approx 0.3678794412;$ similarly, $\lim_{n \rightarrow \infty} \left(1 - \frac{\cos \left(\frac{a}{n}\right)}{bn} \right)^n = e^{-1/b}$

20. $\sum_{n=1}^{\infty} a_n$ converges $\Rightarrow \lim_{n \rightarrow \infty} a_n = 0; \lim_{n \rightarrow \infty} \left[\left(\frac{1 + \sin a_n}{2} \right)^n \right]^{1/n} = \lim_{n \rightarrow \infty} \left(\frac{1 + \sin a_n}{2} \right) = \frac{1 + \sin \left(\lim_{n \rightarrow \infty} a_n \right)}{2} = \frac{1 + \sin 0}{2} = \frac{1}{2}$
 \Rightarrow the series converges by the n th-Root Test

21. $\lim_{n \rightarrow \infty} \left| \frac{u_{n+1}}{u_n} \right| < 1 \Rightarrow \lim_{n \rightarrow \infty} \left| \frac{b^{n+1} x^{n+1}}{\ln(n+1)} \cdot \frac{\ln n}{b^n x^n} \right| < 1 \Rightarrow |bx| < 1 \Rightarrow -\frac{1}{b} < x < \frac{1}{b} = 5 \Rightarrow b = \pm \frac{1}{5}$

24.
$$\lim_{x \rightarrow 0} \frac{\cos ax - b}{2x^2} = -1 \Rightarrow \lim_{x \rightarrow 0} \frac{\left(1 - \frac{a^2 x^2}{2} + \frac{a^4 x^4}{4!} - \dots\right) - b}{2x^2} = -1 \Rightarrow \lim_{x \rightarrow 0} \left(\frac{1-b}{2x^2} - \frac{a^2}{4} + \frac{a^2 x^2}{48} - \dots\right) = -1 \Rightarrow b = 1 \text{ and } a = \pm 2$$

$\Rightarrow \frac{16 \cos^2 t}{16} + \frac{4 \sin^2 t}{4} = 1 \Rightarrow \frac{x^2}{16} + \frac{y^2}{4} = 1$

8. $x = 4 \sin t, y = 5 \cos t, 0 \leq t \leq 2\pi$

$\Rightarrow \frac{16 \sin^2 t}{16} + \frac{25 \cos^2 t}{25} = 1 \Rightarrow \frac{x^2}{16} + \frac{y^2}{25} = 1$

9. $x = \sin t, y = \cos 2t, -\frac{\pi}{2} \leq t \leq \frac{\pi}{2}$

$\Rightarrow y = \cos 2t = 1 - 2 \sin^2 t \Rightarrow y = 1 - 2x^2$

10. $x = 1 + \sin t, y = \cos t - 2, 0 \leq t \leq \pi$

$\Rightarrow \sin^2 t + \cos^2 t = 1 \Rightarrow (x-1)^2 + (y+2)^2 = 1$

11. $x = t^2, y = t^6 - 2t^4, -\infty < t < \infty$

$\Rightarrow y = (t^2)^3 - 2(t^2)^2 \Rightarrow y = x^3 - 2x^2$

12. $x = \frac{t}{t-1}, y = \frac{t-2}{t+1}, -1 < t < 1$

$\Rightarrow t = \frac{x}{x-1}, \Rightarrow y = \frac{2-x}{2x-1}$

13. $x = t, y = \sqrt{1-t^2}, -1 \leq t \leq 0$

$\Rightarrow y = \sqrt{1-x^2}$

14. $x = \sqrt{t+1}, y = \sqrt{t}, t \geq 0$

$\Rightarrow y^2 = t \Rightarrow x = \sqrt{y^2 + 1}, y \geq 0$

15. $x = \sec^2 t - 1, y = \tan t, -\frac{\pi}{2} < t < \frac{\pi}{2}$
 $\Rightarrow \sec^2 t - 1 = \tan^2 t \Rightarrow x = y^2$

16. $x = -\sec t, y = \tan t, -\frac{\pi}{2} < t < \frac{\pi}{2}$
 $\Rightarrow \sec^2 t - \tan^2 t = 1 \Rightarrow x^2 - y^2 = 1$

17. $x = -\cosh t, y = \sinh t, -\infty < t < \infty$
 $\Rightarrow \cosh^2 t - \sinh^2 t = 1 \Rightarrow x^2 - y^2 = 1$

18. $x = 2 \sinh t, y = 2 \cosh t, -\infty < t < \infty$
 $\Rightarrow 4 \cosh^2 t - 4 \sinh^2 t = 4 \Rightarrow y^2 - x^2 = 4$

19. (a) $x = a \cos t, y = -a \sin t, 0 \leq t \leq 2\pi$
 (b) $x = a \cos t, y = a \sin t, 0 \leq t \leq 2\pi$
 (c) $x = a \cos t, y = -a \sin t, 0 \leq t \leq 4\pi$
 (d) $x = a \cos t, y = a \sin t, 0 \leq t \leq 4\pi$

20. (a) $x = a \sin t, y = b \cos t, \frac{\pi}{2} \leq t \leq \frac{5\pi}{2}$
 (b) $x = a \cos t, y = b \sin t, 0 \leq t \leq 2\pi$
 (c) $x = a \sin t, y = b \cos t, \frac{\pi}{2} \leq t \leq \frac{9\pi}{2}$
 (d) $x = a \cos t, y = b \sin t, 0 \leq t \leq 4\pi$

21. Using $(-1, -3)$ we create the parametric equations $x = -1 + at$ and $y = -3 + bt$, representing a line which goes through $(-1, -3)$ at $t = 0$. We determine a and b so that the line goes through $(4, 1)$ when $t = 1$. Since $4 = -1 + a \Rightarrow a = 5$. Since $1 = -3 + b \Rightarrow b = 4$. Therefore, one possible parameterization is $x = -1 + 5t, y = -3 + 4t, 0 \leq t \leq 1$.

22. Using $(-1, 3)$ we create the parametric equations $x = -1 + at$ and $y = 3 + bt$, representing a line which goes through $(-1, 3)$ at $t = 0$. We determine a and b so that the line goes through $(3, -2)$ when $t = 1$. Since $3 = -1 + a \Rightarrow a = 4$. Since $-2 = 3 + b \Rightarrow b = -5$. Therefore, one possible parameterization is $x = -1 + 4t, y = 3 - 5t, 0 \leq t \leq 1$.

23. The lower half of the parabola is given by $x = y^2 + 1$ for $y \leq 0$. Substituting t for y , we obtain one possible parameterization $x = t^2 + 1, y = t, t \leq 0$.

24. The vertex of the parabola is at $(-1, -1)$, so the left half of the parabola is given by $y = x^2 + 2x$ for $x \leq -1$. Substituting t for x , we obtain one possible parameterization: $x = t, y = t^2 + 2t, t \leq -1$.

25. For simplicity, we assume that x and y are linear functions of t and that the point (x, y) starts at $(2, 3)$ for $t = 0$ and passes through $(-1, -1)$ at $t = 1$. Then $x = f(t)$, where $f(0) = 2$ and $f(1) = -1$.
 Since slope $= \frac{\Delta x}{\Delta t} = \frac{-1-2}{1-0} = -3$, $x = f(t) = -3t + 2 = 2 - 3t$. Also, $y = g(t)$, where $g(0) = 3$ and $g(1) = -1$.
 Since slope $= \frac{\Delta y}{\Delta t} = \frac{-1-3}{1-0} = -4$, $y = g(t) = -4t + 3 = 3 - 4t$. One possible parameterization is: $x = 2 - 3t$,
 $y = 3 - 4t, t \geq 0$.
26. For simplicity, we assume that x and y are linear functions of t and that the point (x, y) starts at $(-1, 2)$ for $t = 0$ and passes through $(0, 0)$ at $t = 1$. Then $x = f(t)$, where $f(0) = -1$ and $f(1) = 0$.
 Since slope $= \frac{\Delta x}{\Delta t} = \frac{0-(-1)}{1-0} = 1$, $x = f(t) = 1t + (-1) = -1 + t$. Also, $y = g(t)$, where $g(0) = 2$ and $g(1) = 0$.
 Since slope $= \frac{\Delta y}{\Delta t} = \frac{0-2}{1-0} = -2$, $y = g(t) = -2t + 2 = 2 - 2t$. One possible parameterization is: $x = -1 + t$,
 $y = 2 - 2t, t \geq 0$.
27. Since we only want the top half of a circle, $y \geq 0$, so let $x = 2 \cos t, y = 2|\sin t|, 0 \leq t \leq 4\pi$
28. Since we want x to stay between -3 and 3 , let $x = 3 \sin t$, then $y = (3 \sin t)^2 = 9 \sin^2 t$, thus $x = 3 \sin t$,
 $y = 9 \sin^2 t, 0 \leq t < \infty$
29. $x^2 + y^2 = a^2 \Rightarrow 2x + 2y \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = -\frac{x}{y}$; let $t = \frac{dy}{dx} \Rightarrow -\frac{x}{y} = t \Rightarrow x = -yt$. Substitution yields
 $y^2 t^2 + y^2 = a^2 \Rightarrow y = \frac{a}{\sqrt{1+t^2}}$ and $x = \frac{-at}{\sqrt{1+t^2}}, -\infty < t < \infty$
30. In terms of θ , parametric equations for the circle are $x = a \cos \theta, y = a \sin \theta, 0 \leq \theta < 2\pi$. Since $\theta = \frac{s}{a}$, the arc length parametrizations are: $x = a \cos \frac{s}{a}, y = a \sin \frac{s}{a}$, and $0 \leq \frac{s}{a} < 2\pi \Rightarrow 0 \leq s < 2\pi a$ is the interval for s .
31. Drop a vertical line from the point (x, y) to the x -axis, then θ is an angle in a right triangle, and from trigonometry we know that $\tan \theta = \frac{y}{x} \Rightarrow y = x \tan \theta$. The equation of the line through $(0, 2)$ and $(4, 0)$ is given by $y = -\frac{1}{2}x + 2$. Thus $x \tan \theta = -\frac{1}{2}x + 2 \Rightarrow x = \frac{4}{2 \tan \theta + 1}$ and $y = \frac{4 \tan \theta}{2 \tan \theta + 1}$ where $0 \leq \theta \leq \frac{\pi}{2}$.
32. Drop a vertical line from the point (x, y) to the x -axis, then θ is an angle in a right triangle, and from trigonometry we know that $\tan \theta = \frac{y}{x} \Rightarrow y = x \tan \theta$. Since $y = \sqrt{x} \Rightarrow y^2 = x \Rightarrow (x \tan \theta)^2 = x \Rightarrow x = \cot^2 \theta \Rightarrow y = \cot \theta$ where $0 < \theta \leq \frac{\pi}{2}$.
33. The equation of the circle is given by $(x-2)^2 + y^2 = 1$. Drop a vertical line from the point (x, y) on the circle to the x -axis, then θ is an angle in a right triangle. So that we can start at $(1, 0)$ and rotate in a clockwise direction, let $x = 2 - \cos \theta, y = \sin \theta, 0 \leq \theta \leq 2\pi$.
34. Drop a vertical line from the point (x, y) to the x -axis, then θ is an angle in a right triangle, whose height is y and whose base is $x + 2$. By trigonometry we have $\tan \theta = \frac{y}{x+2} \Rightarrow y = (x+2) \tan \theta$. The equation of the circle

is given by $x^2 + y^2 = 1 \Rightarrow x^2 + ((x+2)\tan\theta)^2 = 1 \Rightarrow x^2 \sec^2\theta + 4x \tan^2\theta + 4 \tan^2\theta - 1 = 0$. Solving for x we

$$\text{obtain } x = \frac{-4 \tan^2\theta \pm \sqrt{(4 \tan^2\theta)^2 - 4 \sec^2\theta(4 \tan^2\theta - 1)}}{2 \sec^2\theta} = \frac{-4 \tan^2\theta \pm 2\sqrt{1-3 \tan^2\theta}}{2 \sec^2\theta} = -2 \sin^2\theta \pm \cos\theta \sqrt{\cos^2\theta - 3 \sin^2\theta}$$

$$= -2 + 2 \cos^2\theta \pm \cos\theta \sqrt{4 \cos^2\theta - 3} \text{ and } y = \left(-2 + 2 \cos^2\theta \pm \cos\theta \sqrt{4 \cos^2\theta - 3} + 2\right) \tan\theta$$

$= 2 \sin\theta \cos\theta \pm \sin\theta \sqrt{4 \cos^2\theta - 3}$. Since we only need to go from $(1, 0)$ to $(0, 1)$, let

$x = -2 + 2 \cos^2\theta + \cos\theta \sqrt{4 \cos^2\theta - 3}$, $y = 2 \sin\theta \cos\theta + \sin\theta \sqrt{4 \cos^2\theta - 3}$, $0 \leq \theta \leq \tan^{-1}\left(\frac{1}{2}\right)$. To obtain the upper limit for θ , note that $x = 0$ and $y = 1$, using $y = (x+2)\tan\theta \Rightarrow 1 = 2 \tan\theta \Rightarrow \theta = \tan^{-1}\left(\frac{1}{2}\right)$.

35. Extend the vertical line through A to the x -axis and let C be the point of intersection. Then $OC = AQ = x$ and

$$\tan t = \frac{2}{OC} = \frac{2}{x} \Rightarrow x = \frac{2}{\tan t} = 2 \cot t; \quad \sin t = \frac{2}{OA} \Rightarrow OA = \frac{2}{\sin t}; \text{ and } (AB)(OA) = (AQ)^2 \Rightarrow AB\left(\frac{2}{\sin t}\right) = x^2$$

$$\Rightarrow AB\left(\frac{2}{\sin t}\right) = \left(\frac{2}{\tan t}\right)^2 \Rightarrow AB = \frac{2 \sin t}{\tan^2 t}. \text{ Next } y = 2 - AB \sin t \Rightarrow y = 2 - \left(\frac{2 \sin t}{\tan^2 t}\right) \sin t = 2 - \frac{2 \sin^2 t}{\tan^2 t}$$

$= 2 - 2 \cos^2 t = 2 \sin^2 t$. Therefore let $x = 2 \cot t$ and $y = 2 \sin^2 t$, $0 < t < \pi$.

36. Arc $PF =$ Arc AF since each is the distance rolled and

$$\frac{\text{Arc } PF}{b} = \angle FCP \Rightarrow \text{Arc } PF = b(\angle FCP);$$

$$\frac{\text{Arc } AF}{a} = \theta \Rightarrow \text{Arc } AF = a\theta \Rightarrow a\theta = b(\angle FCP) \Rightarrow \angle FCP = \frac{a}{b}\theta;$$

$$\angle OCG = \frac{\pi}{2} - \theta; \quad \angle OCG = \angle OCP + \angle PCE = \angle OCP + \left(\frac{\pi}{2} - \alpha\right).$$

Now $\angle OCP = \pi - \angle FCP = \pi - \frac{a}{b}\theta$. Thus $\angle OCG = \pi - \frac{a}{b}\theta + \frac{\pi}{2} - \alpha$

$$\Rightarrow \frac{\pi}{2} - \theta = \pi - \frac{a}{b}\theta + \frac{\pi}{2} - \alpha \Rightarrow \alpha = \pi - \frac{a}{b}\theta + \theta = \pi - \left(\frac{a-b}{b}\theta\right).$$

Then $x = OG - BG = OG - PE = (a-b)\cos\theta - b\cos\alpha$

$$= (a-b)\cos\theta - b\cos\left(\pi - \frac{a-b}{b}\theta\right) = (a-b)\cos\theta + b\cos\left(\frac{a-b}{b}\theta\right).$$

Also $y = EG = CG - CE = (a-b)\sin\theta - b\sin\alpha = (a-b)\sin\theta - b\sin\left(\pi - \frac{a-b}{b}\theta\right)$

$$= (a-b)\sin\theta - b\sin\left(\frac{a-b}{b}\theta\right). \text{ Therefore } x = (a-b)\cos\theta + b\cos\left(\frac{a-b}{b}\theta\right) \text{ and } y = (a-b)\sin\theta - b\sin\left(\frac{a-b}{b}\theta\right).$$

If $b = \frac{a}{4}$, then $x = \left(a - \frac{a}{4}\right)\cos\theta + \frac{a}{4}\cos\left(\frac{a - \left(\frac{a}{4}\right)}{\left(\frac{a}{4}\right)}\theta\right) = \frac{3a}{4}\cos\theta + \frac{a}{4}\cos 3\theta$

$$= \frac{3a}{4}\cos\theta + \frac{a}{4}(\cos\theta \cos 2\theta - \sin\theta \sin 2\theta) = \frac{3a}{4}\cos\theta + \frac{a}{4}\left((\cos\theta)(\cos^2\theta - \sin^2\theta) - (\sin\theta)(2 \sin\theta \cos\theta)\right)$$

$$= \frac{3a}{4}\cos\theta + \frac{a}{4}\cos^3\theta - \frac{a}{4}\cos\theta \sin^2\theta - \frac{2a}{4}\sin^2\theta \cos\theta = \frac{3a}{4}\cos\theta + \frac{a}{4}\cos^3\theta - \frac{3a}{4}(\cos\theta)(1 - \cos^2\theta)$$

$$= a \cos^3\theta; \quad y = \left(a - \frac{a}{4}\right)\sin\theta - \frac{a}{4}\sin\left(\frac{a - \left(\frac{a}{4}\right)}{\left(\frac{a}{4}\right)}\theta\right) = \frac{3a}{4}\sin\theta - \frac{a}{4}\sin 3\theta$$

$$= \frac{3a}{4}\sin\theta - \frac{a}{4}(\sin\theta \cos 2\theta + \cos\theta \sin 2\theta) = \frac{3a}{4}\sin\theta - \frac{a}{4}\left((\sin\theta)(\cos^2\theta - \sin^2\theta) + (\cos\theta)(2 \sin\theta \cos\theta)\right)$$

$$= \frac{3a}{4}\sin\theta - \frac{a}{4}\sin\theta \cos^2\theta + \frac{a}{4}\sin^3\theta - \frac{2a}{4}\cos^2\theta \sin\theta = \frac{3a}{4}\sin\theta - \frac{3a}{4}\sin\theta \cos^2\theta + \frac{a}{4}\sin^3\theta$$

$$= \frac{3a}{4}\sin\theta - \frac{3a}{4}(\sin\theta)(1 - \sin^2\theta) + \frac{a}{4}\sin^3\theta = a \sin^3\theta.$$

37. Draw line AM in the figure and note that $\angle AMO$ is a right angle since it is an inscribed angle which spans the diameter of a circle.

Then $AN^2 = MN^2 + AM^2$. Now, $OA = a$, $\frac{AN}{a} = \tan t$, and $\frac{AM}{a} = \sin t$. Next $MN = OP$

$$\Rightarrow OP^2 = AN^2 - AM^2 = a^2 \tan^2 t - a^2 \sin^2 t$$

$$\Rightarrow OP = \sqrt{a^2 \tan^2 t - a^2 \sin^2 t} = (a \sin t) \sqrt{\sec^2 t - 1} = \frac{a \sin^2 t}{\cos t}$$

In triangle BPO , $x = OP \sin t = \frac{a \sin^3 t}{\cos t} = a \sin^2 t \tan t$ and $y = OP \cos t = a \sin^2 t \Rightarrow x = a \sin^2 t \tan t$ and $y = a \sin^2 t$.

38. Let the x -axis be the line the wheel rolls along with the y -axis through a low point of the trochoid (see the accompanying figure).

Let θ denote the angle through which the wheel turns. Then $h = a\theta$ and $k = a$. Next introduce $x'y'$ -axes parallel to the xy -axes and having their origin at the center C of the wheel. Then $x' = b \cos \alpha$ and $y' = b \sin \alpha$, where $\alpha = \frac{3\pi}{2} - \theta$. It follows that $x' = b \cos(\frac{3\pi}{2} - \theta) = -b \sin \theta$ and $y' = b \sin(\frac{3\pi}{2} - \theta) = -b \cos \theta \Rightarrow x = h + x' = a\theta - b \sin \theta$ and $y = k + y' = a - b \cos \theta$ are parametric equations of the trochoid.

39. $D = \sqrt{(x-2)^2 + (y-\frac{1}{2})^2} \Rightarrow D^2 = (x-2)^2 + (y-\frac{1}{2})^2 = (t-2)^2 + (t^2 - \frac{1}{2})^2 \Rightarrow D^2 = t^4 - 4t + \frac{17}{4}$
 $\Rightarrow \frac{d(D^2)}{dt} = 4t^3 - 4 = 0 \Rightarrow t = 1$. The second derivative is always positive for $t \neq 0 \Rightarrow t = 1$ gives a local minimum for D^2 (and hence D) which is an absolute minimum since it is the only extremum \Rightarrow the closest point on the parabola is $(1, 1)$.

40. $D = \sqrt{(2 \cos t - \frac{3}{4})^2 + (\sin t - 0)^2} \Rightarrow D^2 = (2 \cos t - \frac{3}{4})^2 + \sin^2 t$
 $\Rightarrow \frac{d(D^2)}{dt} = 2(2 \cos t - \frac{3}{4})(-2 \sin t) + 2 \sin t \cos t = (-2 \sin t)(3 \cos t - \frac{3}{2}) = 0 \Rightarrow -2 \sin t = 0$ or $3 \cos t - \frac{3}{2} = 0$
 $\Rightarrow t = 0, \pi$ or $t = \frac{\pi}{3}, \frac{5\pi}{3}$. Now $\frac{d^2(D^2)}{dt^2} = -6 \cos^2 t + 3 \cos t + 6 \sin^2 t$ so that $\frac{d^2(D^2)}{dt^2}(0) = -3 \Rightarrow$ relative maximum, $\frac{d^2(D^2)}{dt^2}(\pi) = -9 \Rightarrow$ relative maximum, $\frac{d^2(D^2)}{dt^2}(\frac{\pi}{3}) = \frac{9}{2} \Rightarrow$ relative minimum, and

$\frac{d^2(D^2)}{dt^2}\left(\frac{5\pi}{3}\right) = \frac{9}{2} \Rightarrow$ relative minimum. Therefore both $t = \frac{\pi}{3}$ and $t = \frac{5\pi}{3}$ give points on the ellipse closest to the point $\left(\frac{3}{4}, 0\right) \Rightarrow \left(1, \frac{\sqrt{3}}{2}\right)$ and $\left(1, -\frac{\sqrt{3}}{2}\right)$ are the desired points.

37. Let the density be $\delta = 1$. Then $x = \cos t + t \sin t \Rightarrow \frac{dx}{dt} = t \cos t$, and $y = \sin t - t \cos t \Rightarrow \frac{dy}{dt} = t \sin t$
 $\Rightarrow dm = 1 \cdot ds = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt = \sqrt{(t \cos t)^2 + (t \sin t)^2} = |t| dt = t dt$ since $0 \leq t \leq \frac{\pi}{2}$. The curve's mass is
 $M = \int dm = \int_0^{\pi/2} t dt = \frac{\pi^2}{8}$. Also $M_x = \int \tilde{y} dm = \int_0^{\pi/2} (\sin t - t \cos t) t dt = \int_0^{\pi/2} t \sin t dt - \int_0^{\pi/2} t^2 \cos t dt$
 $= [\sin t - t \cos t]_0^{\pi/2} - [t^2 \sin t - 2 \sin t + 2t \cos t]_0^{\pi/2} = 3 - \frac{\pi^2}{4}$, where we integrated by parts. Therefore,
 $\bar{y} = \frac{M_x}{M} = \frac{\left(3 - \frac{\pi^2}{4}\right)}{\left(\frac{\pi^2}{8}\right)} = \frac{24}{\pi^2} - 2$. Next, $M_y = \int \tilde{x} dm = \int_0^{\pi/2} (\cos t + t \sin t) t dt = \int_0^{\pi/2} t \cos t dt + \int_0^{\pi/2} t^2 \sin t dt$
 $= [\cos t + t \sin t]_0^{\pi/2} + [-t^2 \cos t + 2 \cos t + 2t \sin t]_0^{\pi/2} = \frac{3\pi}{2} - 3$, again integrating by parts. Hence,
 $\bar{x} = \frac{M_y}{M} = \frac{\left(\frac{3\pi}{2} - 3\right)}{\left(\frac{\pi^2}{8}\right)} = \frac{12}{\pi} - \frac{24}{\pi^2}$. Therefore $(\bar{x}, \bar{y}) = \left(\frac{12}{\pi} - \frac{24}{\pi^2}, \frac{24}{\pi^2} - 2\right)$.

38. Let the density be $\delta = 1$. Then $x = e^t \cos t \Rightarrow \frac{dx}{dt} = e^t \cos t - e^t \sin t$, and $y = e^t \sin t \Rightarrow \frac{dy}{dx} = e^t \sin t + e^t \cos t$
 $\Rightarrow dm = 1 \cdot ds = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt = \sqrt{(e^t \cos t - e^t \sin t)^2 + (e^t \sin t + e^t \cos t)^2} dt = \sqrt{2e^{2t}} dt = \sqrt{2} e^t dt$.
 The curve's mass is $M = \int dm = \int_0^{\pi} \sqrt{2} e^t dt = \sqrt{2} e^{\pi} - \sqrt{2}$. Also $M_x = \int \tilde{y} dm = \int_0^{\pi} (e^t \sin t) (\sqrt{2} e^t) dt$
 $= \int_0^{\pi} \sqrt{2} e^{2t} \sin t dt = \sqrt{2} \left[\frac{e^{2t}}{5} (2 \sin t - \cos t) \right]_0^{\pi} = \sqrt{2} \left(\frac{e^{2\pi}}{5} + \frac{1}{5} \right) \Rightarrow \bar{y} = \frac{M_x}{M} = \frac{\sqrt{2} \left(\frac{e^{2\pi}}{5} + \frac{1}{5} \right)}{\sqrt{2} e^{\pi} - \sqrt{2}} = \frac{e^{2\pi} + 1}{5(e^{\pi} - 1)}$.
 Next $M_y = \int \tilde{x} dm = \int_0^{\pi} (e^t \cos t) (\sqrt{2} e^t) dt = \int_0^{\pi} \sqrt{2} e^{2t} \cos t dt = \sqrt{2} \left[\frac{e^{2t}}{5} (2 \cos t + \sin t) \right]_0^{\pi} = -\sqrt{2} \left(\frac{2e^{2\pi}}{5} + \frac{2}{5} \right)$
 $\Rightarrow \bar{x} = \frac{M_y}{M} = \frac{-\sqrt{2} \left(\frac{2e^{2\pi}}{5} + \frac{2}{5} \right)}{\sqrt{2} e^{\pi} - \sqrt{2}} = -\frac{2e^{2\pi} + 2}{5(e^{\pi} - 1)}$. Therefore $(\bar{x}, \bar{y}) = \left(-\frac{2e^{2\pi} + 2}{5(e^{\pi} - 1)}, \frac{e^{2\pi} + 1}{5(e^{\pi} - 1)} \right)$.

39. Let the density be $\delta = 1$. Then $x = \cos t \Rightarrow \frac{dx}{dt} = -\sin t$, and $y = t + \sin t \Rightarrow \frac{dy}{dt} = 1 + \cos t$
 $\Rightarrow dm = 1 \cdot ds = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt = \sqrt{(-\sin t)^2 + (1 + \cos t)^2} dt = \sqrt{2 + 2 \cos t} dt$. The curve's mass is
 $M = \int dm = \int_0^{\pi} \sqrt{2 + 2 \cos t} dt = \sqrt{2} \int_0^{\pi} \sqrt{1 + \cos t} dt = \sqrt{2} \int_0^{\pi} \sqrt{2 \cos^2 \left(\frac{t}{2}\right)} dt = 2 \int_0^{\pi} \left| \cos \left(\frac{t}{2}\right) \right| dt = 2 \int_0^{\pi} \cos \left(\frac{t}{2}\right) dt$
 (since $0 \leq t \leq \pi \Rightarrow 0 \leq \frac{t}{2} \leq \frac{\pi}{2}$) $= 2 \left[2 \sin \left(\frac{t}{2}\right) \right]_0^{\pi} = 4$. Also $M_x = \int \tilde{y} dm = \int_0^{\pi} (t + \sin t) \left(2 \cos \frac{t}{2} \right) dt$
 $= \int_0^{\pi} 2t \cos \left(\frac{t}{2}\right) dt + \int_0^{\pi} 2 \sin t \cos \left(\frac{t}{2}\right) dt = 2 \left[4 \cos \left(\frac{t}{2}\right) + 2t \sin \left(\frac{t}{2}\right) \right]_0^{\pi} + 2 \left[-\frac{1}{3} \cos \left(\frac{3}{2}t\right) - \cos \left(\frac{1}{2}t\right) \right]_0^{\pi} = 4\pi - \frac{16}{3}$
 $\Rightarrow \bar{y} = \frac{M_x}{M} = \frac{4\pi - \frac{16}{3}}{4} = \pi - \frac{4}{3}$. Next $M_y = \int \tilde{x} dm = \int_0^{\pi} (\cos t) \left(2 \cos \frac{t}{2} \right) dt = 2 \int_0^{\pi} \cos t \cos \left(\frac{t}{2}\right) dt$
 $= 2 \left[\sin \left(\frac{t}{2}\right) + \frac{\sin \left(\frac{3}{2}t\right)}{3} \right]_0^{\pi} = 2 - \frac{2}{3} = \frac{4}{3} \Rightarrow \bar{x} = \frac{M_y}{M} = \frac{\left(\frac{4}{3}\right)}{4} = \frac{1}{3}$. Therefore $(\bar{x}, \bar{y}) = \left(\frac{1}{3}, \pi - \frac{4}{3}\right)$.

40. Let the density be $\delta = 1$. Then $x = t^3 \Rightarrow \frac{dx}{dt} = 3t^2$, and $y = \frac{3t^2}{2} \Rightarrow \frac{dy}{dt} = 3t \Rightarrow dm = 1 \cdot ds = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt$
 $= \sqrt{(3t^2)^2 + (3t)^2} dt = 3|t|\sqrt{t^2 + 1} dt = 3t\sqrt{t^2 + 1} dt$ since $0 \leq t \leq \sqrt{3}$. The curve's mass is
 $M = \int dm = \int_0^{\sqrt{3}} 3t\sqrt{t^2 + 1} dt = \left[(t^2 + 1)^{3/2} \right]_0^{\sqrt{3}} = 7$. Also $M_x = \int \tilde{y} dm = \int_0^{\sqrt{3}} \frac{3t^2}{2} (3t\sqrt{t^2 + 1}) dt$
 $= \frac{9}{2} \int_0^{\sqrt{3}} t^3 \sqrt{t^2 + 1} dt = \frac{87}{5} = 17.4$ (by computer) $\Rightarrow \bar{y} = \frac{M_x}{M} = \frac{17.4}{7} \approx 2.49$. Next $M_y = \int \tilde{x} dm$
 $= \int_0^{\sqrt{3}} t^3 \cdot 3t\sqrt{t^2 + 1} dt = 3 \int_0^{\sqrt{3}} t^4 \sqrt{t^2 + 1} dt \approx 16.4849$ (by computer) $\Rightarrow \bar{x} = \frac{M_y}{M} = \frac{16.4849}{7} \approx 2.35$.
 Therefore, $(\bar{x}, \bar{y}) \approx (2.35, 2.49)$.

11.4 GRAPHING POLAR COORDINATE EQUATIONS

1. $1 + \cos(-\theta) = 1 + \cos \theta = r \Rightarrow$ symmetric about the x -axis;
 $1 + \cos(-\theta) \neq -r$ and $1 + \cos(\pi - \theta) = 1 - \cos \theta \neq r \Rightarrow$ not symmetric
 about the y -axis; therefore not symmetric about the origin

2. $2 - 2\cos(-\theta) = 2 - 2\cos \theta = r \Rightarrow$ symmetric about the x -axis;
 $2 - 2\cos(-\theta) \neq -r$ and $2 - 2\cos(\pi - \theta) = 2 + 2\cos \theta \neq r$
 \Rightarrow not symmetric about the y -axis; therefore not symmetric
 about the origin

3. $1 - \sin(-\theta) = 1 + \sin \theta \neq r$ and $1 - \sin(\pi - \theta) = 1 - \sin \theta \neq -r$
 \Rightarrow not symmetric about the x -axis; $1 - \sin(\pi - \theta) = 1 - \sin \theta = r$
 \Rightarrow symmetric about the y -axis; therefore not symmetric
 about the origin

4. $1 + \sin(-\theta) = 1 - \sin \theta \neq r$ and $1 + \sin(\pi - \theta) = 1 + \sin \theta \neq -r$
 \Rightarrow not symmetric about the x -axis; $1 + \sin(\pi - \theta) = 1 + \sin \theta = r$
 \Rightarrow symmetric about the y -axis; therefore not symmetric about the origin

5. $2 + \sin(-\theta) = 2 - \sin \theta \neq r$ and $2 + \sin(\pi - \theta) = 2 + \sin \theta \neq -r \Rightarrow$ not
 symmetric about the x -axis; $2 + \sin(\pi - \theta) = 2 + \sin \theta = r \Rightarrow$ symmetric
 about the y -axis; therefore not symmetric about the origin

6. $1 + 2\sin(-\theta) = 1 - 2\sin\theta \neq r$ and $1 + 2\sin(\pi - \theta) = 1 + 2\sin\theta \neq -r \Rightarrow$ not symmetric about the x -axis; $1 + 2\sin(\pi - \theta) = 1 + 2\sin\theta = r \Rightarrow$ symmetric about the y -axis; therefore not symmetric about the origin

7. $\sin\left(-\frac{\theta}{2}\right) = -\sin\left(\frac{\theta}{2}\right) = -r \Rightarrow$ symmetric about the y -axis;
 $\sin\left(\frac{2\pi - \theta}{2}\right) = \sin\left(\frac{\theta}{2}\right)$, so the graph is symmetric about the x -axis, and hence the origin.

8. $\cos\left(-\frac{\theta}{2}\right) = \cos\left(\frac{\theta}{2}\right) = r \Rightarrow$ symmetric about the x -axis;
 $\cos\left(\frac{2\pi - \theta}{2}\right) = \cos\left(\frac{\theta}{2}\right)$, so the graph is symmetric about the y -axis, and hence the origin.

9. $\cos(-\theta) = \cos\theta = r^2 \Rightarrow (r, -\theta)$ and $(-r, -\theta)$ are on the graph when (r, θ) is on the graph \Rightarrow symmetric about the x -axis and y -axis; therefore symmetric about the origin

13. Since $(\pm r, -\theta)$ are on the graph when (r, θ) is on the graph, $(\pm r)^2 = 4 \cos 2(-\theta) \Rightarrow r^2 = 4 \cos 2\theta$, the graph is symmetric about the x -axis and the y -axis \Rightarrow the graph is symmetric about the origin

14. Since (r, θ) on the graph $\Rightarrow (-r, \theta)$ is on the graph, $(\pm r)^2 = 4 \sin 2\theta \Rightarrow r^2 = 4 \sin 2\theta$, the graph is symmetric about the origin. But $4 \sin 2(-\theta) = -4 \sin 2\theta \neq r^2$ and $4 \sin 2(\pi - \theta) = 4 \sin (2\pi - 2\theta) = 4 \sin (-2\theta) = -4 \sin 2\theta \neq r^2 \Rightarrow$ the graph is not symmetric about the x -axis; therefore the graph is not symmetric about the y -axis

15. Since (r, θ) on the graph $\Rightarrow (-r, \theta)$ is on the graph, $(\pm r)^2 = -\sin 2\theta \Rightarrow r^2 = -\sin 2\theta$, the graph is symmetric about the origin. But $-\sin 2(-\theta) = -(-\sin 2\theta) = \sin 2\theta \neq r^2$ and $-\sin 2(\pi - \theta) = -\sin(2\pi - 2\theta) = -\sin(-2\theta) = -(-\sin 2\theta) = \sin 2\theta \neq r^2 \Rightarrow$ the graph is not symmetric about the x -axis; therefore the graph is not symmetric about the y -axis

16. Since $(\pm r, -\theta)$ are on the graph when (r, θ) is on the graph, $(\pm r)^2 = -\cos 2(-\theta) \Rightarrow r^2 = -\cos 2\theta$, the graph is symmetric about the x -axis and the y -axis \Rightarrow the graph is symmetric about the origin.

- $$A = \int_{-\pi/6}^{\pi/6} \frac{1}{2} (\cos 3\theta)^2 d\theta = \frac{1}{2} \int_{-\pi/6}^{\pi/6} \cos^2 3\theta d\theta = \frac{1}{2} \int_{-\pi/6}^{\pi/6} \frac{1 + \cos 6\theta}{2} d\theta = \frac{1}{4} \int_{-\pi/6}^{\pi/6} (1 + \cos 6\theta) d\theta$$

$$= \frac{1}{4} \left[\theta + \frac{1}{6} \sin 6\theta \right]_{-\pi/6}^{\pi/6} = \frac{1}{4} \left(\frac{\pi}{6} + 0 \right) - \frac{1}{4} \left(-\frac{\pi}{6} + 0 \right) = \frac{\pi}{12}$$

- $$A = (6)(2) \int_0^{\pi/6} \frac{1}{2} (2 \sin 3\theta) d\theta = 12 \int_0^{\pi/6} \sin 3\theta d\theta = 12 \left[-\frac{\cos 3\theta}{3} \right]_0^{\pi/6} = 4$$

9. $r = 2 \cos \theta$ and $r = 2 \sin \theta \Rightarrow 2 \cos \theta = 2 \sin \theta$
 $\Rightarrow \cos \theta = \sin \theta \Rightarrow \theta = \frac{\pi}{4}$; therefore

$$\begin{aligned} A &= 2 \int_0^{\pi/4} \frac{1}{2} (2 \sin \theta)^2 d\theta = \int_0^{\pi/4} 4 \sin^2 \theta d\theta \\ &= \int_0^{\pi/4} 4 \left(\frac{1 - \cos 2\theta}{2} \right) d\theta = \int_0^{\pi/4} (2 - 2 \cos 2\theta) d\theta \\ &= [2\theta - \sin 2\theta]_0^{\pi/4} = \frac{\pi}{2} - 1 \end{aligned}$$

10. $r = 1$ and $r = 2 \sin \theta \Rightarrow 2 \sin \theta = 1 \Rightarrow \sin \theta = \frac{1}{2}$
 $\Rightarrow \theta = \frac{\pi}{6}$ or $\frac{5\pi}{6}$; therefore

$$\begin{aligned} A &= \pi(1)^2 - \int_{\pi/6}^{5\pi/6} \frac{1}{2} [(2 \sin \theta)^2 - 1^2] d\theta \\ &= \pi - \int_{\pi/6}^{5\pi/6} (2 \sin^2 \theta - \frac{1}{2}) d\theta = \pi - \int_{\pi/6}^{5\pi/6} (1 - \cos 2\theta - \frac{1}{2}) d\theta \\ &= \pi - \int_{\pi/6}^{5\pi/6} (\frac{1}{2} - \cos 2\theta) d\theta = \pi - \left[\frac{1}{2}\theta - \frac{\sin 2\theta}{2} \right]_{\pi/6}^{5\pi/6} \\ &= \pi - \left(\frac{5\pi}{12} - \frac{1}{2} \sin \frac{5\pi}{3} \right) + \left(\frac{\pi}{12} - \frac{1}{2} \sin \frac{\pi}{3} \right) = \frac{4\pi - 3\sqrt{3}}{6} \end{aligned}$$

11. $r = 2$ and $r = 2(1 - \cos \theta) \Rightarrow 2 = 2(1 - \cos \theta) \Rightarrow \cos \theta = 0$
 $\Rightarrow \theta = \pm \frac{\pi}{2}$; therefore

$$\begin{aligned} A &= 2 \int_0^{\pi/2} \frac{1}{2} [2(1 - \cos \theta)]^2 d\theta + \frac{1}{2} \text{ area of the circle} \\ &= \int_0^{\pi/2} 4(1 - 2 \cos \theta + \cos^2 \theta) d\theta + \left(\frac{1}{2} \pi \right) (2)^2 \\ &= \int_0^{\pi/2} 4 \left(1 - 2 \cos \theta + \frac{1 + \cos 2\theta}{2} \right) d\theta + 2\pi \\ &= \int_0^{\pi/2} (4 - 8 \cos \theta + 2 + 2 \cos 2\theta) d\theta + 2\pi \\ &= [6\theta - 8 \sin \theta + \sin 2\theta]_0^{\pi/2} + 2\pi = 5\pi - 8 \end{aligned}$$

12. $r = 2(1 - \cos \theta)$ and $r = 2(1 + \cos \theta)$
 $\Rightarrow 1 - \cos \theta = 1 + \cos \theta \Rightarrow \cos \theta = 0 \Rightarrow \theta = \frac{\pi}{2}$ or $\frac{3\pi}{2}$; the graph also gives the point of intersection $(0, 0)$; therefore

$$\begin{aligned} A &= 2 \int_0^{\pi/2} \frac{1}{2} [2(1 - \cos \theta)]^2 d\theta + 2 \int_{\pi/2}^{\pi} \frac{1}{2} [2(1 + \cos \theta)]^2 d\theta \\ &= \int_0^{\pi/2} 4(1 - 2 \cos \theta + \cos^2 \theta) d\theta + \int_{\pi/2}^{\pi} 4(1 + 2 \cos \theta + \cos^2 \theta) d\theta \\ &= \int_0^{\pi/2} 4 \left(1 - 2 \cos \theta + \frac{1 + \cos 2\theta}{2} \right) d\theta + \int_{\pi/2}^{\pi} 4 \left(1 + 2 \cos \theta + \frac{1 + \cos 2\theta}{2} \right) d\theta \\ &= \int_0^{\pi/2} (6 - 8 \cos \theta + 2 \cos 2\theta) d\theta + \int_{\pi/2}^{\pi} (6 + 8 \cos \theta + 2 \cos 2\theta) d\theta \\ &= [6\theta - 8 \sin \theta + \sin 2\theta]_0^{\pi/2} + [6\theta + 8 \sin \theta + \sin 2\theta]_{\pi/2}^{\pi} = 6\pi - 16 \end{aligned}$$

13. $r = \sqrt{3}$ and $r^2 = 6 \cos 2\theta \Rightarrow 3 = 6 \cos 2\theta \Rightarrow \cos 2\theta = \frac{1}{2}$
 $\Rightarrow \theta = \frac{\pi}{6}$ (in the 1st quadrant); we use symmetry of the graph

$$\begin{aligned} \text{to find the area, so } A &= 4 \int_0^{\pi/6} \left[\frac{1}{2}(6 \cos 2\theta) - \frac{1}{2}(\sqrt{3})^2 \right] d\theta \\ &= 2 \int_0^{\pi/6} (6 \cos 2\theta - 3) d\theta = 2 \left[3 \sin 2\theta - 3\theta \right]_0^{\pi/6} = 3\sqrt{3} - \pi \end{aligned}$$

14. $r = 3a \cos \theta$ and $r = a(1 + \cos \theta) \Rightarrow 3a \cos \theta = a(1 + \cos \theta)$
 $\Rightarrow 3 \cos \theta = 1 + \cos \theta \Rightarrow \cos \theta = \frac{1}{2} \Rightarrow \theta = \frac{\pi}{3}$ or $-\frac{\pi}{3}$; the graph

$$\begin{aligned} \text{also gives the point of intersection } (0, 0); \text{ therefore} \\ A &= 2 \int_0^{\pi/3} \frac{1}{2} \left[(3a \cos \theta)^2 - a^2 (1 + \cos \theta)^2 \right] d\theta \\ &= \int_0^{\pi/3} (9a^2 \cos^2 \theta - a^2 - 2a^2 \cos \theta - a^2 \cos^2 \theta) d\theta \\ &= \int_0^{\pi/3} (8a^2 \cos^2 \theta - 2a^2 \cos \theta - a^2) d\theta \\ &= \int_0^{\pi/3} \left[4a^2 (1 + \cos 2\theta) - 2a^2 \cos \theta - a^2 \right] d\theta \\ &= \int_0^{\pi/3} (3a^2 + 4a^2 \cos 2\theta - 2a^2 \cos \theta) d\theta \\ &= \left[3a^2 \theta + 2a^2 \sin 2\theta - 2a^2 \sin \theta \right]_0^{\pi/3} \\ &= \pi a^2 + 2a^2 \left(\frac{1}{2} \right) - 2a^2 \left(\frac{\sqrt{3}}{2} \right) = a^2 (\pi + 1 - \sqrt{3}) \end{aligned}$$

15. $r = 1$ and $r = -2 \cos \theta \Rightarrow 1 = -2 \cos \theta \Rightarrow \cos \theta = -\frac{1}{2} \Rightarrow \theta = \frac{2\pi}{3}$ in quadrant II; therefore

$$\begin{aligned} A &= 2 \int_{2\pi/3}^{\pi} \frac{1}{2} \left[(-2 \cos \theta)^2 - 1^2 \right] d\theta = \int_{2\pi/3}^{\pi} (4 \cos^2 \theta - 1) d\theta \\ &= \int_{2\pi/3}^{\pi} [2(1 + \cos 2\theta) - 1] d\theta = \int_{2\pi/3}^{\pi} (1 + 2 \cos 2\theta) d\theta \\ &= \left[\theta + \sin 2\theta \right]_{2\pi/3}^{\pi} = \frac{\pi}{3} + \frac{\sqrt{3}}{2} \end{aligned}$$

16. $r = 6$ and $r = 3 \csc \theta \Rightarrow 6 \sin \theta = 3 \Rightarrow \sin \theta = \frac{1}{2} \Rightarrow \theta = \frac{\pi}{6}$ or $\frac{5\pi}{6}$; therefore

$$\begin{aligned} A &= \int_{\pi/6}^{5\pi/6} \frac{1}{2} (6^2 - 9 \csc^2 \theta) d\theta = \int_{\pi/6}^{5\pi/6} \left(18 - \frac{9}{2} \csc^2 \theta \right) d\theta \\ &= \left[18\theta + \frac{9}{2} \cot \theta \right]_{\pi/6}^{5\pi/6} = \left(15\pi - \frac{9}{2}\sqrt{3} \right) - \left(3\pi + \frac{9}{2}\sqrt{3} \right) = 12\pi - 9\sqrt{3} \end{aligned}$$

17. $r = \sec \theta$ and $r = 4 \cos \theta \Rightarrow 4 \cos \theta = \sec \theta \Rightarrow \cos^2 \theta = \frac{1}{4}$
 $\Rightarrow \theta = \frac{\pi}{3}, \frac{2\pi}{3}, \frac{4\pi}{3},$ or $\frac{5\pi}{3}$; therefore
 $A = 2 \int_0^{\pi/3} \frac{1}{2} (16 \cos^2 \theta - \sec^2 \theta) d\theta$
 $= \int_0^{\pi/3} (8 + 8 \cos 2\theta - \sec^2 \theta) d\theta = [8\theta + 4 \sin 2\theta - \tan \theta]_0^{\pi/3}$
 $= \left(\frac{8\pi}{3} + 2\sqrt{3} - \sqrt{3}\right) - (0 + 0 - 0) = \frac{8\pi}{3} + \sqrt{3}$

18. $r = 3 \csc \theta$ and $r = 4 \sin \theta \Rightarrow 4 \sin \theta = 3 \csc \theta \Rightarrow \sin^2 \theta = \frac{3}{4}$
 $\Rightarrow \theta = \frac{\pi}{3}, \frac{2\pi}{3}, \frac{4\pi}{3},$ or $\frac{5\pi}{3}$; therefore
 $A = 4\pi - 2 \int_{\pi/3}^{\pi/2} \frac{1}{2} (16 \sin^2 \theta - 9 \csc^2 \theta) d\theta$
 $= 4\pi - \int_{\pi/3}^{\pi/2} (8 - 8 \cos 2\theta - 9 \csc^2 \theta) d\theta$
 $= 4\pi - [8\theta - 4 \sin 2\theta + 9 \cot \theta]_{\pi/3}^{\pi/2}$
 $= 4\pi - \left[(4\pi - 0 + 0) - \left(\frac{8\pi}{3} - 2\sqrt{3} + 3\sqrt{3}\right)\right] = \frac{8\pi}{3} + \sqrt{3}$

19. (a) $r = \tan \theta$ and $r = \left(\frac{\sqrt{2}}{2}\right) \csc \theta \Rightarrow \tan \theta = \left(\frac{\sqrt{2}}{2}\right) \csc \theta$
 $\Rightarrow \sin^2 \theta = \left(\frac{\sqrt{2}}{2}\right) \cos \theta \Rightarrow 1 - \cos^2 \theta = \left(\frac{\sqrt{2}}{2}\right) \cos \theta$
 $\Rightarrow \cos^2 \theta + \left(\frac{\sqrt{2}}{2}\right) \cos \theta - 1 = 0 \Rightarrow \cos \theta = -\sqrt{2}$ or $\frac{\sqrt{2}}{2}$
 (use the quadratic formula) $\Rightarrow \theta = \frac{\pi}{4}$ (the solution in the first quadrant); therefore the area of R_1 is

$$A_1 = \int_0^{\pi/4} \frac{1}{2} \tan^2 \theta d\theta = \frac{1}{2} \int_0^{\pi/4} (\sec^2 \theta - 1) d\theta = \frac{1}{2} [\tan \theta - \theta]_0^{\pi/4} = \frac{1}{2} \left(\tan \frac{\pi}{4} - \frac{\pi}{4}\right) = \frac{1}{2} - \frac{\pi}{8};$$

$$AO = \left(\frac{\sqrt{2}}{2}\right) \csc \frac{\pi}{2} = \frac{\sqrt{2}}{2} \text{ and } OB = \left(\frac{\sqrt{2}}{2}\right) \csc \frac{\pi}{4} = 1 \Rightarrow AB = \sqrt{1^2 - \left(\frac{\sqrt{2}}{2}\right)^2} = \frac{\sqrt{2}}{2} \Rightarrow \text{the area of } R_2 \text{ is}$$

$$A_2 = \frac{1}{2} \left(\frac{\sqrt{2}}{2}\right) \left(\frac{\sqrt{2}}{2}\right) = \frac{1}{4}; \text{ therefore the area of the region shaded in the text is } 2\left(\frac{1}{2} - \frac{\pi}{8} + \frac{1}{4}\right) = \frac{3}{2} - \frac{\pi}{4}. \text{ Note:}$$

The area must be found this way since no common interval generates the region. For example, the interval $0 \leq \theta \leq \frac{\pi}{4}$ generates the arc OB of $r = \tan \theta$ but does not generate the segment AB of the line $r = \frac{\sqrt{2}}{2} \csc \theta$.

Instead the interval generates the half-line from B to $+\infty$ on the line $r = \frac{\sqrt{2}}{2} \csc \theta$.

(b) $\lim_{\theta \rightarrow \frac{\pi}{2}^-} \tan \theta = \infty$ and the line $x = 1$ is $r = \sec \theta$ in polar coordinates; then

$$\lim_{\theta \rightarrow \frac{\pi}{2}^-} (\tan \theta - \sec \theta) = \lim_{\theta \rightarrow \frac{\pi}{2}^-} \left(\frac{\sin \theta}{\cos \theta} - \frac{1}{\cos \theta}\right) = \lim_{\theta \rightarrow \frac{\pi}{2}^-} \left(\frac{\sin \theta - 1}{\cos \theta}\right) = \lim_{\theta \rightarrow \frac{\pi}{2}^-} \left(\frac{\cos \theta}{-\sin \theta}\right) = 0 \Rightarrow r = \tan \theta \text{ approaches}$$

$r = \sec \theta$ as $\theta \rightarrow \left(\frac{\pi}{2}\right)^- \Rightarrow r = \sec \theta$ (or $x = 1$) is a vertical asymptote of $r = \tan \theta$. Similarly,

$r = -\sec \theta$ (or $x = -1$) is a vertical asymptote of $r = \tan \theta$.

20. It is not because the circle is generated twice from $\theta = 0$ to 2π . The area of the cardioid is

$$\begin{aligned} A &= 2 \int_0^\pi \frac{1}{2} (\cos \theta + 1)^2 d\theta = \int_0^\pi (\cos^2 \theta + 2 \cos \theta + 1) d\theta = \int_0^\pi \left(\frac{1 + \cos 2\theta}{2} + 2 \cos \theta + 1 \right) d\theta \\ &= \left[\frac{3\theta}{2} + \frac{\sin 2\theta}{4} + 2 \sin \theta \right]_0^\pi = \frac{3\pi}{2}. \text{ The area of the circle is } A = \pi \left(\frac{1}{2} \right)^2 = \frac{\pi}{4} \Rightarrow \text{ the area requested} \\ &\text{is actually } \frac{3\pi}{2} - \frac{\pi}{4} = \frac{5\pi}{4} \end{aligned}$$

21. $r = \theta^2, 0 \leq \theta \leq \sqrt{5} \Rightarrow \frac{dr}{d\theta} = 2\theta$; therefore Length $= \int_0^{\sqrt{5}} \sqrt{(\theta^2)^2 + (2\theta)^2} d\theta = \int_0^{\sqrt{5}} \sqrt{\theta^4 + 4\theta^2} d\theta$

$$= \int_0^{\sqrt{5}} |\theta| \sqrt{\theta^2 + 4} d\theta = \int_0^{\sqrt{5}} \theta \sqrt{\theta^2 + 4} d\theta; \text{ (since } \theta \geq 0 \text{)}$$

$$\left[u = \theta^2 + 4 \Rightarrow \frac{1}{2} du = \theta d\theta; \theta = 0 \Rightarrow u = 4, \theta = \sqrt{5} \Rightarrow u = 9 \right] \rightarrow \int_4^9 \frac{1}{2} \sqrt{u} du = \frac{1}{2} \left[\frac{2}{3} u^{3/2} \right]_4^9 = \frac{19}{3}$$

22. $r = \frac{e^\theta}{\sqrt{2}}, 0 \leq \theta \leq \pi \Rightarrow \frac{dr}{d\theta} = \frac{e^\theta}{\sqrt{2}}$; therefore Length $= \int_0^\pi \sqrt{\left(\frac{e^\theta}{\sqrt{2}} \right)^2 + \left(\frac{e^\theta}{\sqrt{2}} \right)^2} d\theta = \int_0^\pi \sqrt{2 \left(\frac{e^{2\theta}}{2} \right)} d\theta$

$$= \int_0^\pi e^\theta d\theta = \left[e^\theta \right]_0^\pi = e^\pi - 1$$

23. $r = 1 + \cos \theta \Rightarrow \frac{dr}{d\theta} = -\sin \theta$; therefore Length $= \int_0^{2\pi} \sqrt{(1 + \cos \theta)^2 + (-\sin \theta)^2} d\theta$

$$= 2 \int_0^\pi \sqrt{2 + 2 \cos \theta} d\theta = 2 \int_0^\pi \sqrt{\frac{4(1 + \cos \theta)}{2}} d\theta = 4 \int_0^\pi \sqrt{\frac{1 + \cos \theta}{2}} d\theta = 4 \int_0^\pi \cos \left(\frac{\theta}{2} \right) d\theta = 4 \left[2 \sin \frac{\theta}{2} \right]_0^\pi = 8$$

24. $r = a \sin^2 \frac{\theta}{2}, 0 \leq \theta \leq \pi, a > 0 \Rightarrow \frac{dr}{d\theta} = a \sin \frac{\theta}{2} \cos \frac{\theta}{2}$; therefore Length $= \int_0^\pi \sqrt{\left(a \sin^2 \frac{\theta}{2} \right)^2 + \left(a \sin \frac{\theta}{2} \cos \frac{\theta}{2} \right)^2} d\theta$

$$= \int_0^\pi \sqrt{a^2 \sin^4 \frac{\theta}{2} + a^2 \sin^2 \frac{\theta}{2} \cos^2 \frac{\theta}{2}} d\theta = \int_0^\pi a \left| \sin \frac{\theta}{2} \right| \sqrt{\sin^2 \frac{\theta}{2} + \cos^2 \frac{\theta}{2}} d\theta = a \int_0^\pi \sin \left(\frac{\theta}{2} \right) d\theta \text{ (since } 0 \leq \theta \leq \pi \text{)}$$

$$= \left[-2a \cos \frac{\theta}{2} \right]_0^\pi = 2a$$

25. $r = \frac{6}{1 + \cos \theta}, 0 \leq \theta \leq \frac{\pi}{2} \Rightarrow \frac{dr}{d\theta} = \frac{6 \sin \theta}{(1 + \cos \theta)^2}$; therefore Length $= \int_0^{\pi/2} \sqrt{\left(\frac{6}{1 + \cos \theta} \right)^2 + \left(\frac{6 \sin \theta}{(1 + \cos \theta)^2} \right)^2} d\theta$

$$= \int_0^{\pi/2} \sqrt{\frac{36}{(1 + \cos \theta)^2} + \frac{36 \sin^2 \theta}{(1 + \cos \theta)^4}} d\theta = 6 \int_0^{\pi/2} \frac{1}{1 + \cos \theta} \sqrt{1 + \frac{\sin^2 \theta}{(1 + \cos \theta)^2}} d\theta$$

$$= 6 \int_0^{\pi/2} \left(\frac{1}{1 + \cos \theta} \right) \sqrt{\frac{1 + 2 \cos \theta + \cos^2 \theta + \sin^2 \theta}{(1 + \cos \theta)^2}} d\theta \text{ (since } \frac{1}{1 + \cos \theta} > 0 \text{ on } 0 \leq \theta \leq \frac{\pi}{2} \text{)}$$

$$= 6 \int_0^{\pi/2} \left(\frac{1}{1 + \cos \theta} \right) \sqrt{\frac{2 + 2 \cos \theta}{(1 + \cos \theta)^2}} d\theta = 6\sqrt{2} \int_0^{\pi/2} \frac{d\theta}{(1 + \cos \theta)^{3/2}} = 6\sqrt{2} \int_0^{\pi/2} \frac{d\theta}{(2 \cos^2 \frac{\theta}{2})^{3/2}} = 3 \int_0^{\pi/2} \left| \sec^3 \frac{\theta}{2} \right| d\theta$$

69. (a) $y^2 = kx \Rightarrow x = \frac{y^2}{k}$; the volume of the solid formed by revolving R_1 about the y -axis is

$$V_1 = \int_0^{\sqrt{kx}} \pi \left(\frac{y^2}{k} \right)^2 dy = \frac{\pi}{k^2} \int_0^{\sqrt{kx}} y^4 dy = \frac{\pi x^2 \sqrt{kx}}{5};$$

the volume of the right circular cylinder formed by revolving PQ about the y -axis is

$$V_2 = \pi x^2 \sqrt{kx} \Rightarrow \text{the volume of the solid formed by revolving } R_2 \text{ about the } y\text{-axis is } V_3 = V_2 - V_1 = \frac{4\pi x^2 \sqrt{kx}}{5}.$$

Therefore we can see the ratio of V_3 to V_1 is 4:1.

(b) The volume of the solid formed by revolving R_2 about the x -axis is $V_1 = \int_0^x \pi (\sqrt{kt})^2 dt = \pi k \int_0^x t dt = \frac{\pi kx^2}{2}$. The volume of the right circular cylinder formed by revolving PS about the x -axis is $V_2 = \pi (\sqrt{kx})^2 x = \pi kx^2 \Rightarrow$ the volume of the solid formed by revolving R_1 about the x -axis is $V_3 = V_2 - V_1 = \pi kx^2 - \frac{\pi kx^2}{2} = \frac{\pi kx^2}{2}$. Therefore the ratio of V_3 to V_1 is 1:1.

70. $y = \int \frac{w}{H} x dx = \frac{w}{H} \left(\frac{x^2}{2} \right) + C = \frac{wx^2}{2H} + C$; $y = 0$ when $x = 0 \Rightarrow 0 = \frac{w(0)^2}{2H} + C \Rightarrow C = 0$; therefore $y = \frac{wx^2}{2H}$ is the equation of the cable's curve

71. $x^2 = 4py$ and $y = p \Rightarrow x^2 = 4p^2 \Rightarrow x = \pm 2p$. Therefore the line $y = p$ cuts the parabola at points $(-2p, p)$ and $(2p, p)$, and these points are $\sqrt{[2p - (-2p)]^2 + (p - p)^2} = 4p$ units apart.

$$72. \lim_{x \rightarrow \infty} \left(\frac{b}{a}x - \frac{b}{a}\sqrt{x^2 - a^2} \right) = \frac{b}{a} \lim_{x \rightarrow \infty} \left(x - \sqrt{x^2 - a^2} \right) = \frac{b}{a} \lim_{x \rightarrow \infty} \left[\frac{(x - \sqrt{x^2 - a^2})(x + \sqrt{x^2 - a^2})}{x + \sqrt{x^2 - a^2}} \right] = \frac{b}{a} \lim_{x \rightarrow \infty} \left[\frac{x^2 - (x^2 - a^2)}{x + \sqrt{x^2 - a^2}} \right]$$

$$= \frac{b}{a} \lim_{x \rightarrow \infty} \left[\frac{a^2}{x + \sqrt{x^2 - a^2}} \right] = 0$$

73. Let $y = \sqrt{1 - \frac{x^2}{4}}$ on the interval $0 \leq x \leq 2$. The area of the inscribed rectangle is given by

$$\text{Thus } A'(x) = 0 \Rightarrow 4\sqrt{1 - \frac{x^2}{4}} - \frac{x^2}{\sqrt{1 - \frac{x^2}{4}}} = 0 \Rightarrow 4\left(1 - \frac{x^2}{4}\right) - x^2 = 0 \Rightarrow x^2 = 2 \Rightarrow x = \sqrt{2} \quad (\text{only the positive square}$$

root lies in the interval). Since $A(0) = A(2) = 0$ we have that $A(\sqrt{2}) = 4$ is the maximum area when the length is $2\sqrt{2}$ and the height is $\sqrt{2}$.

74. (a) Around the x -axis: $9x^2 + 4y^2 = 36 \Rightarrow y^2 = 9 - \frac{9}{4}x^2 \Rightarrow y = \pm\sqrt{9 - \frac{9}{4}x^2}$ and we use the positive root

(b) Around the y -axis: $9x^2 + 4y^2 = 36 \Rightarrow x^2 = 4 - \frac{4}{9}y^2 \Rightarrow x = \pm\sqrt{4 - \frac{4}{9}y^2}$ and we use the positive root

$$\Rightarrow V = 2 \int_0^3 \pi \left(\sqrt{4 - \frac{4}{9}y^2} \right)^2 dy = 2 \int_0^3 \pi \left(4 - \frac{4}{9}y^2 \right) dy = 2\pi \left[4y - \frac{4}{27}y^3 \right]_0^3 = 16\pi$$

75. $9x^2 - 4y^2 = 36 \Rightarrow y^2 = \frac{9x^2 - 36}{4} \Rightarrow y = \pm\frac{3}{2}\sqrt{x^2 - 4}$ on the interval $2 \leq x \leq 4 \Rightarrow V = \int_2^4 \pi \left(\frac{3}{2}\sqrt{x^2 - 4} \right)^2 dx$

$$= \frac{9\pi}{4} \int_2^4 (x^2 - 4) dx = \frac{9\pi}{4} \left[\frac{x^3}{3} - 4x \right]_2^4 = \frac{9\pi}{4} \left[\left(\frac{64}{3} - 16 \right) - \left(\frac{8}{3} - 8 \right) \right] = \frac{9\pi}{4} \left(\frac{56}{3} - 8 \right) = \frac{3\pi}{4} (56 - 24) = 24\pi$$

76. Let $P_1(-p, y_1)$ be any point on $x = -p$, and let $P(x, y)$ be a point where a tangent intersects $y^2 = 4px$.

Now $y^2 = 4px \Rightarrow 2y \frac{dy}{dx} = 4p \Rightarrow \frac{dy}{dx} = \frac{2p}{y}$; then the slope of a tangent line from P_1 is $\frac{y - y_1}{x - (-p)} = \frac{dy}{dx} = \frac{2p}{y}$

$$\Rightarrow y^2 - yy_1 = 2px + 2p^2. \text{ Since } x = \frac{y^2}{4p}, \text{ we have } y^2 - yy_1 = 2p \left(\frac{y^2}{4p} \right) + 2p^2 \Rightarrow y^2 - yy_1 = \frac{1}{2}y^2 + 2p^2$$

$$\Rightarrow \frac{1}{2}y^2 - yy_1 - 2p^2 = 0 \Rightarrow y = \frac{2y_1 \pm \sqrt{4y_1^2 + 16p^2}}{2} = y_1 \pm \sqrt{y_1^2 + 4p^2}. \text{ Therefore the slopes of the two tangents from}$$

$$P_1 \text{ are } m_1 = \frac{2p}{y_1 + \sqrt{y_1^2 + 4p^2}} \text{ and } m_2 = \frac{2p}{y_1 - \sqrt{y_1^2 + 4p^2}} \Rightarrow m_1 m_2 = \frac{4p^2}{y_1^2 - (y_1^2 + 4p^2)} = -1 \Rightarrow \text{the lines are perpendicular}$$

77. $(x-2)^2 + (y-1)^2 = 5 \Rightarrow 2(x-2) + 2(y-1) \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = -\frac{x-2}{y-1}$; $y = 0 \Rightarrow (x-2)^2 + (0-1)^2 = 5 \Rightarrow (x-2)^2 = 4$

$$\Rightarrow (y-1)^2 = 1 \Rightarrow y = 2 \text{ or } y = 0 \Rightarrow \text{the circle crosses the } y\text{-axis at } (0, 2) \text{ and } (0, 0).$$

At $(4, 0)$: $\frac{dy}{dx} = -\frac{4-2}{0-1} = 2 \Rightarrow$ the tangent line is $y = 2(x-4)$ or $y = 2x - 8$

At (0, 0): $\frac{dy}{dx} = -\frac{0-2}{0-1} = -2 \Rightarrow$ the tangent line is $y = -2x$

At (0, 2): $\frac{dy}{dx} = -\frac{0-2}{2-1} = 2 \Rightarrow$ the tangent line is $y - 2 = 2x$ or $y = 2x + 2$

78. $x^2 - y^2 = 1 \Rightarrow x = \pm\sqrt{1+y^2}$ on the interval $-3 \leq y \leq 3 \Rightarrow V = \int_{-3}^3 \pi \left(\sqrt{1+y^2}\right)^2 dy = 2 \int_0^3 \pi \left(\sqrt{1+y^2}\right)^2 dy$
 $= 2\pi \int_0^3 (1+y^2) dy = 2\pi \left[y + \frac{y^3}{3} \right]_0^3 = 24\pi$

79. Let $y = \sqrt{16 - \frac{16}{9}x^2}$ on the interval $-3 \leq x \leq 3$. Since the plate is symmetric about the y -axis, $\bar{x} = 0$.

For a vertical strip: $(\tilde{x}, \tilde{y}) = \left(x, \frac{\sqrt{16 - \frac{16}{9}x^2}}{2}\right)$, length $= \sqrt{16 - \frac{16}{9}x^2}$, width $= dx \Rightarrow$ area $= dA = \sqrt{16 - \frac{16}{9}x^2} dx$

\Rightarrow mass $= dm = \delta dA = \delta \sqrt{16 - \frac{16}{9}x^2} dx$.

Moment of the strip about the x -axis: $\tilde{y} dm = \frac{\sqrt{16 - \frac{16}{9}x^2}}{2} \left(\delta \sqrt{16 - \frac{16}{9}x^2}\right) dx = \delta \left(8 - \frac{8}{9}x^2\right) dx$ so the moment of

the plate about the x -axis is $M_x = \int \tilde{y} dm = \int_{-3}^3 \delta \left(8 - \frac{8}{9}x^2\right) dx = \delta \left[8x - \frac{8}{27}x^3\right]_{-3}^3 = 32\delta$; also the mass of the

plate is $M = \int_{-3}^3 \delta \sqrt{16 - \frac{16}{9}x^2} dx = \int_{-3}^3 4\delta \sqrt{1 - \left(\frac{1}{3}x\right)^2} dx$; $\left[u = \frac{x}{3} \Rightarrow 3 du = dx; x = -3 \Rightarrow u = -1, x = 3 \Rightarrow u = 1\right]$

$\rightarrow 4\delta \int_{-1}^1 3\sqrt{1-u^2} du = 12\delta \int_{-1}^1 \sqrt{1-u^2} du = 12\delta \left[\frac{1}{2} \left(u\sqrt{1-u^2} + \sin^{-1} u\right)\right]_{-1}^1 = 6\pi\delta \Rightarrow \bar{y} = \frac{M_x}{M} = \frac{32\delta}{6\pi\delta} = \frac{16}{3\pi}$.

Therefore the center of mass is $\left(0, \frac{16}{3\pi}\right)$.

Then r_1 and r_2 lie on the same ray on consecutive turns of the spiral and the distance between the two points is $r_2 - r_1 = a\theta_2 - a\theta_1 = a(\theta_2 - \theta_1) = 2\pi a$, which is constant.

CHAPTER 11 ADDITIONAL AND ADVANCED EXERCISES

1. Directrix $x = 3$ and focus $(4, 0) \Rightarrow$ vertex is $(\frac{7}{2}, 0)$

$\Rightarrow p = \frac{1}{2} \Rightarrow$ the equation is $x - \frac{7}{2} = \frac{y^2}{2}$

2. $x^2 - 6x - 12y + 9 = 0 \Rightarrow x^2 - 6x + 9 = 12y \Rightarrow \frac{(x-3)^2}{12} = y \Rightarrow$ vertex is $(3, 0)$ and $p = 3 \Rightarrow$ focus is $(3, 3)$ and the directrix is $y = -3$

3. $x^2 = 4y \Rightarrow$ vertex is $(0, 0)$ and $p = 1 \Rightarrow$ focus is $(0, 1)$; thus the distance from $P(x, y)$ to the vertex is $\sqrt{x^2 + y^2}$ and the distance from P to the focus is $\sqrt{x^2 + (y-1)^2} \Rightarrow \sqrt{x^2 + y^2} = 2\sqrt{x^2 + (y-1)^2}$
 $\Rightarrow x^2 + y^2 = 4[x^2 + (y-1)^2] \Rightarrow x^2 + y^2 = 4x^2 + 4y^2 - 8y + 4 \Rightarrow 3x^2 + 3y^2 - 8y + 4 = 0$, which is a circle

4. Let the segment $a + b$ intersect the y -axis in point A and intersect the x -axis in point B so that $PB = b$ and $PA = a$ (see figure). Draw the horizontal line through P and let it intersect the y -axis in point C . Let $\angle PBO = \theta$

$\Rightarrow \angle APC = \theta$. Then $\sin \theta = \frac{y}{b}$ and $\cos \theta = \frac{x}{a}$
 $\Rightarrow \frac{x^2}{a^2} + \frac{y^2}{b^2} = \cos^2 \theta + \sin^2 \theta = 1$.

5. Vertices are $(0, \pm 2) \Rightarrow a = 2; e = \frac{c}{a} \Rightarrow 0.5 = \frac{c}{2} \Rightarrow c = 1 \Rightarrow$ foci are $(0, \pm 1)$

6. Let the center of the ellipse be $(x, 0)$; directrix $x = 2$, focus $(4, 0)$, and $e = \frac{2}{3} \Rightarrow \frac{a}{e} - c = 2 \Rightarrow \frac{a}{e} = 2 + c$
 $\Rightarrow a = \frac{2}{3}(2 + c)$. Also $c = ae = \frac{2}{3}a \Rightarrow a = \frac{2}{3}(2 + \frac{2}{3}a) \Rightarrow a = \frac{4}{3} + \frac{4}{9}a \Rightarrow \frac{5}{9}a = \frac{4}{3} \Rightarrow a = \frac{12}{5}$;

$x - 2 = \frac{a}{e} \Rightarrow x - 2 = (\frac{12}{5})(\frac{3}{2}) = \frac{18}{5} \Rightarrow x = \frac{28}{5} \Rightarrow$ the center is $(\frac{28}{5}, 0)$; $x - 4 = c \Rightarrow c = \frac{28}{5} - 4 = \frac{8}{5}$ so that

$c^2 = a^2 - b^2 = (\frac{12}{5})^2 - (\frac{8}{5})^2 = \frac{80}{25}$; therefore the equation is $\frac{(x - \frac{28}{5})^2}{(\frac{144}{25})} + \frac{y^2}{(\frac{80}{25})} = 1$ or $\frac{25(x - \frac{28}{5})^2}{144} + \frac{5y^2}{16} = 1$

7. Let the center of the hyperbola be $(0, y)$.

(a) Directrix $y = -1$, focus $(0, -7)$ and $e = 2 \Rightarrow c - \frac{a}{e} = 6 \Rightarrow \frac{a}{e} = c - 6 \Rightarrow a = 2c - 12$. Also $c = ae = 2a$
 $\Rightarrow a = 2(2a) - 12 \Rightarrow a = 4 \Rightarrow c = 8; y - (-1) = \frac{a}{e} = \frac{4}{2} = 2 \Rightarrow y = 1 \Rightarrow$ the center is $(0, 1)$;

$c^2 = a^2 + b^2 \Rightarrow b^2 = c^2 - a^2 = 64 - 16 = 48$; therefore the equation is $\frac{(y-1)^2}{16} - \frac{x^2}{48} = 1$

(b) $e = 5 \Rightarrow c - \frac{a}{e} = 6 \Rightarrow \frac{a}{e} = c - 6 \Rightarrow a = 5c - 30$. Also, $c = ae = 5a \Rightarrow a = 5(5a) - 30 \Rightarrow 24a = 30 \Rightarrow a = \frac{5}{4}$
 $\Rightarrow c = \frac{25}{4}$; $y - (-1) = \frac{a}{e} = \frac{(\frac{5}{4})}{5} = \frac{1}{4} \Rightarrow y = -\frac{3}{4} \Rightarrow$ the center is $(0, -\frac{3}{4})$; $c^2 = a^2 + b^2 \Rightarrow b^2 = c^2 - a^2$
 $= \frac{625}{16} - \frac{25}{16} = \frac{75}{2}$; therefore the equation is $\frac{(y + \frac{3}{4})^2}{(\frac{25}{16})} - \frac{x^2}{(\frac{75}{2})} = 1$ or $\frac{16(y + \frac{3}{4})^2}{25} - \frac{2x^2}{75} = 1$

8. The center is $(0, 0)$ and $c = 2 \Rightarrow 4 = a^2 + b^2 \Rightarrow b^2 = 4 - a^2$. The equation is $\frac{y^2}{a^2} - \frac{x^2}{b^2} = 1 \Rightarrow \frac{49}{a^2} - \frac{144}{b^2} = 1$
 $\Rightarrow \frac{49}{a^2} - \frac{144}{(4-a^2)} = 1 \Rightarrow 49(4-a^2) - 144a^2 = a^2(4-a^2) \Rightarrow 196 - 49a^2 - 144a^2 = 4a^2 - a^4$
 $\Rightarrow a^4 - 197a^2 + 196 = 0 \Rightarrow (a^2 - 196)(a^2 - 1) = 0 \Rightarrow a = 14$ or $a = 1$; $a = 14 \Rightarrow b^2 = 4 - (14)^2 < 0$ which is impossible; $a = 1 \Rightarrow b^2 = 4 - 1 = 3$; therefore the equation is $y^2 - \frac{x^2}{3} = 1$

9. $b^2x^2 + a^2y^2 = a^2b^2 \Rightarrow \frac{dy}{dx} = -\frac{b^2x}{a^2y}$; at (x_1, y_1) the tangent line is $y - y_1 = \left(-\frac{b^2x_1}{a^2y_1}\right)(x - x_1)$
 $\Rightarrow a^2yy_1 + b^2xx_1 = b^2x_1^2 + a^2y_1^2 = a^2b^2 \Rightarrow b^2xx_1 + a^2yy_1 - a^2b^2 = 0$

10. $b^2x^2 - a^2y^2 = a^2b^2 \Rightarrow \frac{dy}{dx} = \frac{b^2x}{a^2y}$; at (x_1, y_1) the tangent line is $y - y_1 = \left(\frac{b^2x_1}{a^2y_1}\right)(x - x_1)$
 $\Rightarrow b^2xx_1 - a^2yy_1 = b^2x_1^2 - a^2y_1^2 = a^2b^2 \Rightarrow b^2xx_1 - a^2yy_1 - a^2b^2 = 0$

 $\Rightarrow t = \tan^{-1}\left(\frac{y}{x}\right) \Rightarrow x^2 + y^2 = e^{4 \tan^{-1}(y/x)}$ is the Cartesian equation. Since $r^2 = x^2 + y^2$ and $\theta = \tan^{-1}\left(\frac{y}{x}\right)$, the polar equation is $r^2 = e^{4\theta}$ or $r = e^{2\theta}$ for $r > 0$

(b) $ds^2 = r^2 d\theta^2 + dr^2; r = e^{2\theta} \Rightarrow dr = 2e^{2\theta} d\theta$
 $\Rightarrow ds^2 = r^2 d\theta^2 + (2e^{2\theta} d\theta)^2 = (e^{2\theta})^2 d\theta^2 + 4e^{4\theta} d\theta^2$
 $= 5e^{4\theta} d\theta^2 \Rightarrow ds = \sqrt{5}e^{2\theta} d\theta$
 $\Rightarrow L = \int_0^{2\pi} \sqrt{5}e^{2\theta} d\theta = \left[\frac{\sqrt{5}e^{2\theta}}{2}\right]_0^{2\pi} = \frac{\sqrt{5}}{2}(e^{4\pi} - 1)$

18. $r = 2 \sin^3\left(\frac{\theta}{3}\right) \Rightarrow dr = 2 \sin^2\left(\frac{\theta}{3}\right) \cos\left(\frac{\theta}{3}\right) d\theta \Rightarrow ds^2 = r^2 d\theta^2 + dr^2$
 $= \left[2 \sin^3\left(\frac{\theta}{3}\right)\right]^2 d\theta^2 + \left[2 \sin^2\left(\frac{\theta}{3}\right) \cos\left(\frac{\theta}{3}\right) d\theta\right]^2 = 4 \sin^6\left(\frac{\theta}{3}\right) d\theta^2 + 4 \sin^4\left(\frac{\theta}{3}\right) \cos^2\left(\frac{\theta}{3}\right) d\theta^2$
 $= \left[4 \sin^4\left(\frac{\theta}{3}\right)\right] \left[\sin^2\left(\frac{\theta}{3}\right) + \cos^2\left(\frac{\theta}{3}\right)\right] d\theta^2 = 4 \sin^4\left(\frac{\theta}{3}\right) d\theta^2 \Rightarrow ds = 2 \sin^2\left(\frac{\theta}{3}\right) d\theta.$

Then $L = \int_0^{3\pi} 2 \sin^2\left(\frac{\theta}{3}\right) d\theta = \int_0^{3\pi} \left[1 - \cos\left(\frac{2\theta}{3}\right)\right] d\theta = \left[\theta - \frac{3}{2} \sin\left(\frac{2\theta}{3}\right)\right]_0^{3\pi} = 3\pi$

$$\Rightarrow r = \frac{2(\frac{1}{2})}{1 + (\frac{1}{2})\sin \theta} = \frac{2}{2 + \sin \theta}$$

22. $e = \frac{1}{3}$ and $r \sin \theta = -6 \Rightarrow y = -6$ is the directrix $\Rightarrow k = 6$; the conic is an ellipse with $r = \frac{ke}{1 - e \sin \theta}$

$$\Rightarrow r = \frac{6(\frac{1}{3})}{1 - (\frac{1}{3})\sin \theta} = \frac{6}{3 - \sin \theta}$$

23. Arc $PF =$ Arc AF since each is the distance rolled;

$$\angle PCF = \frac{\text{Arc } PF}{b} \Rightarrow \text{Arc } PF = b(\angle PCF);$$

$$\theta = \frac{\text{Arc } AF}{a} \Rightarrow \text{Arc } AF = a\theta \Rightarrow a\theta = b(\angle PCF)$$

$$\Rightarrow \angle PCF = \left(\frac{a}{b}\right)\theta; \quad \angle OCB = \frac{\pi}{2} - \theta \text{ and}$$

$$\angle OCB = \angle PCF - \angle PCE = \angle PCF - \left(\frac{\pi}{2} - \alpha\right)$$

$$= \left(\frac{a}{b}\right)\theta - \left(\frac{\pi}{2} - \alpha\right) \Rightarrow \frac{\pi}{2} - \theta = \left(\frac{a}{b}\right)\theta - \left(\frac{\pi}{2} - \alpha\right)$$

$$\Rightarrow \frac{\pi}{2} - \theta = \left(\frac{a}{b}\right)\theta - \frac{\pi}{2} + \alpha \Rightarrow \alpha = \pi - \theta - \left(\frac{a}{b}\right)\theta$$

$$\Rightarrow \alpha = \pi - \left(\frac{a+b}{b}\right)\theta.$$

$$\text{Now } x = OB + BD = OB + EP = (a + b) \cos \theta + b \cos \alpha = (a + b) \cos \theta + b \cos \left(\pi - \left(\frac{a+b}{b}\right)\theta\right)$$

$$= (a + b) \cos \theta + b \cos \pi \cos \left(\left(\frac{a+b}{b}\right)\theta\right) + b \sin \pi \sin \left(\left(\frac{a+b}{b}\right)\theta\right) = (a + b) \cos \theta - b \cos \left(\left(\frac{a+b}{b}\right)\theta\right) \text{ and}$$

$$y = PD = CB - CE = (a + b) \sin \theta - b \sin \alpha = (a + b) \sin \theta - b \sin \left(\left(\frac{a+b}{b}\right)\theta\right)$$

$$= (a + b) \sin \theta - b \sin \pi \cos \left(\left(\frac{a+b}{b}\right)\theta\right) + b \cos \pi \sin \left(\left(\frac{a+b}{b}\right)\theta\right) = (a + b) \sin \theta - b \sin \left(\left(\frac{a+b}{b}\right)\theta\right);$$

$$\text{therefore } x = (a + b) \cos \theta - b \cos \left(\left(\frac{a+b}{b}\right)\theta\right) \text{ and } y = (a + b) \sin \theta - b \sin \left(\left(\frac{a+b}{b}\right)\theta\right)$$

24. $x = a(t - \sin t) \Rightarrow \frac{dx}{dt} = a(1 - \cos t)$ and let $\delta = 1 \Rightarrow dm = dA = y dx = y \left(\frac{dx}{dt}\right) dt = a(1 - \cos t) a(1 - \cos t) dt$

$$= a^2 (1 - \cos t)^2 dt; \text{ then } A = \int_0^{2\pi} a^2 (1 - \cos t)^2 dt = a^2 \int_0^{2\pi} (1 - 2 \cos t + \cos^2 t) dt$$

$$= a^2 \int_0^{2\pi} \left(1 - 2 \cos t + \frac{1}{2} + \frac{1}{2} \cos 2t\right) dt = a^2 \left[\frac{3}{2}t - 2 \sin t + \frac{\sin 2t}{4}\right]_0^{2\pi} = 3\pi a^2; \quad \tilde{x} = x = a(t - \sin t) \text{ and}$$

$$\tilde{y} = \frac{1}{2}y = \frac{1}{2}a(1 - \cos t) \Rightarrow M_x = \int \tilde{y} dm = \int \tilde{y} \delta dA = \int_0^{2\pi} \frac{1}{2}a(1 - \cos t) a^2 (1 - \cos t)^2 dt = \frac{1}{2}a^3 \int_0^{2\pi} (1 - \cos t)^3 dt$$

$$= \frac{a^3}{2} \int_0^{2\pi} (1 - 3 \cos t + 3 \cos^2 t - \cos^3 t) dt = \frac{a^3}{2} \int_0^{2\pi} \left[1 - 3 \cos t + \frac{3}{2} + \frac{3 \cos 2t}{2} - (1 - \sin^2 t)(\cos t)\right] dt$$

$$= \frac{a^3}{2} \left[\frac{5}{2}t - 3 \sin t + \frac{3 \sin 2t}{4} - \sin t + \frac{\sin^3 t}{3}\right]_0^{2\pi} = \frac{5\pi a^3}{2}. \text{ Therefore } \bar{y} = \frac{M_x}{M} = \frac{\left(\frac{5\pi a^3}{2}\right)}{3\pi a^2} = \frac{5}{6}a.$$

$$\begin{aligned} \text{Also, } M_y &= \int \tilde{x} dm = \int \tilde{x} \delta dA = \int_0^{2\pi} a(t - \sin t) a^2 (1 - \cos t)^2 dt \\ &= a^3 \int_0^{2\pi} (t - 2t \cos t + t \cos^2 t - \sin t + 2 \sin t \cos t - \sin t \cos^2 t) dt \\ &= a^3 \left[\frac{t^2}{2} - 2 \cos t - 2t \sin t + \frac{1}{4} t^2 + \frac{1}{8} \cos 2t + \frac{t}{4} \sin 2t + \cos t + \sin^2 t + \frac{\cos^3 t}{3} \right]_0^{2\pi} = 3\pi^2 a^3. \end{aligned}$$

Thus $\bar{x} = \frac{M_y}{M} = \frac{3\pi^2 a^3}{3\pi a^2} = \pi a \Rightarrow (\pi a, \frac{5}{6} a)$ is the center of mass.

25. $\beta = \psi_2 - \psi_1 \Rightarrow \tan \beta = \tan(\psi_2 - \psi_1) = \frac{\tan \psi_2 - \tan \psi_1}{1 + \tan \psi_2 \tan \psi_1}$;

the curves will be orthogonal when $\tan \beta$ is

undefined, or when $\tan \psi_2 = \frac{-1}{\tan \psi_1} \Rightarrow \frac{r}{g'(\theta)} = \frac{-1}{\left[\frac{r}{f'(\theta)} \right]}$

$\Rightarrow r^2 = -f'(\theta)g'(\theta)$

26. $r = \sin^4\left(\frac{\theta}{4}\right) \Rightarrow \frac{dr}{d\theta} = \sin^3\left(\frac{\theta}{4}\right) \cos\left(\frac{\theta}{4}\right) \Rightarrow \tan \psi = \frac{\sin^4\left(\frac{\theta}{4}\right)}{\sin^3\left(\frac{\theta}{4}\right) \cos\left(\frac{\theta}{4}\right)} = \tan\left(\frac{\theta}{4}\right)$

27. $r = 2a \sin 3\theta \Rightarrow \frac{dr}{d\theta} = 6a \cos 3\theta \Rightarrow \tan \psi = \frac{r}{\left(\frac{dr}{d\theta}\right)} = \frac{2a \sin 3\theta}{6a \cos 3\theta} = \frac{1}{3} \tan 3\theta$; when $\theta = \frac{\pi}{6}$, $\tan \psi = \frac{1}{3} \tan \frac{\pi}{2} \Rightarrow \psi = \frac{\pi}{2}$

28. (a)

(b) $r\theta = 1 \Rightarrow r = \theta^{-1} \Rightarrow \frac{dr}{d\theta} = -\theta^{-2}$

$\Rightarrow \tan \psi |_{\theta=1} = \frac{\theta^{-1}}{-\theta^{-2}} = -\theta \Rightarrow \lim_{\theta \rightarrow \infty} \tan \psi = -\infty$

$\Rightarrow \psi \rightarrow \frac{\pi}{2}$ from the right as the spiral winds in around the origin.

29. $\tan \psi_1 = \frac{\sqrt{3} \cos \theta}{-\sqrt{3} \sin \theta} = -\cot \theta$ is $-\frac{1}{\sqrt{3}}$ at $\theta = \frac{\pi}{3}$; $\tan \psi_2 = \frac{\sin \theta}{\cos \theta} = \tan \theta$ is $\sqrt{3}$ at $\theta = \frac{\pi}{3}$; since the product of these slopes is -1 , the tangents are perpendicular

30. $\tan \psi = \frac{r}{\left(\frac{dr}{d\theta}\right)} = \frac{a(1-\cos \theta)}{a \sin \theta}$ is 1 at $\theta = \frac{\pi}{2} \Rightarrow \psi = \frac{\pi}{4}$

 \Rightarrow the center is at $(-2, 0, 2)$ and the radius is $\sqrt{8}$

 \Rightarrow the center is at $(0, 3, -4)$ and the radius is 5
57. $2x^2 + 2y^2 + 2z^2 + x + y + z = 9 \Rightarrow x^2 + \frac{1}{2}x + y^2 + \frac{1}{2}y + z^2 + \frac{1}{2}z = \frac{9}{2}$
 $\Rightarrow (x^2 + \frac{1}{2}x + \frac{1}{16}) + (y^2 + \frac{1}{2}y + \frac{1}{16}) + (z^2 + \frac{1}{2}z + \frac{1}{16}) = \frac{9}{2} + \frac{3}{16} \Rightarrow (x + \frac{1}{4})^2 + (y + \frac{1}{4})^2 + (z + \frac{1}{4})^2 = (\frac{5\sqrt{3}}{4})^2$
 \Rightarrow the center is at $(-\frac{1}{4}, -\frac{1}{4}, -\frac{1}{4})$ and the radius is $\frac{5\sqrt{3}}{4}$

$$58. \quad 3x^2 + 3y^2 + 3z^2 + 2y - 2z = 9 \Rightarrow x^2 + y^2 + \frac{2}{3}y + z^2 - \frac{2}{3}z = 3 \Rightarrow x^2 + \left(y^2 + \frac{2}{3}y + \frac{1}{9}\right) + \left(z^2 - \frac{2}{3}z + \frac{1}{9}\right) = 3 + \frac{2}{9}$$

$$\Rightarrow (x-0)^2 + \left(y + \frac{1}{3}\right)^2 + \left(z - \frac{1}{3}\right)^2 = \left(\frac{\sqrt{29}}{3}\right)^2 \Rightarrow \text{the center is at } \left(0, -\frac{1}{3}, \frac{1}{3}\right) \text{ and the radius is } \frac{\sqrt{29}}{3}$$

$$59. \quad \text{(a) the distance between } (x, y, z) \text{ and } (x, 0, 0) \text{ is } \sqrt{y^2 + z^2}$$

$$61. \quad |AB| = \sqrt{(1-(-1))^2 + (-1-2)^2 + (3-1)^2} = \sqrt{4+9+4} = \sqrt{17}$$

$$|CA| = \sqrt{(-1-3)^2 + (2-4)^2 + (1-5)^2} = \sqrt{16+4+16} = \sqrt{36} = 6$$

Thus the perimeter of triangle ABC is $\sqrt{17} + \sqrt{33} + 6$.

$$62. \quad |PA| = \sqrt{(2-3)^2 + (-1-1)^2 + (3-2)^2} = \sqrt{1+4+1} = \sqrt{6}$$

$$|PB| = \sqrt{(4-3)^2 + (3-1)^2 + (1-2)^2} = \sqrt{1+4+1} = \sqrt{6}$$

Thus P is equidistant from A and B .

$$63. \quad \sqrt{(x-x)^2 + (y-(-1))^2 + (z-z)^2} = \sqrt{(x-x)^2 + (y-3)^2 + (z-z)^2} \Rightarrow (y+1)^2 = (y-3)^2 \Rightarrow 2y+1 = -6y+9$$

$$\Rightarrow y=1$$

$$64. \quad \sqrt{(x-0)^2 + (y-0)^2 + (z-2)^2} = \sqrt{(x-x)^2 + (y-y)^2 + (z-0)^2} \Rightarrow x^2 + y^2 + (z-2)^2 = z^2$$

$$\Rightarrow y = 3 \pm 2 \Rightarrow y = 5 \Rightarrow (0, 5, -5).$$

Since $\mathbf{F}_1 + \mathbf{F}_2 = \langle 0, 100 \rangle \Rightarrow \langle -\frac{\sqrt{3}}{2}|\mathbf{F}_1| + \frac{1}{\sqrt{2}}|\mathbf{F}_2|, \frac{1}{2}|\mathbf{F}_1| + \frac{1}{\sqrt{2}}|\mathbf{F}_2| \rangle = \langle 0, 100 \rangle$
 $\Rightarrow -\frac{\sqrt{3}}{2}|\mathbf{F}_1| + \frac{1}{\sqrt{2}}|\mathbf{F}_2| = 0 \text{ and } \frac{1}{2}|\mathbf{F}_1| + \frac{1}{\sqrt{2}}|\mathbf{F}_2| = 100$. Solving the first equation for $|\mathbf{F}_2|$ results in:
 $|\mathbf{F}_2| = \frac{\sqrt{6}}{2}|\mathbf{F}_1|$. Substituting this result into the second equation gives us: $\frac{1}{2}|\mathbf{F}_1| + \frac{1}{\sqrt{2}}\left(\frac{\sqrt{6}}{2}|\mathbf{F}_1|\right) = 100$
 $\Rightarrow |\mathbf{F}_1| = \frac{200}{1+\sqrt{3}} \approx 73.205 \text{ N} \Rightarrow |\mathbf{F}_2| = \frac{100\sqrt{6}}{1+\sqrt{3}} \approx 89.658 \text{ N} \Rightarrow \mathbf{F}_1 \approx \langle -63.397, 36.603 \rangle \text{ and } \mathbf{F}_2 \approx \langle 63.397, 63.397 \rangle$
46. $\mathbf{F}_1 = \langle -35 \cos \alpha, 35 \sin \alpha \rangle$, $\mathbf{F}_2 = \langle |\mathbf{F}_2| \cos 60^\circ, |\mathbf{F}_2| \sin 60^\circ \rangle = \langle \frac{1}{2}|\mathbf{F}_2|, \frac{\sqrt{3}}{2}|\mathbf{F}_2| \rangle$, and $\mathbf{w} = \langle 0, -50 \rangle$.
 Since $\mathbf{F}_1 + \mathbf{F}_2 = \langle 0, 50 \rangle \Rightarrow \langle -35 \cos \alpha + \frac{1}{2}|\mathbf{F}_2|, 35 \sin \alpha + \frac{\sqrt{3}}{2}|\mathbf{F}_2| \rangle = \langle 0, 50 \rangle \Rightarrow -35 \cos \alpha + \frac{1}{2}|\mathbf{F}_2| = 0$ and
 $35 \sin \alpha + \frac{\sqrt{3}}{2}|\mathbf{F}_2| = 50$. Solving the first equation for $|\mathbf{F}_2|$ results in: $|\mathbf{F}_2| = 70 \cos \alpha$. Substituting this result
 into the second equation gives us: $35 \sin \alpha + 35\sqrt{3} \cos \alpha = 50 \Rightarrow \sqrt{3} \cos \alpha = \frac{10}{7} - \sin \alpha$
 $\Rightarrow 3 \cos^2 \alpha = \frac{100}{49} - \frac{20}{7} \sin \alpha + \sin^2 \alpha \Rightarrow 3(1 - \sin^2 \alpha) = \frac{100}{49} - \frac{20}{7} \sin \alpha + \sin^2 \alpha \Rightarrow 196 \sin^2 \alpha - 140 \sin \alpha - 47 = 0$
 $\Rightarrow \sin \alpha = \frac{5 \pm 6\sqrt{2}}{14}$. Since $\alpha > 0 \Rightarrow \sin \alpha > 0 \Rightarrow \sin \alpha = \frac{5+6\sqrt{2}}{14} \Rightarrow \alpha \approx 74.42^\circ$, and $|\mathbf{F}_2| = 70 \cos \alpha \approx 18.81 \text{ N}$.
47. $\mathbf{F}_1 = \langle -|\mathbf{F}_1| \cos 40^\circ, |\mathbf{F}_1| \sin 40^\circ \rangle$, $\mathbf{F}_2 = \langle 100 \cos 35^\circ, 100 \sin 35^\circ \rangle$, and $\mathbf{w} = \langle 0, -w \rangle$. Since $\mathbf{F}_1 + \mathbf{F}_2 = \langle 0, w \rangle$
 $\Rightarrow \langle -|\mathbf{F}_1| \cos 40^\circ + 100 \cos 35^\circ, |\mathbf{F}_1| \sin 40^\circ + 100 \sin 35^\circ \rangle = \langle 0, w \rangle \Rightarrow -|\mathbf{F}_1| \cos 40^\circ + 100 \cos 35^\circ = 0$ and

$|\mathbf{F}_1| \sin 40^\circ + 100 \sin 35^\circ = w$. Solving the first equation for $|\mathbf{F}_1|$ results in: $|\mathbf{F}_1| = \frac{100 \cos 35^\circ}{\cos 40^\circ} \approx 106.933$ N. Substituting this result into the second equation gives us: $w \approx 126.093$ N.

48. $\mathbf{F}_1 = \langle -|\mathbf{F}_1| \cos \alpha, |\mathbf{F}_1| \sin \alpha \rangle = \langle -75 \cos \alpha, 75 \sin \alpha \rangle$, $\mathbf{F}_2 = \langle |\mathbf{F}_2| \cos \beta, |\mathbf{F}_2| \sin \beta \rangle = \langle 75 \cos \alpha, 75 \sin \alpha \rangle$, and $\mathbf{w} = \langle 0, -25 \rangle$. Since $\mathbf{F}_1 + \mathbf{F}_2 = \langle 0, 25 \rangle \Rightarrow \langle -75 \cos \alpha + 75 \cos \alpha, 75 \sin \alpha + 75 \sin \alpha \rangle = \langle 0, 25 \rangle \Rightarrow 150 \sin \alpha = 25 \Rightarrow \alpha \approx 9.59^\circ$.

49. (a) The tree is located at the tip of the vector $\overline{OP} = (5 \cos 60^\circ)\mathbf{i} + (5 \sin 60^\circ)\mathbf{j} = \frac{5}{2}\mathbf{i} + \frac{5\sqrt{3}}{2}\mathbf{j} \Rightarrow P = \left(\frac{5}{2}, \frac{5\sqrt{3}}{2}\right)$
 (b) The telephone pole is located at the point Q , which is the tip of the vector $\overline{OP} + \overline{PQ}$
 $= \left(\frac{5}{2}\mathbf{i} + \frac{5\sqrt{3}}{2}\mathbf{j}\right) + (10 \cos 315^\circ)\mathbf{i} + (10 \sin 315^\circ)\mathbf{j} = \left(\frac{5}{2} + \frac{10\sqrt{2}}{2}\right)\mathbf{i} + \left(\frac{5\sqrt{3}}{2} - \frac{10\sqrt{2}}{2}\right)\mathbf{j} \Rightarrow Q = \left(\frac{5+10\sqrt{2}}{2}, \frac{5\sqrt{3}-10\sqrt{2}}{2}\right)$

50. Let $t = \frac{q}{p+q}$ and $s = \frac{p}{p+q}$. Choose T on $\overline{OP_1}$ so that \overline{TQ} is parallel to $\overline{OP_2}$, so that ΔTP_1Q is similar to ΔOP_1P_2 . Then $\frac{|OT|}{|OP_1|} = t \Rightarrow \overline{OT} = t\overline{OP_1}$ so that $T = (tx_1, ty_1, tz_1)$. Also, $\frac{|TQ|}{|OP_2|} = s \Rightarrow \overline{TQ} = s\overline{OP_2} = s\langle x_2, y_2, z_2 \rangle$. Letting $Q = (x, y, z)$, we have that $\overline{TQ} = \langle x - tx_1, y - ty_1, z - tz_1 \rangle = s\langle x_2, y_2, z_2 \rangle$
 Thus $x = tx_1 + sx_2$, $y = ty_1 + sy_2$, $z = tz_1 + sz_2$.

(Note that if Q is the midpoint, then $\frac{p}{q} = 1$ and $t = s = \frac{1}{2}$ so that $x = \frac{1}{2}x_1 + \frac{1}{2}x_2 = \frac{x_1+x_2}{2}$, $y = \frac{y_1+y_2}{2}$, $z = \frac{z_1+z_2}{2}$ so that this result agrees with the midpoint formula.)

51. (a) the midpoint of AB is $M\left(\frac{5}{2}, \frac{5}{2}, 0\right)$ and $\overline{CM} = \left(\frac{5}{2} - 1\right)\mathbf{i} + \left(\frac{5}{2} - 1\right)\mathbf{j} + (0 - 3)\mathbf{k} = \frac{3}{2}\mathbf{i} + \frac{3}{2}\mathbf{j} - 3\mathbf{k}$
 (b) the desired vector is $\left(\frac{2}{3}\right)\overline{CM} = \frac{2}{3}\left(\frac{3}{2}\mathbf{i} + \frac{3}{2}\mathbf{j} - 3\mathbf{k}\right) = \mathbf{i} + \mathbf{j} - 2\mathbf{k}$
 (c) the vector whose sum is the vector from the origin to C and the result of part (b) will terminate at the center of mass \Rightarrow the terminal point of $(\mathbf{i} + \mathbf{j} + 3\mathbf{k}) + (\mathbf{i} + \mathbf{j} - 2\mathbf{k}) = 2\mathbf{i} + 2\mathbf{j} + \mathbf{k}$ is the point $(2, 2, 1)$, which is the location of the center of mass

52. The midpoint of AB is $M\left(\frac{3}{2}, 0, \frac{5}{2}\right)$ and $\left(\frac{2}{3}\right)\overline{CM} = \frac{2}{3}\left[\left(\frac{3}{2} + 1\right)\mathbf{i} + (0 - 2)\mathbf{j} + \left(\frac{5}{2} + 1\right)\mathbf{k}\right] = \frac{2}{3}\left(\frac{5}{2}\mathbf{i} - 2\mathbf{j} + \frac{7}{2}\mathbf{k}\right) = \frac{5}{3}\mathbf{i} - \frac{4}{3}\mathbf{j} + \frac{7}{3}\mathbf{k}$. The vector from the origin to the point of intersection of the medians is $\left(\frac{5}{3}\mathbf{i} - \frac{4}{3}\mathbf{j} + \frac{7}{3}\mathbf{k}\right) + \overline{OC} = \left(\frac{5}{3}\mathbf{i} - \frac{4}{3}\mathbf{j} + \frac{7}{3}\mathbf{k}\right) + (-\mathbf{i} + 2\mathbf{j} - \mathbf{k}) = \frac{2}{3}\mathbf{i} + \frac{2}{3}\mathbf{j} + \frac{4}{3}\mathbf{k}$.

53. Without loss of generality we identify the vertices of the quadrilateral such that $A(0, 0, 0)$, $B(x_b, 0, 0)$, $C(x_c, y_c, 0)$ and $D(x_d, y_d, z_d) \Rightarrow$ the midpoint of AB is $M_{AB}\left(\frac{x_b}{2}, 0, 0\right)$, the midpoint of BC is $M_{BC}\left(\frac{x_b+x_c}{2}, \frac{y_c}{2}, 0\right)$, the midpoint of CD is $M_{CD}\left(\frac{x_c+x_d}{2}, \frac{y_c+y_d}{2}, \frac{z_d}{2}\right)$ and the midpoint of AD is $M_{AD}\left(\frac{x_d}{2}, \frac{y_d}{2}, \frac{z_d}{2}\right) \Rightarrow$ the midpoint of $M_{AB}M_{CD}$ is $\left(\frac{\frac{x_b}{2} + \frac{x_c+x_d}{2}}{2}, \frac{\frac{y_c}{2} + \frac{y_c+y_d}{2}}{4}, \frac{\frac{z_d}{2}}{4}\right)$ which is the same as the midpoint of $M_{AD}M_{BC} = \left(\frac{\frac{x_b+x_c}{2} + \frac{x_d}{2}}{2}, \frac{y_c+y_d}{4}, \frac{z_d}{4}\right)$.

54. Let $V_1, V_2, V_3, \dots, V_n$ be the vertices of a regular n -sided polygon and \mathbf{v}_i denote the vector from the center to V_i for $i = 1, 2, 3, \dots, n$. If $\mathbf{S} = \sum_{i=1}^n \mathbf{v}_i$ and the polygon is rotated through an angle of $\frac{i(2\pi)}{n}$ where $i = 1, 2, 3, \dots, n$, then \mathbf{S} would remain the same. Since the vector \mathbf{S} does not change with these rotations we conclude that $\mathbf{S} = \mathbf{0}$.
55. Without loss of generality we can coordinatize the vertices of the triangle such that $A(0, 0)$, $B(b, 0)$ and $C(x_c, y_c) \Rightarrow a$ is located at $(\frac{b+x_c}{2}, \frac{y_c}{2})$, b is at $(\frac{x_c}{2}, \frac{y_c}{2})$ and c is at $(\frac{b}{2}, 0)$. Therefore, $\overline{Aa} = (\frac{b}{2} + \frac{x_c}{2})\mathbf{i} + (\frac{y_c}{2})\mathbf{j}$, $\overline{Bb} = (\frac{x_c}{2} - b)\mathbf{i} + (\frac{y_c}{2})\mathbf{j}$, and $\overline{Cc} = (\frac{b}{2} - x_c)\mathbf{i} + (-y_c)\mathbf{j} \Rightarrow \overline{Aa} + \overline{Bb} + \overline{Cc} = \mathbf{0}$.
56. Let \mathbf{u} be any unit vector in the plane. If \mathbf{u} is positioned so that its initial point is at the origin and terminal point is at (x, y) , then \mathbf{u} makes an angle θ with \mathbf{i} , measured in the counter-clockwise direction. Since $|\mathbf{u}| = 1$, we have that $x = \cos \theta$ and $y = \sin \theta$. Thus $\mathbf{u} = \cos \theta \mathbf{i} + \sin \theta \mathbf{j}$. Since \mathbf{u} was assumed to be any unit vector in the plane, this holds for every unit vector in the plane.

20. Suppose the diagonals of a rectangle are perpendicular, and let \mathbf{u} and \mathbf{v} be the sides of a rectangle
 \Rightarrow the diagonals are $\mathbf{d}_1 = \mathbf{u} + \mathbf{v}$ and $\mathbf{d}_2 = -\mathbf{u} + \mathbf{v}$. Since the diagonals are perpendicular we have $\mathbf{d}_1 \cdot \mathbf{d}_2 = 0$
 $\Leftrightarrow (\mathbf{u} + \mathbf{v}) \cdot (-\mathbf{u} + \mathbf{v}) = -\mathbf{u} \cdot \mathbf{u} + \mathbf{u} \cdot \mathbf{v} - \mathbf{v} \cdot \mathbf{u} + \mathbf{v} \cdot \mathbf{v} = 0 \Leftrightarrow |\mathbf{v}|^2 - |\mathbf{u}|^2 = 0 \Leftrightarrow (|\mathbf{v}| + |\mathbf{u}|)(|\mathbf{v}| - |\mathbf{u}|) = 0 \Leftrightarrow (|\mathbf{v}| + |\mathbf{u}|) = 0$
 which is not possible, or $(|\mathbf{v}| - |\mathbf{u}|) = 0$ which is equivalent to $|\mathbf{v}| = |\mathbf{u}| \Rightarrow$ the rectangle is a square.

21. Clearly the diagonals of a rectangle are equal in length. What is not as obvious is the statement that equal diagonals happen only in a rectangle. We show this is true by letting the adjacent sides of a parallelogram be the vectors $(v_1\mathbf{i} + v_2\mathbf{j})$ and $(u_1\mathbf{i} + u_2\mathbf{j})$. The equal diagonals of the parallelogram are

$$\begin{aligned} \mathbf{d}_1 &= (v_1\mathbf{i} + v_2\mathbf{j}) + (u_1\mathbf{i} + u_2\mathbf{j}) \text{ and } \mathbf{d}_2 = (v_1\mathbf{i} + v_2\mathbf{j}) - (u_1\mathbf{i} + u_2\mathbf{j}). \text{ Hence } |\mathbf{d}_1| = |\mathbf{d}_2| = |(v_1\mathbf{i} + v_2\mathbf{j}) + (u_1\mathbf{i} + u_2\mathbf{j})| \\ &= |(v_1\mathbf{i} + v_2\mathbf{j}) - (u_1\mathbf{i} + u_2\mathbf{j})| \Rightarrow |(v_1 + u_1)\mathbf{i} + (v_2 + u_2)\mathbf{j}| = |(v_1 - u_1)\mathbf{i} + (v_2 - u_2)\mathbf{j}| \Rightarrow \sqrt{(v_1 + u_1)^2 + (v_2 + u_2)^2} \\ &= \sqrt{(v_1 - u_1)^2 + (v_2 - u_2)^2} \Rightarrow v_1^2 + 2v_1u_1 + u_1^2 + v_2^2 + 2v_2u_2 + u_2^2 = v_1^2 - 2v_1u_1 + u_1^2 + v_2^2 - 2v_2u_2 + u_2^2 \\ &\Rightarrow 2(v_1u_1 + v_2u_2) = -2(v_1u_1 + v_2u_2) \Rightarrow v_1u_1 + v_2u_2 = 0 \Rightarrow (v_1\mathbf{i} + v_2\mathbf{j}) \cdot (u_1\mathbf{i} + u_2\mathbf{j}) = 0 \Rightarrow \text{the vectors } (v_1\mathbf{i} + v_2\mathbf{j}) \\ &\text{and } (u_1\mathbf{i} + u_2\mathbf{j}) \text{ are perpendicular and the parallelogram must be a rectangle.} \end{aligned}$$

22. If $|\mathbf{u}| = |\mathbf{v}|$ and $\mathbf{u} + \mathbf{v}$ is the indicated diagonal, then $(\mathbf{u} + \mathbf{v}) \cdot \mathbf{u} = \mathbf{u} \cdot \mathbf{u} + \mathbf{v} \cdot \mathbf{u} = |\mathbf{u}|^2 + \mathbf{v} \cdot \mathbf{u} = \mathbf{u} \cdot \mathbf{v} + |\mathbf{v}|^2$
 $= \mathbf{u} \cdot \mathbf{v} + \mathbf{v} \cdot \mathbf{v} = (\mathbf{u} + \mathbf{v}) \cdot \mathbf{v} \Rightarrow$ the angle $\cos^{-1}\left(\frac{(\mathbf{u} + \mathbf{v}) \cdot \mathbf{u}}{|\mathbf{u} + \mathbf{v}||\mathbf{u}|}\right)$ between the diagonal and \mathbf{u} and the angle
 $\cos^{-1}\left(\frac{(\mathbf{u} + \mathbf{v}) \cdot \mathbf{v}}{|\mathbf{u} + \mathbf{v}||\mathbf{v}|}\right)$ between the diagonal and \mathbf{v} are equal because the inverse cosine function is one-to-one.
 Therefore, the diagonal bisects the angle between \mathbf{u} and \mathbf{v} .

24. $|\mathbf{w}| \cos(33^\circ - 15^\circ) = 2.5$ lb, so $|\mathbf{w}| = \frac{2.5 \text{ lb}}{\cos 18^\circ}$. Then $\mathbf{w} = \frac{2.5 \text{ lb}}{\cos 18^\circ} \langle \cos 33^\circ, \sin 33^\circ \rangle \approx \langle 2.205, 1.432 \rangle$

25. (a) Since $|\cos \theta| \leq 1$, we have $|\mathbf{u} \cdot \mathbf{v}| = |\mathbf{u}||\mathbf{v}||\cos \theta| \leq |\mathbf{u}||\mathbf{v}|(1) = |\mathbf{u}||\mathbf{v}|$.
 (b) We have equality precisely when $|\cos \theta| = 1$ or when one or both of \mathbf{u} and \mathbf{v} is $\mathbf{0}$. In the case of nonzero vectors, we have equality when $\theta = 0$ or π , i.e., when the vectors are parallel.

26. $(x\mathbf{i} + y\mathbf{j}) \cdot \mathbf{v} = |x\mathbf{i} + y\mathbf{j}||\mathbf{v}|\cos \theta \leq 0$ when $\frac{\pi}{2} \leq \theta \leq \pi$.
 This means (x, y) has to be a point whose position vector makes an angle with \mathbf{v} that is a right angle or bigger.

28. No, \mathbf{v}_1 need not equal \mathbf{v}_2 . For example, $\mathbf{i} + \mathbf{j} \neq \mathbf{i} + 2\mathbf{j}$ but $\mathbf{i} \cdot (\mathbf{i} + \mathbf{j}) = \mathbf{i} \cdot \mathbf{i} + \mathbf{i} \cdot \mathbf{j} = 1 + 0 = 1$ and $\mathbf{i} \cdot (\mathbf{i} + 2\mathbf{j}) = \mathbf{i} \cdot \mathbf{i} + 2\mathbf{i} \cdot \mathbf{j} = 1 + 2 \cdot 0 = 1$.

31. (a) yes, $\mathbf{u} \times \mathbf{v}$ and \mathbf{w} are both vectors (b) no, \mathbf{u} is a vector but $\mathbf{v} \cdot \mathbf{w}$ is a scalar
(c) yes, \mathbf{u} and $\mathbf{u} \times \mathbf{w}$ are both vectors (d) no, \mathbf{u} is a vector but $\mathbf{v} \cdot \mathbf{w}$ is a scalar

32. $(\mathbf{u} \times \mathbf{v}) \times \mathbf{w}$ is perpendicular to $\mathbf{u} \times \mathbf{v}$, and $\mathbf{u} \times \mathbf{v}$ is perpendicular to both \mathbf{u} and $\mathbf{v} \Rightarrow (\mathbf{u} \times \mathbf{v}) \times \mathbf{w}$ is parallel to a vector in the plane of \mathbf{u} and \mathbf{v} which means it lies in the plane determined by \mathbf{u} and \mathbf{v} . The situation is degenerate if \mathbf{u} and \mathbf{v} are parallel so $\mathbf{u} \times \mathbf{v} = \mathbf{0}$ and the vectors do not determine a plane. Similar reasoning shows that $\mathbf{u} \times (\mathbf{v} \times \mathbf{w})$ lies in the plane of \mathbf{v} and \mathbf{w} provided \mathbf{v} and \mathbf{w} are nonparallel.

33. No, \mathbf{v} need not equal \mathbf{w} . For example, $\mathbf{i} + \mathbf{j} \neq -\mathbf{i} + \mathbf{j}$, but $\mathbf{i} \times (\mathbf{i} + \mathbf{j}) = \mathbf{i} \times \mathbf{i} + \mathbf{i} \times \mathbf{j} = \mathbf{0} + \mathbf{k} = \mathbf{k}$ and $\mathbf{i} \times (-\mathbf{i} + \mathbf{j}) = \mathbf{i} \times (-\mathbf{i}) + \mathbf{i} \times \mathbf{j} = \mathbf{0} + \mathbf{k} = \mathbf{k}$.

34. Yes. If $\mathbf{u} \times \mathbf{v} = \mathbf{u} \times \mathbf{w}$ and $\mathbf{u} \cdot \mathbf{v} = \mathbf{u} \cdot \mathbf{w}$, then $\mathbf{u} \times (\mathbf{v} - \mathbf{w}) = \mathbf{0}$ and $\mathbf{u} \cdot (\mathbf{v} - \mathbf{w}) = 0$. Suppose now that $\mathbf{v} \neq \mathbf{w}$. Then $\mathbf{u} \times (\mathbf{v} - \mathbf{w}) = \mathbf{0}$ implies that $\mathbf{v} - \mathbf{w} = k\mathbf{u}$ for some real number $k \neq 0$. This in turn implies that $\mathbf{u} \cdot (\mathbf{v} - \mathbf{w}) = \mathbf{u} \cdot (k\mathbf{u}) = k|\mathbf{u}|^2 = 0$, which implies that $\mathbf{u} = \mathbf{0}$. Since $\mathbf{u} \neq \mathbf{0}$, it cannot be true that $\mathbf{v} \neq \mathbf{w}$, so $\mathbf{v} = \mathbf{w}$.

$\underline{L1 \& L3}$: $L1$ and $L3$ have the same direction $\frac{1}{\sqrt{14}}(2\mathbf{i} - \mathbf{j} + 3\mathbf{k})$; hence $L1$ and $L3$ are parallel.

66. The line contains $(0, 0, 3)$ and $(\sqrt{3}, 1, 3)$ because the projection of the line onto the xy -plane contains the origin and intersects the positive x -axis at a 30° angle. 68. The planes are parallel when either vector $A_1\mathbf{i} + B_1\mathbf{j} + C_1\mathbf{k}$ or $A_2\mathbf{i} + B_2\mathbf{j} + C_2\mathbf{k}$ is a multiple of the other or when $(A_1\mathbf{i} + B_1\mathbf{j} + C_1\mathbf{k}) \times (A_2\mathbf{i} + B_2\mathbf{j} + C_2\mathbf{k}) = \mathbf{0}$. The planes are perpendicular when their normals are perpendicular, or $(A_1\mathbf{i} + B_1\mathbf{j} + C_1\mathbf{k}) \cdot (A_2\mathbf{i} + B_2\mathbf{j} + C_2\mathbf{k}) = 0$.

70. Since the plane passes through the origin, its general equation is of the form $Ax + By + Cz = 0$. Since it meets the plane M at a right angle, their normal vectors are perpendicular $\Rightarrow 2A + 3B + C = 0$. One choice satisfying this equation is $A = 1, B = -1$ and $C = 1 \Rightarrow x - y + z = 0$. Any plane $Ax + By + Cz = 0$ with $2A + 3B + C = 0$ will pass through the origin and be perpendicular to M .
71. The points $(a, 0, 0)$, $(0, b, 0)$ and $(0, 0, c)$ are the x, y , and z intercepts of the plane. Since a, b , and c are all nonzero, the plane must intersect all three coordinate axes and cannot pass through the origin. Thus, $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$ describes all planes except those through the origin or parallel to a coordinate axis.
72. Yes. If \mathbf{v}_1 and \mathbf{v}_2 are nonzero vectors parallel to the lines, then $\mathbf{v}_1 \times \mathbf{v}_2 \neq \mathbf{0}$ is perpendicular to the lines.
73. (a) $\overline{EP} = c\overline{EP}_1 \Rightarrow -x_0\mathbf{i} + y\mathbf{j} + z\mathbf{k} = c[(x_1 - x_0)\mathbf{i} + y_1\mathbf{j} + z_1\mathbf{k}] \Rightarrow -x_0 = c(x_1 - x_0), y = cy_1$ and $z = cz_1$, where c is a positive real number
- (b) At $x_1 = 0 \Rightarrow c = 1 \Rightarrow y = y_1$ and $z = z_1$; at $x_1 = x_0 \Rightarrow x_0 = 0, y = 0, z = 0$; $\lim_{x_0 \rightarrow \infty} c = \lim_{x_0 \rightarrow \infty} \frac{-x_0}{x_1 - x_0}$
 $= \lim_{x_0 \rightarrow \infty} \frac{-1}{-1} = 1 \Rightarrow c \rightarrow 1$ so that $y \rightarrow y_1$ and $z \rightarrow z_1$
74. The plane which contains the triangular plane is $x + y + z = 2$. The line containing the endpoints of the line segment is $x = 1 - t, y = 2t, z = 2t$. The plane and the line intersect at $(\frac{2}{3}, \frac{2}{3}, \frac{2}{3})$. The visible section of the line segment is $\sqrt{(\frac{1}{3})^2 + (\frac{2}{3})^2 + (\frac{2}{3})^2} = 1$ unit in length. The length of the line segment is $\sqrt{1^2 + 2^2 + 2^2} = 3 \Rightarrow \frac{2}{3}$ of the line segment is hidden from view.

$$\Rightarrow V = 2 \int_0^c \frac{\pi ab}{c^2} (c^2 - z^2) dz = \frac{2\pi ab}{c^2} \left[c^2 z - \frac{z^3}{3} \right]_0^c = \frac{2\pi ab}{c^2} \left(\frac{2}{3} c^3 \right) = \frac{4\pi abc}{3}. \text{ Note that if } r = a = b = c,$$

then $V = \frac{4\pi r^3}{3}$, which is the volume of a sphere.

46. The ellipsoid has the form $\frac{x^2}{R^2} + \frac{y^2}{R^2} + \frac{z^2}{c^2} = 1$. To determine c^2 we note that the point $(0, r, h)$ lies on the surface of the barrel. Thus, $\frac{r^2}{R^2} + \frac{h^2}{c^2} = 1 \Rightarrow c^2 = \frac{h^2 R^2}{R^2 - r^2}$. We calculate the volume by the disk method:

$$V = \pi \int_{-h}^h y^2 dz. \text{ Now, } \frac{y^2}{R^2} + \frac{z^2}{c^2} = 1 \Rightarrow y^2 = R^2 \left(1 - \frac{z^2}{c^2} \right) = R^2 \left[1 - \frac{z^2(R^2 - r^2)}{h^2 R^2} \right] = R^2 - \left(\frac{R^2 - r^2}{h^2} \right) z^2$$

$$\Rightarrow V = \pi \int_{-h}^h \left[R^2 - \left(\frac{R^2 - r^2}{h^2} \right) z^2 \right] dz = \pi \left[R^2 z - \frac{1}{3} \left(\frac{R^2 - r^2}{h^2} \right) z^3 \right]_{-h}^h = 2\pi \left[R^2 h - \frac{1}{3} (R^2 - r^2) h \right] = 2\pi \left(\frac{2R^2 h}{3} + \frac{r^2 h}{3} \right)$$

$= \frac{4}{3}\pi R^2 h + \frac{2}{3}\pi r^2 h$, the volume of the barrel. If $r = R$, then $V = 2\pi R^2 h$ which is the volume of a cylinder of radius R and height $2h$. If $r = 0$ and $h = R$, then $V = \frac{4}{3}\pi R^3$ which is the volume of a sphere.

47. We calculate the volume by the slicing method, taking slices parallel to the xy -plane. For fixed z , $\frac{x^2}{a^2} + \frac{y^2}{b^2} = \frac{z}{c}$ gives the ellipse $\frac{x^2}{\left(\frac{za^2}{c}\right)} + \frac{y^2}{\left(\frac{zb^2}{c}\right)} = 1$. The area of this ellipse is $\pi\left(a\sqrt{\frac{z}{c}}\right)\left(b\sqrt{\frac{z}{c}}\right) = \frac{\pi abz}{c}$ (see Exercise 45a). Hence

the volume is given by $V = \int_0^h \frac{\pi abz}{c} dz = \left[\frac{\pi abz^2}{2c}\right]_0^h = \frac{\pi abh^2}{c}$. Now the area of the elliptic base when $z = h$ is

$A = \frac{\pi abh}{c}$, as determined previously. Thus, $V = \frac{\pi abh^2}{c} = \frac{1}{2}\left(\frac{\pi abh}{c}\right)h = \frac{1}{2}$ (base)(altitude), as claimed.

48. (a) For each fixed value of z , the hyperboloid $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$ results in a cross-sectional ellipse

$\left[\frac{x^2}{\frac{a^2(c^2+z^2)}{c^2}}\right] + \left[\frac{y^2}{\frac{b^2(c^2+z^2)}{c^2}}\right] = 1$. The area of the cross-sectional ellipse (see Exercise 45a) is

$A(z) = \pi\left(\frac{a}{c}\sqrt{c^2+z^2}\right)\left(\frac{b}{c}\sqrt{c^2+z^2}\right) = \frac{\pi ab}{c^2}(c^2+z^2)$. The volume of the solid by the method of slices is

$$V = \int_0^h A(z) dz = \int_0^h \frac{\pi ab}{c^2}(c^2+z^2) dz = \frac{\pi ab}{c^2}\left[c^2z + \frac{1}{3}z^3\right]_0^h = \frac{\pi ab}{c^2}\left(c^2h + \frac{1}{3}h^3\right) = \frac{\pi abh}{3c^2}(3c^2+h^2)$$

(b) $A_0 = A(0) = \pi ab$ and $A_h = A(h) = \frac{\pi ab}{c^2}(c^2+h^2)$, from part (a) $\Rightarrow V = \frac{\pi abh}{3c^2}(3c^2+h^2)$
 $= \frac{\pi abh}{3}\left(2+1+\frac{h^2}{c^2}\right) = \frac{\pi abh}{3}\left(2+\frac{c^2+h^2}{c^2}\right) = \frac{h}{3}\left[2\pi ab + \frac{\pi ab}{c^2}(c^2+h^2)\right] = \frac{h}{3}(2A_0 + A_h)$

(c) $A_m = A\left(\frac{h}{2}\right) = \frac{\pi ab}{c^2}\left(c^2 + \frac{h^2}{4}\right) = \frac{\pi ab}{4c^2}(4c^2+h^2) \Rightarrow \frac{h}{6}(A_0 + 4A_m + A_h)$
 $= \frac{h}{6}\left[\pi ab + \frac{\pi ab}{c^2}(4c^2+h^2) + \frac{\pi ab}{c^2}(c^2+h^2)\right] = \frac{\pi abh}{6c^2}(c^2+4c^2+h^2+c^2+h^2) = \frac{\pi abh}{6c^2}(6c^2+2h^2)$
 $= \frac{\pi abh}{3c^2}(3c^2+h^2) = V$ from part (a)

Maple:

```
with( plots );
eq := x^2/9 + y^2/36 = 1 - z^2/25;
implicitplot3d( eq, x=-3..3, y=-6..6, z=-5..5, scaling=constrained,

Mathematica: (functions and domains may vary):

In the following chapter, you will consider contours or level curves for surfaces in three dimensions. For the purposes of plotting the functions of two variables expressed implicitly in this section, we will call upon the function **ContourPlot3D**. To insert the stated function, write all terms on the same side of the equal sign and the default contour equating that expression to zero will be plotted.

This built-in function requires the loading of a special graphics package.

```
<<Graphics`ContourPlot3D`
Clear[x, y, z]
ContourPlot3D[x^2/9 - y^2/16 - z^2/2 - 1, {x, -9, 9}, {y, -12, 12}, {z, -5, 5},
              Axes -> True, AxesLabel -> {x, y, z}, Boxed -> False,
              PlotLabel -> "Elliptic Hyperboloid of Two Sheets"]
```

Your identification of the plot may or may not be able to be done without considering the graph.

If a and b are both $\neq 0$, then $ax + by = c$ contains the points $(\frac{c}{a}, 0)$ and $(0, \frac{c}{b}) \Rightarrow$ the vector $ab(\frac{c}{a}\mathbf{i} - \frac{c}{b}\mathbf{j}) = c(b\mathbf{i} - a\mathbf{j})$ and the line are parallel. 36. $P(-1, 6, 0)$ and $\mathbf{n} = \mathbf{i} - 2\mathbf{j} + 3\mathbf{k} \Rightarrow (1)(x-(-1)) + (-2)(y-6) + (3)(z-0) = 0 \Rightarrow x - 2y + 3z = -13$

37. $P(1, -1, 2), Q(2, 1, 3)$ and $R(-1, 2, -1) \Rightarrow \overline{PQ} = \mathbf{i} + 2\mathbf{j} + \mathbf{k}, \overline{PR} = -2\mathbf{i} + 3\mathbf{j} - 3\mathbf{k}$ and

$$\overline{PQ} \times \overline{PR} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2 & 1 \\ -2 & 3 & -3 \end{vmatrix} = -9\mathbf{i} + \mathbf{j} + 7\mathbf{k} \text{ is normal to the plane } \Rightarrow (-9)(x-1) + (1)(y+1) + (7)(z-2) = 0$$

$$\Rightarrow -9x + y + 7z = 4$$

38. $P(1, 0, 0), Q(0, 1, 0)$ and $R(0, 0, 1) \Rightarrow \overline{PQ} = -\mathbf{i} + \mathbf{j}, \overline{PR} = -\mathbf{i} + \mathbf{k}$ and $\overline{PQ} \times \overline{PR} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -1 & 1 & 0 \\ -1 & 0 & 1 \end{vmatrix} = \mathbf{i} + \mathbf{j} + \mathbf{k}$ is

normal to the plane $\Rightarrow (1)(x-1) + (1)(y-0) + (1)(z-0) = 0 \Rightarrow x + y + z = 1$

39. $(0, -\frac{1}{2}, -\frac{3}{2})$, since $t = -\frac{1}{2}, y = -\frac{1}{2}$ and $z = -\frac{3}{2}$ when $x = 0$; $(-1, 0, -3)$, since $t = -1, x = -1$ and $z = -3$ when $y = 0$; $(1, -1, 0)$, since $t = 0, x = 1$ and $y = -1$ when $z = 0$

40. $x = 2t, y = -t, z = -t$ represents a line containing the origin and perpendicular to the plane $2x - y - z = 4$; this line intersects the plane $3x - 5y + 2z = 6$ when t is the solution of $3(2t) - 5(-t) + 2(-t) = 6 \Rightarrow t = \frac{2}{3}$
 $\Rightarrow (\frac{4}{3}, -\frac{2}{3}, -\frac{2}{3})$ is the point of intersection

41. $\mathbf{n}_1 = \mathbf{i}$ and $\mathbf{n}_2 = \mathbf{i} + \mathbf{j} + \sqrt{2}\mathbf{k} \Rightarrow$ the desired angle is $\cos^{-1}\left(\frac{\mathbf{n}_1 \cdot \mathbf{n}_2}{|\mathbf{n}_1||\mathbf{n}_2|}\right) = \cos^{-1}\left(\frac{1}{2}\right) = \frac{\pi}{3}$

42. $\mathbf{n}_1 = \mathbf{i} + \mathbf{j}$ and $\mathbf{n}_2 = \mathbf{j} + \mathbf{k} \Rightarrow$ the desired angle is $\cos^{-1}\left(\frac{\mathbf{n}_1 \cdot \mathbf{n}_2}{|\mathbf{n}_1||\mathbf{n}_2|}\right) = \cos^{-1}\left(\frac{1}{2}\right) = \frac{\pi}{3}$

43. The direction of the line is $\mathbf{n}_1 \times \mathbf{n}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2 & 1 \\ 1 & -1 & 2 \end{vmatrix} = 5\mathbf{i} - \mathbf{j} - 3\mathbf{k}$. Since the point $(-5, 3, 0)$ is on both planes, the desired line is $x = -5 + 5t, y = 3 - t, z = -3t$.

44. The direction of the intersection is $\mathbf{n}_1 \times \mathbf{n}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2 & -2 \\ 5 & -2 & -1 \end{vmatrix} = -6\mathbf{i} - 9\mathbf{j} - 12\mathbf{k} = -3(2\mathbf{i} + 3\mathbf{j} + 4\mathbf{k})$ and is the same as the direction of the given line.

45. (a) The corresponding normals are $\mathbf{n}_1 = 3\mathbf{i} + 6\mathbf{k}$ and $\mathbf{n}_2 = 2\mathbf{i} + 2\mathbf{j} - \mathbf{k}$ and since $\mathbf{n}_1 \cdot \mathbf{n}_2 = (3)(2) + (0)(2) + (6)(-1) = 6 + 0 - 6 = 0$, we have that the plans are orthogonal

(b) The line of intersection is parallel to $\mathbf{n}_1 \times \mathbf{n}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3 & 0 & 6 \\ 2 & 2 & -1 \end{vmatrix} = -12\mathbf{i} + 15\mathbf{j} + 6\mathbf{k}$. Now to find a point in the

intersection, solve $\begin{cases} 3x + 6z = 1 \\ 2x + 2y - z = 3 \end{cases} \Rightarrow \begin{cases} 3x + 6z = 1 \\ 12x + 12y - 6z = 18 \end{cases} \Rightarrow 15x + 12y = 19 \Rightarrow x = 0 \text{ and } y = \frac{19}{12}$
 $\Rightarrow (0, \frac{19}{12}, \frac{1}{6})$ is a point on the line we seek. Therefore, the line is $x = -12t, y = \frac{19}{12} + 15t$ and $z = \frac{1}{6} + 6t$.

46. A vector in the direction of the plane's normal is $\mathbf{n} = \mathbf{u} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 3 & 1 \\ 1 & -1 & 2 \end{vmatrix} = 7\mathbf{i} - 3\mathbf{j} - 5\mathbf{k}$ and $P(1, 2, 3)$ on the plane $\Rightarrow 7(x-1) - 3(y-2) - 5(z-3) = 0 \Rightarrow 7x - 3y - 5z = -14$.

47. Yes; $\mathbf{v} \cdot \mathbf{n} = (2\mathbf{i} - 4\mathbf{j} + \mathbf{k}) \cdot (7\mathbf{i} - 3\mathbf{j} - 5\mathbf{k}) = 2 \cdot 7 - 4 \cdot (-3) + 1 \cdot (-5) = 14 + 12 - 5 = 21 \neq 0 \Rightarrow$ the vector is not orthogonal to the plane's normal $\Rightarrow \mathbf{v}$ is not parallel to the plane

48. $\mathbf{n} \cdot \overline{PP_0} > 0$ represents the half-space of points lying on one side of the plane in the direction which the normal \mathbf{n} points

49. A normal to the plane is $\mathbf{n} = \overline{AB} \times \overline{AC} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 0 & -1 \\ 2 & -1 & 0 \end{vmatrix} = -\mathbf{i} - 2\mathbf{j} - 2\mathbf{k} \Rightarrow$ the distance is

$$d = \left| \frac{\overline{AP} \cdot \mathbf{n}}{|\mathbf{n}|} \right| = \left| \frac{(1+4\mathbf{j}) \cdot (-\mathbf{i} - 2\mathbf{j} - 2\mathbf{k})}{\sqrt{1+4+4}} \right| = \left| \frac{-1-8+0}{3} \right| = 3$$

50. $P(0, 0, 0)$ lies on the plane $2x + 3y + 5z = 0$, and $\overline{PS} = 2\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}$ with $\mathbf{n} = 2\mathbf{i} + 3\mathbf{j} + 5\mathbf{k}$

$$\Rightarrow d = \left| \frac{\mathbf{n} \cdot \overline{PS}}{|\mathbf{n}|} \right| = \left| \frac{4+6+15}{\sqrt{4+9+25}} \right| = \frac{25}{\sqrt{38}}$$

51. $\mathbf{n} = 2\mathbf{i} - \mathbf{j} - \mathbf{k}$ is normal to the plane $\Rightarrow \mathbf{n} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & -1 & -1 \\ 1 & 1 & 1 \end{vmatrix} = 0\mathbf{i} - 3\mathbf{j} + 3\mathbf{k} = -3\mathbf{j} + 3\mathbf{k}$ is orthogonal to \mathbf{v} and parallel to the plane

52. The vector $\mathbf{B} \times \mathbf{C}$ is normal to the plane of \mathbf{B} and $\mathbf{C} \Rightarrow \mathbf{A} \times (\mathbf{B} \times \mathbf{C})$ is orthogonal to \mathbf{A} and parallel to the plane of \mathbf{B} and \mathbf{C} :

$$\mathbf{B} \times \mathbf{C} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2 & 1 \\ 1 & 1 & -2 \end{vmatrix} = -5\mathbf{i} + 3\mathbf{j} - \mathbf{k} \text{ and } \mathbf{A} \times (\mathbf{B} \times \mathbf{C}) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & -1 & 1 \\ -5 & 3 & -1 \end{vmatrix} = -2\mathbf{i} - 3\mathbf{j} + \mathbf{k}$$

$$\Rightarrow |\mathbf{A} \times (\mathbf{B} \times \mathbf{C})| = \sqrt{4+9+1} = \sqrt{14} \text{ and } \mathbf{u} = \frac{1}{\sqrt{14}}(-2\mathbf{i} - 3\mathbf{j} + \mathbf{k}) \text{ is the desired unit vector.}$$

53. A vector parallel to the line of intersection is $\mathbf{v} = \mathbf{n}_1 \times \mathbf{n}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2 & 1 \\ 1 & -1 & 2 \end{vmatrix} = 5\mathbf{i} - \mathbf{j} - 3\mathbf{k} \Rightarrow |\mathbf{v}| = \sqrt{25+1+9} = \sqrt{35}$

$$\Rightarrow 2 \left(\frac{\mathbf{v}}{|\mathbf{v}|} \right) = \frac{2}{\sqrt{35}}(5\mathbf{i} - \mathbf{j} - 3\mathbf{k}) \text{ is the desired vector.}$$

54. The line containing $(0, 0, 0)$ normal to the plane is represented by $x = 2t$, $y = -t$, and $z = -t$. This line intersects the plane $3x - 5y + 2z = 6$ when $3(2t) - 5(-t) + 2(-t) = 6 \Rightarrow t = \frac{2}{3} \Rightarrow$ the point is $\left(\frac{4}{3}, -\frac{2}{3}, -\frac{2}{3}\right)$.

55. The line is represented by $x = 3 + 2t$, $y = 2 - t$, and $z = 1 + 2t$. It meets the plane $2x - y + 2z = -2$ when $2(3 + 2t) - (2 - t) + 2(1 + 2t) = -2 \Rightarrow t = -\frac{8}{9} \Rightarrow$ the point is $(\frac{11}{9}, \frac{26}{9}, -\frac{7}{9})$.

56. The direction of the intersection is $\mathbf{v} = \mathbf{n}_1 \times \mathbf{n}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 1 & -1 \\ 1 & 1 & 2 \end{vmatrix} = 3\mathbf{i} - 5\mathbf{j} + \mathbf{k}$

$$\Rightarrow \theta = \cos^{-1}\left(\frac{\mathbf{v} \cdot \mathbf{i}}{|\mathbf{v}|}\right) = \cos^{-1}\left(\frac{3}{\sqrt{35}}\right) \approx 59.5^\circ$$

57. The intersection occurs when $(3 + 2t) + 3(2t) - t = -4 \Rightarrow t = -1 \Rightarrow$ the point is $(1, -2, -1)$. The required line must be perpendicular to both the given line and to the normal, and hence is parallel to

$$\begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 2 & 1 \\ 1 & 3 & -1 \end{vmatrix} = -5\mathbf{i} + 3\mathbf{j} + 4\mathbf{k} \Rightarrow \text{the line is represented by } x = 1 - 5t, y = -2 + 3t, \text{ and } z = -1 + 4t.$$

58. If $P(a, b, c)$ is a point on the line of intersection, then P lies in both planes $\Rightarrow a - 2b + c + 3 = 0$ and $2a - b - c + 1 = 0 \Rightarrow (a - 2b + c + 3) + k(2a - b - c + 1) = 0$ for all k .

59. The vector $\overline{AB} \times \overline{CD} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3 & -2 & 4 \\ \frac{26}{5} & 0 & -\frac{26}{5} \end{vmatrix} = \frac{26}{5}(2\mathbf{i} + 7\mathbf{j} + 2\mathbf{k})$ is normal to the plane and $A(-2, 0, -3)$ lies on the plane $\Rightarrow 2(x + 2) + 7(y - 0) + 2(z - (-3)) = 0 \Rightarrow 2x + 7y + 2z + 10 = 0$ is an equation of the plane.

60. Yes; the line's direction vector is $2\mathbf{i} + 3\mathbf{j} - 5\mathbf{k}$ which is parallel to the line and also parallel to the normal $-4\mathbf{i} - 6\mathbf{j} + 10\mathbf{k}$ to the plane \Rightarrow the line is orthogonal to the plane.

61. The vector $\overline{PQ} \times \overline{PR} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & -1 & 3 \\ -3 & 0 & 1 \end{vmatrix} = -\mathbf{i} - 11\mathbf{j} - 3\mathbf{k}$ is normal to the plane.

- (a) No, the plane is not orthogonal to $\overline{PQ} \times \overline{PR}$.
- (b) No, these equations represent a line, not a plane.
- (c) No, the plane $(x + 2) + 11(y - 1) - 3z = 0$ has normal $\mathbf{i} + 11\mathbf{j} - 3\mathbf{k}$ which is not parallel to $\overline{PQ} \times \overline{PR}$.
- (d) No, this vector equation is equivalent to the equations $3y + 3z = 3, 3x - 2z = -6$, and $3x + 2y = -4 \Rightarrow x = -\frac{4}{3} - \frac{2}{3}t, y = t, z = 1 - t$, which represents a line, not a plane.
- (e) yes, this is a plane containing the point $R(-2, 1, 0)$ with normal $\overline{PQ} \times \overline{PR}$.

62. (a) The line through A and B is $x = 1 + t, y = -t, z = -1 + 5t$; the line through C and D must be parallel and is $L_1: x = 1 + t, y = 2 - t, z = 3 + 5t$. The line through B and C is $x = 1, y = 2 + 2s, z = 3 + 4s$; the line through A and D must be parallel and is $L_2: x = 2, y = -1 + 2s, z = 4 + 4s$. The lines L_1 and L_2 intersect at $D(2, 1, 8)$ where $t = 1$ and $s = 1$.

- (e) From part (d), $\mathbf{n} = 14\mathbf{i} + 4\mathbf{j} - 2\mathbf{k}$ is normal to the plane $\Rightarrow 14(x-1) + 4(y-0) - 2(z+1) = 0$
 $\Rightarrow 7x + 2y - z = 8.$
- (f) From part (d), $\mathbf{n} = 14\mathbf{i} + 4\mathbf{j} - 2\mathbf{k} \Rightarrow$ the area of the projection on the yz -plane is $|\mathbf{n} \cdot \mathbf{i}| = 14$; the area of the projection on the xz -plane is $|\mathbf{n} \cdot \mathbf{j}| = 4$; and the area of the projection on the xy -plane is $|\mathbf{n} \cdot \mathbf{k}| = 2.$

63. $\overline{AB} = -2\mathbf{i} + \mathbf{j} + \mathbf{k}, \overline{CD} = \mathbf{i} + 4\mathbf{j} - \mathbf{k},$ and $\overline{AC} = 2\mathbf{i} + \mathbf{j} \Rightarrow \mathbf{n} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -2 & 1 & 1 \\ 1 & 4 & -1 \end{vmatrix} = -5\mathbf{i} - \mathbf{j} - 9\mathbf{k} \Rightarrow$ the distance is

$$d = \frac{|(2\mathbf{i} + \mathbf{j}) \cdot (-5\mathbf{i} - \mathbf{j} - 9\mathbf{k})|}{\sqrt{25 + 1 + 81}} = \frac{11}{\sqrt{107}}$$

CHAPTER 12 ADDITIONAL AND ADVANCED EXERCISES

- Information from ship A indicates the submarine is now on the line $L_1: x = 4 + 2t, y = 3t, z = -\frac{1}{3}t$; information from ship B indicates the submarine is now on the line $L_2: x = 18s, y = 5 - 6s, z = -s$. The current position of the sub is $(6, 3, -\frac{1}{3})$ and occurs when the lines intersect at $t = 1$ and $s = \frac{1}{3}$. The straight line path of the submarine contains both point $P(2, -1, -\frac{1}{3})$ and $Q(6, 3, -\frac{1}{3})$; the line representing this path is $L: x = 2 + 4t, y = -1 + 4t, z = -\frac{1}{3}$. The submarine traveled the distance between P and Q in 4 minutes \Rightarrow a speed of $\frac{|PQ|}{4} = \frac{\sqrt{32}}{4} = \sqrt{2}$ thousand ft/min. In 20 minutes the submarine will move $20\sqrt{2}$ thousand ft from Q along the line $L \Rightarrow 20\sqrt{2} = \sqrt{(2 + 4t - 6)^2 + (-1 + 4t - 3)^2 + 0^2} \Rightarrow 800 = 16(t - 1)^2 + 16(t - 1)^2 = 32(t - 1)^2 \Rightarrow (t - 1)^2 = \frac{800}{32} = 25 \Rightarrow t = 6 \Rightarrow$ the submarine will be located at $(26, 23, -\frac{1}{3})$ in 20 minutes.
- H_2 stops its flight when $6 + 110t = 446 \Rightarrow t = 4$ hours. After 6 hours, H_1 is at $P(246, 57, 9)$ while H_2 is at $(446, 13, 0)$. The distance between P and Q is $\sqrt{(246 - 446)^2 + (57 - 13)^2 + (9 - 0)^2} \approx 204.98$ miles. At 150 mph, it would take about 1.37 hours for H_1 to reach H_2 .
- Torque $= |\overrightarrow{PQ} \times \mathbf{F}| \Rightarrow 15 \text{ ft}\cdot\text{lb} = |\overrightarrow{PQ}| |\mathbf{F}| \sin \frac{\pi}{2} = \frac{3}{4} \text{ ft} \cdot |\mathbf{F}| \Rightarrow |\mathbf{F}| = 20 \text{ lb}$

4. Let $\mathbf{a} = \mathbf{i} + \mathbf{j} + \mathbf{k}$ be the vector from O to A and $\mathbf{b} = \mathbf{i} + 3\mathbf{j} + 2\mathbf{k}$ be the vector from O to B . The vector \mathbf{v} orthogonal to \mathbf{a} and $\mathbf{b} \Rightarrow \mathbf{v}$ is parallel to $\mathbf{b} \times \mathbf{a}$ (since the rotation is clockwise). Now $\mathbf{b} \times \mathbf{a} = \mathbf{i} + \mathbf{j} - 2\mathbf{k}$; $\text{proj}_{\mathbf{a}} \mathbf{b} = \left(\frac{\mathbf{a} \cdot \mathbf{b}}{\mathbf{a} \cdot \mathbf{a}}\right) \mathbf{a} = 2\mathbf{i} + 2\mathbf{j} + 2\mathbf{k} \Rightarrow (2, 2, 2)$ is the center of the circular path (1, 3, 2) takes \Rightarrow radius $= \sqrt{1^2 + (-1)^2 + 0^2} = \sqrt{2} \Rightarrow$ arc length per second covered by the point is $\frac{3}{2}\sqrt{2}$ units/sec $= |\mathbf{v}|$ (velocity is constant). A unit vector in the direction of \mathbf{v} is $\frac{\mathbf{b} \times \mathbf{a}}{|\mathbf{b} \times \mathbf{a}|} = \frac{1}{\sqrt{6}}\mathbf{i} + \frac{1}{\sqrt{6}}\mathbf{j} - \frac{2}{\sqrt{6}}\mathbf{k}$ $\Rightarrow \mathbf{v} = |\mathbf{v}| \left(\frac{\mathbf{b} \times \mathbf{a}}{|\mathbf{b} \times \mathbf{a}|}\right) = \frac{3}{2}\sqrt{2} \left(\frac{1}{\sqrt{6}}\mathbf{i} + \frac{1}{\sqrt{6}}\mathbf{j} - \frac{2}{\sqrt{6}}\mathbf{k}\right) = \frac{\sqrt{3}}{2}\mathbf{i} + \frac{\sqrt{3}}{2}\mathbf{j} - \sqrt{3}\mathbf{k}$

5. (a) By the Law of Cosines we have $\cos \alpha = \frac{3^2 + 5^2 - 4^2}{2(3)(5)} = \frac{3}{5}$ and $\cos \beta = \frac{4^2 + 5^2 - 3^2}{2(4)(5)} = \frac{4}{5} \Rightarrow \sin \alpha = \frac{4}{5}$ and $\sin \beta = \frac{3}{5}$ $\Rightarrow \mathbf{F}_1 = \langle -|\mathbf{F}_1| \cos \alpha, |\mathbf{F}_1| \sin \alpha \rangle = \langle -\frac{3}{5}|\mathbf{F}_1|, \frac{4}{5}|\mathbf{F}_1| \rangle$, $\mathbf{F}_2 = \langle |\mathbf{F}_2| \cos \beta, |\mathbf{F}_2| \sin \beta \rangle = \langle \frac{4}{5}|\mathbf{F}_2|, \frac{3}{5}|\mathbf{F}_2| \rangle$, and $\mathbf{w} = \langle 0, -100 \rangle$. Since $\mathbf{F}_1 + \mathbf{F}_2 = \langle 0, 100 \rangle \Rightarrow \langle -\frac{3}{5}|\mathbf{F}_1| + \frac{4}{5}|\mathbf{F}_2|, \frac{4}{5}|\mathbf{F}_1| + \frac{3}{5}|\mathbf{F}_2| \rangle = \langle 0, 100 \rangle \Rightarrow -\frac{3}{5}|\mathbf{F}_1| + \frac{4}{5}|\mathbf{F}_2| = 0$ and $\frac{4}{5}|\mathbf{F}_1| + \frac{3}{5}|\mathbf{F}_2| = 100$. Solving the first equation for $|\mathbf{F}_2|$ results in: $|\mathbf{F}_2| = \frac{3}{4}|\mathbf{F}_1|$. Substituting this result into the second equation gives us: $\frac{4}{5}|\mathbf{F}_1| + \frac{9}{20}|\mathbf{F}_1| = 100 \Rightarrow |\mathbf{F}_1| = 80$ lb. $\Rightarrow |\mathbf{F}_2| = 60$ lb. $\Rightarrow \mathbf{F}_1 = \langle -48, 64 \rangle$ and $\mathbf{F}_2 = \langle 48, 36 \rangle$, and $\alpha = \tan^{-1}\left(\frac{4}{3}\right)$ and $\beta = \tan^{-1}\left(\frac{3}{4}\right)$

(b) By the Law of Cosines we have $\cos \alpha = \frac{5^2 + 13^2 - 12^2}{2(5)(13)} = \frac{5}{13}$ and $\cos \beta = \frac{12^2 + 13^2 - 5^2}{2(12)(13)} = \frac{12}{13} \Rightarrow \sin \alpha = \frac{12}{13}$ and $\sin \beta = \frac{5}{13} \Rightarrow \mathbf{F}_1 = \langle -|\mathbf{F}_1| \cos \alpha, |\mathbf{F}_1| \sin \alpha \rangle = \langle -\frac{5}{13}|\mathbf{F}_1|, \frac{12}{13}|\mathbf{F}_1| \rangle$, $\mathbf{F}_2 = \langle |\mathbf{F}_2| \cos \beta, |\mathbf{F}_2| \sin \beta \rangle = \langle \frac{12}{13}|\mathbf{F}_2|, \frac{5}{13}|\mathbf{F}_2| \rangle$, and $\mathbf{w} = \langle 0, -200 \rangle$. Since $\mathbf{F}_1 + \mathbf{F}_2 = \langle 0, 200 \rangle \Rightarrow \langle -\frac{5}{13}|\mathbf{F}_1| + \frac{12}{13}|\mathbf{F}_2|, \frac{12}{13}|\mathbf{F}_1| + \frac{5}{13}|\mathbf{F}_2| \rangle = \langle 0, 200 \rangle \Rightarrow -\frac{5}{13}|\mathbf{F}_1| + \frac{12}{13}|\mathbf{F}_2| = 0$ and $\frac{12}{13}|\mathbf{F}_1| + \frac{5}{13}|\mathbf{F}_2| = 200$. Solving the first equation for $|\mathbf{F}_2|$ results in: $|\mathbf{F}_2| = \frac{5}{12}|\mathbf{F}_1|$. Substituting this result into the second equation gives us: $\frac{12}{13}|\mathbf{F}_1| + \frac{25}{156}|\mathbf{F}_1| = 200 \Rightarrow |\mathbf{F}_1| = \frac{2400}{13} \approx 184.615$ lb. $\Rightarrow |\mathbf{F}_2| = \frac{1000}{13} \approx 76.923$ lb. $\Rightarrow \mathbf{F}_1 = \langle -\frac{12000}{1169}, \frac{28800}{1169} \rangle \approx \langle -71.006, 170.414 \rangle$ and $\mathbf{F}_2 = \langle \frac{12000}{1169}, \frac{5000}{1169} \rangle \approx \langle 71.006, 29.586 \rangle$.

6. (a) $\mathbf{T}_1 = \langle -|\mathbf{T}_1| \cos \alpha, |\mathbf{T}_1| \sin \alpha \rangle$, $\mathbf{T}_2 = \langle |\mathbf{T}_2| \cos \beta, |\mathbf{T}_2| \sin \beta \rangle$, and $\mathbf{w} = \langle 0, -w \rangle$. Since $\mathbf{T}_1 + \mathbf{T}_2 = \langle 0, w \rangle \Rightarrow \langle -|\mathbf{T}_1| \cos \alpha + |\mathbf{T}_2| \cos \beta, |\mathbf{T}_1| \sin \alpha + |\mathbf{T}_2| \sin \beta \rangle = \langle 0, w \rangle \Rightarrow -|\mathbf{T}_1| \cos \alpha + |\mathbf{T}_2| \cos \beta = 0$ and $|\mathbf{T}_1| \sin \alpha + |\mathbf{T}_2| \sin \beta = w$. Solving the first equation for $|\mathbf{T}_2|$ results in: $|\mathbf{T}_2| = \frac{\cos \alpha}{\cos \beta} |\mathbf{T}_1|$. Substituting this

result into the second equation gives us: $|\mathbf{T}_1| \sin \alpha + \frac{\cos \alpha \sin \beta}{\cos \beta} |\mathbf{T}_1| = w$ $\Rightarrow |\mathbf{T}_1| = \frac{w \cos \beta}{\sin \alpha \cos \beta + \cos \alpha \sin \beta} = \frac{w \cos \beta}{\sin(\alpha + \beta)}$ and $|\mathbf{T}_2| = \frac{w \cos \beta}{\sin(\alpha + \beta)}$

(b) $\frac{d}{d\alpha} (|\mathbf{T}_1|) = \frac{d}{d\alpha} \left(\frac{w \cos \beta}{\sin(\alpha + \beta)} \right) = \frac{-w \cos \beta \cos(\alpha + \beta)}{\sin^2(\alpha + \beta)}$; $\frac{d}{d\alpha} (|\mathbf{T}_1|) = 0 \Rightarrow -w \cos \beta \cos(\alpha + \beta) = 0 \Rightarrow \cos(\alpha + \beta) = 0$

$\Rightarrow \alpha + \beta = \frac{\pi}{2} \Rightarrow \alpha = \frac{\pi}{2} - \beta$; $\frac{d^2}{d\alpha^2} (|\mathbf{T}_1|) = \frac{d}{d\alpha} \left(\frac{-w \cos \beta \cos(\alpha + \beta)}{\sin^2(\alpha + \beta)} \right) = \frac{w \cos \beta (\cos^2(\alpha + \beta) + 1)}{\sin^3(\alpha + \beta)}$;

$\frac{d^2}{d\alpha^2} (|\mathbf{T}_1|) \Big|_{\alpha = \frac{\pi}{2} - \beta} = w \cos \beta > 0 \Rightarrow$ local minimum when $\alpha = \frac{\pi}{2} - \beta$

$$(c) \frac{d}{d\beta}(|\mathbf{T}_2|) = \frac{d}{d\beta} \left(\frac{w \cos \alpha}{\sin(\alpha + \beta)} \right) = \frac{-w \cos \alpha \cos(\alpha + \beta)}{\sin^2(\alpha + \beta)}; \quad \frac{d}{d\beta}(|\mathbf{T}_2|) = 0 \Rightarrow -w \cos \alpha \cos(\alpha + \beta) = 0$$

$$\Rightarrow \cos(\alpha + \beta) = 0 \Rightarrow \alpha + \beta = \frac{\pi}{2} \Rightarrow \beta = \frac{\pi}{2} - \alpha; \quad \frac{d^2}{d\beta^2}(|\mathbf{T}_2|) = \frac{d}{d\beta} \left(\frac{-w \cos \alpha \cos(\alpha + \beta)}{\sin^2(\alpha + \beta)} \right) = \frac{w \cos \alpha (\cos^2(\alpha + \beta) + 1)}{\sin^3(\alpha + \beta)};$$

$$\frac{d^2}{d\alpha^2}(|\mathbf{T}_2|) \Big|_{\beta = \frac{\pi}{2} - \alpha} = w \cos \alpha > 0 \Rightarrow \text{local minimum when } \beta = \frac{\pi}{2} - \alpha$$

7. (a) If $P(x, y, z)$ is a point in the plane determined by the three points $P_1(x_1, y_1, z_1)$, $P_2(x_2, y_2, z_2)$ and $P_3(x_3, y_3, z_3)$, then the vectors $\overline{PP_1}$, $\overline{PP_2}$ and $\overline{PP_3}$ all lie in the plane. Thus $\overline{PP_1} \cdot (\overline{PP_2} \times \overline{PP_3}) = 0$

$$\Rightarrow \begin{vmatrix} x_1 - x & y_1 - y & z_1 - z \\ x_2 - x & y_2 - y & z_2 - z \\ x_3 - x & y_3 - y & z_3 - z \end{vmatrix} = 0 \text{ by the determinant formula for the triple scalar product in Section 12.4.}$$

- (b) Subtract row 1 from rows 2, 3, and 4 and evaluate the resulting determinant (which has the same value as the given determinant) by cofactor expansion about column 4. This expansion is exactly the determinant in part (a) so we have all points $P(x, y, z)$ in the plane determined by $P_1(x_1, y_1, z_1)$, $P_2(x_2, y_2, z_2)$, and $P_3(x_3, y_3, z_3)$.

8. Let $L_1: x = a_1s + b_1, y = a_2s + b_2, z = a_3s + b_3$ and $L_2: x = c_1t + d_1, y = c_2t + d_2, z = c_3t + d_3$. If $L_1 \parallel L_2$, then for

some $k, a_i = kc_i, i = 1, 2, 3$ and the determinant $\begin{vmatrix} a_1 & c_1 & b_1 - d_1 \\ a_2 & c_2 & b_2 - d_2 \\ a_3 & c_3 & b_3 - d_3 \end{vmatrix} = \begin{vmatrix} kc_1 & c_1 & b_1 - d_1 \\ kc_2 & c_2 & b_2 - d_2 \\ kc_3 & c_3 & b_3 - d_3 \end{vmatrix} = 0$, since the first

column is a multiple of the second column. The lines L_1 and L_2 intersect if and only if the system

$$\begin{cases} a_1s - c_1t + (b_1 - d_1) = 0 \\ a_2s - c_2t + (b_2 - d_2) = 0 \\ a_3s - c_3t + (b_3 - d_3) = 0 \end{cases} \text{ has a nontrivial solution } \Leftrightarrow \text{the determinant of the coefficients is zero.}$$

9. (a) Place the tetrahedron so that A is at $(0, 0, 0)$, the point P is on the y -axis, and $\triangle ABC$ lies in the xy -plane. Since $\triangle ABC$ is an equilateral triangle, all the angles in the triangle are 60° and since AP bisects $BC \Rightarrow \triangle ABP$ is a $30^\circ - 60^\circ - 90^\circ$ triangle. Thus the coordinates of P are $(0, \sqrt{3}, 0)$, the coordinates of B are $(1, \sqrt{3}, 0)$, and the coordinates of C are $(-1, \sqrt{3}, 0)$. Let the coordinates of D be given by (a, b, c) . Since all of the faces are equilateral triangles \Rightarrow all the angles in each of the triangles are $60^\circ \Rightarrow \cos(\angle DAB) = \cos(60^\circ) = \frac{\overline{AD} \cdot \overline{AB}}{|\overline{AD}| |\overline{AB}|} = \frac{a + b\sqrt{3}}{(2)(2)} = \frac{1}{2} \Rightarrow a + b\sqrt{3} = 2$ and $\cos(\angle DAC) = \cos(60^\circ) = \frac{\overline{AD} \cdot \overline{AC}}{|\overline{AD}| |\overline{AC}|} = \frac{-a + b\sqrt{3}}{(2)(2)} = \frac{1}{2} \Rightarrow -a + b\sqrt{3} = 2$. Add the two equations to obtain: $2b\sqrt{3} = 4 \Rightarrow b = \frac{2}{\sqrt{3}}$.

Substituting this value for b in the first equation gives us: $a + \left(\frac{2}{\sqrt{3}}\right)\sqrt{3} = 2 \Rightarrow a = 0$. Since

$$|\overline{AD}| = \sqrt{a^2 + b^2 + c^2} = 2 \Rightarrow 0^2 + \left(\frac{2}{\sqrt{3}}\right)^2 + c^2 = 4 \Rightarrow c = \frac{2\sqrt{2}}{\sqrt{3}}. \text{ Thus the coordinates of } D \text{ are } \left(0, \frac{2}{\sqrt{3}}, \frac{2\sqrt{2}}{\sqrt{3}}\right).$$

$$\cos \theta = \cos(\angle DAP) = \frac{\overline{AD} \cdot \overline{AP}}{|\overline{AD}| |\overline{AP}|} = \frac{2}{2\sqrt{3}} \Rightarrow \theta = \cos^{-1}\left(\frac{1}{\sqrt{3}}\right) \Rightarrow 57.74^\circ$$

- (b) Since $\triangle ABC$ lies in the xy -plane \Rightarrow the normal to the face given by $\triangle ABC$ is $\mathbf{n}_1 = \mathbf{k}$. The face given by $\triangle BCD$ is an adjacent face. The vectors $\overline{DB} = \mathbf{i} + \frac{1}{\sqrt{3}}\mathbf{j} - \frac{2\sqrt{2}}{\sqrt{3}}\mathbf{k}$ and $\overline{DC} = -\mathbf{i} + \frac{1}{\sqrt{3}}\mathbf{j} - \frac{2\sqrt{2}}{\sqrt{3}}\mathbf{k}$ both lie in the

plane containing $\triangle BCD$. The normal to this plane is given by $\mathbf{n}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & \frac{1}{\sqrt{3}} & -\frac{2\sqrt{2}}{\sqrt{3}} \\ -1 & \frac{1}{\sqrt{3}} & -\frac{2\sqrt{2}}{\sqrt{3}} \end{vmatrix} = \frac{4\sqrt{2}}{\sqrt{3}}\mathbf{j} + \frac{2}{\sqrt{3}}\mathbf{k}$.

The angle θ between two adjacent faces is given by $\cos \theta = \cos(\angle DAP) = \frac{\mathbf{n}_1 \cdot \mathbf{n}_2}{|\mathbf{n}_1||\mathbf{n}_2|} = \frac{2/\sqrt{3}}{(1)(6/\sqrt{3})}$

$$\Rightarrow \theta = \cos^{-1}\left(\frac{1}{3}\right) \approx 70.53^\circ.$$

10. Extend \overline{CD} to \overline{CG} so that $\overline{CD} = \overline{DG}$. Then $\overline{CG} = t\overline{CF} = \overline{CB} + \overline{BG}$ and $t\overline{CF} = 3\overline{CE} + \overline{CA}$, since $ACBG$ is a parallelogram. If $t\overline{CF} - 3\overline{CE} = \overline{CA} = \mathbf{0}$, then $t - 3 - 1 = 0 \Rightarrow t = 4$, since F, E , and A are collinear. Therefore, $\overline{CG} = 4\overline{CF} \Rightarrow \overline{CD} = 2\overline{CF} \Rightarrow F$ is the midpoint of \overline{CD} .
11. If $Q(x, y)$ is a point on the line $ax + by = c$, then $\overline{P_1Q} = (x - x_1)\mathbf{i} + (y - y_1)\mathbf{j}$, and $\mathbf{n} = a\mathbf{i} + b\mathbf{j}$ is normal to the line. The distance is $|\text{proj}_{\mathbf{n}} \overline{P_1Q}| = \left| \frac{[(x - x_1)\mathbf{i} + (y - y_1)\mathbf{j}] \cdot (a\mathbf{i} + b\mathbf{j})}{\sqrt{a^2 + b^2}} \right| = \frac{|a(x - x_1) + b(y - y_1)|}{\sqrt{a^2 + b^2}} = \frac{|ax_1 + by_1 - c|}{\sqrt{a^2 + b^2}}$, since $c = ax + by$.
12. (a) Let $Q(x, y, z)$ be any point on $Ax + By + Cz - D = 0$. Let $\overline{QP_1} = (x - x_1)\mathbf{i} + (y - y_1)\mathbf{j} + (z - z_1)\mathbf{k}$, and $\mathbf{n} = \frac{A\mathbf{i} + B\mathbf{j} + C\mathbf{k}}{\sqrt{A^2 + B^2 + C^2}}$. The distance is $|\text{proj}_{\mathbf{n}} \overline{QP_1}| = \left| \frac{[(x - x_1)\mathbf{i} + (y - y_1)\mathbf{j} + (z - z_1)\mathbf{k}] \cdot \left(\frac{A\mathbf{i} + B\mathbf{j} + C\mathbf{k}}{\sqrt{A^2 + B^2 + C^2}}\right)}{\sqrt{A^2 + B^2 + C^2}} \right| = \frac{|Ax_1 + By_1 + Cz_1 - D|}{\sqrt{A^2 + B^2 + C^2}}$.
- (b) Since both tangent planes are parallel, one-half of the distance between them is equal to the radius of the sphere, i. e., $r = \frac{1}{2} \frac{|3 - 9|}{\sqrt{1 + 1 + 1}} = \sqrt{3}$ (see also Exercise 12a). Clearly, the points $(1, 2, 3)$ and $(-1, -2, -3)$ are on the line containing the sphere's center. Hence, the line containing the center is $x = 1 + 2t$, $y = 2 + 4t$, $z = 3 + 6t$. The distance from the plane $x + y + z - 3 = 0$ to the center is $\sqrt{3} \Rightarrow \frac{|(1 + 2t) + (2 + 4t) + (3 + 6t) - 3|}{\sqrt{1 + 1 + 1}} = \sqrt{3}$ from part (a) $\Rightarrow t = 0 \Rightarrow$ the center is at $(1, 2, 3)$. Therefore an equation of the sphere is $(x - 1)^2 + (y - 2)^2 + (z - 3)^2 = 3$.
13. (a) If (x_1, y_1, z_1) is on the plane $Ax + By + Cz = D_1$, then the distance d between the planes is $d = \frac{|Ax_1 + By_1 + Cz_1 - D_2|}{\sqrt{A^2 + B^2 + C^2}} = \frac{|D_1 - D_2|}{|A\mathbf{i} + B\mathbf{j} + C\mathbf{k}|}$, since $Ax_1 + By_1 + Cz_1 = D_1$, by Exercise 12(a).
- (b) $d = \frac{|12 - 6|}{\sqrt{4 + 9 + 1}} = \frac{6}{\sqrt{14}}$
- (c) $\frac{|2(3) + (-1)(2) + 2(-1) + 4|}{\sqrt{14}} = \frac{|2(3) + (-1)(2) + 2(-1) - D|}{\sqrt{14}} \Rightarrow D = 8$ or $-4 \Rightarrow$ the desired plane is $2x - y + 2z = 8$
- (d) Choose the point $(2, 0, 1)$ on the plane. Then $\frac{|3 - D|}{\sqrt{6}} = 5 \Rightarrow D = 3 \pm 5\sqrt{6} \Rightarrow$ the desired planes are $x - 2y + z = 3 + 5\sqrt{6}$ and $x - 2y + z = 3 - 5\sqrt{6}$.

14. Let $\mathbf{n} = \overline{AB} \times \overline{BC}$ and $D(x, y, z)$ be any point in the plane determined by A, B and C . Then the point D lies in this plane if and only if $\overline{AD} \cdot \mathbf{n} = 0 \Leftrightarrow \overline{AD} \cdot (\overline{AB} \times \overline{BC}) = 0$.

15. $\mathbf{n} = \mathbf{i} + 2\mathbf{j} + 6\mathbf{k}$ is normal to the plane $x + 2y + 6z = 6$; $\mathbf{v} \times \mathbf{n} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 1 & 1 \\ 1 & 2 & 6 \end{vmatrix} = 4\mathbf{i} - 5\mathbf{j} + \mathbf{k}$ is parallel to the plane and

perpendicular to the plane of \mathbf{v} and $\mathbf{n} \Rightarrow \mathbf{w} = \mathbf{n} \times (\mathbf{v} \times \mathbf{n}) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2 & 6 \\ 4 & -5 & 1 \end{vmatrix} = 32\mathbf{i} + 23\mathbf{j} - 13\mathbf{k}$ is a vector parallel to the

plane $x + 2y + 6z = 6$ in the direction of the projection vector $\text{proj}_P \mathbf{v}$. Therefore,

$$\text{proj}_P \mathbf{v} = \text{proj}_{\mathbf{w}} \mathbf{v} = \left(\mathbf{v} \cdot \frac{\mathbf{w}}{|\mathbf{w}|} \right) \frac{\mathbf{w}}{|\mathbf{w}|} = \left(\frac{\mathbf{v} \cdot \mathbf{w}}{|\mathbf{w}|^2} \right) \mathbf{w} = \left(\frac{32+23-13}{32^2+23^2+13^2} \right) \mathbf{w} = \frac{42}{1722} \mathbf{w} = \frac{1}{41} \mathbf{w} = \frac{32}{41} \mathbf{i} + \frac{23}{41} \mathbf{j} - \frac{13}{41} \mathbf{k}$$

16. $\text{proj}_z \mathbf{w} = -\text{proj}_z \mathbf{v}$ and $\mathbf{w} - \text{proj}_z \mathbf{w} = \mathbf{v} - \text{proj}_z \mathbf{v} \Rightarrow \mathbf{w} = (\mathbf{w} - \text{proj}_z \mathbf{w}) + \text{proj}_z \mathbf{w} = (\mathbf{v} - \text{proj}_z \mathbf{v}) + \text{proj}_z \mathbf{w}$
 $= \mathbf{v} - 2 \text{proj}_z \mathbf{v} = \mathbf{v} - 2 \left(\frac{\mathbf{v} \cdot \mathbf{z}}{|\mathbf{z}|^2} \right) \mathbf{z}$

18. (a) $\mathbf{u} \times (\mathbf{v} \times \mathbf{w}) + \mathbf{v} \times (\mathbf{w} \times \mathbf{u}) + \mathbf{w} \times (\mathbf{u} \times \mathbf{v}) = (\mathbf{u} \cdot \mathbf{w})\mathbf{v} - (\mathbf{u} \cdot \mathbf{v})\mathbf{w} + (\mathbf{v} \cdot \mathbf{u})\mathbf{w} - (\mathbf{v} \cdot \mathbf{w})\mathbf{u} + (\mathbf{w} \cdot \mathbf{v})\mathbf{u} - (\mathbf{w} \cdot \mathbf{u})\mathbf{v} = \mathbf{0}$

(b) $[\mathbf{u} \cdot (\mathbf{v} \times \mathbf{i})]\mathbf{i} + [\mathbf{u} \cdot (\mathbf{v} \times \mathbf{j})]\mathbf{j} + [\mathbf{u} \cdot (\mathbf{v} \times \mathbf{k})]\mathbf{k} = [(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{i}]\mathbf{i} + [(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{j}]\mathbf{j} + [(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{k}]\mathbf{k} = \mathbf{u} \times \mathbf{v}$

(c) $(\mathbf{u} \times \mathbf{v}) \cdot (\mathbf{w} \times \mathbf{r}) = \mathbf{u} \cdot [\mathbf{v} \times (\mathbf{w} \times \mathbf{r})] = \mathbf{u} \cdot [(\mathbf{v} \cdot \mathbf{r})\mathbf{w} - (\mathbf{v} \cdot \mathbf{w})\mathbf{r}] = (\mathbf{u} \cdot \mathbf{w})(\mathbf{v} \cdot \mathbf{r}) - (\mathbf{u} \cdot \mathbf{r})(\mathbf{v} \cdot \mathbf{w}) = \begin{vmatrix} \mathbf{u} \cdot \mathbf{w} & \mathbf{v} \cdot \mathbf{w} \\ \mathbf{u} \cdot \mathbf{r} & \mathbf{v} \cdot \mathbf{r} \end{vmatrix}$

19. The formula is always true; $\mathbf{u} \times [\mathbf{u} \times (\mathbf{u} \times \mathbf{v})] \cdot \mathbf{w} = \mathbf{u} \times [(\mathbf{u} \cdot \mathbf{v})\mathbf{u} - (\mathbf{u} \cdot \mathbf{u})\mathbf{v}] \cdot \mathbf{w} = [(\mathbf{u} \cdot \mathbf{v})\mathbf{u} \times \mathbf{u} - (\mathbf{u} \cdot \mathbf{u})\mathbf{u} \times \mathbf{v}] \cdot \mathbf{w} = -|\mathbf{u}|^2 \mathbf{u} \times \mathbf{v} \cdot \mathbf{w} = -|\mathbf{u}|^2 \mathbf{u} \cdot \mathbf{v} \times \mathbf{w}$

20. If $\mathbf{u} = (\cos B)\mathbf{i} + (\sin B)\mathbf{j}$ and $\mathbf{v} = (\cos A)\mathbf{i} + (\sin A)\mathbf{j}$, where $A > B$, then $\mathbf{u} \times \mathbf{v} = [|\mathbf{u}||\mathbf{v}|\sin(A - B)]\mathbf{k}$

$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \cos B & \sin B & 0 \\ \cos A & \sin A & 0 \end{vmatrix} = (\cos B \sin A - \sin B \cos A)\mathbf{k} \Rightarrow \sin(A - B) = \cos B \sin A - \sin B \cos A, \text{ since}$$

$$|\mathbf{u}| = 1 \text{ and } |\mathbf{v}| = 1.$$

21. If $\mathbf{u} = a\mathbf{i} + b\mathbf{j}$ and $\mathbf{v} = c\mathbf{i} + d\mathbf{j}$, then $\mathbf{u} \cdot \mathbf{v} = |\mathbf{u}||\mathbf{v}|\cos\theta \Rightarrow ac + bd = \sqrt{a^2 + b^2}\sqrt{c^2 + d^2}\cos\theta$
 $\Rightarrow (ac + bd)^2 = (a^2 + b^2)(c^2 + d^2)\cos^2\theta \Rightarrow (ac + bd)^2 \leq (a^2 + b^2)(c^2 + d^2)$, since $\cos^2\theta \leq 1$.

22. If $\mathbf{u} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k}$, then $\mathbf{u} \cdot \mathbf{u} = a^2 + b^2 + c^2 \geq 0$ and $\mathbf{u} \cdot \mathbf{u} = 0$ iff $a = b = c = 0$.

23. $|\mathbf{u} + \mathbf{v}|^2 = (\mathbf{u} + \mathbf{v}) \cdot (\mathbf{u} + \mathbf{v}) = \mathbf{u} \cdot \mathbf{u} + 2\mathbf{u} \cdot \mathbf{v} + \mathbf{v} \cdot \mathbf{v} \leq |\mathbf{u}|^2 + 2|\mathbf{u}||\mathbf{v}| + |\mathbf{v}|^2 = (|\mathbf{u}| + |\mathbf{v}|)^2 \Rightarrow |\mathbf{u} + \mathbf{v}| \leq |\mathbf{u}| + |\mathbf{v}|$

24. Let α denote the angle between \mathbf{w} and \mathbf{u} , and β the angle between \mathbf{w} and \mathbf{v} . Let $a = |\mathbf{u}|$ and $b = |\mathbf{v}|$.

Then $\cos\alpha = \frac{\mathbf{w} \cdot \mathbf{u}}{|\mathbf{w}||\mathbf{u}|} = \frac{(a\mathbf{v} + b\mathbf{u}) \cdot \mathbf{u}}{|\mathbf{w}||\mathbf{u}|} = \frac{(a\mathbf{v} \cdot \mathbf{u} + b\mathbf{u} \cdot \mathbf{u})}{|\mathbf{w}||\mathbf{u}|} = \frac{(a\mathbf{v} \cdot \mathbf{u} + ba^2)}{|\mathbf{w}||\mathbf{u}|} = \frac{\mathbf{v} \cdot \mathbf{u} + ba}{|\mathbf{w}|}$, and likewise, $\cos\beta = \frac{\mathbf{u} \cdot \mathbf{v} + ba}{|\mathbf{w}|}$.

Since the angle between \mathbf{u} and \mathbf{v} is always $\leq \frac{\pi}{2}$ and $\cos\alpha = \cos\beta$, we have that $\alpha = \beta \Rightarrow \mathbf{w}$ bisects the angle between \mathbf{u} and \mathbf{v} .

25. $(|\mathbf{u}|\mathbf{v} + |\mathbf{v}|\mathbf{u}) \cdot (|\mathbf{v}|\mathbf{u} - |\mathbf{u}|\mathbf{v}) = |\mathbf{u}||\mathbf{v}| \cdot |\mathbf{v}||\mathbf{u}| + |\mathbf{v}||\mathbf{u}| \cdot |\mathbf{v}||\mathbf{u}| - |\mathbf{u}||\mathbf{v}| \cdot |\mathbf{u}|\mathbf{v} - |\mathbf{v}||\mathbf{u}| \cdot |\mathbf{u}|\mathbf{v}$
 $= |\mathbf{v}||\mathbf{u}| \cdot |\mathbf{u}|\mathbf{v} + |\mathbf{v}|^2 \mathbf{u} \cdot \mathbf{u} - |\mathbf{u}|^2 \mathbf{v} \cdot \mathbf{v} - |\mathbf{v}||\mathbf{u}| \cdot |\mathbf{u}|\mathbf{v} = |\mathbf{v}|^2|\mathbf{u}|^2 - |\mathbf{u}|^2|\mathbf{v}|^2 = 0$

24. Let $\mathbf{p} = 2\mathbf{i} + 2\mathbf{j} + \mathbf{k}$ denote the position vector of the point $(2, 2, 1)$ and let, $\mathbf{u} = \frac{1}{\sqrt{2}}\mathbf{i} - \frac{1}{\sqrt{2}}\mathbf{j}$ and $\mathbf{v} = \frac{1}{\sqrt{3}}\mathbf{i} + \frac{1}{\sqrt{3}}\mathbf{j} + \frac{1}{\sqrt{3}}\mathbf{k}$. Then $\mathbf{r}(t) = \mathbf{p} + (\cos t)\mathbf{u} + (\sin t)\mathbf{v}$. Note that $(2, 2, 1)$ is a point on the plane and $\mathbf{n} = \mathbf{i} + \mathbf{j} - 2\mathbf{k}$ is normal to the plane. Moreover, \mathbf{u} and \mathbf{v} are orthogonal unit vectors with $\mathbf{u} \cdot \mathbf{n} = \mathbf{v} \cdot \mathbf{n} = 0 \Rightarrow \mathbf{u}$ and \mathbf{v} are parallel to the plane. Therefore, $\mathbf{r}(t)$ identifies a point that lies in the plane for each t . Also, for each t , $(\cos t)\mathbf{u} + (\sin t)\mathbf{v}$ is a unit vector. Starting at the point $(2 + \frac{1}{\sqrt{2}}, 2 - \frac{1}{\sqrt{2}}, 1)$ the vector $\mathbf{r}(t)$ traces out a circle of radius 1 and center $(2, 2, 1)$ in the plane $x + y - 2z = 2$.

25. The velocity vector is tangent to the graph of $y^2 = 2x$ at the point $(2, 2)$, has length 5, and a positive \mathbf{i} component. Now, $y^2 = 2x \Rightarrow 2y \frac{dy}{dx} = 2 \Rightarrow \frac{dy}{dx}\bigg|_{(2,2)} = \frac{2}{2 \cdot 2} = \frac{1}{2} \Rightarrow$ the tangent vector lies in the direction of the vector $\mathbf{i} + \frac{1}{2}\mathbf{j} \Rightarrow$ the velocity vector is $\mathbf{v} = \frac{5}{\sqrt{1 + \frac{1}{4}}}(\mathbf{i} + \frac{1}{2}\mathbf{j}) = \frac{5}{(\frac{\sqrt{5}}{2})}(\mathbf{i} + \frac{1}{2}\mathbf{j}) = 2\sqrt{5}\mathbf{i} + \sqrt{5}\mathbf{j}$

Mathematica: (assigned functions, parameters, and intervals will vary)

The x-y-z components for the curve are entered as a list of functions of t. The unit vectors \mathbf{i} , \mathbf{j} , \mathbf{k} are not inserted.

If a graph is too small, highlight it and drag out a corner or side to make it larger.

Only the components of $\mathbf{r}[t]$ and values for t_0 , t_{\min} , and t_{\max} require alteration for each problem.

19. $x = (v_0 \cos \alpha)t \Rightarrow (21 \text{ km})\left(\frac{1000 \text{ m}}{1 \text{ km}}\right) = (840 \text{ m/s})(\cos 60^\circ)t \Rightarrow t = \frac{21,000 \text{ m}}{(840 \text{ m/s})(\cos 60^\circ)} = 50 \text{ seconds}$
20. $R = \frac{v_0^2}{g} \sin 2\alpha$ and maximum R occurs when $\alpha = 45^\circ \Rightarrow 24.5 \text{ km} = \left(\frac{v_0^2}{9.8 \text{ m/s}^2}\right)(\sin 90^\circ)$
 $\Rightarrow v_0 = \sqrt{(9.8)(24,500) \text{ m}^2/\text{s}^2} = 490 \text{ m/s}$
21. (a) $t = \frac{2v_0 \sin \alpha}{g} = \frac{2(500 \text{ m/s})(\sin 45^\circ)}{9.8 \text{ m/s}^2} \approx 72.2 \text{ seconds}$; $R = \frac{v_0^2}{g} \sin 2\alpha = \frac{(500 \text{ m/s})^2}{9.8 \text{ m/s}^2}(\sin 90^\circ) \approx 25,510.2 \text{ m}$
 (b) $x = (v_0 \cos \alpha)t \Rightarrow 5000 \text{ m} = (500 \text{ m/s})(\cos 45^\circ)t \Rightarrow t = \frac{5000 \text{ m}}{(500 \text{ m/s})(\cos 45^\circ)} \approx 14.14 \text{ s}$; thus,
 $y = (v_0 \sin \alpha)t - \frac{1}{2}gt^2 \Rightarrow y \approx (500 \text{ m/s})(\sin 45^\circ)(14.14 \text{ s}) - \frac{1}{2}(9.8 \text{ m/s}^2)(14.14 \text{ s})^2 \approx 4020 \text{ m}$
 (c) $y_{\max} = \frac{(v_0 \sin \alpha)^2}{2g} = \frac{((500 \text{ m/s})(\sin 45^\circ))^2}{2(9.8 \text{ m/s}^2)} \approx 6378 \text{ m}$
22. $y = y_0 + (v_0 \sin \alpha)t - \frac{1}{2}gt^2 \Rightarrow y = 32 \text{ ft} + (32 \text{ ft/sec})(\sin 30^\circ)t - \frac{1}{2}(32 \text{ ft/sec}^2)t^2 \Rightarrow y = 32 + 16t - 16t^2$;
 the ball hits the ground when $y = 0 \Rightarrow 0 = 32 + 16t - 16t^2 \Rightarrow t = -1$ or $t = 2 \Rightarrow t = 2 \text{ sec}$ since $t > 0$; thus,
 $x = (v_0 \cos \alpha)t \Rightarrow x = (32 \text{ ft/sec})(\cos 30^\circ)t = 32\left(\frac{\sqrt{3}}{2}\right)(2) \approx 55.4 \text{ ft}$

23. (a) $R = \frac{v_0^2}{g} \sin 2\alpha \Rightarrow 10 \text{ m} = \left(\frac{v_0^2}{9.8 \text{ m/s}^2}\right)(\sin 90^\circ) \Rightarrow v_0^2 = 98 \text{ m}^2/\text{s}^2 \Rightarrow v_0 \approx 9.9 \text{ m/s};$

(b) $6 \text{ m} \approx \frac{(9.9 \text{ m/s}^2)}{9.8 \text{ m/s}^2}(\sin 2\alpha) \Rightarrow \sin 2\alpha \approx 0.59999 \Rightarrow 2\alpha \approx 36.87^\circ \text{ or } 143.12^\circ \Rightarrow \alpha \approx 18.4^\circ \text{ or } 71.6^\circ$

24. $v_0 = 5 \times 10^6 \text{ m/s}$ and $x = 40 \text{ cm} = 0.4 \text{ m}$; thus $x = (v_0 \cos \alpha)t \Rightarrow 0.4 \text{ m} = (5 \times 10^6 \text{ m/s})(\cos 0^\circ)t$
 $\Rightarrow t = 0.08 \times 10^{-6} \text{ s} = 8 \times 10^{-8} \text{ s}$; also, $y = y_0 + (v_0 \sin \alpha)t - \frac{1}{2}gt^2$

$\Rightarrow y = (5 \times 10^6 \text{ m/s})(\sin 0^\circ)(8 \times 10^{-8} \text{ s}) - \frac{1}{2}(9.8 \text{ m/s}^2)(8 \times 10^{-8} \text{ s})^2 = -3.136 \times 10^{-14} \text{ m}$ or $-3.136 \times 10^{-12} \text{ cm}$.

Therefore, it drops $3.136 \times 10^{-12} \text{ cm}$.

25. $R = \frac{v_0^2}{g} \sin 2\alpha \Rightarrow 16,000 \text{ m} = \frac{(400 \text{ m/s})^2}{9.8 \text{ m/s}^2} \sin 2\alpha \Rightarrow \sin 2\alpha = 0.98 \Rightarrow 2\alpha \approx 78.5^\circ \text{ or } 2\alpha \approx 101.5^\circ \Rightarrow \alpha \approx 39.3^\circ$
 or 50.7°

26. (a) $R = \frac{(2v_0)^2}{g} \sin 2\alpha = \frac{4v_0^2}{g} \sin 2\alpha = 4\left(\frac{v_0^2}{g} \sin 2\alpha\right)$ or 4 times the original range.

(b) Now, let the initial range be $R = \frac{v_0^2}{g} \sin 2\alpha$. Then we want the factor p so that pv_0 will double the range

$\Rightarrow \frac{(pv_0)^2}{g} \sin 2\alpha = 2\left(\frac{v_0^2}{g} \sin 2\alpha\right) \Rightarrow p^2 = 2 \Rightarrow p = \sqrt{2}$ or about 141%. The same percentage will

approximately double the height: $\frac{(pv_0 \sin \alpha)^2}{2g} = \frac{2(v_0 \sin \alpha)^2}{2g} \Rightarrow p^2 = 2 \Rightarrow p = \sqrt{2}$.

27. The projectile reaches its maximum height when its vertical component of velocity is zero

$\Rightarrow \frac{dy}{dt} = v_0 \sin \alpha - gt = 0 \Rightarrow t = \frac{v_0 \sin \alpha}{g} \Rightarrow y_{\max} = (v_0 \sin \alpha)\left(\frac{v_0 \sin \alpha}{g}\right) - \frac{1}{2}g\left(\frac{v_0 \sin \alpha}{g}\right)^2 = \frac{(v_0 \sin \alpha)^2}{g} - \frac{(v_0 \sin \alpha)^2}{2g}$

$= \frac{(v_0 \sin \alpha)^2}{2g}$. To find the flight time we find the time when the projectile lands: $(v_0 \sin \alpha)t - \frac{1}{2}gt^2 = 0$

$\Rightarrow t(v_0 \sin \alpha - \frac{1}{2}gt) = 0 \Rightarrow t = 0$ or $t = \frac{2v_0 \sin \alpha}{g}$. Since $t = 0$ is the time when the projectile is fired, then

$t = \frac{2v_0 \sin \alpha}{g}$ is the time when the projectile strikes the ground. The range is the value of the horizontal

component when $t = \frac{2v_0 \sin \alpha}{g} \Rightarrow R = x = (v_0 \cos \alpha)\left(\frac{2v_0 \sin \alpha}{g}\right) = \frac{v_0^2}{g}(2 \sin \alpha \cos \alpha) = \frac{v_0^2}{g} \sin 2\alpha$. The range is

largest when $2\alpha = 1 \Rightarrow \alpha = 45^\circ$.

28. When marble A is located R units downrange, we have $x = (v_0 \cos \alpha)t \Rightarrow R = (v_0 \cos \alpha)t \Rightarrow t = \frac{R}{v_0 \cos \alpha}$. At that

time the height of marble A is $y = y_0 + (v_0 \sin \alpha)t - \frac{1}{2}gt^2 = (v_0 \sin \alpha)\left(\frac{R}{v_0 \cos \alpha}\right) - \frac{1}{2}g\left(\frac{R}{v_0 \cos \alpha}\right)^2$

$\Rightarrow y = R \tan \alpha - \frac{1}{2}g\left(\frac{R^2}{v_0^2 \cos^2 \alpha}\right)$. The height of marble B at the same time $t = \frac{R}{v_0 \cos \alpha}$ seconds is

$h = R \tan \alpha - \frac{1}{2}gt^2 = R \tan \alpha - \frac{1}{2}g\left(\frac{R^2}{v_0^2 \cos^2 \alpha}\right)$. Since the heights are the same, the marbles collide regardless of

the initial velocity v_0 .

29. $\frac{d\mathbf{r}}{dt} = \int (-g\mathbf{j})dt = -gt\mathbf{j} + \mathbf{C}_1$ and $\frac{d\mathbf{r}}{dt}(0) = (v_0 \cos \alpha)\mathbf{i} + (v_0 \sin \alpha)\mathbf{j} \Rightarrow -g(0)\mathbf{j} - \mathbf{C}_1 = (v_0 \cos \alpha)\mathbf{i} + (v_0 \sin \alpha)\mathbf{j}$
 $\Rightarrow \mathbf{C}_1 = (v_0 \cos \alpha)\mathbf{i} + (v_0 \sin \alpha)\mathbf{j} \Rightarrow \frac{d\mathbf{r}}{dt} = (v_0 \cos \alpha)\mathbf{i} + (v_0 \sin \alpha - gt)\mathbf{j}$; $\mathbf{r} = \int [(v_0 \cos \alpha)\mathbf{i} + (v_0 \sin \alpha - gt)\mathbf{j}] dt$
 $= (v_0 t \cos \alpha)\mathbf{i} + (v_0 t \sin \alpha - \frac{1}{2}gt^2)\mathbf{j} + \mathbf{C}_2$ and $\mathbf{r}(0) = x_0\mathbf{i} + y_0\mathbf{j} \Rightarrow [v_0(0) \cos \alpha]\mathbf{i} + [v_0(0) \sin \alpha - \frac{1}{2}g(0)^2]\mathbf{j} + \mathbf{C}_2$
 $= x_0\mathbf{i} + y_0\mathbf{j} \Rightarrow \mathbf{C}_2 = x_0\mathbf{i} + y_0\mathbf{j} \Rightarrow \mathbf{r} = (x_0 + v_0 t \cos \alpha)\mathbf{i} + (y_0 + v_0 t \sin \alpha - \frac{1}{2}gt^2)\mathbf{j} \Rightarrow x = x_0 + v_0 t \cos \alpha$ and
 $y = y_0 + v_0 t \sin \alpha - \frac{1}{2}gt^2$

30. The maximum height is $y = \frac{(v_0 \sin \alpha)^2}{2g}$ and this occurs for $x = \frac{v_0^2}{2g} \sin 2\alpha = \frac{v_0^2 \sin \alpha \cos \alpha}{g}$. These equations describe parametrically the points on a curve in the xy -plane associated with the maximum heights on the parabolic trajectories in terms of the parameter (launch angle) α . Eliminating the parameter α , we have

$$x^2 = \frac{v_0^4 \sin^2 \alpha \cos^2 \alpha}{g^2} = \frac{(v_0^4 \sin^2 \alpha)(1 - \sin^2 \alpha)}{g^2} = \frac{v_0^4 \sin^2 \alpha}{g^2} - \frac{v_0^4 \sin^4 \alpha}{g^2} = \frac{v_0^2}{g} (2y) - (2y)^2 \Rightarrow x^2 + 4y^2 - \left(\frac{2v_0^2}{g}\right)y = 0$$

$$\Rightarrow x^2 + 4\left[y^2 - \left(\frac{v_0^2}{2g}\right)y + \frac{v_0^4}{16g^2}\right] = \frac{v_0^4}{4g^2} \Rightarrow x^2 + 4\left(y - \frac{v_0^2}{4g}\right)^2 = \frac{v_0^4}{4g^2}, \text{ where } x \geq 0.$$

31. (a) At the time t when the projectile hits the line OR

we have $\tan \beta = \frac{y}{x}$; $x = [v_0 \cos(\alpha - \beta)]t$ and

$y = [v_0 \sin(\alpha - \beta)]t - \frac{1}{2}gt^2 < 0$ since R is

below level ground. Therefore let

$|y| = \frac{1}{2}gt^2 - [v_0 \sin(\alpha - \beta)]t > 0$ so that

$$\tan \beta = \frac{[\frac{1}{2}gt^2 - v_0 \sin(\alpha - \beta)]t}{[v_0 \cos(\alpha - \beta)]t} = \frac{[\frac{1}{2}gt - v_0 \sin(\alpha - \beta)]}{v_0 \cos(\alpha - \beta)}$$

$$\Rightarrow v_0 \cos(\alpha - \beta) \tan \beta = \frac{1}{2}gt - v_0 \sin(\alpha - \beta)$$

$$\Rightarrow t = \frac{2v_0 \sin(\alpha - \beta) + 2v_0 \cos(\alpha - \beta) \tan \beta}{g},$$

which is the time when the projectile hits the downhill slope. Therefore,

$$x = [v_0 \cos(\alpha - \beta)] \left[\frac{2v_0 \sin(\alpha - \beta) + 2v_0 \cos(\alpha - \beta) \tan \beta}{g} \right] = \frac{2v_0^2}{g} [\cos^2(\alpha - \beta) \tan \beta + \sin(\alpha - \beta) \cos(\alpha - \beta)].$$

If x is maximized, then OR is maximized: $\frac{dx}{d\alpha} = \frac{2v_0^2}{g} [-\sin 2(\alpha - \beta) \tan \beta + \cos 2(\alpha - \beta)] = 0$

$$\Rightarrow -\sin 2(\alpha - \beta) \tan \beta + \cos 2(\alpha - \beta) = 0 \Rightarrow \tan \beta = \cot 2(\alpha - \beta) \Rightarrow 2(\alpha - \beta) = 90^\circ - \beta$$

$$\Rightarrow \alpha - \beta = \frac{1}{2}(90^\circ - \beta) \Rightarrow \alpha = \frac{1}{2}(90^\circ + \beta) = \frac{1}{2} \text{ of } \angle AOR.$$

(b) At the time t when the projectile hits OR we have

$\tan \beta = \frac{y}{x}$; $x = [v_0 \cos(\alpha + \beta)]t$ and

$y = [v_0 \sin(\alpha + \beta)]t - \frac{1}{2}gt^2$

$$\Rightarrow \tan \beta = \frac{[v_0 \sin(\alpha + \beta)]t - \frac{1}{2}gt^2}{[v_0 \cos(\alpha + \beta)]t} = \frac{[v_0 \sin(\alpha + \beta) - \frac{1}{2}gt]}{v_0 \cos(\alpha + \beta)}$$

$$\Rightarrow v_0 \cos(\alpha + \beta) \tan \beta = v_0 \sin(\alpha + \beta) - \frac{1}{2}gt$$

$$\Rightarrow t = \frac{2v_0 \sin(\alpha + \beta) - 2v_0 \cos(\alpha + \beta) \tan \beta}{g}, \text{ which is the}$$

time when the projectile hits the uphill slope.

Therefore, $x = [v_0 \cos(\alpha + \beta)] \left[\frac{2v_0 \sin(\alpha + \beta) - 2v_0 \cos(\alpha + \beta) \tan \beta}{g} \right]$
 $= \frac{2v_0^2}{g} [\sin(\alpha + \beta) \cos(\alpha + \beta) - \cos^2(\alpha + \beta) \tan \beta]$. If x is maximized, then OR is maximized:
 $\frac{dx}{d\alpha} = \frac{2v_0^2}{g} [\cos 2(\alpha + \beta) + \sin 2(\alpha + \beta) \tan \beta] = 0 \Rightarrow \cos 2(\alpha + \beta) + \sin 2(\alpha + \beta) \tan \beta = 0$
 $\Rightarrow \cot 2(\alpha + \beta) + \tan \beta = 0 \Rightarrow \cot 2(\alpha + \beta) = -\tan \beta = \tan(-\beta) \Rightarrow 2(\alpha + \beta) = 90^\circ - (-\beta) = 90^\circ + \beta$
 $\Rightarrow \alpha = \frac{1}{2}(90^\circ - \beta) = \frac{1}{2}$ of $\angle AOR$. Therefore v_0 would bisect $\angle AOR$ for maximum range uphill.

32. $v_0 = 116$ ft/sec, $\alpha = 45^\circ$, and $x = (v_0 \cos \alpha)t$

$\Rightarrow 369 = (116 \cos 45^\circ)t \Rightarrow t \approx 4.50$ sec;

also $y = (v_0 \sin \alpha)t - \frac{1}{2}gt^2$

$\Rightarrow y = (116 \sin 45^\circ)(4.50) - \frac{1}{2}(32)(4.50)^2 \approx 45.11$ ft.

It will take the ball 4.50 sec to travel 369 ft. At that time the ball will be 45.11 ft in the air and will hit the green past the pin.

33. (a) (Assuming that "x" is zero at the point of impact:)

$\mathbf{r}(t) = (x(t))\mathbf{i} + (y(t))\mathbf{j}$; where $x(t) = (35 \cos 27^\circ)t$ and $y(t) = 4 + (35 \sin 27^\circ)t - 16t^2$.

(b) $y_{\max} = \frac{(v_0 \sin \alpha)^2}{2g} + 4 = \frac{(35 \sin 27^\circ)^2}{64} + 4 \approx 7.945$ feet, which is reached at $t = \frac{v_0 \sin \alpha}{g} = \frac{35 \sin 27^\circ}{32} \approx 0.497$ seconds.

(c) For the time, solve $y = 4 + (35 \sin 27^\circ)t - 16t^2 = 0$ for t , using the quadratic formula

$t = \frac{35 \sin 27^\circ + \sqrt{(-35 \sin 27^\circ)^2 + 256}}{32} \approx 1.201$ sec. Then the range is about $x(1.201) = (35 \cos 27^\circ)(1.201) \approx 37.453$ feet.

(d) For the time, solve $y = 4 + (35 \sin 27^\circ)t - 16t^2 = 7$ for t , using the quadratic formula

$t = \frac{35 \sin 27^\circ + \sqrt{(-35 \sin 27^\circ)^2 - 192}}{32} \approx 0.254$ and 0.740 seconds. At those times the ball is about $x(0.254) = (35 \cos 27^\circ)(0.254) \approx 7.921$ feet and $x(0.740) = (35 \cos 27^\circ)(0.740) \approx 23.077$ feet from the impact point, or about $37.453 - 7.921 \approx 29.532$ feet and $37.453 - 23.077 \approx 14.376$ feet from the landing spot.

(e) Yes. It changes things because the ball won't clear the net ($y_{\max} \approx 7.945$).

34. $x = x_0 + (v_0 \cos \alpha)t = 0 + (v_0 \cos 40^\circ)t \approx 0.766 v_0 t$ and $y = y_0 + (v_0 \sin \alpha)t - \frac{1}{2}gt^2 = 6.5 + (v_0 \sin 40^\circ)t - 16t^2$
 $\approx 6.5 + 0.643 v_0 t - 16t^2$; now the shot went 73.833 ft $\Rightarrow 73.833 = 0.766 v_0 t \Rightarrow t \approx \frac{96.383}{v_0}$ sec; the shot lands when $y = 0 \Rightarrow 0 = 6.5 + (0.643)(96.383) - 16 \left(\frac{96.383}{v_0} \right)^2 \Rightarrow 0 \approx 68.474 - \frac{148.635}{v_0^2} \Rightarrow v_0 \approx \sqrt{\frac{148.635}{68.474}} \approx 46.6$ ft/sec, the shot's initial speed

35. Flight time = 1 sec and the measure of the angle of elevation is about 64° (using a protractor) so that

$t = \frac{2v_0 \sin \alpha}{g} \Rightarrow 1 = \frac{2v_0 \sin 64^\circ}{32} \Rightarrow v_0 \approx 17.80$ ft/sec. Then $y_{\max} = \frac{(17.80 \sin 64^\circ)^2}{2(32)} \approx 4.00$ ft and $R = \frac{v_0^2}{g} \sin 2\alpha$

$\Rightarrow R = \frac{(17.80)^2}{32} \sin 128^\circ \approx 7.80 \text{ ft} \Rightarrow$ the engine traveled about 7.80 ft in 1 sec \Rightarrow the engine velocity was about 7.80 ft/sec

36. (a) $\mathbf{r}(t) = (x(t))\mathbf{i} + (y(t))\mathbf{j}$; where $x(t) = (145 \cos 23^\circ - 14)t$ and $y(t) = 2.5 + (145 \sin 23^\circ)t - 16t^2$.
 (b) $y_{\max} = \frac{(v_0 \sin \alpha)^2}{2g} + 2.5 = \frac{(145 \sin 23^\circ)^2}{64} + 2.5 \approx 52.655$ feet, which is reached at $t = \frac{v_0 \sin \alpha}{g} = \frac{145 \sin 23^\circ}{32} \approx 1.771$ seconds.
 (c) For the time, solve $y = 2.5 + (145 \sin 23^\circ)t - 16t^2 = 0$ for t , using the quadratic formula
 $t = \frac{145 \sin 23^\circ + \sqrt{(145 \sin 23^\circ)^2 + 160}}{32} \approx 3.585$ sec. Then the range at $t \approx 3.585$ is about
 $x = (145 \cos 23^\circ - 14)(3.585) \approx 428.311$ feet.
 (d) For the time, solve $y = 2.5 + (145 \sin 23^\circ)t - 16t^2 = 20$ for t , using the quadratic formula
 $t = \frac{145 \sin 23^\circ + \sqrt{(145 \sin 23^\circ)^2 - 1120}}{32} \approx 0.342$ and 3.199 seconds. At those times the ball is about
 $x(0.342) = (145 \cos 23^\circ - 14)(0.342) \approx 40.860$ feet from home plate and
 $x(3.199) = (145 \cos 23^\circ - 14)(3.199) \approx 382.195$ feet from home plate.
 (e) Yes. According to part (d), the ball is still 20 feet above the ground when it is 382 feet from home plate.

 (b) Solve graphically using a calculator or CAS: At $t \approx 1.484$ seconds the ball reaches a maximum height of about 40.435 feet.
 (c) Use a graphing calculator or CAS to find that $y = 0$ when the ball has traveled for ≈ 3.126 seconds. The range is about $x(3.126) = \left(\frac{152}{0.12} \right) (1 - e^{-0.12(3.126)}) (\cos 20^\circ) \approx 372.311$ feet.

 (e) Yes, the batter has hit a home run since a graph of the trajectory shows that the ball is more than 14 feet above the ground when it passes over the fence.

 is continuous for every t_0 in $[a, b]$.

41. (a) If $\mathbf{R}_1(t)$ and $\mathbf{R}_2(t)$ have identical derivatives on I , then
$$\frac{d\mathbf{R}_1}{dt} = \frac{df_1}{dt}\mathbf{i} + \frac{dg_1}{dt}\mathbf{j} + \frac{dh_1}{dt}\mathbf{k} = \frac{df_2}{dt}\mathbf{i} + \frac{dg_2}{dt}\mathbf{j} + \frac{dh_2}{dt}\mathbf{k}$$

(b) Let $\mathbf{R}(t)$ be an antiderivative of $\mathbf{r}(t)$ on I . Then $\mathbf{R}'(t) = \mathbf{r}(t)$. If $\mathbf{U}(t)$ is an antiderivative of $\mathbf{r}(t)$ on I , then $\mathbf{U}'(t) = \mathbf{r}(t)$. Thus $\mathbf{U}'(t) = \mathbf{R}'(t)$ on $I \Rightarrow \mathbf{U}(t) = \mathbf{R}(t) + \mathbf{C}$.

$$= f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k} = \mathbf{r}(t).$$
 Since $\frac{d}{dt} \int_a^t \mathbf{r}(\tau) d\tau = \mathbf{r}(t)$, we have that $\int_a^t \mathbf{r}(\tau) d\tau$ is an antiderivative of \mathbf{r} .

If \mathbf{R} is any antiderivative of \mathbf{r} , then $\mathbf{R}(t) = \int_a^t \mathbf{r}(\tau) d\tau + \mathbf{C}$ by Exercise 41(b). Then $\mathbf{R}(a) = \int_a^a \mathbf{r}(\tau) d\tau + \mathbf{C} = \mathbf{0} + \mathbf{C} \Rightarrow \mathbf{C} = \mathbf{R}(a) \Rightarrow \int_a^t \mathbf{r}(\tau) d\tau = \mathbf{R}(t) - \mathbf{C} = \mathbf{R}(t) - \mathbf{R}(a) \Rightarrow \int_a^b \mathbf{r}(\tau) d\tau = \mathbf{R}(b) - \mathbf{R}(a)$.

- (b) Solve graphically using a calculator or CAS: At $t \approx 1.527$ seconds the ball reaches a maximum height of about 41.893 feet.
- (c) Use a graphing calculator or CAS to find that $y = 0$ when the ball has traveled for ≈ 3.181 seconds. The range is about $x(3.181) = \left(\frac{1}{0.08}\right)(1 - e^{-0.08(3.181)})(152 \cos 20^\circ - 17.6) \approx 351.734$ feet.
- (d) Use a graphing calculator or CAS to find that $y = 35$ for $t \approx 0.877$ and 2.190 seconds, at which times the ball is about $x(0.877) \approx 106.028$ feet and $x(2.190) \approx 251.530$ feet from home plate.
- (e) No; the range is less than 380 feet. To find the wind needed for a home run, first use the method of part (d) to find that $y = 20$ at $t \approx 0.376$ and 2.716 seconds. Then define $x(w) = \left(\frac{1}{0.08}\right)(1 - e^{-0.08(2.716)})(152 \cos 20^\circ + w)$, and solve $x(w) = 380$ to find $w \approx 12.846$ ft/sec.

44. $y_{\max} = \frac{(v_0 \sin \alpha)^2}{2g} \Rightarrow \frac{3}{4} y_{\max} = \frac{3(v_0 \sin \alpha)^2}{8g}$ and $y = (v_0 \sin \alpha)t - \frac{1}{2}gt^2 \Rightarrow \frac{3(v_0 \sin \alpha)^2}{8g} = (v_0 \sin \alpha)t - \frac{1}{2}gt^2$
 $\Rightarrow 3(v_0 \sin \alpha)^2 = (8gv_0 \sin \alpha)t - 4g^2t^2 \Rightarrow 4g^2t^2 - (8gv_0 \sin \alpha)t + 3(v_0 \sin \alpha)^2 = 0 \Rightarrow 2gt - 3v_0 \sin \alpha = 0$ or $2gt - v_0 \sin \alpha = 0 \Rightarrow t = \frac{3v_0 \sin \alpha}{2g}$ or $t = \frac{v_0 \sin \alpha}{2g}$. Since the time it takes to reach y_{\max} is $t_{\max} = \frac{v_0 \sin \alpha}{g}$, then the time it takes the projectile to reach $\frac{3}{4}$ of y_{\max} is the shorter time $t = \frac{v_0 \sin \alpha}{2g}$ or half the time it takes to reach the maximum height.

16. Let the helix make one complete turn from $t = 0$ to $t = 2\pi$. Note that the radius of the cylinder is 1
 \Rightarrow the circumference of the base is 2π . When $t = 2\pi$, the point P is
 $(\cos 2\pi, \sin 2\pi, 2\pi) = (1, 0, 2\pi) \Rightarrow$ the cylinder is 2π units high. Cut the cylinder along PQ and flatten. The resulting rectangle has a width equal to the circumference of the cylinder $= 2\pi$ and a height equal to 2π , the height of the cylinder. Therefore, the rectangle is a square and the portion of the helix from $t = 0$ to $t = 2\pi$ is its diagonal.

17. (a) $\mathbf{r} = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + (1 - \cos t)\mathbf{k}$, $0 \leq t \leq 2\pi \Rightarrow x = \cos t, y = \sin t, z = 1 - \cos t$
 $\Rightarrow x^2 + y^2 = \cos^2 t + \sin^2 t = 1$, a right circular cylinder with the z -axis as the axis and radius $= 1$.
 Therefore $P(\cos t, \sin t, 1 - \cos t)$ lies on the cylinder $x^2 + y^2 = 1$; $t = 0 \Rightarrow P(1, 0, 0)$ is on the curve;
 $t = \frac{\pi}{2} \Rightarrow Q(0, 1, 1)$ is on the curve; $t = \pi \Rightarrow R(-1, 0, 2)$ is on the curve. Then $\overline{PQ} = -\mathbf{i} + \mathbf{j} + \mathbf{k}$ and
 $\overline{PR} = -2\mathbf{i} + 2\mathbf{k} \Rightarrow \overline{PQ} \times \overline{PR} = \begin{bmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -1 & 1 & 1 \\ -2 & 0 & 2 \end{bmatrix} = 2\mathbf{i} + 2\mathbf{k}$ is a vector normal to the plane of P, Q , and R . Then

the plane containing P, Q , and R has an equation $2x + 2z = 2(1) + 2(0)$ or $x + z = 1$. Any point on the curve will satisfy this equation since $x + z = \cos t + (1 - \cos t) = 1$. Therefore, any point on the curve lies on the intersection of the cylinder $x^2 + y^2 = 1$ and the plane $x + z = 1 \Rightarrow$ the curve is an ellipse.

 $s(t) = \int_0^t |\mathbf{v}| dt = \int_0^t |\mathbf{u}| d\tau = \int_0^t 1 d\tau = t$

22. $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + t^3\mathbf{k} \Rightarrow \mathbf{v}(t) = \mathbf{i} + 2t\mathbf{j} + 3t^2\mathbf{k} \Rightarrow |\mathbf{v}(t)| = \sqrt{(1)^2 + (2t)^2 + (3t^2)^2} = \sqrt{1 + 4t^2 + 9t^4}$. $(0, 0, 0) \Rightarrow t = 0$
 and $(2, 4, 8) \Rightarrow t = 2$. Thus $L = \int_0^2 |\mathbf{v}(t)| dt = \int_0^2 \sqrt{1 + 4t^2 + 9t^4} dt$. Using Simpson's rule with $n = 10$ and $\Delta x = \frac{2-0}{10} = 0.2$

$$17. y = ax^2 \Rightarrow y' = 2ax \Rightarrow y'' = 2a; \text{ from Exercise 5(a), } \kappa(x) = \frac{|2a|}{(1+4a^2x^2)^{3/2}} = |2a|(1+4a^2x^2)^{-3/2}$$

$\Rightarrow \kappa'(x) = -\frac{3}{2}|2a|(1+4a^2x^2)^{-5/2}(8a^2x)$; thus, $\kappa'(x) = 0 \Rightarrow x = 0$. Now, $\kappa'(x) > 0$ for $x < 0$ and $\kappa'(x) < 0$ for $x > 0$ so that $\kappa(x)$ has an absolute maximum at $x = 0$ which is the vertex of the parabola. Since $x = 0$ is the only critical point for $\kappa(x)$, the curvature has no minimum value.

18. $\mathbf{r} = (a \cos t)\mathbf{i} + (b \sin t)\mathbf{j} \Rightarrow \mathbf{v} = (-a \sin t)\mathbf{i} + (b \cos t)\mathbf{j} \Rightarrow \mathbf{a} = (-a \cos t)\mathbf{i} - (b \sin t)\mathbf{j}$

 $= -\frac{3}{2}(ab)(a^2 - b^2)(\sin t)(a^2 \sin^2 t + b^2 \cos^2 t)^{-5/2}$; thus, $\kappa'(t) = 0 \Rightarrow \sin 2t = 0 \Rightarrow t = 0, \pi$ identifying points on the major axis, or $t = \frac{\pi}{2}, \frac{3\pi}{2}$ identifying points on the minor axis. Furthermore, $\kappa'(t) < 0$ for $0 < t < \frac{\pi}{2}$ and for $\pi < t < \frac{3\pi}{2}$; $\kappa'(t) > 0$ for $\frac{\pi}{2} < t < \pi$ and $\frac{3\pi}{2} < t < 2\pi$. Therefore, the points associated with $t = 0$ and $t = \pi$ on the major axis give absolute maximum curvature and the points associated with $t = \frac{\pi}{2}$ and $t = \frac{3\pi}{2}$ on the minor axis give absolute minimum curvature.

19. $\kappa = \frac{a}{a^2 + b^2} \Rightarrow \frac{d\kappa}{da} = \frac{-a^2 + b^2}{(a^2 + b^2)^2}$; $\frac{d\kappa}{da} = 0 \Rightarrow -a^2 + b^2 = 0 \Rightarrow a = \pm b \Rightarrow a = b$ since $a, b \geq 0$. Now, $\frac{d\kappa}{da} > 0$ if $a < b$ and $\frac{d\kappa}{da} < 0$ if $a > b \Rightarrow \kappa$ is at a maximum for $a = b$ and $\kappa(b) = \frac{b}{b^2 + b^2} = \frac{1}{2b}$ is the maximum value of κ .

20. (a) From Example 5, the curvature of the helix $\mathbf{r}(t) = (a \cos t)\mathbf{i} + (a \sin t)\mathbf{j} + bt\mathbf{k}$, $a, b \geq 0$ is $\kappa = \frac{a}{a^2 + b^2}$; also $|\mathbf{v}| = \sqrt{a^2 + b^2}$. For the helix $\mathbf{r}(t) = (3 \cos t)\mathbf{i} + (3 \sin t)\mathbf{j} + t\mathbf{k}$, $0 \leq t \leq 4\pi$, $a = 3$ and $b = 1 \Rightarrow \kappa = \frac{3}{3^2 + 1^2} = \frac{3}{10}$ and $|\mathbf{v}| = \sqrt{10} \Rightarrow K = \int_0^{4\pi} \frac{3}{10} \sqrt{10} dt = \left[\frac{3}{\sqrt{10}} t \right]_0^{4\pi} = \frac{12\pi}{\sqrt{10}}$

(b) $y = x^2 \Rightarrow x = t$ and $y = t^2$, $-\infty < t < \infty \Rightarrow \mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} \Rightarrow \mathbf{v} = \mathbf{i} + 2t\mathbf{j} \Rightarrow |\mathbf{v}| = \sqrt{1 + 4t^2}$;
 $\mathbf{T} = \frac{1}{\sqrt{1 + 4t^2}}\mathbf{i} + \frac{2t}{\sqrt{1 + 4t^2}}\mathbf{j}$; $\frac{d\mathbf{T}}{dt} = \frac{-4t}{(1 + 4t^2)^{3/2}}\mathbf{i} + \frac{2}{(1 + 4t^2)^{3/2}}\mathbf{j}$; $\left| \frac{d\mathbf{T}}{dt} \right| = \sqrt{\frac{16t^2 + 4}{(1 + 4t^2)^3}} = \frac{2}{1 + 4t^2}$. Thus $\kappa = \frac{1}{\sqrt{1 + 4t^2}} \cdot \frac{2t}{1 + 4t^2}$
 $= \frac{2}{(\sqrt{1 + 4t^2})^3}$. Then $K = \int_{-\infty}^{\infty} \frac{2}{(\sqrt{1 + 4t^2})^3} (\sqrt{1 + 4t^2}) dt = \int_{-\infty}^{\infty} \frac{2}{1 + 4t^2} dt = \lim_{a \rightarrow -\infty} \int_a^0 \frac{2}{1 + 4t^2} dt + \lim_{b \rightarrow \infty} \int_0^b \frac{2}{1 + 4t^2} dt$

21. $\mathbf{r} = t\mathbf{i} + (\sin t)\mathbf{j} \Rightarrow \mathbf{v} = \mathbf{i} + (\cos t)\mathbf{j} \Rightarrow |\mathbf{v}| = \sqrt{1^2 + (\cos t)^2} = \sqrt{1 + \cos^2 t} \Rightarrow \left| \mathbf{v} \left(\frac{\pi}{2} \right) \right| = \sqrt{1 + \cos^2 \left(\frac{\pi}{2} \right)} = 1$;
 $\mathbf{T} = \frac{\mathbf{v}}{|\mathbf{v}|} = \frac{\mathbf{i} + (\cos t)\mathbf{j}}{\sqrt{1 + \cos^2 t}} \Rightarrow \frac{d\mathbf{T}}{dt} = \frac{-\sin t \cos t}{(1 + \cos^2 t)^{3/2}}\mathbf{i} + \frac{-\sin t}{(1 + \cos^2 t)^{3/2}}\mathbf{j} \Rightarrow \left| \frac{d\mathbf{T}}{dt} \right| = \frac{|\sin t|}{1 + \cos^2 t}$; $\left| \frac{d\mathbf{T}}{dt} \right|_{t=\frac{\pi}{2}} = \frac{|\sin \frac{\pi}{2}|}{1 + \cos^2 \left(\frac{\pi}{2} \right)} = \frac{1}{1} = 1$. Thus $\kappa \left(\frac{\pi}{2} \right) = \frac{1}{1} \cdot 1 = 1 \Rightarrow \rho = \frac{1}{1} = 1$ and the center is $\left(\frac{\pi}{2}, 0 \right) \Rightarrow \left(x - \frac{\pi}{2} \right)^2 + y^2 = 1$

22. $\mathbf{r} = (2 \ln t)\mathbf{i} - \left(t + \frac{1}{t} \right)\mathbf{j} \Rightarrow \mathbf{v} = \left(\frac{2}{t} \right)\mathbf{i} - \left(1 - \frac{1}{t^2} \right)\mathbf{j} \Rightarrow |\mathbf{v}| = \sqrt{\frac{4}{t^2} + \left(1 - \frac{1}{t^2} \right)^2} = \frac{t^2 + 1}{t^2} \Rightarrow \mathbf{T} = \frac{\mathbf{v}}{|\mathbf{v}|} = \frac{2t}{t^2 + 1}\mathbf{i} - \frac{t^2 - 1}{t^2 + 1}\mathbf{j}$;
 $\frac{d\mathbf{T}}{dt} = \frac{-2(t^2 - 1)}{(t^2 + 1)^2}\mathbf{i} - \frac{4t}{(t^2 + 1)^2}\mathbf{j} \Rightarrow \left| \frac{d\mathbf{T}}{dt} \right| = \sqrt{\frac{4(t^2 - 1)^2 + 16t^2}{(t^2 + 1)^4}} = \frac{2}{t^2 + 1}$. Thus $\kappa = \frac{1}{|\mathbf{v}|} \cdot \left| \frac{d\mathbf{T}}{dt} \right| = \frac{t^2}{t^2 + 1} \cdot \frac{2}{t^2 + 1} = \frac{2t^2}{(t^2 + 1)^2}$

$\Rightarrow \kappa(1) = \frac{2}{2^2} = \frac{1}{2} \Rightarrow \rho = \frac{1}{\kappa} = 2$. The circle of curvature is tangent to the curve at $P(0, -2) \Rightarrow$ circle has same tangent as the curve $\Rightarrow \mathbf{v}(1) = 2\mathbf{i}$ is tangent to the circle \Rightarrow the center lies on the y -axis. If $t \neq 1 (t > 0)$, then $(t-1)^2 > 0 \Rightarrow t^2 - 2t + 1 > 0 \Rightarrow t^2 + 1 > 2t \Rightarrow \frac{t^2+1}{t} > 2$ since $t > 0 \Rightarrow t + \frac{1}{t} > 2 \Rightarrow -(t + \frac{1}{t}) < -2 \Rightarrow y < -2$ on both sides of $(0, -2) \Rightarrow$ the curve is concave down \Rightarrow center of circle of curvature is $(0, -4) \Rightarrow x^2 + (y+4)^2 = 4$ is an equation of the circle of curvature

23. $y = x^2 \Rightarrow f'(x) = 2x$ and $f''(x) = 2$

$$\Rightarrow \kappa = \frac{|2|}{(1+(2x)^2)^{3/2}} = \frac{2}{(1+4x^2)^{3/2}}$$

24. $y = \frac{x^4}{4} \Rightarrow f'(x) = x^3$ and $f''(x) = 3x^2$

$$\Rightarrow \kappa = \frac{|3x^2|}{(1+(x^3)^2)^{3/2}} = \frac{3x^2}{(1+x^6)^{3/2}}$$

25. $y = \sin x \Rightarrow f'(x) = \cos x$ and $f''(x) = -\sin x$

$$\Rightarrow \kappa = \frac{|-\sin x|}{(1+\cos^2 x)^{3/2}} = \frac{|\sin x|}{(1+\cos^2 x)^{3/2}}$$

26. $y = e^x \Rightarrow f'(x) = e^x$ and $f''(x) = e^x$

$$\Rightarrow \kappa = \frac{|e^x|}{(1+(e^x)^2)^{3/2}} = \frac{e^x}{(1+e^{2x})^{3/2}}$$

27. We will use the formula $\kappa = \frac{1}{|\mathbf{v}(a)|} \left| \frac{d\mathbf{T}}{dt}(a) \right|$ to find the curvature at the point (a, a^2) .

By Example 4 in Section 13.4,

$$\mathbf{v}(t) = \sqrt{1+4t^2} \text{ and } \frac{d\mathbf{T}}{dt} = 2(1+4t^2)^{-3/2}(-2t\mathbf{i} + \mathbf{j}).$$

At $t = a$ this gives $\kappa = \frac{1}{|\mathbf{v}(a)|} \left| \frac{d\mathbf{T}}{dt}(a) \right| = \frac{2}{\sqrt{1+4a^2}} (1+4a^2)^{-3/2} \sqrt{1+4a^2} = \frac{2}{(1+4a^2)^{3/2}}$. Thus the radius of

the osculating circle is $r = \frac{1}{2}(1+4a^2)^{3/2}$. To show that the given formulas for center and radius are correct we must first show that the distance between (a, a^2) and $(-4a^3, 3a^2 + \frac{1}{2})$ is r . This distance is

$$\sqrt{\left(-4a^3 - a\right)^2 + \left(3a^2 + \frac{1}{2} - a^2\right)^2} = \sqrt{16a^6 + 12a^4 + 3a^2 + \frac{1}{4}} = \frac{1}{2}\sqrt{\left(1+4a^2\right)^3}$$
 as required. Finally we must show

that the line containing the points $(-4a^3, 3a^2 + \frac{1}{2})$ and (a, a^2) is perpendicular to the tangent line at (a, a^2) ,

which has slope $2a$. This requires that $\frac{3a^2 + \frac{1}{2} - a^2}{-4a^3 - a} = -\frac{1}{2a}$, which is correct.

28. By Exercise 27, for $a = 1$, the center of the osculating circle is at $(-4, \frac{7}{2})$ and its radius is $\frac{5\sqrt{5}}{2}$. A

parametrization of this circle is $x(\theta) = -4 + \frac{5\sqrt{5}}{2}\cos\theta$, $y(\theta) = \frac{7}{2} + \frac{5\sqrt{5}}{2}\sin\theta$.

Mathematica: (assigned functions and parameters may vary)

In Mathematica, the dot product can be applied either with a period "." or with the word, "Dot". Similarly, the cross product can be applied either with a very small "x" (in the palette next to the arrow) or with the word, "Cross". However, the Cross command assumes the vectors are in three dimensions. For the purposes of applying the cross product command, we will define the position vector r as a three dimensional vector with zero for its z -component. For graphing, we will use only the first two components.

12. By Exercise 12 in Section 13.4, $\mathbf{T} = \left(\frac{12}{13} \cos 2t\right)\mathbf{i} - \left(\frac{12}{13} \sin 2t\right)\mathbf{j} + \frac{5}{13}\mathbf{k}$ and $\mathbf{N} = (-\sin 2t)\mathbf{i} - (\cos 2t)\mathbf{j}$ Thus

$$\mathbf{B} = \mathbf{T} \times \mathbf{N} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{12}{13} \cos 2t & -\frac{12}{13} \sin 2t & \frac{5}{13} \\ -\sin 2t & -\cos 2t & 0 \end{vmatrix} = \left(\frac{5}{13} \cos 2t\right)\mathbf{i} - \left(\frac{5}{13} \sin 2t\right)\mathbf{j} - \frac{12}{13}\mathbf{k}.$$

$$\text{Also, } \mathbf{v} = (12 \cos 2t)\mathbf{i} - (12 \sin 2t)\mathbf{j} + 5\mathbf{k} \Rightarrow \mathbf{a} = (-24 \sin 2t)\mathbf{i} - (24 \cos 2t)\mathbf{j} \text{ and } \frac{d\mathbf{a}}{dt} = (-48 \cos 2t)\mathbf{i} + (48 \sin 2t)\mathbf{j}$$

$$\mathbf{v} \times \mathbf{a} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 12 \cos 2t & -12 \sin 2t & 5 \\ -24 \sin 2t & -24 \cos 2t & 0 \end{vmatrix} = (120 \cos 2t)\mathbf{i} - (120 \sin 2t)\mathbf{j} - 288\mathbf{k}$$

$$\Rightarrow |\mathbf{v} \times \mathbf{a}|^2 = (120 \cos 2t)^2 + (-120 \sin 2t)^2 + (-288)^2 = 120^2(\cos^2 2t + \sin^2 2t) + 288^2 = 97344. \text{ Thus}$$

$$\tau = \frac{\begin{vmatrix} 12 \cos 2t & -12 \sin 2t & 5 \\ -24 \sin 2t & -24 \cos 2t & 0 \\ -48 \cos 2t & 48 \sin 2t & 0 \end{vmatrix}}{97344} = \frac{5 \cdot (-24 \cdot 48)}{97344} = -\frac{10}{169}$$

13. By Exercise 13 in Section 13.4, $\mathbf{T} = \frac{t}{\sqrt{t^2+1}}\mathbf{i} + \frac{1}{\sqrt{t^2+1}}\mathbf{j}$ and $\mathbf{N} = \frac{1}{\sqrt{t^2+1}}\mathbf{i} - \frac{t}{\sqrt{t^2+1}}\mathbf{j}$ so that

$$\mathbf{B} = \mathbf{T} \times \mathbf{N} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{t}{\sqrt{t^2+1}} & \frac{1}{\sqrt{t^2+1}} & 0 \\ \frac{1}{\sqrt{t^2+1}} & \frac{-t}{\sqrt{t^2+1}} & 0 \end{vmatrix} = -\mathbf{k}. \text{ Also, } \mathbf{v} = t^2\mathbf{i} + t\mathbf{j} \Rightarrow \mathbf{a} = 2t\mathbf{i} + \mathbf{j} \Rightarrow \frac{d\mathbf{a}}{dt} = 2\mathbf{i} \text{ so that } \begin{vmatrix} t^2 & t & 0 \\ 2t & 1 & 0 \\ 2 & 0 & 0 \end{vmatrix} = 0 \Rightarrow \tau = 0$$

14. By Exercise 14 in Section 13.4, $\mathbf{T} = (-\cos t)\mathbf{i} + (\sin t)\mathbf{j}$ and $\mathbf{N} = (\sin t)\mathbf{i} + (\cos t)\mathbf{j}$ so that

$$\mathbf{B} = \mathbf{T} \times \mathbf{N} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -\cos t & \sin t & 0 \\ \sin t & \cos t & 0 \end{vmatrix} = -\mathbf{k}. \text{ Also, } \mathbf{v} = (-3\cos^2 t \sin t)\mathbf{i} + (3\sin^2 t \cos t)\mathbf{j}$$

$$\Rightarrow \mathbf{a} = \frac{d}{dt}(-3\cos^2 t \sin t)\mathbf{i} + \frac{d}{dt}(3\sin^2 t \cos t)\mathbf{j} \Rightarrow \frac{d\mathbf{a}}{dt} = \frac{d}{dt} \left[\frac{d}{dt}(-3\cos^2 t \sin t) \right] \mathbf{i} + \frac{d}{dt} \left[\frac{d}{dt}(3\sin^2 t \cos t) \right] \mathbf{j}$$

$$\Rightarrow \begin{vmatrix} -3\cos^2 t \sin t & 3\sin^2 t \cos t & 0 \\ \frac{d}{dt}(-3\cos^2 t \sin t) & \frac{d}{dt}(3\sin^2 t \cos t) & 0 \\ \frac{d}{dt} \left[\frac{d}{dt}(-3\cos^2 t \sin t) \right] & \frac{d}{dt} \left[\frac{d}{dt}(3\sin^2 t \cos t) \right] & 0 \end{vmatrix} = 0 \Rightarrow \tau = 0$$

15. By Exercise 15 in Section 13.4, $\mathbf{T} = \frac{\mathbf{v}}{|\mathbf{v}|} = (\operatorname{sech} \frac{t}{a})\mathbf{i} + (\tanh \frac{t}{a})\mathbf{j}$ and $\mathbf{N} = (-\tanh \frac{t}{a})\mathbf{i} + (\operatorname{sech} \frac{t}{a})\mathbf{j}$ so that

$$\mathbf{B} = \mathbf{T} \times \mathbf{N} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \operatorname{sech}(\frac{t}{a}) & \tanh(\frac{t}{a}) & 0 \\ -\tanh(\frac{t}{a}) & \operatorname{sech}(\frac{t}{a}) & 0 \end{vmatrix} = \mathbf{k}. \text{ Also, } \mathbf{v} = \mathbf{i} + (\sinh \frac{t}{a})\mathbf{j} \Rightarrow \mathbf{a} = (\frac{1}{a} \cosh \frac{t}{a})\mathbf{j} \Rightarrow \frac{d\mathbf{a}}{dt} = \frac{1}{a^2} \sinh(\frac{t}{a})\mathbf{j} \text{ so}$$

$$\text{that } \begin{vmatrix} 1 & \sinh(\frac{t}{a}) & 0 \\ 0 & \frac{1}{a} \cosh(\frac{t}{a}) & 0 \\ 0 & \frac{1}{a^2} \sinh(\frac{t}{a}) & 0 \end{vmatrix} = 0 \Rightarrow \tau = 0$$

16. By Exercise 16 in Section 13.4, $\mathbf{T} = (\frac{1}{\sqrt{2}} \tanh t)\mathbf{i} - \frac{1}{\sqrt{2}}\mathbf{j} + (\frac{1}{\sqrt{2}} \operatorname{sech} t)\mathbf{k}$ and $\mathbf{N} = (\operatorname{sech} t)\mathbf{i} - (\tanh t)\mathbf{k}$ so that

$$\mathbf{B} = \mathbf{T} \times \mathbf{N} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{1}{\sqrt{2}} \tanh t & -\frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \operatorname{sech} t \\ \operatorname{sech} t & 0 & -\tanh t \end{vmatrix} = (\frac{1}{\sqrt{2}} \tanh t)\mathbf{i} + \frac{1}{\sqrt{2}}\mathbf{j} + (\frac{1}{\sqrt{2}} \operatorname{sech} t)\mathbf{k}. \text{ Also, } \mathbf{v} = (\sinh t)\mathbf{i} - (\cosh t)\mathbf{j} + \mathbf{k}$$

$$\mathbf{a} = (\cosh t)\mathbf{i} - (\sinh t)\mathbf{j} \Rightarrow \frac{d\mathbf{a}}{dt} = (\sinh t)\mathbf{i} - (\cosh t)\mathbf{j} \text{ and } \mathbf{v} \times \mathbf{a} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \sinh t & -\cosh t & 1 \\ \cosh t & -\sinh t & 0 \end{vmatrix}$$

$$= (\sinh t)\mathbf{i} + (\cosh t)\mathbf{j} + (\cosh^2 t - \sinh^2 t)\mathbf{k} = (\sinh t)\mathbf{i} + (\cosh t)\mathbf{j} + \mathbf{k} \Rightarrow |\mathbf{v} \times \mathbf{a}|^2 = \sinh^2 t + \cosh^2 t + 1. \text{ Thus}$$

$$\tau = \frac{\begin{vmatrix} \sinh t & -\cosh t & 1 \\ \cosh t & -\sinh t & 0 \\ \sinh t & -\cosh t & 0 \end{vmatrix}}{\sinh^2 t + \cosh^2 t + 1} = \frac{-1}{\sinh^2 t + \cosh^2 t + 1} = \frac{-1}{2\cosh^2 t}.$$

17. Yes. If the car is moving along a curved path, then $\kappa \neq 0$ and $a_N = \kappa |\mathbf{v}|^2 \neq 0 \Rightarrow \mathbf{a} = a_T \mathbf{T} + a_N \mathbf{N} \neq \mathbf{0}$.

18. $|\mathbf{v}|$ constant $\Rightarrow a_T = \frac{d}{dt}|\mathbf{v}| = 0 \Rightarrow \mathbf{a} = a_N \mathbf{N}$ is orthogonal to $\mathbf{T} \Rightarrow$ the acceleration is normal to the path

19. $\mathbf{a} \perp \mathbf{v} \Rightarrow \mathbf{a} \perp \mathbf{T} \Rightarrow a_T = 0 \Rightarrow \frac{d}{dt}|\mathbf{v}| = 0 \Rightarrow |\mathbf{v}|$ is constant

20. $\mathbf{a}(t) = a_T \mathbf{T} + a_N \mathbf{N}$, where $a_T = \frac{d}{dt}|\mathbf{v}| = \frac{d}{dt}(10) = 0$ and $a_N = \kappa|\mathbf{v}|^2 = 100\kappa \Rightarrow \mathbf{a} = 0\mathbf{T} + 100\kappa \mathbf{N}$. Now, from Exercise 5(a) Section 13.4, we find for $y = f(x) = x^2$ that $\kappa = \frac{|f''(x)|}{(1+[f'(x)]^2)^{3/2}} = \frac{2}{[1+(2x)^2]^{3/2}} = \frac{2}{(1+4x^2)^{3/2}}$; also, $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j}$ is the position vector of the moving mass $\Rightarrow \mathbf{v} = \mathbf{i} + 2t\mathbf{j} \Rightarrow |\mathbf{v}| = \sqrt{1+4t^2} \Rightarrow \mathbf{T} = \frac{1}{\sqrt{1+4t^2}}(\mathbf{i} + 2t\mathbf{j})$. At $(0, 0)$: $\mathbf{T}(0) = \mathbf{i}$, $\mathbf{N}(0) = \mathbf{j}$ and $\kappa(0) = 2 \Rightarrow \mathbf{F} = m\mathbf{a} = m(100\kappa)\mathbf{N} = 200m \mathbf{j}$;
 At $(\sqrt{2}, 2)$: $\mathbf{T}(\sqrt{2}) = \frac{1}{3}(\mathbf{i} + 2\sqrt{2}\mathbf{j}) = \frac{1}{3}\mathbf{i} + \frac{2\sqrt{2}}{3}\mathbf{j}$, $\mathbf{N}(\sqrt{2}) = -\frac{2\sqrt{2}}{3}\mathbf{i} + \frac{1}{3}\mathbf{j}$, and $\kappa(\sqrt{2}) = \frac{2}{27}$
 $\Rightarrow \mathbf{F} = m\mathbf{a} = m(100\kappa)\mathbf{N} = \left(\frac{200}{27}m\right)\left(-\frac{2\sqrt{2}}{3}\mathbf{i} + \frac{1}{3}\mathbf{j}\right) = -\frac{400\sqrt{2}}{81}m\mathbf{i} + \frac{200}{81}m\mathbf{j}$

21. $\mathbf{r} = (x_0 + At)\mathbf{i} + (y_0 + Bt)\mathbf{j} + (z_0 + Ct)\mathbf{k} \Rightarrow \mathbf{v} = A\mathbf{i} + B\mathbf{j} + C\mathbf{k} \Rightarrow \mathbf{a} = \mathbf{0} \Rightarrow \mathbf{v} \times \mathbf{a} = \mathbf{0} \Rightarrow \kappa = 0$. Since the curve is a plane curve, $\tau = 0$.

22. $a_N = 0 \Rightarrow \kappa|\mathbf{v}|^2 = 0 \Rightarrow \kappa = 0$ (since the particle is moving, we cannot have zero speed) \Rightarrow the curvature is zero so the particle is moving along a straight line

23. From Example 1, $|\mathbf{v}| = t$ and $a_N = t$ so that $a_N = \kappa|\mathbf{v}|^2 \Rightarrow \kappa = \frac{a_N}{|\mathbf{v}|^2} = \frac{t}{t^2} = \frac{1}{t}$, $t \neq 0 \Rightarrow \rho = \frac{1}{\kappa} = t$

24. If a plane curve is sufficiently differentiable the torsion is zero as the following argument shows:

$$\mathbf{r} = f(t)\mathbf{i} + g(t)\mathbf{j} \Rightarrow \mathbf{v} = f'(t)\mathbf{i} + g'(t)\mathbf{j} \Rightarrow \mathbf{a} = f''(t)\mathbf{i} + g''(t)\mathbf{j} \Rightarrow \frac{d\mathbf{a}}{dt} = f'''(t)\mathbf{i} + g'''(t)\mathbf{j} \Rightarrow \tau = \frac{\begin{vmatrix} f'(t) & g'(t) & 0 \\ f''(t) & g''(t) & 0 \\ f'''(t) & g'''(t) & 0 \end{vmatrix}}{|\mathbf{v} \times \mathbf{a}|^2} = 0$$

25. $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k} \Rightarrow \mathbf{v} = f'(t)\mathbf{i} + g'(t)\mathbf{j} + h'(t)\mathbf{k}$; $\mathbf{v} \cdot \mathbf{k} = 0 \Rightarrow h'(t) = 0 \Rightarrow h(t) = C$
 $\Rightarrow \mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + C\mathbf{k}$ and $\mathbf{r}(a) = f(a)\mathbf{i} + g(a)\mathbf{j} + C\mathbf{k} = \mathbf{0} \Rightarrow f(a) = 0, g(a) = 0$ and $C = 0 \Rightarrow h(t) = 0$.

26. From Example 2, $\mathbf{v} = -(a \sin t)\mathbf{i} + (a \cos t)\mathbf{j} + b\mathbf{k} \Rightarrow |\mathbf{v}| = \sqrt{a^2 + b^2}$

$$\Rightarrow \mathbf{T} = \frac{\mathbf{v}}{|\mathbf{v}|} = \frac{1}{\sqrt{a^2 + b^2}}[-(a \sin t)\mathbf{i} + (a \cos t)\mathbf{j} + b\mathbf{k}]; \quad \frac{d\mathbf{T}}{dt} = \frac{1}{\sqrt{a^2 + b^2}}[-(a \cos t)\mathbf{i} - (a \sin t)\mathbf{j}]$$

$$\Rightarrow \mathbf{N} = \frac{\left(\frac{d\mathbf{T}}{dt}\right)}{\left|\frac{d\mathbf{T}}{dt}\right|} = -(\cos t)\mathbf{i} - (\sin t)\mathbf{j}; \quad \mathbf{B} = \mathbf{T} \times \mathbf{N} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{-a \sin t}{\sqrt{a^2 + b^2}} & \frac{a \cos t}{\sqrt{a^2 + b^2}} & \frac{b}{\sqrt{a^2 + b^2}} \\ -\cos t & -\sin t & 0 \end{vmatrix} = \frac{b \sin t}{\sqrt{a^2 + b^2}}\mathbf{i} - \frac{b \cos t}{\sqrt{a^2 + b^2}}\mathbf{j} + \frac{a}{\sqrt{a^2 + b^2}}\mathbf{k}$$

$$\Rightarrow \frac{d\mathbf{B}}{dt} = \frac{1}{\sqrt{a^2 + b^2}}[(b \cos t)\mathbf{i} + (b \sin t)\mathbf{j}] \Rightarrow \frac{d\mathbf{B}}{dt} \cdot \mathbf{N} = -\frac{b}{\sqrt{a^2 + b^2}} \Rightarrow \tau = -\frac{1}{|\mathbf{v}|} \left(\frac{d\mathbf{B}}{dt} \cdot \mathbf{N}\right) = \left(-\frac{1}{\sqrt{a^2 + b^2}}\right) \left(-\frac{b}{\sqrt{a^2 + b^2}}\right) = \frac{b}{a^2 + b^2},$$

which is consistent with the result in Example 2.

10. For each of the planets listed we form the ratio $\frac{T^2 / a^3}{(4\pi^2) / (GM)}$. The values we obtain are

Mercury	1.00225
Venus	1.00288
Mars	1.00252
Saturn	1.00019

These values are all close to 1, so they support Kepler's third law.

$$11. \quad \text{Solve Kepler's third law for } a \text{ and double this result: } 2 \cdot \left(\frac{(365.256 \text{ days})^2}{(4\pi^2) / (GM)} \right)^{1/3} \approx 29.925 \times 10^{10} \text{ m}$$

$$12. \quad \text{Solve Kepler's third law for } a \text{ and double this result: } 2 \cdot \left(\frac{(84 \text{ years})^2}{(4\pi^2) / (GM)} \right)^{1/3} \approx 573.95 \times 10^{10} \text{ m}$$

13. Assuming Earth has a circular orbit with radius 150×10^6 km, the rate of change of area is

$$\frac{\pi(150 \times 10^6 \text{ km})^2}{365.256 \text{ days}} \approx 2.24 \times 10^9 \text{ km}^2/\text{sec}.$$

14. Solving Kepler's third law for T we find $T = \sqrt{\frac{4\pi^2}{GM}(77.8 \times 10^{10} \text{ m})^3} \approx 11.857$ years.

15. Solving Kepler's third law for the mass M of the body around which Io is orbiting we find

$$M = 4\pi^2 \frac{a^3}{T^2 G} = 4\pi^2 \frac{(0.042 \times 10^{10} \text{ m})^3}{(1.769 \text{ days})^2 G} \approx 1.876 \times 10^{27} \text{ kg}.$$

16. To solve this we need a value for the mass of Earth, which is approximately $M = 5.972 \times 10^{24}$ kg. Solving Kepler's third law for the orbital radius we get

$$a = (4\pi^2)^{-1/3} (T^2 GM)^{1/3} = (4\pi^2)^{-1/3} \left((2.36055 \times 10^6 \text{ sec}) G (5.972 \times 10^{24} \text{ kg}) \right)^{1/3} \approx 3.831 \times 10^5 \text{ km}.$$

Since Earth's radius is about 6371, the orbit of the moon is about $383,143 - 6371 = 376,772$ km from the surface, assuming a circular orbit for the moon.

CHAPTER 13 PRACTICE EXERCISES

1. $\mathbf{r}(t) = (4 \cos t)\mathbf{i} + (\sqrt{2} \sin t)\mathbf{j}$

$\Rightarrow x = 4 \cos t$ and $y = \sqrt{2} \sin t \Rightarrow \frac{x^2}{16} + \frac{y^2}{2} = 1;$

$\mathbf{v} = (-4 \sin t)\mathbf{i} + (\sqrt{2} \cos t)\mathbf{j}$ and

$\mathbf{a} = (-4 \cos t)\mathbf{i} - (\sqrt{2} \sin t)\mathbf{j};$

$\mathbf{r}(0) = 4\mathbf{i}, \mathbf{v}(0) = \sqrt{2}\mathbf{j}, \mathbf{a}(0) = -4\mathbf{i};$

$\mathbf{r}(\frac{\pi}{4}) = 2\sqrt{2}\mathbf{i} + \mathbf{j}, \mathbf{v}(\frac{\pi}{4}) = -2\sqrt{2}\mathbf{i} + \mathbf{j}, \mathbf{a}(\frac{\pi}{4}) = -2\sqrt{2}\mathbf{i} - \mathbf{j}; |\mathbf{v}| = \sqrt{16 \sin^2 t + 2 \cos^2 t}$

$\Rightarrow a_T = \frac{d}{dt}|\mathbf{v}| = \frac{14 \sin t \cos t}{\sqrt{16 \sin^2 t + 2 \cos^2 t}}; \text{ at } t=0: a_T = 0, a_N = \sqrt{|\mathbf{a}|^2 - 0} = 4, \mathbf{a} = 0\mathbf{T} + 4\mathbf{N} = 4\mathbf{N},$

$\kappa = \frac{a_N}{|\mathbf{v}|^2} = \frac{4}{2} = 2; \text{ at } t = \frac{\pi}{4}: a_T = \frac{7}{\sqrt{8+1}} = \frac{7}{3}, a_N = \sqrt{9 - \frac{49}{9}} = \frac{4\sqrt{2}}{3}, \mathbf{a} = \frac{7}{3}\mathbf{T} + \frac{4\sqrt{2}}{3}\mathbf{N}, \kappa = \frac{a_N}{|\mathbf{v}|^2} = \frac{4\sqrt{2}}{27}$

2. $\mathbf{r}(t) = (\sqrt{3} \sec t)\mathbf{i} + (\sqrt{3} \tan t)\mathbf{j} \Rightarrow x = \sqrt{3} \sec t$ and $y = \sqrt{3} \tan t \Rightarrow \frac{x^2}{3} - \frac{y^2}{3} = \sec^2 t - \tan^2 t = 1 \Rightarrow x^2 - y^2 = 3;$

$\mathbf{v} = (\sqrt{3} \sec t \tan t)\mathbf{i} + (\sqrt{3} \sec^2 t)\mathbf{j}$ and

$\mathbf{a} = (\sqrt{3} \sec t \tan^2 t + \sqrt{3} \sec^3 t)\mathbf{i} - (2\sqrt{3} \sec^2 t \tan t)\mathbf{j};$

$\mathbf{r}(0) = \sqrt{3}\mathbf{i}, \mathbf{v}(0) = \sqrt{3}\mathbf{j}, \mathbf{a}(0) = \sqrt{3}\mathbf{i};$

$|\mathbf{v}| = \sqrt{3 \sec^2 t \tan^2 t + 3 \sec^4 t}$

$\Rightarrow a_T = \frac{d}{dt}|\mathbf{v}| = \frac{6 \sec^2 t \tan^3 t + 18 \sec^4 t \tan t}{2\sqrt{3} \sec^2 t \tan^2 t + 3 \sec^4 t};$

at $t=0: a_T = 0, a_N = \sqrt{|\mathbf{a}|^2 - 0} = \sqrt{3},$

$\mathbf{a} = 0\mathbf{T} + \sqrt{3}\mathbf{N} = \sqrt{3}\mathbf{N}, \kappa = \frac{a_N}{|\mathbf{v}|^2} = \frac{\sqrt{3}}{3} = \frac{1}{\sqrt{3}}$

3. $\mathbf{r} = \frac{1}{\sqrt{1+t^2}}\mathbf{i} + \frac{t}{\sqrt{1+t^2}}\mathbf{j} \Rightarrow \mathbf{v} = -t(1+t^2)^{-3/2}\mathbf{i} + (1+t^2)^{-3/2}\mathbf{j} \Rightarrow |\mathbf{v}| = \sqrt{[-t(1+t^2)^{-3/2}]^2 + [(1+t^2)^{-3/2}]^2} = \frac{1}{1+t^2}.$

We want to maximize $|\mathbf{v}|: \frac{d|\mathbf{v}|}{dt} = \frac{-2t}{(1+t^2)^2}$ and $\frac{d|\mathbf{v}|}{dt} = 0 \Rightarrow \frac{-2t}{(1+t^2)^2} = 0 \Rightarrow t = 0.$ For $t < 0, \frac{-2t}{(1+t^2)^2} > 0;$ for $t > 0,$

$\frac{-2t}{(1+t^2)^2} < 0 \Rightarrow |\mathbf{v}|_{\max}$ occurs when $t = 0 \Rightarrow |\mathbf{v}|_{\max} = 1$

4. $\mathbf{r} = (e^t \cos t)\mathbf{i} + (e^t \sin t)\mathbf{j} \Rightarrow \mathbf{v} = (e^t \cos t - e^t \sin t)\mathbf{i} + (e^t \sin t + e^t \cos t)\mathbf{j}$

$\Rightarrow \mathbf{a} = (e^t \cos t - e^t \sin t - e^t \sin t - e^t \cos t)\mathbf{i} + (e^t \sin t + e^t \cos t + e^t \cos t - e^t \sin t)\mathbf{j} = (-2e^t \sin t)\mathbf{i} + (2e^t \cos t)\mathbf{j}.$

Let θ be the angle between \mathbf{r} and $\mathbf{a}.$ Then $\theta = \cos^{-1}\left(\frac{\mathbf{r} \cdot \mathbf{a}}{|\mathbf{r}||\mathbf{a}|}\right) = \cos^{-1}\left(\frac{-2e^{2t} \sin t \cos t + 2e^{2t} \sin t \cos t}{\sqrt{(e^t \cos t)^2 + (e^t \sin t)^2} \sqrt{(-2e^t \sin t)^2 + (2e^t \cos t)^2}}\right)$

$= \cos^{-1}\left(\frac{0}{2e^{2t}}\right) = \cos^{-1} 0 = \frac{\pi}{2}$ for all t

5. $\mathbf{v} = 3\mathbf{i} + 4\mathbf{j}$ and $\mathbf{a} = 5\mathbf{i} + 15\mathbf{j} \Rightarrow \mathbf{v} \times \mathbf{a} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3 & 4 & 0 \\ 5 & 15 & 0 \end{vmatrix} = 25\mathbf{k} \Rightarrow |\mathbf{v} \times \mathbf{a}| = 25$; $|\mathbf{v}| = \sqrt{3^2 + 4^2} = 5 \Rightarrow \kappa = \frac{|\mathbf{v} \times \mathbf{a}|}{|\mathbf{v}|^3} = \frac{25}{5^3} = \frac{1}{5}$

6. $\kappa = \frac{|y''|}{[1+(y')^2]^{3/2}} = e^x (1+e^{2x})^{-3/2} \Rightarrow \frac{d\kappa}{dx} = e^x (1+e^{2x})^{-3/2} + e^x \left[-\frac{3}{2}(1+e^{2x})^{-5/2} (2e^{2x}) \right]$
 $= e^x (1+e^{2x})^{-3/2} - 3e^{3x} (1+e^{2x})^{-5/2} = e^x (1+e^{2x})^{-5/2} [(1+e^{2x}) - 3e^{2x}] = e^x (1+e^{2x})^{-5/2} (1-2e^{2x})$;
 $\frac{d\kappa}{dx} = 0 \Rightarrow (1-2e^{2x}) = 0 \Rightarrow e^{2x} = \frac{1}{2} \Rightarrow 2x = -\ln 2 \Rightarrow x = -\frac{1}{2} \ln 2 = -\ln \sqrt{2} \Rightarrow y = \frac{1}{\sqrt{2}}$; therefore κ is at a maximum at the point $(-\ln \sqrt{2}, \frac{1}{\sqrt{2}})$

7. $\mathbf{r} = x\mathbf{i} + y\mathbf{j} \Rightarrow \mathbf{v} = \frac{dx}{dt}\mathbf{i} + \frac{dy}{dt}\mathbf{j}$ and $\mathbf{v} \cdot \mathbf{i} = y \Rightarrow \frac{dx}{dt} = y$. Since the particle moves around the unit circle $x^2 + y^2 = 1$, $2x \frac{dx}{dt} + 2y \frac{dy}{dt} = 0 \Rightarrow \frac{dy}{dt} = -\frac{x}{y} \frac{dx}{dt} \Rightarrow \frac{dy}{dt} = -\frac{x}{y}(y) = -x$. Since $\frac{dx}{dt} = y$ and $\frac{dy}{dt} = -x$, we have $\mathbf{v} = y\mathbf{i} - x\mathbf{j} \Rightarrow$ at $(1, 0)$, $\mathbf{v} = -\mathbf{j}$ and the motion is clockwise.

8. $9y = x^3 \Rightarrow 9 \frac{dy}{dt} = 3x^2 \frac{dx}{dt} \Rightarrow \frac{dy}{dt} = \frac{1}{3} x^2 \frac{dx}{dt}$. If $\mathbf{r} = x\mathbf{i} + y\mathbf{j}$, where x and y are differentiable functions of t , then $\mathbf{v} = \frac{dx}{dt}\mathbf{i} + \frac{dy}{dt}\mathbf{j}$. Hence $\mathbf{v} \cdot \mathbf{i} = 4 \Rightarrow \frac{dx}{dt} = 4$ and $\mathbf{v} \cdot \mathbf{j} = \frac{dy}{dt} = \frac{1}{3} x^2 \frac{dx}{dt} = \frac{1}{3} (3)^2 (4) = 12$ at $(3, 3)$.
 Also, $\mathbf{a} = \frac{d^2x}{dt^2}\mathbf{i} + \frac{d^2y}{dt^2}\mathbf{j}$ and $\frac{d^2y}{dt^2} = \left(\frac{2}{3}x\right)\left(\frac{dx}{dt}\right) + \left(\frac{1}{3}x^2\right)\frac{d^2x}{dt^2}$. Hence $\mathbf{a} \cdot \mathbf{i} = -2 \Rightarrow \frac{d^2x}{dt^2} = -2$ and $\mathbf{a} \cdot \mathbf{j} = \frac{d^2y}{dt^2} = \frac{2}{3}(3)(4)^2 + \frac{1}{3}(3)^2(-2) = 26$ at the point $(x, y) = (3, 3)$.

9. $\frac{d\mathbf{r}}{dt}$ orthogonal to $\mathbf{r} \Rightarrow 0 = \frac{d\mathbf{r}}{dt} \cdot \mathbf{r} = \frac{1}{2} \frac{d\mathbf{r}}{dt} \cdot \mathbf{r} + \frac{1}{2} \mathbf{r} \cdot \frac{d\mathbf{r}}{dt} = \frac{1}{2} \frac{d}{dt}(\mathbf{r} \cdot \mathbf{r}) \Rightarrow \mathbf{r} \cdot \mathbf{r} = K$, a constant. If $\mathbf{r} = x\mathbf{i} + y\mathbf{j}$, where x and y are differentiable functions of t , then $\mathbf{r} \cdot \mathbf{r} = x^2 + y^2 \Rightarrow x^2 + y^2 = K$, which is the equation of a circle centered at the origin.

10. (a)

(b) $\mathbf{v} = (\pi - \pi \cos \pi t)\mathbf{i} + (\pi \sin \pi t)\mathbf{j}$
 $\Rightarrow \mathbf{a} = (\pi^2 \sin \pi t)\mathbf{i} + (\pi^2 \cos \pi t)\mathbf{j}$;
 $\mathbf{v}(0) = \mathbf{0}$ and $\mathbf{a}(0) = \pi^2 \mathbf{j}$;
 $\mathbf{v}(1) = 2\pi \mathbf{i}$ and $\mathbf{a}(1) = -\pi^2 \mathbf{j}$;
 $\mathbf{v}(2) = \mathbf{0}$ and $\mathbf{a}(2) = \pi^2 \mathbf{j}$;
 $\mathbf{v}(3) = 2\pi \mathbf{i}$; and $\mathbf{a}(3) = -\pi^2 \mathbf{j}$

(c) Forward speed at the topmost point is $|\mathbf{v}(1)| = |\mathbf{v}(3)| = 2\pi$ ft/sec; since the circle makes $\frac{1}{2}$ revolution per second, the center moves π ft parallel to the x -axis each second \Rightarrow the forward speed of C is π ft/sec.

11. $y = y_0 + (v_0 \sin \alpha)t - \frac{1}{2}gt^2 \Rightarrow y = 6.5 + (44 \text{ ft/sec})(\sin 45^\circ)(3 \text{ sec}) - \frac{1}{2}(32 \text{ ft/sec}^2)(3 \text{ sec})^2 = 6.5 + 66\sqrt{2} - 144$
 $\approx -44.16 \text{ ft} \Rightarrow$ the shot put is on the ground. Now, $y = 0 \Rightarrow 6.5 + 22\sqrt{2}t - 16t^2 = 0 \Rightarrow t \approx 2.13 \text{ sec}$ (the positive root) $\Rightarrow x \approx (44 \text{ ft/sec})(\cos 45^\circ)(2.13 \text{ sec}) \approx 66.27 \text{ ft}$ or about 66 ft, 3 in. from the stopboard

12. $y_{\max} = y_0 + \frac{(v_0 \sin \alpha)^2}{2g} = 7 \text{ ft} + \frac{[(80 \text{ ft/sec})(\sin 45^\circ)]^2}{(2)(32 \text{ ft/sec}^2)} \approx 57 \text{ ft}$

13. $x = (v_0 \cos \alpha)t$ and $y = (v_0 \sin \alpha)t - \frac{1}{2}gt^2 \Rightarrow \tan \phi = \frac{y}{x} = \frac{(v_0 \sin \alpha)t - \frac{1}{2}gt^2}{(v_0 \cos \alpha)t} = \frac{(v_0 \sin \alpha) - \frac{1}{2}gt}{v_0 \cos \alpha}$
 $\Rightarrow v_0 \cos \alpha \tan \phi = v_0 \sin \alpha - \frac{1}{2}gt \Rightarrow t = \frac{2v_0 \sin \alpha - 2v_0 \cos \alpha \tan \phi}{g}$, which is the time when the golf ball hits the upward slope. At this time $x = (v_0 \cos \alpha)\left(\frac{2v_0 \sin \alpha - 2v_0 \cos \alpha \tan \phi}{g}\right) = \left(\frac{2}{g}\right)(v_0^2 \sin \alpha \cos \alpha - v_0^2 \cos^2 \alpha \tan \phi)$. Now

$$OR = \frac{x}{\cos \phi} \Rightarrow OR = \left(\frac{2}{g}\right)\left(\frac{v_0^2 \sin \alpha \cos \alpha - v_0^2 \cos^2 \alpha \tan \phi}{\cos \phi}\right)$$

$$= \left(\frac{2v_0^2 \cos \alpha}{g}\right)\left(\frac{\sin \alpha}{\cos \phi} - \frac{\cos \alpha \tan \phi}{\cos \phi}\right) = \left(\frac{2v_0^2 \cos \alpha}{g}\right)\left(\frac{\sin \alpha \cos \phi - \cos \alpha \sin \phi}{\cos^2 \phi}\right)$$

$$= \left(\frac{2v_0^2 \cos \alpha}{g \cos^2 \phi}\right)[\sin(\alpha - \phi)].$$
 The distance OR is maximized when x

is maximized: $\frac{dx}{d\alpha} = \left(\frac{2v_0^2}{g}\right)(\cos 2\alpha + \sin 2\alpha \tan \phi) = 0$

$$\Rightarrow (\cos 2\alpha + \sin 2\alpha \tan \phi) = 0 \Rightarrow \cot 2\alpha + \tan \phi = 0 \Rightarrow \cot 2\alpha = \tan(-\phi) \Rightarrow 2\alpha = \frac{\pi}{2} + \phi \Rightarrow \alpha = \frac{\phi}{2} + \frac{\pi}{4}$$

14. (a) $x = v_0(\cos 40^\circ)t$ and $y = 6.5 + v_0(\sin 40^\circ)t - \frac{1}{2}gt^2 = 6.5 + v_0(\sin 40^\circ)t - 16t^2$; $x = 262\frac{5}{12} \text{ ft}$ and

$$y = 0 \text{ ft} \Rightarrow 262\frac{5}{12} = v_0(\cos 40^\circ)t \text{ or } v_0 = \frac{262.4167}{(\cos 40^\circ)t} \text{ and } 0 = 6.5 + \left[\frac{262.4167}{(\cos 40^\circ)t}\right](\sin 40^\circ)t - 16t^2$$

$$\Rightarrow t^2 = 14.1684 \Rightarrow t \approx 3.764 \text{ sec. Therefore, } 262.4167 \approx v_0(\cos 40^\circ)(3.764 \text{ sec})$$

$$\Rightarrow v_0 \approx \frac{262.4167}{(\cos 40^\circ)(3.764 \text{ sec})} \Rightarrow v_0 \approx 91 \text{ ft/sec}$$

(b) $y_{\max} = y_0 + \frac{(v_0 \sin \alpha)^2}{2g} \approx 6.5 + \frac{(91)(\sin 40^\circ)^2}{(2)(32)} \approx 60 \text{ ft}$

15. $\mathbf{r} = (2 \cos t)\mathbf{i} + (2 \sin t)\mathbf{j} + t^2\mathbf{k} \Rightarrow \mathbf{v} = (-2 \sin t)\mathbf{i} + (2 \cos t)\mathbf{j} + 2t\mathbf{k} \Rightarrow |\mathbf{v}| = \sqrt{(-2 \sin t)^2 + (2 \cos t)^2 + (2t)^2}$
 $= 2\sqrt{1+t^2} \Rightarrow \text{Length} = \int_0^{\pi/4} 2\sqrt{1+t^2} dt = \left[t\sqrt{1+t^2} + \ln|t + \sqrt{1+t^2}| \right]_0^{\pi/4} = \frac{\pi}{4}\sqrt{1 + \frac{\pi^2}{16}} + \ln\left(\frac{\pi}{4} + \sqrt{1 + \frac{\pi^2}{16}}\right)$

16. $\mathbf{r} = (3 \cos t)\mathbf{i} + (3 \sin t)\mathbf{j} + 2t^{3/2}\mathbf{k} \Rightarrow \mathbf{v} = (-3 \sin t)\mathbf{i} + (3 \cos t)\mathbf{j} + 3t^{1/2}\mathbf{k} \Rightarrow |\mathbf{v}| = \sqrt{(-3 \sin t)^2 + (3 \cos t)^2 + (3t^{1/2})^2}$
 $= \sqrt{9+9t} = 3\sqrt{1+t} \Rightarrow \text{Length} = \int_0^3 3\sqrt{1+t} dt = \left[2(1+t)^{3/2} \right]_0^3 = 14$

 $\Rightarrow \theta = 0$ or π . Note that $\frac{dr}{d\theta} > 0$ when $\sin \theta > 0$ and $\frac{dr}{d\theta} < 0$ when $\sin \theta < 0$. Since $\sin \theta < 0$ on $-\pi < \theta < 0$ and $\sin \theta > 0$ on $0 < \theta < \pi$, r is a minimum when $\theta = 0$ and $r(0) = \frac{(1+e)r_0}{1+e \cos 0} = r_0$
4. (a) $f(x) = x - 1 - \frac{1}{2} \sin x = 0 \Rightarrow f(0) = -1$ and $f(2) = 2 - 1 - \frac{1}{2} \sin 2 \geq \frac{1}{2}$ since $|\sin 2| \leq 1$; since f is continuous on $[0, 2]$, the Intermediate Value Theorem implies there is a root between 0 and 2

5. (a) $\mathbf{v} = \dot{x} \mathbf{i} + \dot{y} \mathbf{j}$ and $\mathbf{v} = \dot{r} \mathbf{u}_r + r\dot{\theta} \mathbf{u}_\theta = (\dot{r}) [(\cos \theta)\mathbf{i} + (\sin \theta)\mathbf{j}] + (r\dot{\theta}) [(-\sin \theta)\mathbf{i} + (\cos \theta)\mathbf{j}] \Rightarrow \mathbf{v} \cdot \mathbf{i} = \dot{x}$ and $\mathbf{v} \cdot \mathbf{j} = \dot{y}$
 $\mathbf{v} \cdot \mathbf{i} = \dot{r} \cos \theta - r\dot{\theta} \sin \theta \Rightarrow \dot{x} = \dot{r} \cos \theta - r\dot{\theta} \sin \theta$; $\mathbf{v} \cdot \mathbf{j} = \dot{y}$ and $\mathbf{v} \cdot \mathbf{j} = \dot{r} \sin \theta + r\dot{\theta} \cos \theta \Rightarrow \dot{y} = \dot{r} \sin \theta + r\dot{\theta} \cos \theta$

- (b) $\mathbf{u}_r = (\cos \theta)\mathbf{i} + (\sin \theta)\mathbf{j} \Rightarrow \mathbf{v} \cdot \mathbf{u}_r = \dot{x} \cos \theta + \dot{y} \sin \theta = (\dot{r} \cos \theta - r\dot{\theta} \sin \theta)(\cos \theta) + (\dot{r} \sin \theta + r\dot{\theta} \cos \theta)(\sin \theta)$
 by part (a), $\Rightarrow \mathbf{v} \cdot \mathbf{u}_r = \dot{r}$; therefore, $\dot{r} = \dot{x} \cos \theta + \dot{y} \sin \theta$; $\mathbf{u}_\theta = -(\sin \theta)\mathbf{i} + (\cos \theta)\mathbf{j}$
 $\Rightarrow \mathbf{v} \cdot \mathbf{u}_\theta = -\dot{x} \sin \theta + \dot{y} \cos \theta = (\dot{r} \cos \theta - r\dot{\theta} \sin \theta)(-\sin \theta) + (\dot{r} \sin \theta + r\dot{\theta} \cos \theta)(\cos \theta)$ by part (a)
 $\Rightarrow \mathbf{v} \cdot \mathbf{u}_\theta = r\dot{\theta}$; therefore, $r\dot{\theta} = -\dot{x} \sin \theta + \dot{y} \cos \theta$

6. $r = f(\theta) \Rightarrow \frac{dr}{dt} = f'(\theta) \frac{d\theta}{dt} \Rightarrow \frac{d^2r}{dt^2} = f''(\theta) \left(\frac{d\theta}{dt}\right)^2 + f'(\theta) \frac{d^2\theta}{dt^2}$;

$\mathbf{v} = \frac{dr}{dt} \mathbf{u}_r + r \frac{d\theta}{dt} \mathbf{u}_\theta = \left(\cos \theta \frac{dr}{dt} - r \sin \theta \frac{d\theta}{dt}\right) \mathbf{i} + \left(\sin \theta \frac{dr}{dt} + r \cos \theta \frac{d\theta}{dt}\right) \mathbf{j}$

$\Rightarrow |\mathbf{v}| = \left[\left(\frac{dr}{dt}\right)^2 + r^2 \left(\frac{d\theta}{dt}\right)^2 \right]^{1/2} = \left[(f')^2 + f^2 \right]^{1/2} \left(\frac{d\theta}{dt}\right)$; $|\mathbf{v} \times \mathbf{a}| = |\dot{x} \ddot{y} - \dot{y} \ddot{x}|$,

where $x = r \cos \theta$ and $y = r \sin \theta$. Then $\frac{dx}{dt} = (-r \sin \theta) \frac{d\theta}{dt} + (\cos \theta) \frac{dr}{dt}$

$\Rightarrow \frac{d^2x}{dt^2} = (-2 \sin \theta) \frac{d\theta}{dt} \frac{dr}{dt} - (r \cos \theta) \left(\frac{d\theta}{dt}\right)^2 - (r \sin \theta) \frac{d^2\theta}{dt^2} + (\cos \theta) \frac{d^2r}{dt^2}$; $\frac{dy}{dt} = (r \cos \theta) \frac{d\theta}{dt} + (\sin \theta) \frac{dr}{dt}$

$\Rightarrow \frac{d^2y}{dt^2} = (2 \cos \theta) \frac{d\theta}{dt} \frac{dr}{dt} - (r \sin \theta) \left(\frac{d\theta}{dt}\right)^2 + (r \cos \theta) \frac{d^2\theta}{dt^2} + (\sin \theta) \frac{d^2r}{dt^2}$. Then, after much algebra $|\mathbf{v} \times \mathbf{a}|$

$= r^2 \left(\frac{d\theta}{dt}\right)^3 + r \frac{d^2\theta}{dt^2} \frac{dr}{dt} - r \frac{d\theta}{dt} \frac{d^2r}{dt^2} + 2 \frac{d\theta}{dt} \left(\frac{dr}{dt}\right)^2 = \left(\frac{d\theta}{dt}\right)^3 (f^2 - f \cdot f'' + 2(f')^2) \Rightarrow \kappa_{3/2} \frac{|\mathbf{v} \times \mathbf{a}|}{|\mathbf{v}|} = \frac{f^2 - f \cdot f'' + 2(f')^2}{[(f')^2 + f^2]^{3/2}}$

7. (a) Let $r = 2 - t$ and $\theta = 3t \Rightarrow \frac{dr}{dt} = -1$ and $\frac{d\theta}{dt} = 3 \Rightarrow \frac{d^2r}{dt^2} = \frac{d^2\theta}{dt^2} = 0$. The halfway point is $(1, 3) \Rightarrow t = 1$;

$\mathbf{v} = \frac{dr}{dt} \mathbf{u}_r + r \frac{d\theta}{dt} \mathbf{u}_\theta \Rightarrow \mathbf{v}(1) = -\mathbf{u}_r + 3\mathbf{u}_\theta$; $\mathbf{a} = \left[\frac{d^2r}{dt^2} - r \left(\frac{d\theta}{dt}\right)^2\right] \mathbf{u}_r + \left[r \frac{d^2\theta}{dt^2} + 2 \frac{dr}{dt} \frac{d\theta}{dt}\right] \mathbf{u}_\theta$

$\Rightarrow \mathbf{a}(1) = -9\mathbf{u}_r - 6\mathbf{u}_\theta$

- (b) It takes the beetle 2 min to crawl to the origin \Rightarrow the rod has revolved 6 radians

$\Rightarrow L = \int_0^6 \sqrt{[f(\theta)]^2 + [f'(\theta)]^2} d\theta = \int_0^6 \sqrt{\left(2 - \frac{\theta}{3}\right)^2 + \left(-\frac{1}{3}\right)^2} d\theta = \int_0^6 \sqrt{4 - \frac{4\theta}{3} + \frac{\theta^2}{9} + \frac{1}{9}} d\theta$

$= \int_0^6 \sqrt{\frac{37 - 12\theta + \theta^2}{9}} d\theta = \frac{1}{3} \int_0^6 \sqrt{(\theta - 6)^2 + 1} d\theta = \frac{1}{3} \left[\frac{(\theta - 6)}{2} \sqrt{(\theta - 6)^2 + 1} + \frac{1}{2} \ln \left| \theta - 6 + \sqrt{(\theta - 6)^2 + 1} \right| \right]_0^6$

$= \sqrt{37} - \frac{1}{6} \ln(\sqrt{37} - 6) \approx 6.5$ in.

8. (a) $x = r \cos \theta \Rightarrow dx = \cos \theta dr - r \sin \theta d\theta$; $y = r \sin \theta \Rightarrow dy = \sin \theta dr + r \cos \theta d\theta$; thus

$dx^2 = \cos^2 \theta dr^2 - 2r \sin \theta \cos \theta dr d\theta + r^2 \sin^2 \theta d\theta^2$ and

$dy^2 = \sin^2 \theta dr^2 + 2r \sin \theta \cos \theta dr d\theta + r^2 \cos^2 \theta d\theta^2 \Rightarrow ds^2 = dx^2 + dy^2 + dz^2 = dr^2 + r^2 d\theta^2 + dz^2$

- (c) $r = e^\theta \Rightarrow dr = e^\theta d\theta$

$\Rightarrow L = \int_0^{\ln 8} \sqrt{dr^2 + r^2 d\theta^2 + dz^2}$

$= \int_0^{\ln 8} \sqrt{e^{2\theta} + e^{2\theta} + e^{2\theta}} d\theta$

 $\Rightarrow 2x - y + z = 0$

65. $f(x, y) = \sum_{n=0}^{\infty} \left(\frac{x}{y}\right)^n = \frac{1}{1-\left(\frac{x}{y}\right)} = \frac{y}{y-x}$ for $\left|\frac{x}{y}\right| < 1$
 \Rightarrow Domain: all points (x, y) satisfying $|x| < |y|$;

Thus
 $y = \sin\left(\frac{\pi}{2} + \sin^{-1} x\right) = \sqrt{1-x^2}, x \leq 0$

        shading=zhue, title="#77(Section 14.1)");
```

69-80. Example CAS commands:

Mathematica: (assigned functions and bounds will vary)

For 69 - 72, the command **ContourPlot** draws 2-dimensional contours that are z-level curves of surfaces $z = f(x,y)$.

```
Clear[x, y, f]
f[x_,y_]:= x Sin[y/2] + y Sin[2x]
xmin=0; xmax= 5π; ymin=0; ymax= 5π; {x0, y0}={3π, 3π};
cp= ContourPlot[f[x,y], {x, xmin, xmax}, {y, ymin, ymax}, ContourShading -> False];
cp0= ContourPlot[{f[x,y], {x, xmin, xmax}, {y, ymin, ymax}, Contours -> [f[x0,y0]},
                ContourShading -> False, PlotStyle -> {RGBColor[1,0,0]}];
Show[cp, cp0]
```

For 73 - 76, the command **ContourPlot3D** will be used. Write the function $f[x, y, z]$ so that when it is equated to zero, it represents the level surface given.

For 73, the problem associated with $\text{Log}[0]$ can be avoided by rewriting the function as $x^2 + y^2 + z^2 - e^{1/4}$

```
Clear[x, y, z, f]
f[x_,y_,z_]:= x2 + y2 + z2 - Exp[1/4]
ContourPlot3D[f[x, y, z], {x, -5, 5}, {y, -5, 5}, {z, -5, 5}, PlotPoints -> (7, 7)];
```

For 77 - 80, the command **ParametricPlot3D** will be used. To get the z-level curves here, we solve x and y in terms of z and either u or v (v here), create a table of level curves, then plot that table.

```
Clear[x, y, z, u, v]
ParametricPlot3D[{u Cos[v], u Sin[v], u}, {u, 0, 2}, {v, 0, 2Pi}];
zlevel=Table[{z Cos[v], z Sin[v]}, {z, 0, 2, .1}];
ParametricPlot[Evaluate[zlevel], {v, 0, 2π}];
```

51. $f(x,y) = \begin{cases} 1 & \text{if } y \geq x^4 \\ 1 & \text{if } y \leq 0 \\ 0 & \text{otherwise} \end{cases}$

(a) $\lim_{(x,y) \rightarrow (0,1)} f(x,y) = 1$ since any path through $(0,1)$ that is close to $(0,1)$ satisfies $y \geq x^4$

(b) $\lim_{(x,y) \rightarrow (2,3)} f(x,y) = 0$ since any path through $(2,3)$ that is close to $(2,3)$ does not satisfy either $y \geq x^4$ or $y \leq 0$

(c) $\lim_{\substack{(x,y) \rightarrow (0,0) \\ \text{along } x=0}} f(x,y) = 1$ and $\lim_{\substack{(x,y) \rightarrow (0,0) \\ \text{along } y=x^2}} f(x,y) = 0 \Rightarrow \lim_{(x,y) \rightarrow (0,0)} f(x,y)$ does not exist

52. $f(x,y) = \begin{cases} x^2 & \text{if } x \geq 0 \\ x^3 & \text{if } x < 0 \end{cases}$

(a) $\lim_{(x,y) \rightarrow (3,-2)} f(x,y) = 3^2 = 9$ since any path through $(3,-2)$ that is close to $(3,-2)$ satisfies $x \geq 0$

(b) $\lim_{(x,y) \rightarrow (-2,1)} f(x,y) = (-2)^3 = -8$ since any path through $(-2,1)$ that is close to $(-2,1)$ satisfies $x < 0$

(c) $\lim_{(x,y) \rightarrow (0,0)} f(x,y) = 0$ since the limit is 0 along any path through $(0,0)$ with $x < 0$ and the limit is also zero along any path through $(0,0)$ with $x \geq 0$

53. First consider the vertical line $x = 0 \Rightarrow \lim_{\substack{(x,y) \rightarrow (0,0) \\ \text{along } x=0}} \frac{2x^2y}{x^4+y^2} = \lim_{y \rightarrow 0} \frac{2(0)^2y}{(0)^4+y^2} = \lim_{y \rightarrow 0} 0 = 0$. Now consider any

nonvertical line through $(0,0)$. The equation of any line through $(0,0)$ is of the form $y = mx$

$$\Rightarrow \lim_{\substack{(x,y) \rightarrow (0,0) \\ \text{along } y=mx}} f(x,y) = \lim_{\substack{(x,y) \rightarrow (0,0) \\ \text{along } y=mx}} \frac{2x^2y}{x^4+y^2} = \lim_{x \rightarrow 0} \frac{2x^2(mx)}{x^4+(mx)^2} = \lim_{x \rightarrow 0} \frac{2mx^3}{x^4+m^2x^2} = \lim_{x \rightarrow 0} \frac{2mx^3}{x^2(x^2+m^2)} = \lim_{x \rightarrow 0} \frac{2mx}{x^2+m^2} = 0.$$

Thus $\lim_{\substack{(x,y) \rightarrow (0,0) \\ \text{any line through } (0,0)}} \frac{2x^2y}{x^4+y^2} = 0$.

54. If f is continuous at (x_0, y_0) , then $\lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y)$ must equal $f(x_0, y_0) = 3$. If f is not continuous at (x_0, y_0) , the limit could have any value different from 3, and need not even exist.

55. $\lim_{(x,y) \rightarrow (0,0)} \left(1 - \frac{x^2y^2}{3}\right) = 1$ and $\lim_{(x,y) \rightarrow (0,0)} 1 = 1 \Rightarrow \lim_{(x,y) \rightarrow (0,0)} \frac{\tan^{-1}xy}{xy} = 1$ by the Sandwich Theorem

56. If $xy > 0$, $\lim_{(x,y) \rightarrow (0,0)} \frac{2|xy| - \left(\frac{x^2y^2}{6}\right)}{|xy|} = \lim_{(x,y) \rightarrow (0,0)} \frac{2xy - \left(\frac{x^2y^2}{6}\right)}{xy} = \lim_{(x,y) \rightarrow (0,0)} \left(2 - \frac{xy}{6}\right) = 2$ and $\lim_{(x,y) \rightarrow (0,0)} \frac{2|xy|}{|xy|} = 2$; if $xy < 0$, $\lim_{(x,y) \rightarrow (0,0)} \frac{2|xy| - \left(\frac{x^2y^2}{6}\right)}{|xy|} = \lim_{(x,y) \rightarrow (0,0)} \frac{-2xy - \left(\frac{x^2y^2}{6}\right)}{-xy} = \lim_{(x,y) \rightarrow (0,0)} \left(2 + \frac{xy}{6}\right) = 2$ and $\lim_{(x,y) \rightarrow (0,0)} \frac{2|xy|}{|xy|} = 2 \Rightarrow \lim_{(x,y) \rightarrow (0,0)} \frac{4 - 4\cos\sqrt{|xy|}}{|xy|} = 2$, by the Sandwich Theorem

57. The limit is 0 since $\left|\sin\left(\frac{1}{x}\right)\right| \leq 1 \Rightarrow -1 \leq \sin\left(\frac{1}{x}\right) \leq 1 \Rightarrow -y \leq y \sin\left(\frac{1}{x}\right) \leq y$ for $y \geq 0$, and $-y \geq y \sin\left(\frac{1}{x}\right) \geq y$ for $y \leq 0$. Thus as $(x,y) \rightarrow (0,0)$, both $-y$ and y approach 0 $\Rightarrow y \sin\left(\frac{1}{x}\right) \rightarrow 0$, by the Sandwich Theorem.

58. The limit is 0 since $\left|\cos\left(\frac{1}{y}\right)\right| \leq 1 \Rightarrow -1 \leq \cos\left(\frac{1}{y}\right) \leq 1 \Rightarrow -x \leq x \cos\left(\frac{1}{y}\right) \leq x$ and $-x \geq x \cos\left(\frac{1}{y}\right) \geq x$ for $x \leq 0$. Thus as $(x,y) \rightarrow (0,0)$, both $-x$ and x approach 0 $\Rightarrow x \cos\left(\frac{1}{y}\right) \rightarrow 0$, by the Sandwich Theorem.

59. (a) $f(x,y)|_{y=mx} = \frac{2m}{1+m^2} = \frac{2 \tan \theta}{1+\tan^2 \theta} = \sin 2\theta$. The value of $f(x,y) = \sin 2\theta$ varies with θ , which is the line's angle of inclination.

(b) Since $f(x,y)|_{y=mx} = \sin 2\theta$ and since $-1 \leq \sin 2\theta \leq 1$ for every θ , $\lim_{(x,y) \rightarrow (0,0)} f(x,y)$ varies from -1 to 1 along $y = mx$.

60. $\left|xy(x^2 - y^2)\right| = |xy||x^2 - y^2| \leq |x||y||x^2 + y^2| = \sqrt{x^2}\sqrt{y^2}|x^2 + y^2| \leq \sqrt{x^2 + y^2}\sqrt{x^2 + y^2}|x^2 + y^2|$
 $= (x^2 + y^2)^2 \Rightarrow \left|\frac{xy(x^2 - y^2)}{x^2 + y^2}\right| \leq \frac{(x^2 + y^2)^2}{x^2 + y^2} = x^2 + y^2 \Rightarrow -(x^2 + y^2) \leq \frac{xy(x^2 - y^2)}{x^2 + y^2} \leq (x^2 + y^2)$
 $\Rightarrow \lim_{(x,y) \rightarrow (0,0)} \left(\frac{xy(x^2 - y^2)}{x^2 + y^2}\right) = 0$ by the Sandwich Theorem, since $\lim_{(x,y) \rightarrow (0,0)} \pm(x^2 + y^2) = 0$; thus, define $f(0,0) = 0$

61.

88. If the first partial derivatives are continuous throughout an open region R , then by Theorem 3 in this section of the text, $f(x, y) = f(x_0, y_0) + f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \epsilon_1\Delta x + \epsilon_2\Delta y$, where $\epsilon_1, \epsilon_2 \rightarrow 0$ as $\Delta x, \Delta y \rightarrow 0$.

Then as $(x, y) \rightarrow (x_0, y_0)$, $\Delta x \rightarrow 0$ and $\Delta y \rightarrow 0 \Rightarrow \lim_{(x,y) \rightarrow (x_0,y_0)} f(x, y) = f(x_0, y_0) \Rightarrow f$ is continuous at every point (x_0, y_0) in R .

89. Yes, since f_{xx}, f_{yy}, f_{xy} , and f_{yx} are all continuous on R , use the same reasoning as in Exercise 88 with

$f_x(x, y) = f_x(x_0, y_0) + f_{xx}(x_0, y_0)\Delta x + f_{xy}(x_0, y_0)\Delta y + \epsilon_1\Delta x + \epsilon_2\Delta y$ and
 $f_y(x, y) = f_y(x_0, y_0) + f_{yx}(x_0, y_0)\Delta x + f_{yy}(x_0, y_0)\Delta y + \hat{\epsilon}_1\Delta x + \hat{\epsilon}_2\Delta y$. Then
 $\lim_{(x,y) \rightarrow (x_0,y_0)} f_x(x, y) = f_x(x_0, y_0)$ and $\lim_{(x,y) \rightarrow (x_0,y_0)} f_y(x, y) = f_y(x_0, y_0)$.

90. To find α and β so that $u_t = u_{xx} \Rightarrow u_t = -\beta\sin(\alpha x)e^{-\beta t}$ and $u_x = \alpha\cos(\alpha x)e^{-\beta t}$
 $\Rightarrow u_{xx} = -\alpha^2\sin(\alpha x)e^{-\beta t}$; then $u_t = u_{xx} \Rightarrow -\beta\sin(\alpha x)e^{-\beta t} = -\alpha^2\sin(\alpha x)e^{-\beta t}$, thus $u_t = u_{xx}$ only if $\beta = \alpha^2$

 $f(1, 0) = 5$

- (iii) On AB , $f(x, y) = f(x, -x + 1) = 8x^2 - 6x + 3$ on $0 \leq x \leq 1$; $f'(x, -x + 1) = 16x - 6 = 0 \Rightarrow x = \frac{3}{8}$ and $y = \frac{5}{8}$; $f(\frac{3}{8}, \frac{5}{8}) = \frac{15}{8}$, $f(0, 1) = 3$, and $f(1, 0) = 5$
- (iv) For interior points of the triangular region, $f_x(x, y) = 4 - 8y = 0$ and $f_y(x, y) = -8x + 2 = 0 \Rightarrow y = \frac{1}{2}$ and $x = \frac{1}{4}$ which is an interior critical point with $f(\frac{1}{4}, \frac{1}{2}) = 2$. Therefore the absolute maximum is 5 at $(1, 0)$ and the absolute minimum is 1 at $(0, 0)$.

39. Let $F(a, b) = \int_a^b (6 - x - x^2) dx$ where $a \leq b$. The boundary of the domain of F is the line $a = b$ in the ab -plane, and $F(a, a) = 0$, so F is identically 0 on the boundary of its domain. For interior critical points we have: $\frac{\partial F}{\partial a} = -(6 - a - a^2) = 0 \Rightarrow a = -3, 2$ and $\frac{\partial F}{\partial b} = (6 - b - b^2) = 0 \Rightarrow b = -3, 2$. Since $a \leq b$, there is only one interior critical point $(-3, 2)$ and $F(-3, 2) = \int_{-3}^2 (6 - x - x^2) dx$ gives the area under the parabola $y = 6 - x - x^2$ that is above the x -axis. Therefore, $a = -3$ and $b = 2$.

40. Let $F(a, b) = \int_a^b (24 - 2x - x^2)^{1/3} dx$ where $a \leq b$. The boundary of the domain of F is the line $a = b$ and on this line F is identically 0. For interior critical points we have: $\frac{\partial F}{\partial a} = -(24 - 2a - a^2)^{1/3} = 0 \Rightarrow a = 4, -6$ and $\frac{\partial F}{\partial b} = (24 - 2b - b^2)^{1/3} = 0 \Rightarrow b = 4, -6$. Since $a \leq b$, there is only one critical point $(-6, 4)$ and $F(-6, 4) = \int_{-6}^4 (24 - 2x - x^2)^{1/3} dx$ gives the area under the curve $y = (24 - 2x - x^2)^{1/3}$ that is above the x -axis. Therefore, $a = -6$ and $b = 4$.

41. $T_x(x, y) = 2x - 1 = 0$ and $T_y(x, y) = 4y = 0 \Rightarrow x = \frac{1}{2}$ and $y = 0$ with $T(\frac{1}{2}, 0) = -\frac{1}{4}$; on the boundary $x^2 + y^2 = 1$: $T(x, y) = -x^2 - x + 2$ for $-1 \leq x \leq 1 \Rightarrow T'(x, y) = -2x - 1 = 0 \Rightarrow x = -\frac{1}{2}$ and $y = \pm \frac{\sqrt{3}}{2}$;
 $T(-\frac{1}{2}, \frac{\sqrt{3}}{2}) = \frac{9}{4}$, $T(-\frac{1}{2}, -\frac{\sqrt{3}}{2}) = \frac{9}{4}$, $T(-1, 0) = 2$, and $T(1, 0) = 0 \Rightarrow$ the hottest is $(\frac{2}{4})^\circ$ at $(-\frac{1}{2}, -\frac{\sqrt{3}}{2})$ and $(-\frac{1}{2}, \frac{\sqrt{3}}{2})$; the coldest is $(-\frac{1}{4})^\circ$ at $(\frac{1}{2}, 0)$.

42. $f_x(x, y) = y + 2 - \frac{2}{x} = 0$ and $f_y(x, y) = x - \frac{1}{y} = 0 \Rightarrow x = \frac{1}{2}$ and $y = 2$; $f_{xx}(\frac{1}{2}, 2) = \frac{2}{x^2} \Big|_{(\frac{1}{2}, 2)} = 8$,
 $f_{yy}(\frac{1}{2}, 2) = \frac{1}{y^2} \Big|_{(\frac{1}{2}, 2)} = \frac{1}{4}$, $f_{xy}(\frac{1}{2}, 2) = 1 \Rightarrow f_{xx}f_{yy} - f_{xy}^2 = 1 > 0$ and $f_{xx} > 0 \Rightarrow$ a local minimum of

 $f_{xy}(1, 2) = 0 \Rightarrow f_{xx}f_{yy} - f_{xy}^2 = 4 > 0$ and $f_{xx} > 0 \Rightarrow$ local minimum at $(1, 2)$
- (c) $f_x(x, y) = 9x^2 - 9 = 0$ and $f_y(x, y) = 2y + 4 = 0 \Rightarrow x = \pm 1$ and $y = -2$; $f_{xx}(1, -2) = 18x|_{(1, -2)} = 18$,
 $f_{yy}(1, -2) = 2$, $f_{xy}(1, -2) = 0 \Rightarrow f_{xx}f_{yy} - f_{xy}^2 = 36 > 0$ and $f_{xx} > 0 \Rightarrow$ local minimum at $(1, -2)$;
 $f_{xx}(-1, -2) = -18$, $f_{yy}(-1, -2) = 2$, $f_{xy}(-1, -2) = 0 \Rightarrow f_{xx}f_{yy} - f_{xy}^2 = -36 < 0 \Rightarrow$ saddle point at $(-1, -2)$
44. (a) Minimum at $(0, 0)$ Since $f(x, y) > 0$ for all other (x, y)

 (c) Neither since $f(x, y) < 0$ for $x < 0$ and $f(x, y) > 0$ for $x > 0$
 (d) Neither since $f(x, y) < 0$ for $x < 0$ and $f(x, y) > 0$ for $x > 0$
 (e) Neither since $f(x, y) < 0$ for $x < 0$ and $y > 0$, but $f(x, y) > 0$ for $x > 0$ and $y > 0$
 (f) Minimum at $(0, 0)$ since $f(x, y) > 0$ for all other (x, y)
45. If $k = 0$, then $f(x, y) = x^2 + y^2 \Rightarrow f_x(x, y) = 2x = 0$ and $f_y(x, y) = 2y = 0 \Rightarrow x = 0$ and $y = 0 \Rightarrow (0, 0)$ is the only critical point. If $k \neq 0$, $f_x(x, y) = 2x + ky = 0 \Rightarrow y = -\frac{2}{k}x$; $f_y(x, y) = kx + 2y = 0 \Rightarrow kx + 2\left(-\frac{2}{k}x\right) = 0 \Rightarrow kx - \frac{4x}{k} = 0 \Rightarrow \left(k - \frac{4}{k}\right)x = 0 \Rightarrow x = 0$ or $k = \pm 2 \Rightarrow y = \left(-\frac{2}{k}\right)(0) = 0$ or $y = \pm x$; in any case $(0, 0)$ is a critical point.
46. (See Exercise 45 above): $f_{xx}(x, y) = 2$, $f_{yy}(x, y) = 2$, and $f_{xy}(x, y) = k \Rightarrow f_{xx}f_{yy} - f_{xy}^2 = 4 - k^2$; f will have a saddle point at $(0, 0)$ if $4 - k^2 < 0 \Rightarrow k > 2$ or $k < -2$; f will have a local minimum at $(0, 0)$ if $4 - k^2 > 0 \Rightarrow -2 < k < 2$; the test is inconclusive if $4 - k^2 = 0 \Rightarrow k = \pm 2$.
47. No; for example $f(x, y) = xy$ has a saddle point at $(a, b) = (0, 0)$ where $f_x = f_y = 0$.
48. If $f_{xx}(a, b)$ and $f_{yy}(a, b)$ differ in sign, then $f_{xx}(a, b)f_{yy}(a, b) < 0$ so $f_{xx}f_{yy} - f_{xy}^2 < 0$. The surface must therefore have a saddle point at (a, b) by the second derivative test.
49. We want the point on $z = 10 - x^2 - y^2$ where the tangent plane is parallel to the plane $x + 2y + 3z = 0$. To find a normal vector to $z = 10 - x^2 - y^2$ let $w = z + x^2 + y^2 - 10$. Then $\nabla w = 2x\mathbf{i} + 2y\mathbf{j} + \mathbf{k}$ is normal to $z = 10 - x^2 - y^2$ at (x, y) . The vector ∇w is parallel to $\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}$ which is normal to the plane $x + 2y + 3z = 0$ if $6x\mathbf{i} + 6y\mathbf{j} + 3\mathbf{k} = \mathbf{i} + 2\mathbf{j} + 3\mathbf{k}$ or $x = \frac{1}{6}$ and $y = \frac{1}{3}$. Thus the point is $\left(\frac{1}{6}, \frac{1}{3}, 10 - \frac{1}{36} - \frac{1}{9}\right)$ or $\left(\frac{1}{6}, \frac{1}{3}, \frac{355}{36}\right)$.
50. We want the point on $z = x^2 + y^2 + 10$ where the tangent plane is parallel to the plane $x + 2y - z = 0$. Let $w = z - x^2 - y^2 - 10$, then $\nabla w = -2x\mathbf{i} - 2y\mathbf{j} + \mathbf{k}$ is normal to $z = x^2 + y^2 + 10$ at (x, y) . The vector ∇w is

parallel to $\mathbf{i} + 2\mathbf{j} - \mathbf{k}$ which is normal to the plane if $x = \frac{1}{2}$ and $y = 1$. Thus the point $(\frac{1}{2}, 1, \frac{1}{4} + 1 + 10)$ or $(\frac{1}{2}, 1, \frac{45}{4})$ is the point on the surface $z = x^2 + y^2 + 10$ nearest the plane $x + 2y - z = 0$.

The absolute minimum is $f\left(\frac{4}{5}, \frac{2}{5}\right) = \frac{4}{5}$ at the interior critical point when $t = \frac{4}{5}$; the absolute maximum is $f(0, 2) = 4$ at the endpoint when $t = 0$.

(i) $x = t$ and $y = 2 - 2t \Rightarrow x^2 + y^2 = 5t^2 - 8t + 4 \Rightarrow \frac{dg}{dt} = -(5t^2 - 8t + 4)^{-2} [(-2t)(1) + (-2)(2 - 2t)(-2)] = -(5t^2 - 8t + 4)^{-2} (-10t + 8) = 0 \Rightarrow t = \frac{4}{5} \Rightarrow x = \frac{4}{5}$ and $y = \frac{2}{5}$ with $g\left(\frac{4}{5}, \frac{2}{5}\right) = \frac{1}{\left(\frac{4}{5}\right)} = \frac{5}{4}$.  $\Rightarrow 2[(mx_1 + b - y_1)(x_1) + (mx_2 + b - y_2)(x_2) + \dots + (mx_n + b - y_n)(x_n)] = 0$
 $\Rightarrow mx_1^2 + bx_1 - x_1y_1 + mx_2^2 + bx_2 - x_2y_2 + \dots + mx_n^2 + bx_n - x_ny_n = 0$
 $\Rightarrow m(x_1^2 + x_2^2 + \dots + x_n^2) + b(x_1 + x_2 + \dots + x_n) - (x_1y_1 + x_2y_2 + \dots + x_ny_n) = m \sum_{k=1}^n (x_k^2) + b \sum_{k=1}^n x_k - \sum_{k=1}^n (x_k y_k) = 0$
 $\Rightarrow \frac{\partial w}{\partial b} = 2(mx_1 + b - y_1)(1) + 2(mx_2 + b - y_2)(1) + \dots + 2(mx_n + b - y_n)(1) = 0$

 $\Rightarrow mx_1 + b - y_1 + mx_2 + b - y_2 + \dots + mx_n + b - y_n = 0$
 $\Rightarrow m(x_1 + x_2 + \dots + x_n) + (b + b + \dots + b) - (y_1 + y_2 + \dots + y_n) = m \sum_{k=1}^n x_k + bn - \sum_{k=1}^n y_k = 0$
 $\Rightarrow b = \frac{1}{n} \left(\sum_{k=1}^n y_k - m \sum_{k=1}^n x_k \right)$. Substituting for b in the equation obtained for $\frac{\partial w}{\partial m}$ we get

$$\begin{aligned}
 & m \sum_{k=1}^n (x_k^2) + \frac{1}{n} \left(\sum_{k=1}^n y_k - m \sum_{k=1}^n x_k \right) \sum_{k=1}^n x_k - \sum_{k=1}^n (x_k y_k) = 0. \text{ Multiply both sides by } n \text{ to obtain} \\
 & mn \sum_{k=1}^n (x_k^2) + \left(\sum_{k=1}^n y_k - m \sum_{k=1}^n x_k \right) \sum_{k=1}^n x_k - n \sum_{k=1}^n (x_k y_k) = mn \sum_{k=1}^n (x_k^2) + \left(\sum_{k=1}^n x_k \right) \left(\sum_{k=1}^n y_k \right) - m \left(\sum_{k=1}^n x_k \right)^2 - n \sum_{k=1}^n (x_k y_k) = 0 \\
 & \Rightarrow m \left[n \sum_{k=1}^n (x_k^2) - \left(\sum_{k=1}^n x_k \right)^2 \right] = n \sum_{k=1}^n (x_k y_k) - \left(\sum_{k=1}^n x_k \right) \left(\sum_{k=1}^n y_k \right) \\
 & \Rightarrow m = \frac{n \sum_{k=1}^n (x_k y_k) - \left(\sum_{k=1}^n x_k \right) \left(\sum_{k=1}^n y_k \right)}{n \sum_{k=1}^n (x_k^2) - \left(\sum_{k=1}^n x_k \right)^2} = \frac{\left(\sum_{k=1}^n x_k \right) \left(\sum_{k=1}^n y_k \right) - n \sum_{k=1}^n (x_k y_k)}{\left(\sum_{k=1}^n x_k \right)^2 - n \sum_{k=1}^n (x_k^2)}
 \end{aligned}$$

To show that these values for m and b minimize the sum of the squares of the distances, use second derivative test. $\frac{\partial^2 w}{\partial m^2} = 2x_1^2 + 2x_2^2 + \dots + 2x_n^2 = 2 \sum_{k=1}^n (x_k^2)$; $\frac{\partial^2 w}{\partial m \partial b} = 2x_1 + 2x_2 + \dots + 2x_n = 2 \sum_{k=1}^n x_k$; $\frac{\partial^2 w}{\partial b^2} = 2 + 2 + \dots + 2 = 2n$

The discriminant is: $\left(\frac{\partial^2 w}{\partial m^2} \right) \left(\frac{\partial^2 w}{\partial b^2} \right) - \left(\frac{\partial^2 w}{\partial m \partial b} \right)^2 = \left[2 \sum_{k=1}^n (x_k^2) \right] (2n) - \left[2 \sum_{k=1}^n x_k \right]^2 = 4 \left[n \sum_{k=1}^n (x_k^2) - \left(\sum_{k=1}^n x_k \right)^2 \right]$.

Now, $n \sum_{k=1}^n (x_k^2) - \left(\sum_{k=1}^n x_k \right)^2 = n(x_1^2 + x_2^2 + \dots + x_n^2) - (x_1 + x_2 + \dots + x_n)(x_1 + x_2 + \dots + x_n)$

$$\begin{aligned}
 &= nx_1^2 + nx_2^2 + \dots + nx_n^2 - x_1^2 - x_1x_2 - \dots - x_1x_n - x_2x_1 - x_2^2 - \dots - x_2x_n - \dots - x_nx_1 - x_nx_2 - \dots - x_n^2 \\
 &= (n-1)x_1^2 + (n-1)x_2^2 + \dots + (n-1)x_n^2 - 2x_1x_2 - 2x_1x_3 - \dots - 2x_1x_n - 2x_2x_3 - \dots - 2x_2x_n - \dots - 2x_{n-1}x_n \\
 &= (x_1^2 - 2x_1x_2 + x_2^2) + (x_1^2 - 2x_1x_3 + x_3^2) + \dots + (x_1^2 - 2x_1x_n + x_n^2) + (x_2^2 - 2x_2x_3 + x_3^2) + \dots \\
 &\quad + (x_2^2 - 2x_2x_n + x_n^2) + \dots + (x_{n-1}^2 - 2x_{n-1}x_n + x_n^2) \\
 &= (x_1 - x_2)^2 + (x_1 - x_3)^2 + \dots + (x_1 - x_n)^2 + (x_2 - x_3)^2 + \dots + (x_2 - x_n)^2 + \dots + (x_{n-1} - x_n)^2 \geq 0.
 \end{aligned}$$

Thus we have: $\left(\frac{\partial^2 w}{\partial m^2} \right) \left(\frac{\partial^2 w}{\partial b^2} \right) - \left(\frac{\partial^2 w}{\partial m \partial b} \right)^2 = 4 \left[n \sum_{k=1}^n (x_k^2) - \left(\sum_{k=1}^n x_k \right)^2 \right] \geq 4(0) = 0$. If $x_1 = x_2 = \dots = x_n$ then

$\left(\frac{\partial^2 w}{\partial m^2} \right) \left(\frac{\partial^2 w}{\partial b^2} \right) - \left(\frac{\partial^2 w}{\partial m \partial b} \right)^2 = 0$. Also, $\frac{\partial^2 w}{\partial m^2} = 2 \sum_{k=1}^n (x_k^2) \geq 0$. If $x_1 = x_2 = \dots = x_n = 0$, then $\frac{\partial^2 w}{\partial m^2} = 0$. Provided that at

least one x_i is nonzero and different from the rest of $x_j, j \neq i$, then $\left(\frac{\partial^2 w}{\partial m^2} \right) \left(\frac{\partial^2 w}{\partial b^2} \right) - \left(\frac{\partial^2 w}{\partial m \partial b} \right)^2 > 0$ and

$\frac{\partial^2 w}{\partial m^2} > 0 \Rightarrow$ the values given above for m and b minimize w .

14.8 LAGRANGE MULTIPLIERS

- $\nabla f = y\mathbf{i} + x\mathbf{j}$ and $\nabla g = 2x\mathbf{i} + 4y\mathbf{j}$ so that $\nabla f = \lambda \nabla g \Rightarrow y\mathbf{i} + x\mathbf{j} = \lambda(2x\mathbf{i} + 4y\mathbf{j}) \Rightarrow y = 2x\lambda$ and $x = 4y\lambda$
 $\Rightarrow x = 8x\lambda^2 \Rightarrow \lambda = \pm \frac{\sqrt{2}}{4}$ or $x = 0$.

CASE 1: If $x = 0$, then $y = 0$. But $(0, 0)$ is not on the ellipse so $x \neq 0$.

CASE 2: $x \neq 0 \Rightarrow \lambda = \pm \frac{\sqrt{2}}{4} \Rightarrow x = \pm \sqrt{2}y \Rightarrow (\pm \sqrt{2}y)^2 + 2y^2 = 1 \Rightarrow y = \pm \frac{1}{2}$.

Therefore f takes on its extreme values at $(\pm \frac{\sqrt{2}}{2}, \frac{1}{2})$ and $(\pm \frac{\sqrt{2}}{2}, -\frac{1}{2})$. The extreme values of f on the ellipse are $\pm \frac{\sqrt{2}}{2}$.
- $\nabla f = y\mathbf{i} + x\mathbf{j}$ and $\nabla g = 2x\mathbf{i} + 2y\mathbf{j}$ so that $\nabla f = \lambda \nabla g \Rightarrow y\mathbf{i} + x\mathbf{j} = \lambda(2x\mathbf{i} + 2y\mathbf{j}) \Rightarrow y = 2x\lambda$ and $x = 2y\lambda$
 $\Rightarrow x = 4x\lambda^2 \Rightarrow x = 0$ or $\lambda = \pm \frac{1}{2}$.

CASE 1: If $x = 0$, then $y = 0$. But $(0, 0)$ is not on the circle $x^2 + y^2 - 10 = 0$ so $x \neq 0$.

CASE 2: $x \neq 0 \Rightarrow \lambda = \pm \frac{1}{2} \Rightarrow y = 2x(\pm \frac{1}{2}) = \pm x \Rightarrow x^2 + (\pm x)^2 - 10 = 0 \Rightarrow x = \pm \sqrt{5} \Rightarrow y = \pm \sqrt{5}$.

Therefore f takes on its extreme values at $(\pm \sqrt{5}, \sqrt{5})$ and $(\pm \sqrt{5}, -\sqrt{5})$. The extreme values of f on the circle are 5 and -5.
- $\nabla f = -2x\mathbf{i} - 2y\mathbf{j}$ and $\nabla g = \mathbf{i} + 3\mathbf{j}$ so that $\nabla f = \lambda \nabla g \Rightarrow -2x\mathbf{i} - 2y\mathbf{j} = \lambda(\mathbf{i} + 3\mathbf{j}) \Rightarrow x = -\frac{\lambda}{2}$ and $y = -\frac{3\lambda}{2}$
 $\Rightarrow (-\frac{\lambda}{2}) + 3(-\frac{3\lambda}{2}) = 10 \Rightarrow \lambda = -2 \Rightarrow x = 1$ and $y = 3 \Rightarrow f$ takes on its extreme value at $(1, 3)$ on the line. The extreme value is $f(1, 3) = 49 - 1 - 9 = 39$.
- $\nabla f = 2xy\mathbf{i} + x^2\mathbf{j}$ and $\nabla g = \mathbf{i} + \mathbf{j}$ so that $\nabla f = \lambda \nabla g \Rightarrow 2xy\mathbf{i} + x^2\mathbf{j} = \lambda(\mathbf{i} + \mathbf{j}) \Rightarrow 2xy = \lambda$ and $x^2 = \lambda$
 $\Rightarrow 2xy = x^2 \Rightarrow x = 0$ or $2y = x$.

CASE 1: If $x = 0$, then $x + y = 3 \Rightarrow y = 3$.

CASE 2: If $x \neq 0$, then $2y = x$ so that $x + y = 3 \Rightarrow 2y + y = 3 \Rightarrow y = 1 \Rightarrow x = 2$.

Therefore f takes on its extreme values at $(0, 3)$ and $(2, 1)$. The extreme values of f are $f(0, 3) = 0$ and $f(2, 1) = 4$.

5. We optimize $f(x, y) = x^2 + y^2$, the square of the distance to the origin, subject to the constraint $g(x, y) = xy^2 - 54 = 0$. Thus $\nabla f = 2x\mathbf{i} + 2y\mathbf{j}$ and $\nabla g = y^2\mathbf{i} + 2xy\mathbf{j}$ so that $\nabla f = \lambda \nabla g \Rightarrow 2x\mathbf{i} + 2y\mathbf{j} = \lambda(y^2\mathbf{i} + 2xy\mathbf{j}) \Rightarrow 2x = \lambda y^2$ and $2y = 2\lambda xy$.

CASE 1: If $y = 0$, then $x = 0$. But $(0, 0)$ does not satisfy the constraint $xy^2 = 54$ so $y \neq 0$.

CASE 2: If $y \neq 0$, then $2 = 2\lambda x \Rightarrow x = \frac{1}{\lambda} \Rightarrow 2\left(\frac{1}{\lambda}\right) = \lambda y^2 \Rightarrow y^2 = \frac{2}{\lambda^2}$. Then $xy^2 = 54 \Rightarrow \left(\frac{1}{\lambda}\right)\left(\frac{2}{\lambda^2}\right) = 54 \Rightarrow \lambda^3 = \frac{1}{27} \Rightarrow \lambda = \frac{1}{3} \Rightarrow x = 3$ and $y^2 = 18 \Rightarrow x = 3$ and $y = \pm 3\sqrt{2}$.

Therefore $(3, \pm 3\sqrt{2})$ are the points on the curve $xy^2 = 54$ nearest the origin (since $xy^2 = 54$ has points increasingly far away as y gets close to 0, no points are farthest away).

6. We optimize $f(x, y) = x^2 + y^2$, the square of the distance to the origin, subject to the constraint $g(x, y) = x^2y - 2 = 0$. Thus $\nabla f = 2x\mathbf{i} + 2y\mathbf{j}$ and $\nabla g = 2xy\mathbf{i} + x^2\mathbf{j}$ so that $\nabla f = \lambda \nabla g \Rightarrow 2x = 2xy\lambda$ and $2y = x^2\lambda \Rightarrow \lambda = \frac{2y}{x^2}$, since $x = 0 \Rightarrow y = 0$ (but $g(0, 0) \neq 0$). Thus $x \neq 0$ and $2x = 2xy\left(\frac{2y}{x^2}\right) \Rightarrow x^2 = 2y^2 \Rightarrow (2y^2)y - 2 = 0 \Rightarrow y = 1$ (since $y > 0$) $\Rightarrow x = \pm\sqrt{2}$. Therefore $(\pm\sqrt{2}, 1)$ are the points on the curve $x^2y = 2$ nearest the origin (since $x^2y = 2$ has points increasingly far away as x gets close to 0, no points are farthest away).

7. (a) $\nabla f = \mathbf{i} + \mathbf{j}$ and $\nabla g = y\mathbf{i} + x\mathbf{j}$ so that $\nabla f = \lambda \nabla g \Rightarrow \mathbf{i} + \mathbf{j} = \lambda(y\mathbf{i} + x\mathbf{j}) \Rightarrow 1 = \lambda y$ and $1 = \lambda x \Rightarrow y = \frac{1}{\lambda}$ and $x = \frac{1}{\lambda} \Rightarrow \frac{1}{\lambda^2} = 16 \Rightarrow \lambda = \pm\frac{1}{4}$. Use $\lambda = \frac{1}{4}$ since $x > 0$ and $y > 0$. Then $x = 4$ and $y = 4 \Rightarrow$ the minimum value is 8 at the point $(4, 4)$. Now, $xy = 16, x > 0, y > 0$ is a branch of a hyperbola in the first quadrant with the x - and y -axes as asymptotes. The equations $x + y = c$ give a family of parallel lines with $m = -1$. As these lines move away from the origin, the number c increases. Thus the minimum value of c occurs where $x + y = c$ is tangent to the hyperbola's branch.

(b) $\nabla f = y\mathbf{i} + x\mathbf{j}$ and $\nabla g = \mathbf{i} + \mathbf{j}$ so that $\nabla f = \lambda \nabla g \Rightarrow y\mathbf{i} + x\mathbf{j} = \lambda(\mathbf{i} + \mathbf{j}) \Rightarrow y = \lambda = x \Rightarrow y + y = 16 \Rightarrow y = 8 \Rightarrow x = 8 \Rightarrow f(8, 8) = 64$ is the maximum value. The equations $xy = c$ ($x > 0$ and $y > 0$ or $x < 0$ and $y < 0$ to get a maximum value) give a family of hyperbolas in the first and third quadrants with the x - and y -axes as asymptotes. The maximum value of c occurs where the hyperbola $xy = c$ is tangent to the line $x + y = 16$.

8. Let $f(x, y) = x^2 + y^2$ be the square of the distance from the origin. Then $\nabla f = 2x\mathbf{i} + 2y\mathbf{j}$ and $\nabla g = (2x + y)\mathbf{i} + (2y + x)\mathbf{j}$ so that $\nabla f = \lambda \nabla g \Rightarrow 2x = \lambda(2x + y)$ and $2y = \lambda(2y + x) \Rightarrow \frac{2y}{2y+x} = \lambda \Rightarrow 2x = \left(\frac{2y}{2y+x}\right)(2x + y) \Rightarrow x(2y + x) = y(2x + y) \Rightarrow x^2 = y^2 \Rightarrow y = \pm x$.

CASE 1: $y = x \Rightarrow x^2 + x(x) + x^2 - 1 = 0 \Rightarrow x = \pm\frac{1}{\sqrt{3}}$ and $y = x$.

CASE 2: $y = -x \Rightarrow x^2 + x(-x) + (-x)^2 - 1 = 0 \Rightarrow x = \pm 1$ and $y = -x$. Thus $f\left(\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right) = \frac{2}{3} = f\left(-\frac{1}{\sqrt{3}}, -\frac{1}{\sqrt{3}}\right)$ and $f(1, -1) = 2 = f(-1, 1)$.

Therefore the points $(1, -1)$ and $(-1, 1)$ are the farthest away; $\left(\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right)$ and $\left(-\frac{1}{\sqrt{3}}, -\frac{1}{\sqrt{3}}\right)$ are the closest points to the origin.

9. $V = \pi r^2 h \Rightarrow 16\pi = \pi r^2 h \Rightarrow 16 = r^2 h \Rightarrow g(r, h) = r^2 h - 16$; $S = 2\pi r h + 2\pi r^2 \Rightarrow \nabla S = (2\pi h + 4\pi r)\mathbf{i} + 2\pi r\mathbf{j}$ and $\nabla g = 2r h \mathbf{i} + r^2 \mathbf{j}$ so that $\nabla S = \lambda \nabla g \Rightarrow (2\pi r h + 4\pi r)\mathbf{i} + 2\pi r\mathbf{j} = \lambda(2r h \mathbf{i} + r^2 \mathbf{j}) \Rightarrow 2\pi r h + 4\pi r = 2r h \lambda$ and $2\pi r = \lambda r^2 \Rightarrow r = 0$ or $\lambda = \frac{2\pi}{r}$. But $r = 0$ gives no physical can, so $r \neq 0 \Rightarrow \lambda = \frac{2\pi}{r} \Rightarrow 2\pi h + 4\pi r = 2r h \left(\frac{2\pi}{r}\right) \Rightarrow 2r = h \Rightarrow 16 = r^2(2r) \Rightarrow r = 2 \Rightarrow h = 4$; thus $r = 2$ cm and $h = 4$ cm give the only extreme surface area of 24π cm². Since $r = 4$ cm and $h = 1$ cm $\Rightarrow V = 16\pi$ cm³ and $S = 40\pi$ cm², which is a larger surface area, then 24π cm² must be the minimum surface area.
10. For a cylinder of radius r and height h we want to maximize the surface area $S = 2\pi r h$ subject to the constraint $g(r, h) = r^2 + \left(\frac{h}{2}\right)^2 - a^2 = 0$. Thus $\nabla S = 2\pi h \mathbf{i} + 2\pi r \mathbf{j}$ and $\nabla g = 2r \mathbf{i} + \frac{h}{2} \mathbf{j}$ so that $\nabla S = \lambda \nabla g \Rightarrow 2\pi h = 2\lambda r$ and $2\pi r = \frac{\lambda h}{2} \Rightarrow \frac{\pi h}{r} = \lambda$ and $2\pi r = \left(\frac{\pi h}{r}\right)\left(\frac{h}{2}\right) \Rightarrow 4r^2 = h^2 \Rightarrow h = 2r \Rightarrow r^2 + \frac{4r^2}{4} = a^2 \Rightarrow 2r^2 = a^2 \Rightarrow r = \frac{a}{\sqrt{2}} \Rightarrow h = a\sqrt{2} \Rightarrow S = 2\pi\left(\frac{a}{\sqrt{2}}\right)(a\sqrt{2}) = 2\pi a^2$.
11. $A = (2x)(2y) = 4xy$ subject to $g(x, y) = \frac{x^2}{16} + \frac{y^2}{9} - 1 = 0$; $\nabla A = 4y \mathbf{i} + 4x \mathbf{j}$ and $\nabla g = \frac{x}{8} \mathbf{i} + \frac{2y}{9} \mathbf{j}$ so that $\nabla A = \lambda \nabla g \Rightarrow 4y \mathbf{i} + 4x \mathbf{j} = \lambda\left(\frac{x}{8} \mathbf{i} + \frac{2y}{9} \mathbf{j}\right) \Rightarrow 4y = \left(\frac{x}{8}\right)\lambda$ and $4x = \left(\frac{2y}{9}\right)\lambda \Rightarrow \lambda = \frac{32y}{x}$ and $4x = \left(\frac{2y}{9}\right)\left(\frac{32y}{x}\right) \Rightarrow y = \pm \frac{3}{4}x \Rightarrow \frac{x^2}{16} + \frac{\left(\pm \frac{3}{4}x\right)^2}{9} = 1 \Rightarrow x^2 = 8 \Rightarrow x = \pm 2\sqrt{2}$. We use $x = 2\sqrt{2}$ since x represents distance. Then $y = \frac{3}{4}(2\sqrt{2}) = \frac{3\sqrt{2}}{2}$, so the length is $2x = 4\sqrt{2}$ and the width is $2y = 3\sqrt{2}$.
12. $P = 4x + 4y$ subject to $g(x, y) = \frac{x^2}{a^2} + \frac{y^2}{b^2} - 1 = 0$; $\nabla P = 4\mathbf{i} + 4\mathbf{j}$ and $\nabla g = \frac{2x}{a^2} \mathbf{i} + \frac{2y}{b^2} \mathbf{j}$ so that $\nabla P = \lambda \nabla g \Rightarrow 4 = \left(\frac{2x}{a^2}\right)\lambda$ and $4 = \left(\frac{2y}{b^2}\right)\lambda \Rightarrow \lambda = \frac{2a^2}{x}$ and $4 = \left(\frac{2y}{b^2}\right)\left(\frac{2a^2}{x}\right) \Rightarrow y = \left(\frac{b^2}{a^2}\right)x \Rightarrow \frac{x^2}{a^2} + \frac{\left(\frac{b^2}{a^2}\right)^2 x^2}{b^2} = 1 \Rightarrow \frac{x^2}{a^2} + \frac{b^2 x^2}{a^4} = 1 \Rightarrow (a^2 + b^2)x^2 = a^4 \Rightarrow x = \frac{a^2}{\sqrt{a^2 + b^2}}$, since $x > 0 \Rightarrow y = \left(\frac{b^2}{a^2}\right)x = \frac{b^2}{\sqrt{a^2 + b^2}} \Rightarrow \text{width} = 2x = \frac{2a^2}{\sqrt{a^2 + b^2}}$ and height $= 2y = \frac{2b^2}{\sqrt{a^2 + b^2}} \Rightarrow \text{perimeter is } P = 4x + 4y = \frac{4a^2 + 4b^2}{\sqrt{a^2 + b^2}} = 4\sqrt{a^2 + b^2}$
13. $\nabla f = 2x\mathbf{i} + 2y\mathbf{j}$ and $\nabla g = (2x - 2)\mathbf{i} + (2y - 4)\mathbf{j}$ so that $\nabla f = \lambda \nabla g = 2x\mathbf{i} + 2y\mathbf{j} = \lambda[(2x - 2)\mathbf{i} + (2y - 4)\mathbf{j}] \Rightarrow 2x = \lambda(2x - 2)$ and $2y = \lambda(2y - 4) \Rightarrow x = \frac{\lambda}{\lambda - 1}$, and $y = \frac{2\lambda}{\lambda - 1}$, $\lambda \neq 1 \Rightarrow y = 2x \Rightarrow x^2 - 2x + (2x)^2 - 4(2x) = 0 \Rightarrow x = 0$ and $y = 0$, or $x = 2$ and $y = 4$. $f(0, 0) = 0$ is the minimum value and $f(2, 4) = 20$ is the maximum value. (Note that $\lambda = 1$ gives $2x = 2x - 2$ or $0 = -2$, which is impossible.)
14. $\nabla f = 3\mathbf{i} - \mathbf{j}$ and $\nabla g = 2x\mathbf{i} + 2y\mathbf{j}$ so that $\nabla f = \lambda \nabla g \Rightarrow 3 = 2\lambda x$ and $-1 = 2\lambda y \Rightarrow \lambda = \frac{3}{2x}$ and $-1 = 2\left(\frac{3}{2x}\right)y \Rightarrow y = -\frac{x}{3} \Rightarrow x^2 + \left(-\frac{x}{3}\right)^2 = 4 \Rightarrow 10x^2 = 36 \Rightarrow x = \pm \frac{6}{\sqrt{10}} \Rightarrow x = \frac{6}{\sqrt{10}}$ and $y = -\frac{2}{\sqrt{10}}$, or $x = -\frac{6}{\sqrt{10}}$ and $y = \frac{2}{\sqrt{10}}$. Therefore $f\left(\frac{6}{\sqrt{10}}, -\frac{2}{\sqrt{10}}\right) = \frac{20}{\sqrt{10}} + 6 = 2\sqrt{10} + 6 \approx 12.325$ is the maximum value, and $f\left(-\frac{6}{\sqrt{10}}, \frac{2}{\sqrt{10}}\right) = -2\sqrt{10} + 6 \approx -0.325$ is the minimum value.

15. $\nabla T = (8x - 4y)\mathbf{i} + (-4x + 2y)\mathbf{j}$ and $g(x, y) = x^2 + y^2 - 25 = 0 \Rightarrow \nabla g = 2x\mathbf{i} + 2y\mathbf{j}$ so that $\nabla T = \lambda \nabla g$
 $\Rightarrow (8x - 4y)\mathbf{i} + (-4x + 2y)\mathbf{j} = \lambda(2x\mathbf{i} + 2y\mathbf{j}) \Rightarrow 8x - 4y = 2\lambda x$ and $-4x + 2y = 2\lambda y \Rightarrow y = \frac{-2x}{\lambda - 1}, \lambda \neq 1$
 $\Rightarrow 8x - 4\left(\frac{-2x}{\lambda - 1}\right) = 2\lambda x \Rightarrow x = 0$, or $\lambda = 0$, or $\lambda = 5$.

CASE 1: $x = 0 \Rightarrow y = 0$; but $(0, 0)$ is not on $x^2 + y^2 = 25$ so $x \neq 0$.

CASE 2: $\lambda = 0 \Rightarrow y = 2x \Rightarrow x^2 + (2x)^2 = 25 \Rightarrow x = \pm\sqrt{5}$ and $y = 2x$.

CASE 3: $\lambda = 5 \Rightarrow y = -\frac{2x}{4} = -\frac{x}{2} \Rightarrow x^2 + \left(-\frac{x}{2}\right)^2 = 25 \Rightarrow x = \pm 2\sqrt{5} \Rightarrow x = 2\sqrt{5}$ and $y = -\sqrt{5}$, or $x = -2\sqrt{5}$
and $y = \sqrt{5}$.

Therefore $T(\sqrt{5}, 2\sqrt{5}) = 0^\circ = T(-\sqrt{5}, -2\sqrt{5})$ is the minimum value and $T(2\sqrt{5}, -\sqrt{5}) = 125^\circ = T(-2\sqrt{5}, \sqrt{5})$ is the maximum value. (Note: $\lambda = 1 \Rightarrow x = 0$ from the equation $-4x + 2y = 2\lambda y$; but we found $x \neq 0$ in CASE 1.)

16. The surface area is given by $S = 4\pi r^2 + 2\pi rh$ subject to the constraint $V(r, h) = \frac{4}{3}\pi r^3 + \pi r^2 h = 8000$. Thus
 $\nabla S = (8\pi r + 2\pi h)\mathbf{i} + 2\pi r\mathbf{j}$ and $\nabla V = (4\pi r^2 + 2\pi rh)\mathbf{i} + 2\pi r^2\mathbf{j}$ so that $\nabla S = \lambda \nabla V = (8\pi r + 2\pi h)\mathbf{i} + 2\pi r\mathbf{j}$
 $= \lambda \left[(4\pi r^2 + 2\pi rh)\mathbf{i} + 2\pi r^2\mathbf{j} \right] \Rightarrow 8\pi r + 2\pi h = \lambda(4\pi r^2 + 2\pi rh)$ and $2\pi r = \lambda 2\pi r^2 \Rightarrow r = 0$ or $2 = r\lambda$. But $r \neq 0$
so $2 = r\lambda \Rightarrow \lambda = \frac{2}{r} \Rightarrow 4r + h = \frac{2}{r}(2r^2 + rh) \Rightarrow h = 0 \Rightarrow$ the tank is a sphere (there is no cylindrical part) and
 $\frac{4}{3}\pi r^3 = 8000 \Rightarrow r = 10\left(\frac{6}{\pi}\right)^{1/3}$.

17. Let $f(x, y, z) = (x-1)^2 + (y-1)^2 + (z-1)^2$ be the square of the distance from $(1, 1, 1)$. Then
 $\nabla f = 2(x-1)\mathbf{i} + 2(y-1)\mathbf{j} + 2(z-1)\mathbf{k}$ and $\nabla g = \mathbf{i} + 2\mathbf{j} + 3\mathbf{k}$ so that $\nabla f = \lambda \nabla g$
 $\Rightarrow 2(x-1)\mathbf{i} + 2(y-1)\mathbf{j} + 2(z-1)\mathbf{k} = \lambda(\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}) \Rightarrow 2(x-1) = \lambda, 2(y-1) = 2\lambda, 2(z-1) = 3\lambda$
 $\Rightarrow 2(y-1) = 2[2(x-1)]$ and $2(z-1) = 3[2(x-1)] \Rightarrow x = \frac{y+1}{2} \Rightarrow z+2 = 3\left(\frac{y+1}{2}\right)$ or $z = \frac{3y-1}{2}$; thus
 $\frac{y+1}{2} + 2y + 3\left(\frac{3y-1}{2}\right) - 13 = 0 \Rightarrow y = 2 \Rightarrow x = \frac{3}{2}$ and $z = \frac{5}{2}$. Therefore the point $\left(\frac{3}{2}, 2, \frac{5}{2}\right)$ is closest (since no
point on the plane is farthest from the point $(1, 1, 1)$).

18. Let $f(x, y, z) = (x-1)^2 + (y+1)^2 + (z-1)^2$ be the square of the distance from $(1, -1, 1)$. Then
 $\nabla f = 2(x-1)\mathbf{i} + 2(y+1)\mathbf{j} + 2(z-1)\mathbf{k}$ and $\nabla g = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ so that $\nabla f = \lambda \nabla g \Rightarrow x-1 = \lambda x, y+1 = \lambda y$ and
 $z-1 = \lambda z \Rightarrow x = \frac{1}{1-\lambda}, y = -\frac{1}{1-\lambda}$, and $z = \frac{1}{1-\lambda}$ for $\lambda \neq 1 \Rightarrow \left(\frac{1}{1-\lambda}\right)^2 + \left(\frac{-1}{1-\lambda}\right)^2 + \left(\frac{1}{1-\lambda}\right)^2 = 4 \Rightarrow \frac{1}{1-\lambda} = \pm \frac{2}{\sqrt{3}}$
 $\Rightarrow x = \frac{2}{\sqrt{3}}, y = -\frac{2}{\sqrt{3}}, z = \frac{2}{\sqrt{3}}$ or $x = -\frac{2}{\sqrt{3}}, y = \frac{2}{\sqrt{3}}, z = -\frac{2}{\sqrt{3}}$. The largest value of f occurs where $x < 0, y > 0$,
and $z < 0$ or at the point $\left(-\frac{2}{\sqrt{3}}, \frac{2}{\sqrt{3}}, -\frac{2}{\sqrt{3}}\right)$ on the sphere.

19. Let $f(x, y, z) = x^2 + y^2 + z^2$ be the square of the distance from the origin. Then $\nabla f = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ and
 $\nabla g = 2x\mathbf{i} - 2y\mathbf{j} - 2z\mathbf{k}$ so that $\nabla f = \lambda \nabla g \Rightarrow 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k} = \lambda(2x\mathbf{i} - 2y\mathbf{j} - 2z\mathbf{k}) \Rightarrow 2x = 2x\lambda, 2y = -2y\lambda$, and
 $2z = -2z\lambda \Rightarrow x = 0$ or $\lambda = 1$.

CASE 1: $\lambda = 1 \Rightarrow 2y = -2y \Rightarrow y = 0; 2z = -2z \Rightarrow z = 0 \Rightarrow x^2 - 1 = 0 \Rightarrow x^2 - 1 = 0 \Rightarrow x = \pm 1$ and $y = z = 0$.

CASE 2: $x = 0 \Rightarrow y^2 - z^2 = 1$, which has no solution.

Therefore the points on the unit circle $x^2 + y^2 = 1$, are the points on the surface $x^2 + y^2 - z^2 = 1$ closest to the origin. The minimum distance is 1.

20. Let $f(x, y, z) = x^2 + y^2 + z^2$ be the square of the distance to the origin. Then $\nabla f = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ and $\nabla g = y\mathbf{i} + x\mathbf{j} - \mathbf{k}$ so that $\nabla f = \lambda \nabla g \Rightarrow 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k} = \lambda(y\mathbf{i} + x\mathbf{j} - \mathbf{k}) \Rightarrow 2x = \lambda y$, $2y = \lambda x$, and $2z = -\lambda$
 $\Rightarrow x = \frac{\lambda y}{2} \Rightarrow 2y = \lambda \left(\frac{\lambda y}{2} \right) \Rightarrow y = 0$ or $\lambda = \pm 2$.

CASE 1: $y = 0 \Rightarrow x = 0 \Rightarrow -z + 1 = 0 \Rightarrow z = 1$.

CASE 2: $\lambda = 2 \Rightarrow x = y$ and $z = -1 \Rightarrow x^2 - (-1) + 1 = 0 \Rightarrow x^2 + 2 = 0$, so no solution.

CASE 3: $\lambda = -2 \Rightarrow x = -y$ and $z = 1 \Rightarrow (-y)y - 1 + 1 = 0 \Rightarrow y = 0$, again.

Therefore $(0, 0, 1)$ is the point on the surface closest to the origin since this point gives the only extreme value and there is no maximum distance from the surface to the origin.

21. Let $f(x, y, z) = x^2 + y^2 + z^2$ be the square of the distance to the origin. Then $\nabla f = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ and $\nabla g = -y\mathbf{i} - x\mathbf{j} + 2z\mathbf{k}$ so that $\nabla f = \lambda \nabla g \Rightarrow 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k} = \lambda(-y\mathbf{i} - x\mathbf{j} + 2z\mathbf{k}) \Rightarrow 2x = -y\lambda$, $2y = -x\lambda$, and $2z = 2z\lambda \Rightarrow \lambda = 1$ or $z = 0$.

CASE 1: $\lambda = 1 \Rightarrow 2x = -y$ and $2y = -x \Rightarrow y = 0$ and $x = 0 \Rightarrow z^2 - 4 = 0 \Rightarrow z = \pm 2$ and $x = y = 0$.

CASE 2: $z = 0 \Rightarrow -xy - 4 = 0 \Rightarrow y = -\frac{4}{x}$. Then $2x = \frac{4}{x}\lambda \Rightarrow \lambda = \frac{x^2}{2}$, and $-\frac{8}{x} = -x\lambda \Rightarrow -\frac{8}{x} = -x \left(\frac{x^2}{2} \right)$

$$\Rightarrow x^4 = 16 \Rightarrow x = \pm 2. \text{ Thus, } x = 2 \text{ and } y = -2, \text{ or } x = -2 \text{ and } y = 2.$$

Therefore we get four points: $(2, -2, 0)$, $(-2, 2, 0)$, $(0, 0, -2)$, and $(0, 0, 2)$. But the points $(0, 0, 2)$ and $(0, 0, -2)$ are closest to the origin since they are 2 units away and the others are $2\sqrt{2}$ units away.

22. Let $f(x, y, z) = x^2 + y^2 + z^2$ be the square of the distance to the origin. Then $\nabla f = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ and $\nabla g = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$ so that $\nabla f = \lambda \nabla g \Rightarrow 2x = \lambda yz$, $2y = \lambda xz$, and $2z = \lambda xy \Rightarrow 2x^2 = \lambda xyz$ and $2y^2 = \lambda yxz \Rightarrow x^2 = y^2 \Rightarrow y = \pm x \Rightarrow z = \pm x \Rightarrow x(\pm x)(\pm x) = 1 \Rightarrow x = \pm 1 \Rightarrow$ the points are $(1, 1, 1)$, $(1, -1, -1)$, $(-1, -1, 1)$, and $(-1, 1, -1)$.

23. $\nabla f = \mathbf{i} - 2\mathbf{j} + 5\mathbf{k}$ and $\nabla g = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ so that $\nabla f = \lambda \nabla g \Rightarrow \mathbf{i} - 2\mathbf{j} + 5\mathbf{k} = \lambda(2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}) \Rightarrow 1 = 2x\lambda$, $-2 = 2y\lambda$, and $5 = 2z\lambda \Rightarrow x = \frac{1}{2\lambda}$, $y = -\frac{1}{\lambda} = -2x$, and $z = \frac{5}{2\lambda} = 5x \Rightarrow x^2 + (-2x)^2 + (5x)^2 = 30 \Rightarrow x = \pm 1$. Thus, $x = 1$, $y = -2$, $z = 5$ or $x = -1$, $y = 2$, $z = -5$. Therefore $f(1, -2, 5) = 30$ is the maximum value and $f(-1, 2, -5) = -30$ is the minimum value.

24. $\nabla f = \mathbf{i} + 2\mathbf{j} + 3\mathbf{k}$ and $\nabla g = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ so that $\nabla f = \lambda \nabla g \Rightarrow \mathbf{i} + 2\mathbf{j} + 3\mathbf{k} = \lambda(2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}) \Rightarrow 1 = 2x\lambda$, $2 = 2y\lambda$, and $3 = 2z\lambda \Rightarrow x = \frac{1}{2\lambda}$, $y = \frac{1}{\lambda} = 2x$, and $z = \frac{3}{2\lambda} = 3x \Rightarrow x^2 + (2x)^2 + (3x)^2 = 25 \Rightarrow x = \pm \frac{5}{\sqrt{14}}$. Thus, $x = \frac{5}{\sqrt{14}}$, $y = \frac{10}{\sqrt{14}}$, $z = \frac{15}{\sqrt{14}}$ or $x = -\frac{5}{\sqrt{14}}$, $y = -\frac{10}{\sqrt{14}}$, $z = -\frac{15}{\sqrt{14}}$. Therefore $f\left(\frac{5}{\sqrt{14}}, \frac{10}{\sqrt{14}}, \frac{15}{\sqrt{14}}\right) = 5\sqrt{14}$ is the maximum value and $f\left(-\frac{5}{\sqrt{14}}, -\frac{10}{\sqrt{14}}, -\frac{15}{\sqrt{14}}\right) = -5\sqrt{14}$ is the minimum value.

25. $f(x, y, z) = x^2 + y^2 + z^2$ and $g(x, y, z) = x + y + z - 9 = 0 \Rightarrow \nabla f = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ and $\nabla g = \mathbf{i} + \mathbf{j} + \mathbf{k}$ so that $\nabla f = \lambda \nabla g \Rightarrow 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k} = \lambda(\mathbf{i} + \mathbf{j} + \mathbf{k}) \Rightarrow 2x = \lambda, 2y = \lambda,$ and $2z = \lambda \Rightarrow x = y = z \Rightarrow x + x + x - 9 = 0 \Rightarrow x = 3, y = 3,$ and $z = 3.$
26. $f(x, y, z) = xyz$ and $g(x, y, z) = x + y + z^2 - 16 = 0 \Rightarrow \nabla f = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$ and $\nabla g = \mathbf{i} + \mathbf{j} + 2z\mathbf{k}$ so that $\nabla f = \lambda \nabla g \Rightarrow yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k} = \lambda(\mathbf{i} + \mathbf{j} + 2z\mathbf{k}) \Rightarrow yz = \lambda, xz = \lambda,$ and $xy = 2z\lambda \Rightarrow yz = xz \Rightarrow z = 0$ or $y = x.$ But $z > 0$ so that $y = x \Rightarrow x^2 = 2z\lambda$ and $xz = \lambda.$ Then $x^2 = 2z(xz) \Rightarrow x = 0$ or $x = 2z^2.$ But $x > 0$ so that $x = 2z^2 \Rightarrow y = 2z^2 \Rightarrow 2z^2 + 2z^2 + z^2 = 16 \Rightarrow z = \pm \frac{4}{\sqrt{5}}.$ We use $z = \frac{4}{\sqrt{5}}$ since $z > 0.$ Then $x = \frac{32}{5}$ and $y = \frac{32}{5}$ which yields $f\left(\frac{32}{5}, \frac{32}{5}, \frac{4}{\sqrt{5}}\right) = \frac{4096}{25\sqrt{5}}.$
27. $V = xyz$ and $g(x, y, z) = x^2 + y^2 + z^2 - 1 = 0 \Rightarrow \nabla V = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$ and $\nabla g = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ so that $\nabla V = \lambda \nabla g \Rightarrow yz = \lambda x, xz = \lambda y,$ and $xy = \lambda z \Rightarrow xyz = \lambda x^2$ and $xyz = \lambda y^2 \Rightarrow y = \pm x \Rightarrow z = \pm x \Rightarrow x^2 + x^2 + x^2 = 1 \Rightarrow x = \frac{1}{\sqrt{3}}$ since $x > 0 \Rightarrow$ the dimensions of the box are $\frac{1}{\sqrt{3}}$ by $\frac{1}{\sqrt{3}}$ by $\frac{1}{\sqrt{3}}$ for maximum volume. (Note that there is no minimum volume since the box could be made arbitrarily thin.)
28. $V = xyz$ with x, y, z all positive and $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1;$ thus $V = xyz$ and $g(x, y, z) = bcx + acy + abz - abc = 0 \Rightarrow \nabla V = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$ and $\nabla g = bc\mathbf{i} + ac\mathbf{j} + ab\mathbf{k}$ so that $\nabla V = \lambda \nabla g \Rightarrow yz = \lambda bc, xz = \lambda ac,$ and $xy = \lambda ab \Rightarrow xyz = \lambda bcx, xyz = \lambda acy,$ and $xyz = \lambda abz \Rightarrow \lambda \neq 0.$ Also, $\lambda bcx = \lambda acy = \lambda abz \Rightarrow bx = ay, cy = bz,$ and $cx = az \Rightarrow y = \frac{b}{a}x$ and $z = \frac{c}{a}x.$ Then $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1 \Rightarrow \frac{x}{a} + \frac{1}{b}\left(\frac{b}{a}x\right) + \frac{1}{c}\left(\frac{c}{a}x\right) = 1 \Rightarrow \frac{3x}{a} = 1 \Rightarrow x = \frac{a}{3} \Rightarrow y = \left(\frac{b}{a}\right)\left(\frac{a}{3}\right) = \frac{b}{3}$ and $z = \left(\frac{c}{a}\right)\left(\frac{a}{3}\right) = \frac{c}{3} \Rightarrow V = xyz = \left(\frac{a}{3}\right)\left(\frac{b}{3}\right)\left(\frac{c}{3}\right) = \frac{abc}{27}$ is the maximum volume. (Note that there is no minimum volume since the box could be made arbitrarily thin.)
29. $\nabla T = 16x\mathbf{i} + 4z\mathbf{j} + (4y - 16)\mathbf{k}$ and $\nabla g = 8x\mathbf{i} + 2y\mathbf{j} + 8z\mathbf{k}$ so that $\nabla T = \lambda \nabla g \Rightarrow 16x\mathbf{i} + 4z\mathbf{j} + (4y - 16)\mathbf{k} = \lambda(8x\mathbf{i} + 2y\mathbf{j} + 8z\mathbf{k}) \Rightarrow 16x = 8x\lambda, 4z = 2y\lambda,$ and $4y - 16 = 8z\lambda \Rightarrow \lambda = 2$ or $x = 0.$
CASE 1: $\lambda = 2 \Rightarrow 4z = 2y(2) \Rightarrow z = y.$ Then $4z - 16 = 16z \Rightarrow z = -\frac{4}{3} \Rightarrow y = -\frac{4}{3}.$ Then $4x^2 + \left(-\frac{4}{3}\right)^2 + 4\left(-\frac{4}{3}\right)^2 = 16 \Rightarrow x = \pm \frac{4}{3}.$
CASE 2: $x = 0 \Rightarrow \lambda = \frac{2z}{y} \Rightarrow 4y - 16 = 8z\left(\frac{2z}{y}\right) \Rightarrow y^2 - 4y = 4z^2 \Rightarrow 4(0)^2 + y^2 + (y^2 - 4y) - 16 = 0 \Rightarrow y^2 - 2y - 8 = 0 \Rightarrow (y - 4)(y + 2) = 0 \Rightarrow y = 4$ or $y = -2.$ Now $y = 4 \Rightarrow 4z^2 = 4^2 - 4(4) \Rightarrow z = 0$ and $y = -2 \Rightarrow 4z^2 = (-2)^2 - 4(-2) \Rightarrow z = \pm \sqrt{3}.$
The temperatures are $T\left(\pm \frac{4}{3}, -\frac{4}{3}, -\frac{4}{3}\right) = \left(642 \frac{2}{3}\right)^\circ, T(0, 4, 0) = 600^\circ, T(0, -2, \sqrt{3}) = \left(600 - 24\sqrt{3}\right)^\circ,$ and $T(0, -2, -\sqrt{3}) = \left(600 + 24\sqrt{3}\right)^\circ \approx 641.6^\circ.$ Therefore $\left(\pm \frac{4}{3}, -\frac{4}{3}, -\frac{4}{3}\right)$ are the hottest points on the space probe.
30. $\nabla T = 400yz^2\mathbf{i} + 400xz^2\mathbf{j} + 800xyz\mathbf{k}$ and $\nabla g = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ so that $\nabla T = \lambda \nabla g \Rightarrow 400yz^2\mathbf{i} + 400xz^2\mathbf{j} + 800xyz\mathbf{k} = \lambda(2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}) \Rightarrow 400yz^2 = 2x\lambda, 400xz^2 = 2y\lambda,$ and $800xyz = 2z\lambda.$ Solving this system yields the points $(0, \pm 1, 0), (\pm 1, 0, 0),$ and $\left(\pm \frac{1}{2}, \pm \frac{1}{2}, \pm \frac{\sqrt{2}}{2}\right).$ The corresponding

temperatures are $T(0, \pm 1, 0) = 0$, $T(\pm 1, 0, 0) = 0$, and $T\left(\pm \frac{1}{2}, \pm \frac{1}{2}, \pm \frac{\sqrt{2}}{2}\right) = \pm 50$. Therefore 50 is the maximum temperature at $\left(\frac{1}{2}, \frac{1}{2}, \pm \frac{\sqrt{2}}{2}\right)$ and $\left(-\frac{1}{2}, -\frac{1}{2}, \pm \frac{\sqrt{2}}{2}\right)$; -50 is the minimum temperature at $\left(\frac{1}{2}, -\frac{1}{2}, \pm \frac{\sqrt{2}}{2}\right)$ and $\left(-\frac{1}{2}, \frac{1}{2}, \pm \frac{\sqrt{2}}{2}\right)$.

31. (a) If we replace x by $2x$ and y by $2y$ in the formula for P , P changes by a factor of $2^\alpha \cdot 2^{1-\alpha} = 2$.
 (b) For the given information, the production function is $P(x, y) = 120x^{3/4}y^{1/4}$ and the constraint is $G(x, y) = 250x + 400y - 100,000 = 0$. $\nabla P = \lambda \nabla G$ implies

$$90\left(\frac{x}{y}\right)^{-1/4} = 250\lambda$$

$$30\left(\frac{x}{y}\right)^{3/4} = 400\lambda$$

Eliminating λ yields $\frac{x}{y} = \frac{24}{5}$ or $5x = 24y$. Now we solve the system

$$5x - 24y = 0$$

$$250x + 400y = 100,000$$

and find $x = 300$, $y = 62.5$. $P(300, 62.5) \approx 24,322$ units.

32. We can omit k since it affects the value but not the location of the maximum. We then have $P(x, y) = x^\alpha y^{1-\alpha}$ and $G(x, y) = c_1x + c_2y - B = 0$. $\nabla P = \lambda \nabla G$ implies

$$\alpha\left(\frac{x}{y}\right)^{\alpha-1} = \lambda c_1$$

$$(1-\alpha)\left(\frac{x}{y}\right)^{\alpha-1} = \lambda \frac{1-\alpha}{c_2}$$

Eliminating λ yields $\frac{x}{y} = \frac{c_2}{c_1} \cdot \frac{\alpha}{1-\alpha}$. Now we solve the system

$$c_1(1-\alpha)x = c_2\alpha y$$

$$c_1x + c_2y = B$$

and find $x = \frac{\alpha B}{c_1}$, $y = \frac{(1-\alpha)B}{c_2}$.

33. $\nabla U = (y+2)\mathbf{i} + x\mathbf{j}$ and $\nabla g = 2\mathbf{i} + \mathbf{j}$ so that $\nabla U = \lambda \nabla g \Rightarrow (y+2)\mathbf{i} + x\mathbf{j} = \lambda(2\mathbf{i} + \mathbf{j}) \Rightarrow y+2 = 2\lambda$ and $x = \lambda \Rightarrow y+2 = 2x \Rightarrow y = 2x-2 \Rightarrow 2x + (2x-2) = 30 \Rightarrow x = 8$ and $y = 14$. Therefore $U(8, 14) = \$128$ is the maximum value of U under the constraint.

34. $Q(p, q, r) = 2(pq + pr + qr)$ and $G(p, q, r) = p + q + r - 1 = 0$. $\nabla Q = \lambda \nabla G$ implies

$$\begin{aligned} 2(q + r) &= \lambda \\ 2(p + r) &= \lambda \\ 2(p + q) &= \lambda \end{aligned}$$

which is true only when $p = q = r$. $p + q + r = 1$ then implies that $p = q = r = \frac{1}{3}$. Thus the maximum of Q is $Q\left(\frac{1}{3}, \frac{1}{3}, \frac{1}{3}\right) = 2\left(\frac{1}{9} + \frac{1}{9} + \frac{1}{9}\right) = \frac{2}{3}$.

35. The following diagram shows $L, h,$ and k . We also name the lengths u and v as shown; we assume all named lengths are positive. We will minimize the square of L , which is equal to $(u + k)^2 + (v + h)^2$.

Our function to minimize is $S(u, v) = (u + k)^2 + (v + h)^2$. Using similar triangles, $\frac{v}{k} = \frac{h}{u}$, so our constraint equation is $G(u, v) = uv - hk = 0$. $\nabla S = \lambda \nabla G$ implies

$$\begin{aligned} 2(u + k) &= \lambda v \\ 2(v + h) &= \lambda u \end{aligned}$$

Eliminating λ by dividing the first equation by the second yields $\frac{u + k}{v + h} = \frac{v}{u}$. We combine this with the constraint equation and solve the system

$$\begin{aligned} (u + k) \cdot u &= (v + h) \cdot v \\ hk &= uv \end{aligned}$$

Substituting hk/v for u in the first equation, expanding, and moving all variables to the left side yields the equation $u^4 + ku^3 - h^2ku - h^2k^2 = 0$. Factoring by grouping we get $(u^3 - h^2k)(u + k) = 0$. Since no lengths are negative this gives us the solution $u = (h^2k)^{1/3}$. Substituting this value for u in $hk = uv$ we find

$v = (hk^2)^{1/3}$. (Note that throughout this calculation interchanging h and k has the effect of interchanging u and v . This must be true, since if we rotate the diagram 90 degrees clockwise we don't change the solution to the minimization problem, but now h and v are the horizontal distances and k and u are the vertical distances. All of our equations reflect this symmetry, and we could exploit it to save some computation.)

$$\begin{aligned} \text{Now } L^2 &= (u + k)^2 + (v + h)^2 = \left[(h^2k)^{1/3} + k \right]^2 + \left[(hk^2)^{1/3} + h \right]^2 \\ &= h^{4/3}k^{2/3} + 2h^{2/3}k^{4/3} + k^2 + h^{2/3}k^{4/3} + 2h^{4/3}k^{2/3} + h^2 \\ &= (h^{2/3} + k^{2/3})^3 \end{aligned}$$

Thus the minimum L is given by $(h^{2/3} + k^{2/3})^{3/2}$.

36. $\nabla M = (6+z)\mathbf{i} - 2y\mathbf{j} + x\mathbf{k}$ and $\nabla g = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ so that $\nabla M = \lambda\nabla g \Rightarrow (6+z)\mathbf{i} - 2y\mathbf{j} + x\mathbf{k} = \lambda(2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}) \Rightarrow 6+z = 2x\lambda, -2y = 2y\lambda, x = 2z\lambda \Rightarrow \lambda = -1$ or $y = 0$.

CASE 1: $\lambda = -1 \Rightarrow 6+z = -2x$ and $x = -2z \Rightarrow 6+z = -2(-2z) \Rightarrow z = 2$ and $x = -4$. Then

$$(-4)^2 + y^2 + 2^2 - 36 = 0 \Rightarrow y = \pm 4.$$

CASE 2: $y = 0, 6+z = 2x\lambda$, and $x = 2z\lambda \Rightarrow \lambda = \frac{x}{2z} \Rightarrow 6+z = 2x\left(\frac{x}{2z}\right) \Rightarrow 6z + z^2 = x^2 \Rightarrow (6z + z^2) + 0^2 + z^2 = 36 \Rightarrow z = -6$ or $z = 3$. Now $z = -6 \Rightarrow x^2 = 0 \Rightarrow x = 0; z = 3 \Rightarrow x^2 = 27 \Rightarrow x = \pm 3\sqrt{3}$.

Therefore we have the points $(\pm 3\sqrt{3}, 0, 3), (0, 0, -6)$, and $(-4, \pm 4, 2)$. Then $M(3\sqrt{3}, 0, 3) = 27\sqrt{3} + 60 \approx 106.8, M(-3\sqrt{3}, 0, 3) = 60 - 27\sqrt{3} \approx 13.2, M(0, 0, -6) = 60$, and $M(-4, 4, 2) = 12 = M(-4, -4, 2)$.

Therefore, the weakest field is at $(-4, \pm 4, 2)$.

37. Let $g_1(x, y, z) = 2x - y = 0$ and $g_2(x, y, z) = y + z = 0 \Rightarrow \nabla g_1 = 2\mathbf{i} - \mathbf{j}, \nabla g_2 = \mathbf{j} + \mathbf{k}$, and $\nabla f = 2x\mathbf{i} + 2\mathbf{j} - 2z\mathbf{k}$ so that $\nabla f = \lambda\nabla g_1 + \mu\nabla g_2 \Rightarrow 2x\mathbf{i} + 2\mathbf{j} - 2z\mathbf{k} = \lambda(2\mathbf{i} - \mathbf{j}) + \mu(\mathbf{j} + \mathbf{k}) \Rightarrow 2x\mathbf{i} + 2\mathbf{j} - 2z\mathbf{k} = 2\lambda\mathbf{i} + (\mu - \lambda)\mathbf{j} + \mu\mathbf{k} \Rightarrow 2x = 2\lambda, 2 = \mu - \lambda$, and $-2z = \mu \Rightarrow x = \lambda$. Then $2 = -2z - x \Rightarrow x = -2z - 2$ so that $2x - y = 0 \Rightarrow 2(-2z - 2) - y = 0 \Rightarrow -4z - 4 - y = 0$. This equation coupled with $y + z = 0$ implies $z = -\frac{4}{3}$ and $y = \frac{4}{3}$.

Then $x = \frac{2}{3}$ so that $(\frac{2}{3}, \frac{4}{3}, -\frac{4}{3})$ is the point that gives the maximum value $f(\frac{2}{3}, \frac{4}{3}, -\frac{4}{3}) = (\frac{2}{3})^2 + 2(\frac{4}{3}) - (-\frac{4}{3})^2 = \frac{4}{3}$.

38. Let $g_1(x, y, z) = x + 2y + 3z - 6 = 0$ and $g_2(x, y, z) = x + 3y + 9z - 9 = 0 \Rightarrow \nabla g_1 = \mathbf{i} + 2\mathbf{j} + 3\mathbf{k}, \nabla g_2 = \mathbf{i} + 3\mathbf{j} + 9\mathbf{k}$, and $\nabla f = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ so that $\nabla f = \lambda\nabla g_1 + \mu\nabla g_2 \Rightarrow 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k} = \lambda(\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}) + \mu(\mathbf{i} + 3\mathbf{j} + 9\mathbf{k}) \Rightarrow 2x = \lambda + \mu, 2y = 2\lambda + 3\mu$, and $2z = 3\lambda + 9\mu$. Then $0 = x + 2y + 3z - 6 = \frac{1}{2}(\lambda + \mu) + (2\lambda + 3\mu) + (\frac{9}{2}\lambda + \frac{27}{2}\mu) - 6 \Rightarrow 7\lambda + 17\mu = 6; 0 = x + 3y + 9z - 9 \Rightarrow \frac{1}{2}(\lambda + \mu) + (3\lambda + \frac{9}{2}\mu) + (\frac{27}{2}\lambda + \frac{81}{2}\mu) - 9 \Rightarrow 34\lambda + 91\mu = 18$. Solving these two equations for λ and μ gives $\lambda = \frac{240}{59}$ and $\mu = -\frac{78}{59} \Rightarrow x = \frac{\lambda + \mu}{2} = \frac{81}{59}, y = \frac{2\lambda + 3\mu}{2} = \frac{123}{59}$, and $z = \frac{3\lambda + 9\mu}{2} = \frac{9}{59}$. The minimum value is $f(\frac{81}{59}, \frac{123}{59}, \frac{9}{59}) = \frac{21,771}{59^2} = \frac{369}{59}$. (Note that there is no maximum value of f subject to the constraints because at least one of the variables x, y , or z can be made arbitrary and assume a value as large as we please.)

39. Let $f(x, y, z) = x^2 + y^2 + z^2$ be the square of the distance from the origin. We want to minimize $f(x, y, z)$ subject to the constraints $g_1(x, y, z) = y + 2z - 12 = 0$ and $g_2(x, y, z) = x + y - 6 = 0$. Thus $\nabla f = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}, \nabla g_1 = \mathbf{j} + 2\mathbf{k}$, and $\nabla g_2 = \mathbf{i} + \mathbf{j}$ so that $\nabla f = \lambda\nabla g_1 + \mu\nabla g_2 \Rightarrow 2x = \mu, 2y = \lambda + \mu$, and $2z = 2\lambda$. Then $0 = y + 2z - 12 = (\frac{\lambda}{2} + \frac{\mu}{2}) + 2\lambda - 12 \Rightarrow \frac{5}{2}\lambda + \frac{1}{2}\mu = 12 \Rightarrow 5\lambda + \mu = 24; 0 = x + y - 6 = \frac{\mu}{2} + (\frac{\lambda}{2} + \frac{\mu}{2}) - 6 \Rightarrow \frac{1}{2}\lambda + \mu = 6 \Rightarrow \lambda + 2\mu = 12$. Solving these two equations for λ and μ gives $\lambda = 4$ and $\mu = 4 \Rightarrow x = \frac{\mu}{2} = 2, y = \frac{\lambda + \mu}{2} = 4$, and $z = \lambda = 4$. The point $(2, 4, 4)$ on the line of intersection is closest to the origin. (There is no maximum distance from the origin since points on the line can be arbitrarily far away.)

40. The maximum value is $f(\frac{2}{3}, \frac{4}{3}, -\frac{4}{3}) = \frac{4}{3}$ from Exercise 33 above.

41. Let $g_1(x, y, z) = z - 1 = 0$ and $g_2(x, y, z) = x^2 + y^2 + z^2 - 10 = 0 \Rightarrow \nabla g_1 = \mathbf{k}$, $\nabla g_2 = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$, and $\nabla f = 2xyz\mathbf{i} + x^2z\mathbf{j} + x^2y\mathbf{k}$ so that $\nabla f = \lambda \nabla g_1 + \mu \nabla g_2 \Rightarrow 2xyz\mathbf{i} + x^2z\mathbf{j} + x^2y\mathbf{k} = \lambda(\mathbf{k}) + \mu(2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k})$
 $\Rightarrow 2xyz = 2x\mu$, $x^2z = 2y\mu$, and $x^2y = 2z\mu + \lambda \Rightarrow xyz = x\mu \Rightarrow x = 0$ or $yz = \mu \Rightarrow \mu = y$ since $z = 1$.
CASE 1: $x = 0$ and $z = 1 \Rightarrow y^2 - 9 = 0$ (from g_2) $\Rightarrow y = \pm 3$ yielding the points $(0, \pm 3, 1)$.
CASE 2: $\mu = y \Rightarrow x^2z = 2y^2 \Rightarrow x^2 = 2y^2$ (since $z = 1$) $\Rightarrow 2y^2 + y^2 + 1 - 10 = 0$ (from g_2) $\Rightarrow 3y^2 - 9 = 0$
 $\Rightarrow y = \pm \sqrt{3} \Rightarrow x^2 = 2(\pm\sqrt{3})^2 \Rightarrow x = \pm\sqrt{6}$ yielding the points $(\pm\sqrt{6}, \pm\sqrt{3}, 1)$.
Now $f(0, \pm 3, 1) = 1$ and $f(\pm\sqrt{6}, \pm\sqrt{3}, 1) = 6(\pm\sqrt{3}) + 1 = 1 \pm 6\sqrt{3}$. Therefore the maximum of f is $1 + 6\sqrt{3}$ at $(\pm\sqrt{6}, \sqrt{3}, 1)$, and the minimum of f is $1 - 6\sqrt{3}$ at $(\pm\sqrt{6}, -\sqrt{3}, 1)$.
42. (a) Let $g_1(x, y, z) = x + y + z - 40 = 0$ and $g_2(x, y, z) = x + y - z = 0 \Rightarrow \nabla g_1 = \mathbf{i} + \mathbf{j} + \mathbf{k}$, $\nabla g_2 = \mathbf{i} + \mathbf{j} - \mathbf{k}$, and $\nabla w = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$ so that $\nabla w = \lambda \nabla g_1 + \mu \nabla g_2 \Rightarrow yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k} = \lambda(\mathbf{i} + \mathbf{j} + \mathbf{k}) + \mu(\mathbf{i} + \mathbf{j} - \mathbf{k})$
 $\Rightarrow yz = \lambda + \mu$, $xz = \lambda + \mu$, and $xy = \lambda - \mu \Rightarrow yz = xz \Rightarrow z = 0$ or $y = x$.
CASE 1: $z = 0 \Rightarrow x + y = 40$ and $x + y = 0 \Rightarrow$ no solution.
CASE 2: $x = y \Rightarrow 2x + z - 40 = 0$ and $2x - z = 0 \Rightarrow z = 20 \Rightarrow x = 10$ and $y = 10 \Rightarrow w = (10)(10)(20) = 2000$
- (b) $\mathbf{n} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 1 & 1 \\ 1 & 1 & -1 \end{vmatrix} = -2\mathbf{i} + 2\mathbf{j}$ is parallel to the line of intersection \Rightarrow the line is $x = -2t + 10$, $y = 2t + 10$,
 $z = 20$. Since $z = 20$, we see that $w = xyz = (-2t + 10)(2t + 10)(20) = (-4t^2 + 100)(20)$ which has its maximum when $t = 0 \Rightarrow x = 10$, $y = 10$, and $z = 20$.
43. Let $g_1(x, y, z) = y - x = 0$ and $g_2(x, y, z) = x^2 + y^2 + z^2 - 4 = 0$. Then $\nabla f = y\mathbf{i} + x\mathbf{j} + 2z\mathbf{k}$, $\nabla g_1 = -\mathbf{i} + \mathbf{j}$, and $\nabla g_2 = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ so that $\nabla f = \lambda \nabla g_1 + \mu \nabla g_2 \Rightarrow y\mathbf{i} + x\mathbf{j} + 2z\mathbf{k} = \lambda(-\mathbf{i} + \mathbf{j}) + \mu(2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k})$
 $\Rightarrow y = -\lambda + 2x\mu$, $x = \lambda + 2y\mu$, and $2z = 2z\mu \Rightarrow z = 0$ or $\mu = 1$.
CASE 1: $z = 0 \Rightarrow x^2 + y^2 - 4 = 0 \Rightarrow 2x^2 - 4 = 0$ (since $x = y$) $\Rightarrow x = \pm\sqrt{2}$ and $y = \pm\sqrt{2}$ yielding the points $(\pm\sqrt{2}, \pm\sqrt{2}, 0)$.
CASE 2: $\mu = 1 \Rightarrow y = -\lambda + 2x$ and $x = \lambda + 2y \Rightarrow x + y = 2(x + y) \Rightarrow 2x = 2(2x)$ since $x = y \Rightarrow x = 0 \Rightarrow y = 0$
 $\Rightarrow z^2 - 4 = 0 \Rightarrow z = \pm 2$ yielding the points $(0, 0, \pm 2)$.
Now, $f(0, 0, \pm 2) = 4$ and $f(\pm\sqrt{2}, \pm\sqrt{2}, 0) = 2$. Therefore the maximum value of f is 4 at $(0, 0, \pm 2)$ and the minimum value of f is 2 at $f(\pm\sqrt{2}, \pm\sqrt{2}, 0)$.
44. Let $f(x, y, z) = x^2 + y^2 + z^2$ be the square of the distance from the origin. We want to minimize $f(x, y, z)$ subject to the constraints $g_1(x, y, z) = 2y + 4z - 5 = 0$ and $g_2(x, y, z) = 4x^2 + 4y^2 - z^2 = 0$. Thus $\nabla f = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$, $\nabla g_1 = 2\mathbf{j} + 4\mathbf{k}$, and $\nabla g_2 = 8x\mathbf{i} + 8y\mathbf{j} - 2z\mathbf{k}$ so that $\nabla f = \lambda \nabla g_1 + \mu \nabla g_2$
 $\Rightarrow 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k} = \lambda(2\mathbf{j} + 4\mathbf{k}) + \mu(8x\mathbf{i} + 8y\mathbf{j} - 2z\mathbf{k}) \Rightarrow 2x = 8x\mu$, $2y = 2\lambda + 8y\mu$, and $2z = 4\lambda - 2z\mu \Rightarrow x = 0$ or $\mu = \frac{1}{4}$.
CASE 1: $x = 0 \Rightarrow 4(0)^2 + 4y^2 - z^2 = 0 \Rightarrow z = \pm 2y \Rightarrow 2y + 4(2y) - 5 = 0 \Rightarrow y = \frac{1}{2}$, or $2y + 4(-2y) - 5 = 0$

$$\Rightarrow y = -\frac{5}{6} \text{ yielding the points } \left(0, \frac{1}{2}, 1\right) \text{ and } \left(0, -\frac{5}{6}, \frac{5}{3}\right).$$

CASE 2: $\mu = \frac{1}{4} \Rightarrow y = \lambda + y \Rightarrow \lambda = 0 \Rightarrow 2z = 4(0) - 2z\left(\frac{1}{4}\right) \Rightarrow z = 0 \Rightarrow 2y + 4(0) = 5 \Rightarrow y = \frac{5}{2}$ and

$$(0)^2 = 4x^2 + 4\left(\frac{5}{2}\right)^2 \Rightarrow \text{no solution.}$$

Then $f\left(0, \frac{1}{2}, 1\right) = \frac{5}{4}$ and $f\left(0, -\frac{5}{6}, \frac{5}{3}\right) = \frac{25}{36} + \frac{25}{9} = \frac{125}{36} \Rightarrow$ the point $\left(0, \frac{1}{2}, 1\right)$ is closest to the origin.

45. $\nabla f = \mathbf{i} + \mathbf{j}$ and $\nabla g = y\mathbf{i} + x\mathbf{j}$ so that $\nabla f = \lambda \nabla g \Rightarrow \mathbf{i} + \mathbf{j} = \lambda(y\mathbf{i} + x\mathbf{j}) \Rightarrow 1 = y\lambda$ and $1 = x\lambda \Rightarrow y = x \Rightarrow y^2 = 16 \Rightarrow y = \pm 4 \Rightarrow (4, 4)$ and $(-4, -4)$ are candidates for the location of extreme values. But as $x \rightarrow \infty, y \rightarrow \infty$ and $f(x, y) \rightarrow \infty$; as $x \rightarrow -\infty, y \rightarrow 0$ and $f(x, y) \rightarrow -\infty$. Therefore no maximum or minimum value exists subject to the constraint.

46. Let $f(A, B, C) = \sum_{k=1}^4 (Ax_k + By_k + C - z_k)^2 = C^2 + (B + C - 1)^2 + (A + B + C - 1)^2 + (A + C + 1)^2$. We want to minimize f . Then $f_A(A, B, C) = 4A + 2B + 4C, f_B(A, B, C) = 2A + 4B + 4C - 4$, and $f_C(A, B, C) = 4A + 4B + 8C - 2$. Set each partial derivative equal to 0 and solve the system to get $A = -\frac{1}{2}, B = \frac{3}{2}$, and $C = -\frac{1}{4}$ or the critical point of f is $\left(-\frac{1}{2}, \frac{3}{2}, -\frac{1}{4}\right)$.

47. (a) Maximize $f(a, b, c) = a^2b^2c^2$ subject to $a^2 + b^2 + c^2 = r^2$. Thus $\nabla f = 2ab^2c^2\mathbf{i} + 2a^2bc^2\mathbf{j} + 2a^2b^2c\mathbf{k}$ and $\nabla g = 2a\mathbf{i} + 2b\mathbf{j} + 2c\mathbf{k}$ so that $\nabla f = \lambda \nabla g \Rightarrow 2ab^2c^2 = 2a\lambda, 2a^2bc^2 = 2b\lambda$, and $2a^2b^2c = 2c\lambda \Rightarrow 2a^2b^2c^2 = 2a^2\lambda = 2b^2\lambda = 2c^2\lambda \Rightarrow \lambda = 0$ or $a^2 = b^2 = c^2$.

CASE 1: $\lambda = 0 \Rightarrow a^2b^2c^2 = 0$.

CASE 2: $a^2 = b^2 = c^2 \Rightarrow f(a, b, c) = a^2a^2a^2$ and $3a^2 = r^2 \Rightarrow f(a, b, c) = \left(\frac{r^2}{3}\right)^3$ is the maximum value.

- (b) The point $(\sqrt{a}, \sqrt{b}, \sqrt{c})$ is on the sphere if $a + b + c = r^2$. Moreover, by part (a),

$$abc = f(\sqrt{a}, \sqrt{b}, \sqrt{c}) \leq \left(\frac{r^2}{3}\right)^3 \Rightarrow (abc)^{1/3} \leq \frac{r^2}{3} = \frac{a+b+c}{3}, \text{ as claimed.}$$

48. Let $f(x_1, x_2, \dots, x_n) = \sum_{i=1}^n a_i x_i = a_1 x_1 + a_2 x_2 + \dots + a_n x_n$ and $g(x_1, x_2, \dots, x_n) = x_1^2 + x_2^2 + \dots + x_n^2 - 1$. Then we

want $\nabla f = \lambda \nabla g \Rightarrow a_1 = \lambda(2x_1), a_2 = \lambda(2x_2), \dots, a_n = \lambda(2x_n), \lambda \neq 0 \Rightarrow x_i = \frac{a_i}{2\lambda} \Rightarrow \frac{a_1^2}{4\lambda^2} + \frac{a_2^2}{4\lambda^2} + \dots + \frac{a_n^2}{4\lambda^2} = 1$

$$\Rightarrow 4\lambda^2 = \sum_{i=1}^n a_i^2 \Rightarrow 2\lambda = \left(\sum_{i=1}^n a_i^2\right)^{1/2} \Rightarrow f(x_1, x_2, \dots, x_n) = \sum_{i=1}^n a_i x_i = \sum_{i=1}^n a_i \left(\frac{a_i}{2\lambda}\right) = \frac{1}{2\lambda} \sum_{i=1}^n a_i^2 = \left(\sum_{i=1}^n a_i^2\right)^{1/2}$$
 is the maximum value.

derivatives of f are products of sines and cosines, the absolute value of these derivatives is less than or equal to 1 $\Rightarrow E(x, y) \leq \frac{1}{6}[(0.1)^3 + 3(0.1)^3 + 3(0.1)^3 + (0.1)^3] \leq 0.00134$.

Now, $f_{xxx} = e^x \sin y, f_{xxy} = e^x \cos y, f_{xyy} = -e^x \sin y$, and $f_{yyy} = -e^x \cos y$.

Since $|x| \leq 0.1, |e^x \sin y| \leq e^{0.1} \sin 0.1 \approx 0.11$ and $|e^x \cos y| \leq |e^{0.1} \cos 0.1| \approx 1.11$.

$= (2x)(1) + (-2y)(0) + (4)(0) + (1)\left(\frac{\partial t}{\partial x}\right) = 2x + \frac{\partial t}{\partial x}$. Thus $x + 2z + t + 25 \Rightarrow 1 + 0 + \frac{\partial t}{\partial x} = 0 \Rightarrow \frac{\partial t}{\partial x} = -1$

$\Rightarrow \left(\frac{\partial w}{\partial x}\right)_{y,z} = 2x - 1$. On the other hand, if $x, y,$ and t are independent, then

$$\left(\frac{\partial w}{\partial x}\right)_{y,t} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial x} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial x} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial x} + \frac{\partial w}{\partial t} \frac{\partial t}{\partial x} = (2x)(1) + (-2y)(0) + 4 \frac{\partial z}{\partial x} + (1)(0) = 2x + 4 \frac{\partial z}{\partial x}.$$

Thus, $x + 2z + t = 25 \Rightarrow 1 + 2 \frac{\partial z}{\partial x} + 0 = 0 \Rightarrow \frac{\partial z}{\partial x} = -\frac{1}{2} \Rightarrow \left(\frac{\partial w}{\partial x}\right)_{y,t} = 2x + 4\left(-\frac{1}{2}\right) = 2x - 2$.

$\Rightarrow \left(\frac{\partial x}{\partial y}\right)_z = -\frac{\partial f / \partial y}{\partial f / \partial x}$. Similarly, if y is a differentiable function of x and z , $\left(\frac{\partial y}{\partial z}\right)_x = -\frac{\partial f / \partial z}{\partial f / \partial x}$ and if z is a

differentiable function of x and y , $\left(\frac{\partial z}{\partial x}\right)_y = -\frac{\partial f / \partial x}{\partial f / \partial y}$. Then $\left(\frac{\partial x}{\partial y}\right)_z \left(\frac{\partial y}{\partial z}\right)_x \left(\frac{\partial z}{\partial x}\right)_y = \left(-\frac{\partial f / \partial y}{\partial f / \partial x}\right) \left(-\frac{\partial f / \partial z}{\partial f / \partial x}\right) \left(-\frac{\partial f / \partial x}{\partial f / \partial y}\right) = -1$

$$x \frac{\partial z}{\partial x} - y \frac{\partial z}{\partial y} = x \left(1 + y \frac{df}{du}\right) - y \left(x \frac{df}{du}\right) = x$$

11. If x and y are independent, then $g(x, y, z) = 0 \Rightarrow \frac{\partial g}{\partial x} \frac{\partial x}{\partial y} + \frac{\partial g}{\partial y} \frac{\partial y}{\partial y} + \frac{\partial g}{\partial z} \frac{\partial z}{\partial y} = 0$ and $\frac{\partial x}{\partial y} = 0 \Rightarrow \frac{\partial g}{\partial y} + \frac{\partial g}{\partial z} \frac{\partial z}{\partial y} = 0$

12. $\lim_{(x,y) \rightarrow (1,1)} \frac{x^3 y^3 - 1}{xy - y} = \lim_{(x,y) \rightarrow (1,1)} \frac{(xy-1)(x^2 y^2 + xy + 1)}{xy-1} = \lim_{(x,y) \rightarrow (1,1)} (x^2 y^2 + xy + 1) = 1^2 \cdot 1^2 + 1 \cdot 1 + 1 = 3$

43. (a) Let $\nabla f = a\mathbf{i} + b\mathbf{j}$ at $(1, 2)$. The direction toward $(2, 2)$ is determined by $\mathbf{v}_1 = (2-1)\mathbf{i} + (2-2)\mathbf{j} = \mathbf{i} = \mathbf{u}$ so that $\nabla f \cdot \mathbf{u} = 2 \Rightarrow a = 2$. The direction toward $(1, 1)$ is determined by $\mathbf{v}_2 = (1-1)\mathbf{i} + (1-2)\mathbf{j} = -\mathbf{j} = \mathbf{u}$ so that $\nabla f \cdot \mathbf{u} = -2 \Rightarrow -b = -2 \Rightarrow b = 2$. - (iii) On CD , $f(x, y) = f(2, y) = y^2 - 5y + 4$ for $-2 \leq y \leq 2 \Rightarrow f'(2, y) = 2y - 5 = 0 \Rightarrow y = \frac{5}{2}$ and $x = 2$. But $(2, \frac{5}{2})$ is not in the region. Endpoints: $f(2, -2) = 18$ and $f(2, 2) = -2$.

- (iv) On AD , $f(x, y) = f(x, -2) = 4x + 10$ for $-2 \leq x \leq 2 \Rightarrow f'(x, -2) = 4 \Rightarrow$ no critical points in the interior of AD . Endpoints: $f(-2, -2) = 2$ and $f(2, -2) = 18$.

- (v) For the interior of the square, $f_x(x, y) = -y + 2 = 0$ and $f_y(x, y) = 2y - x - 3 = 0 \Rightarrow y = 2$ and $x = 1 \Rightarrow (1, 2)$ is an interior critical point of the square with $f(1, 2) = -2$. Therefore the absolute maximum is 18 at $(2, -2)$ and the absolute minimum is $-\frac{17}{4}$ at $(-2, \frac{1}{2})$.

74. (i) On OA , $f(x, y) = f(0, y) = 2y - y^2$ for $0 \leq y \leq 2 \Rightarrow f'(0, y) = 2 - 2y = 0 \Rightarrow y = 1$ and $x = 0 \Rightarrow (0, 1)$ is an interior critical point of OA with $f(0, 1) = 1$.
Endpoints: $f(0, 0) = 0$ and $f(0, 2) = 0$.

(ii) On AB , $f(x, y) = f(x, 2) = 2x - x^2$ for $0 \leq x \leq 2 \Rightarrow f'(x, 2) = 2 - 2x = 0 \Rightarrow x = 1$ and $y = 2 \Rightarrow (1, 2)$ is an interior critical point of AB with $f(1, 2) = 1$.
Endpoints: $f(0, 2) = 0$ and $f(2, 2) = 0$.

(iii) On BC , $f(x, y) = f(2, y) = 2y - y^2$ for $0 \leq y \leq 2 \Rightarrow f'(2, y) = 2 - 2y = 0 \Rightarrow y = 1$ and $x = 2 \Rightarrow (2, 1)$ is an interior critical point of BC with $f(2, 1) = 1$. Endpoints: $f(2, 0) = 0$ and $f(2, 2) = 0$.

(iv) On OC , $f(x, y) = f(x, 0) = 2x - x^2$ for $0 \leq x \leq 2 \Rightarrow f'(x, 0) = 2 - 2x = 0 \Rightarrow x = 1$ and $y = 0 \Rightarrow (1, 0)$ is an interior critical point of OC with $f(1, 0) = 1$. Endpoints: $f(0, 0) = 0$ and $f(2, 0) = 0$.

(v) For the interior of the rectangular region, $f_x(x, y) = 2 - 2x = 0$ and $f_y(x, y) = 2 - 2y = 0 \Rightarrow x = 1$ and $y = 1 \Rightarrow (1, 1)$ is an interior critical point of the square with $f(1, 1) = 2$. Therefore the absolute maximum is 2 at $(1, 1)$ and the absolute minimum is 0 at the corners $(0, 0)$, $(0, 2)$, $(2, 2)$, and $(2, 0)$.

75. (i) On AB , $f(x, y) = f(x, x+2) = -2x + 4$ for $-2 \leq x \leq 2 \Rightarrow f'(x, x+2) = -2 = 0 \Rightarrow$ no critical points in the interior of AB .
Endpoints: $f(-2, 0) = 8$ and $f(2, 4) = 0$.

(ii) On BC , $f(x, y) = f(2, y) = -y^2 + 4y$ for $0 \leq y \leq 4 \Rightarrow f'(2, y) = -2y + 4 = 0 \Rightarrow y = 2$ and $x = 2 \Rightarrow (2, 2)$ is an interior critical point of BC with $f(2, 2) = 4$.
Endpoints: $f(2, 0) = 0$ and $f(2, 4) = 0$.

(iii) On AC , $f(x, y) = f(x, 0) = x^2 - 2x$ for $-2 \leq x \leq 2 \Rightarrow f'(x, 0) = 2x - 2 = 0 \Rightarrow x = 1$ and $y = 0 \Rightarrow (1, 0)$ is an interior critical point of AC with $f(1, 0) = -1$. Endpoints: $f(-2, 0) = 8$ and $f(2, 0) = 0$.

(iv) For the interior of the triangular region, $f_x(x, y) = 2x - 2 = 0$ and $f_y(x, y) = -2y + 4 = 0 \Rightarrow x = 1$ and $y = 2 \Rightarrow (1, 2)$ is an interior critical point of the region with $f(1, 2) = 3$. Therefore the absolute maximum is 8 at $(-2, 0)$ and the absolute minimum is -1 at $(1, 0)$.

76. (i) On AB , $f(x, y) = f(x, x) = 4x^2 - 2x^4 + 16$ for $-2 \leq x \leq 2 \Rightarrow f'(x, x) = 8x - 8x^3 = 0 \Rightarrow x = 0$ and $y = 0$, or $x = 1$ and $y = 1$, or $x = -1$ and $y = -1 \Rightarrow (0, 0)$, $(1, 1)$, $(-1, -1)$ are all interior points of AB with $f(0, 0) = 16$, $f(1, 1) = 18$, and $f(-1, -1) = 18$.
Endpoints: $f(-2, -2) = 0$ and $f(2, 2) = 0$.

- (ii) On BC , $f(x, y) = f(2, y) = 8y - y^4$ for $-2 \leq y \leq 2 \Rightarrow f'(2, y) = 8 - 4y^3 = 0 \Rightarrow y = \sqrt[3]{2}$ and $x = 2 \Rightarrow (2, \sqrt[3]{2})$ is an interior critical point of BC with $f(2, \sqrt[3]{2}) = 6\sqrt[3]{2}$.
Endpoints: $f(2, -2) = -32$ and $f(2, 2) = 0$.
- (iii) On AC , $f(x, y) = f(x, -2) = -8x - x^4$ for $-2 \leq x \leq 2 \Rightarrow f'(x, -2) = -8 - 4x^3 = 0 \Rightarrow x = \sqrt[3]{-2}$ and $y = -2 \Rightarrow (\sqrt[3]{-2}, -2)$ is an interior critical point of AC with $f(\sqrt[3]{-2}, -2) = 6\sqrt[3]{2}$.
Endpoints: $f(-2, -2) = 0$ and $f(2, -2) = -32$.
- (iv) For the interior of the triangular region, $f_x(x, y) = 4y - 4x^3 = 0$ and $f_y(x, y) = 4x - 4y^3 = 0 \Rightarrow x = 0$ and $y = 0$, or $x = 1$ and $y = 1$ or $x = -1$ and $y = -1$. But neither of the points $(0, 0)$ and $(1, 1)$, or $(-1, -1)$ are interior to the region. Therefore the absolute maximum is 18 at $(1, 1)$, and $(-1, -1)$, the absolute minimum is -32 at $(2, -2)$.

77. (i) On AB , $f(x, y) = f(-1, y) = y^3 - 3y^2 + 2$ for $-1 \leq y \leq 1 \Rightarrow f'(-1, y) = 3y^2 - 6y = 0 \Rightarrow y = 0$ and $x = -1$, or $y = 2$ and $x = -1 \Rightarrow (-1, 0)$ is an interior critical point of AB with $f(-1, 0) = 2$; $(-1, 2)$ is outside the boundary.
Endpoints: $f(-1, -1) = -2$ and $f(-1, 1) = 0$.

- (ii) On BC , $f(x, y) = f(x, 1) = x^3 + 3x^2 - 2$ for $-1 \leq x \leq 1 \Rightarrow f'(x, 1) = 3x^2 + 6x = 0 \Rightarrow x = 0$ and $y = 1$, or $x = -2$ and $y = 1 \Rightarrow (0, 1)$ is an interior critical point of BC with $f(0, 1) = -2$; $(-2, 1)$ is outside the boundary. Endpoints: $f(-1, 1) = 0$ and $f(1, 1) = 2$.
- (iii) On CD , $f(x, y) = f(1, y) = y^3 - 3y^2 + 4$ for $-1 \leq y \leq 1 \Rightarrow f'(1, y) = 3y^2 - 6y = 0 \Rightarrow y = 0$ and $x = 1$, or $y = 2$ and $x = 1 \Rightarrow (1, 0)$ is an interior critical point of CD with $f(1, 0) = 4$; $(1, 2)$ is outside the boundary. Endpoints: $f(1, 1) = 2$ and $f(1, -1) = 0$.
- (iv) On AD , $f(x, y) = f(x, -1) = x^3 + 3x^2 - 4$ for $-1 \leq x \leq 1 \Rightarrow f'(x, -1) = 3x^2 + 6x = 0 \Rightarrow x = 0$ and $y = -1$, or $x = -2$ and $y = -1 \Rightarrow (0, -1)$ is an interior critical point of AD with $f(0, -1) = -4$; $(-2, -1)$ is outside the boundary. Endpoints: $f(-1, -1) = -2$ and $f(1, -1) = 0$.
- (v) For the interior of the square, $f_x(x, y) = 3x^2 + 6x = 0$ and $f_y(x, y) = 3y^2 - 6y = 0 \Rightarrow x = 0$ or $x = -2$, and $y = 0$ or $y = 2 \Rightarrow (0, 0)$ is an interior critical point of the square region with $f(0, 0) = 0$; the points $(0, 2)$, $(-2, 0)$, and $(-2, 2)$ are outside the region. Therefore the absolute maximum is 4 at $(1, 0)$ and the absolute minimum is -4 at $(0, -1)$.

78. (i) On AB , $f(x, y) = f(-1, y) = y^3 - 3y$ for $-1 \leq y \leq 1 \Rightarrow f'(-1, y) = 3y^2 - 3 = 0 \Rightarrow y = \pm 1$ and $x = -1$ yielding the corner points $(-1, -1)$ and $(-1, 1)$ with $f(-1, -1) = 2$ and $f(-1, 1) = -2$.
- (ii) On BC , $f(x, y) = f(x, 1) = x^3 + 3x + 2$ for $-1 \leq x \leq 1 \Rightarrow f'(x, 1) = 3x^2 + 3 = 0 \Rightarrow$ no solution.
Endpoints: $f(-1, 1) = -2$ and $f(1, 1) = 6$.

- (iii) On CD , $f(x, y) = f(1, y) = y^3 + 3y + 2$ for $-1 \leq y \leq 1 \Rightarrow f'(1, y) = 3y^2 + 3 = 0 \Rightarrow$ no solution.
 Endpoints: $f(1, 1) = 6$ and $f(1, -1) = -2$.
- (iv) On AD , $f(x, y) = f(x, -1) = x^3 - 3x$ for $-1 \leq x \leq 1 \Rightarrow f'(x, -1) = 3x^2 - 3 = 0 \Rightarrow x = \pm 1$ and $y = -1$
 yielding the corner points $(-1, -1)$ and $(1, -1)$ with $f(-1, -1) = 2$ and $f(1, -1) = -2$
- (v) For the interior of the square, $f_x(x, y) = 3x^2 + 3y = 0$ and $f_y(x, y) = 3y^2 + 3x = 0 \Rightarrow y = -x^2$ and
 $x^4 + x = 0 \Rightarrow x = 0$ or $x = -1 \Rightarrow y = 0$ or $y = -1 \Rightarrow (0, 0)$ is an interior critical point of the square region
 with $f(0, 0) = 1$; $(-1, -1)$ is on the boundary. Therefore the absolute maximum is 6 at $(1, 1)$ and the
 absolute minimum is -2 at $(1, -1)$ and $(-1, 1)$.

79. $\nabla f = 3x^2\mathbf{i} + 2y\mathbf{j}$ and $\nabla g = 2x\mathbf{i} + 2y\mathbf{j}$ so that $\nabla f = \lambda \nabla g \Rightarrow 3x^2\mathbf{i} + 2y\mathbf{j} = \lambda(2x\mathbf{i} + 2y\mathbf{j}) \Rightarrow 3x^2 = 2x\lambda$ and
 $2y = 2y\lambda \Rightarrow \lambda = 1$ or $y = 0$.

CASE 1: $\lambda = 1 \Rightarrow 3x^2 = 2x \Rightarrow x = 0$ or $x = \frac{2}{3}$; $x = 0 \Rightarrow y = \pm 1$ yielding the points $(0, 1)$ and $(0, -1)$;

$$x = \frac{2}{3} \Rightarrow y = \pm \frac{\sqrt{5}}{3} \text{ yielding the points } \left(\frac{2}{3}, \frac{\sqrt{5}}{3}\right) \text{ and } \left(\frac{2}{3}, -\frac{\sqrt{5}}{3}\right).$$

CASE 2: $y = 0 \Rightarrow x^2 - 1 = 0 \Rightarrow x = \pm 1$ yielding the points $(1, 0)$ and $(-1, 0)$.

Evaluations give $f(0, \pm 1) = 1$, $f\left(\frac{2}{3}, \pm \frac{\sqrt{5}}{3}\right) = \frac{23}{27}$, $f(1, 0) = 1$, and $f(-1, 0) = -1$. Therefore the absolute
 maximum is 1 at $(0, \pm 1)$ and $(1, 0)$, and the absolute minimum is -1 at $(-1, 0)$.

80. $\nabla f = y\mathbf{i} + x\mathbf{j}$ and $\nabla g = 2x\mathbf{i} + 2y\mathbf{j}$ so that $\nabla f = \lambda \nabla g \Rightarrow y\mathbf{i} + x\mathbf{j} = \lambda(2x\mathbf{i} + 2y\mathbf{j}) \Rightarrow y = 2\lambda x$ and $xy = 2\lambda y$
 $\Rightarrow x = 2\lambda(2\lambda x) = 4\lambda^2 x \Rightarrow x = 0$ or $4\lambda^2 = 1$.

CASE 1: $x = 0 \Rightarrow y = 0$ but $(0, 0)$ does not lie on the circle, so no solution.

CASE 2: $4\lambda^2 = 1 \Rightarrow \lambda = \frac{1}{2}$ or $\lambda = -\frac{1}{2}$. For $\lambda = \frac{1}{2}$, $y = x \Rightarrow 1 = x^2 + y^2 = 2x^2 \Rightarrow x = y = \pm \frac{1}{\sqrt{2}}$ yielding the

$$\text{points } \left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right) \text{ and } \left(-\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}\right). \text{ For } \lambda = -\frac{1}{2}, y = -x \Rightarrow 1 = x^2 + y^2 = 2x^2 \Rightarrow x = \pm \frac{1}{\sqrt{2}} \text{ and}$$

$$y = -x \text{ yielding the points } \left(-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right) \text{ and } \left(\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}\right).$$

Evaluations give the absolute maximum value $f\left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right) = f\left(-\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}\right) = \frac{1}{2}$ and the absolute minimum

$$\text{value } f\left(-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right) = f\left(\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}\right) = -\frac{1}{2}.$$

81. (i) $f(x, y) = x^2 + 3y^2 + 2y$ on $x^2 + y^2 = 1 \Rightarrow \nabla f = 2x\mathbf{i} + (6y + 2)\mathbf{j}$ and $\nabla g = 2x\mathbf{i} + 2y\mathbf{j}$ so that
 $\nabla f = \lambda \nabla g \Rightarrow 2x\mathbf{i} + (6y + 2)\mathbf{j} = \lambda(2x\mathbf{i} + 2y\mathbf{j}) \Rightarrow 2x = 2x\lambda$ and $6y + 2 = 2y\lambda \Rightarrow \lambda = 1$ or $x = 0$.

CASE 1: $\lambda = 1 \Rightarrow 6y + 2 = 2y \Rightarrow y = -\frac{1}{2}$ and $x = \pm \frac{\sqrt{3}}{2}$ yielding the points $\left(\pm \frac{\sqrt{3}}{2}, -\frac{1}{2}\right)$.

CASE 2: $x = 0 \Rightarrow y^2 = 1 \Rightarrow y = \pm 1$ yielding the points $(0, \pm 1)$.

Evaluations give $f\left(\pm \frac{\sqrt{3}}{2}, -\frac{1}{2}\right) = \frac{1}{2}$, $f(0, 1) = 5$, and $f(0, -1) = 1$. Therefore $\frac{1}{2}$ and 5 are the extreme
 values on the boundary of the disk.

- (ii) For the interior of the disk, $f_x(x, y) = 2x = 0$ and $f_y(x, y) = 6y + 2 = 0 \Rightarrow x = 0$ and $y = -\frac{1}{3} \Rightarrow (0, -\frac{1}{3})$ is an interior critical point with $f(0, -\frac{1}{3}) = -\frac{1}{3}$. Therefore the absolute maximum of f on the disk is 5 at $(0, 1)$ and the absolute minimum of f on the disk is $-\frac{1}{3}$ at $(0, -\frac{1}{3})$.
82. (i) $f(x, y) = x^2 + y^2 - 3x - xy$ on $x^2 + y^2 = 9 \Rightarrow \nabla f = (2x - 3 - y)\mathbf{i} + (2y - x)\mathbf{j}$ and $\nabla g = 2x\mathbf{i} + 2y\mathbf{j}$ so that $\nabla f = \lambda \nabla g \Rightarrow (2x - 3 - y)\mathbf{i} + (2y - x)\mathbf{j} = \lambda(2x\mathbf{i} + 2y\mathbf{j}) \Rightarrow 2x - 3 - y = 2x\lambda$ and $2y - x = 2y\lambda$
 $\Rightarrow 2x(1 - \lambda) - y = 3$ and $-x + 2y(1 - \lambda) = 0 \Rightarrow 1 - \lambda = \frac{x}{2y}$ and $(2x)\left(\frac{x}{2y}\right) - y = 3 \Rightarrow x^2 - y^2 = 3y$
 $\Rightarrow x^2 = y^2 + 3y$. Thus, $9 = x^2 + y^2 = y^2 + 3y + y^2 \Rightarrow 2y^2 + 3y - 9 = 0 \Rightarrow (2y - 3)(y + 3) = 0$
 $\Rightarrow y = -3$ or $y = \frac{3}{2}$. For $y = -3$, $x^2 + y^2 = 9 \Rightarrow x = 0$ yielding the point $(0, -3)$. For $y = \frac{3}{2}$, $x^2 + y^2 = 9$
 $\Rightarrow x^2 + \frac{9}{4} = 9 \Rightarrow x^2 = \frac{27}{4} \Rightarrow x = \pm \frac{3\sqrt{3}}{2}$. Evaluations give $f(0, -3) = 9$, $f\left(-\frac{3\sqrt{3}}{2}, \frac{3}{2}\right) = 9 + \frac{27\sqrt{3}}{4} \approx 20.691$,
and $f\left(\frac{3\sqrt{3}}{2}, \frac{3}{2}\right) = 9 - \frac{27\sqrt{3}}{4} \approx -2.691$.
- (ii) For the interior of the disk, $f_x(x, y) = 2x - 3 - y = 0$ and $f_y(x, y) = 2y - x = 0 \Rightarrow x = 2$ and $y = 1 \Rightarrow (2, 1)$ is an interior critical point of the disk with $f(2, 1) = -3$. Therefore, the absolute maximum of f on the disk is $9 + \frac{27\sqrt{3}}{4}$ at $\left(-\frac{3\sqrt{3}}{2}, \frac{3}{2}\right)$ and the absolute minimum of f on the disk is -3 at $(2, 1)$.
83. $\nabla f = \mathbf{i} - \mathbf{j} + \mathbf{k}$ and $\nabla g = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ so that $\nabla f = \lambda \nabla g \Rightarrow \mathbf{i} - \mathbf{j} + \mathbf{k} = \lambda(2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}) \Rightarrow 1 = 2x\lambda$,
 $-1 = 2y\lambda$, $1 = 2z\lambda \Rightarrow x = -y = z = \frac{1}{\lambda}$. Thus $x^2 + y^2 + z^2 = 1 \Rightarrow 3x^2 = 1 \Rightarrow x = \pm \frac{1}{\sqrt{3}}$ yielding the points
 $\left(\frac{1}{\sqrt{3}}, -\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right)$ and $\left(-\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, -\frac{1}{\sqrt{3}}\right)$. Evaluations give the absolute maximum value of
 $f\left(\frac{1}{\sqrt{3}}, -\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right) = \frac{3}{\sqrt{3}} = \sqrt{3}$ and the absolute minimum value of $f\left(-\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, -\frac{1}{\sqrt{3}}\right) = -\sqrt{3}$.
84. Let $f(x, y, z) = x^2 + y^2 + z^2$ be the square of the distance to the origin and $g(x, y, z) = x^2 - zy - 4$. Then
 $\nabla f = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ and $\nabla g = 2x\mathbf{i} - z\mathbf{j} - y\mathbf{k}$ so that $\nabla f = \lambda \nabla g \Rightarrow 2x = 2\lambda x$, $2y = -\lambda z$, and $2z = -\lambda y$
 $\Rightarrow x = 0$ or $\lambda = 1$.
- CASE 1: $x = 0 \Rightarrow zy = -4 \Rightarrow z = -\frac{4}{y}$ and $y = -\frac{4}{z} \Rightarrow 2\left(-\frac{4}{y}\right) = -\lambda\lambda$ and $2\left(-\frac{4}{z}\right) = -\lambda z \Rightarrow \frac{8}{\lambda} = y^2$ and
 $\frac{8}{\lambda} = z^2 \Rightarrow y^2 = z^2 \Rightarrow y = \pm z$. But $y = x \Rightarrow z^2 = -4$ leads to no solution, so $y = -z \Rightarrow z^2 = 4$
 $\Rightarrow z = \pm 2$ yielding the points $(0, -2, 2)$ and $(0, 2, -2)$.
- CASE 2: $\lambda = 1 \Rightarrow 2z = -y$ and $2y = -z \Rightarrow 2y = -\left(-\frac{y}{2}\right) \Rightarrow 4y = y \Rightarrow y = 0 \Rightarrow z = 0 \Rightarrow x^2 - 4 = 0$
 $\Rightarrow x = \pm 2$ yielding the points $(-2, 0, 0)$ and $(2, 0, 0)$.
- Evaluations give $f(0, -2, 2) = f(0, 2, -2) = 8$ and $f(-2, 0, 0) = f(2, 0, 0) = 4$. Thus the points $(-2, 0, 0)$ and $(2, 0, 0)$ on the surface are closest to the origin.
85. The cost is $f(x, y, z) = 2axy + 2bxz + 2cyz$ subject to the constraint $xyz = V$. Then $\nabla f = \lambda \nabla g$
 $\Rightarrow 2ay + 2bz = \lambda yz$, $2ax + 2cz = \lambda xz$, and $2bx + 2cy = \lambda xy \Rightarrow 2axy + 2bxz = \lambda xyz$, $2axy + 2cyz = \lambda xyz$, and
 $2bxz + 2cyz = \lambda xyz \Rightarrow 2axy + 2bxz = 2axy + 2cyz \Rightarrow y = \left(\frac{b}{c}\right)x$. Also $2axy + 2bxz = 2bxz + 2cyz \Rightarrow z = \left(\frac{a}{c}\right)x$.

Then $x\left(\frac{b}{c}x\right)\left(\frac{a}{c}x\right) = V \Rightarrow x^3 = \frac{c^2V}{ab} \Rightarrow \text{width} = x = \left(\frac{c^2V}{ab}\right)^{1/3}$, $\text{Depth} = y = \left(\frac{b}{c}\right)\left(\frac{c^2V}{ab}\right)^{1/3} = \left(\frac{b^2V}{ac}\right)^{1/3}$, and $\text{Height} = z = \left(\frac{a}{c}\right)\left(\frac{c^2V}{ab}\right)^{1/3} = \left(\frac{a^2V}{bc}\right)^{1/3}$.

86. The volume of the pyramid in the first octant formed by the plane is $V(a, b, c) = \frac{1}{3}\left(\frac{1}{2}ab\right)c = \frac{1}{6}abc$. The point $(2, 1, 2)$ on the plane $\Rightarrow \frac{2}{a} + \frac{1}{b} + \frac{2}{c} = 1$. We want to minimize V subject to the constraint $2bc + ac + 2ab = abc$. Thus, $\nabla V = \frac{bc}{6}\mathbf{i} + \frac{ac}{6}\mathbf{j} + \frac{ab}{6}\mathbf{k}$ and $\nabla g = (c + 2b - bc)\mathbf{i} + (2c + 2a - ac)\mathbf{j} + (2b + a - ab)\mathbf{k}$ so that $\nabla V = \lambda \nabla g \Rightarrow \frac{bc}{6} = \lambda(c + 2b - bc)$, $\frac{ac}{6} = \lambda(2c + 2a - ac)$, and $\frac{ab}{6} = \lambda(2b + a - ab) \Rightarrow \frac{abc}{6} = \lambda(ac + 2ab - abc)$, $\frac{abc}{6} = \lambda(2bc + 2ab - abc)$, and $\frac{abc}{6} = \lambda(2bc + ac - abc) \Rightarrow \lambda ac = 2\lambda bc$ and $2\lambda ab = 2\lambda bc$. Now $\lambda \neq 0$ since $a \neq 0, b \neq 0$, and $c \neq 0 \Rightarrow ac = 2bc$ and $ab = bc \Rightarrow a = 2b = c$. Substituting into the constraint equation gives $\frac{2}{a} + \frac{2}{a} + \frac{2}{a} = 1 \Rightarrow a = 6 \Rightarrow b = 3$ and $c = 6$. Therefore the desired plane is $\frac{x}{6} + \frac{y}{3} + \frac{z}{6} = 1$ or $x + 2y + z = 6$.

87. $\nabla f = (y + z)\mathbf{i} + x\mathbf{j} + x\mathbf{k}$, $\nabla g = 2x\mathbf{i} + 2y\mathbf{j}$, and $\nabla h = z\mathbf{i} + x\mathbf{k}$ so that $\nabla f = \lambda \nabla g + \mu \nabla h \Rightarrow (y + z)\mathbf{i} + x\mathbf{j} + x\mathbf{k} = \lambda(2x\mathbf{i} + 2y\mathbf{j}) + \mu(z\mathbf{i} + x\mathbf{k}) \Rightarrow y + z = 2\lambda x + \mu z, x = 2\lambda y, x = \mu z \Rightarrow x = 0$ or $\mu = 1$.

CASE 1: $x = 0$ which is impossible since $xz = 1$.

CASE 2: $\mu = 1 \Rightarrow y + z = 2\lambda x + z \Rightarrow y = 2\lambda x$ and $x = 2\lambda y \Rightarrow y = (2\lambda)(2\lambda y) \Rightarrow y = 0$ or $4\lambda^2 = 1$. If $y = 0$, then $x^2 = 1 \Rightarrow x = \pm 1$ so with $xz = 1$ we obtain the points $(1, 0, 1)$ and $(-1, 0, -1)$. If $4\lambda^2 = 1$, then $\lambda = \pm \frac{1}{2}$. For $\lambda = -\frac{1}{2}, y = -x$ so $x^2 + y^2 = 1 \Rightarrow x^2 = \frac{1}{2} \Rightarrow x = \pm \frac{1}{\sqrt{2}}$ with $xz = 1 \Rightarrow z = \pm\sqrt{2}$, and we obtain the points $\left(\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}, \sqrt{2}\right)$ and $\left(-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}, -\sqrt{2}\right)$. For $\lambda = \frac{1}{2}, y = x \Rightarrow x^2 = \frac{1}{2} \Rightarrow x = \pm \frac{1}{\sqrt{2}}$ with $xz = 1 \Rightarrow z = \pm\sqrt{2}$, and we obtain the points $\left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}, \sqrt{2}\right)$ and $\left(-\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}, -\sqrt{2}\right)$.

Evaluations give $f(1, 0, 1) = 1, f(-1, 0, -1) = 1, f\left(\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}, \sqrt{2}\right) = \frac{1}{2}, f\left(-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}, -\sqrt{2}\right) = \frac{1}{2}, f\left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}, \sqrt{2}\right) = \frac{3}{2}$, and $f\left(-\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}, -\sqrt{2}\right) = \frac{3}{2}$. Therefore the absolute maximum is $\frac{3}{2}$ at $\left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}, \sqrt{2}\right)$ and $\left(-\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}, -\sqrt{2}\right)$, and the absolute minimum is $\frac{1}{2}$ at $\left(-\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}, -\sqrt{2}\right)$ and $\left(\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}, \sqrt{2}\right)$.

88. Let $f(x, y, z) = x^2 + y^2 + z^2$ be the square of the distance to the origin. Then $\nabla f = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$, $\nabla g = \mathbf{i} + \mathbf{j} + \mathbf{k}$, and $\nabla h = 4x\mathbf{i} + 4y\mathbf{j} - 2z\mathbf{k}$ so that $\nabla f = \lambda \nabla g + \mu \nabla h \Rightarrow 2x = \lambda + 4x\mu, 2y = \lambda + 4y\mu$, and $2z = \lambda - 2z\mu \Rightarrow \lambda = 2x(1 - 2\mu) = 2y(1 - 2\mu) = 2z(1 + 2\mu) \Rightarrow x = y$ or $\mu = \frac{1}{2}$.

CASE 1: $x = y \Rightarrow z^2 = 4x^2 \Rightarrow z = \pm 2x$ so that $x + y + z = 1 \Rightarrow x + x + 2x = 1$ or $x + x - 2x = 1$ (impossible and $\Rightarrow x = \frac{1}{4} \Rightarrow y = \frac{1}{4}$ and $z = \frac{1}{2}$ yielding the point $\left(\frac{1}{4}, \frac{1}{4}, \frac{1}{2}\right)$.

CASE 2: $\mu = \frac{1}{2} \Rightarrow \lambda = 0 \Rightarrow 0 = 2z(1 + 1) \Rightarrow z = 0$ so that $2x^2 + 2y^2 = 0 \Rightarrow x = y = 0$. But the origin $(0, 0, 0)$ fails to satisfy the first constraint $x + y + z = 1$.

Therefore, the point $\left(\frac{1}{4}, \frac{1}{4}, \frac{1}{2}\right)$ on the curve of intersection is closest to the origin.

89. Note that $x = r \cos \theta$ and $y = r \sin \theta \Rightarrow r = \sqrt{x^2 + y^2}$ and $\theta = \tan^{-1}\left(\frac{y}{x}\right)$. Thus,

$$\frac{\partial w}{\partial x} = \frac{\partial w}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial w}{\partial \theta} \frac{\partial \theta}{\partial x} = \left(\frac{\partial w}{\partial r}\right)\left(\frac{x}{\sqrt{x^2 + y^2}}\right) + \left(\frac{\partial w}{\partial \theta}\right)\left(\frac{-y}{x^2 + y^2}\right) = (\cos \theta) \frac{\partial w}{\partial r} - \left(\frac{\sin \theta}{r}\right) \frac{\partial w}{\partial \theta},$$

$$\frac{\partial w}{\partial y} = \frac{\partial w}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial w}{\partial \theta} \frac{\partial \theta}{\partial y} = \left(\frac{\partial w}{\partial r}\right)\left(\frac{y}{\sqrt{x^2 + y^2}}\right) + \left(\frac{\partial w}{\partial \theta}\right)\left(\frac{x}{x^2 + y^2}\right) = (\sin \theta) \frac{\partial w}{\partial r} + \left(\frac{\cos \theta}{r}\right) \frac{\partial w}{\partial \theta}$$

90. $z_x = f_u \frac{\partial u}{\partial x} + f_v \frac{\partial v}{\partial x} = af_u + af_v$, and $z_y = f_u \frac{\partial u}{\partial y} + f_v \frac{\partial v}{\partial y} = bf_u - bf_v$

91. $\frac{\partial u}{\partial y} = b$ and $\frac{\partial u}{\partial x} = a \Rightarrow \frac{\partial w}{\partial x} = \frac{dw}{du} \frac{\partial u}{\partial x} = a \frac{dw}{du}$ and $\frac{\partial w}{\partial y} = \frac{dw}{du} \frac{\partial u}{\partial y} = b \frac{dw}{du} \Rightarrow \frac{1}{a} \frac{\partial w}{\partial x} = \frac{dw}{du}$ and $\frac{1}{b} \frac{\partial w}{\partial y} = \frac{dw}{du}$
 $\Rightarrow \frac{1}{a} \frac{\partial w}{\partial x} = \frac{1}{b} \frac{\partial w}{\partial y} \Rightarrow b \frac{\partial w}{\partial x} = a \frac{\partial w}{\partial y}$

92. $\frac{\partial w}{\partial x} = \frac{2x}{x^2 + y^2 + 2z} = \frac{2(r+s)}{(r+s)^2 + (r-s)^2 + 4rs} = \frac{2(r+s)}{2(r^2 + 2rs + s^2)} = \frac{1}{r+s}$, $\frac{\partial w}{\partial y} = \frac{2y}{x^2 + y^2 + 2z} = \frac{2(r-s)}{2(r+s)^2} = \frac{r-s}{(r+s)^2}$, and

$$\frac{\partial w}{\partial z} = \frac{2}{x^2 + y^2 + 2z} = \frac{1}{(r+s)^2} \Rightarrow \frac{\partial w}{\partial r} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial r} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial r} = \frac{1}{r+s} + \frac{r-s}{(r+s)^2} + \left[\frac{1}{(r+s)^2}\right](2s) = \frac{2r+2s}{(r+s)^2} = \frac{2}{r+s}$$
 and

$$\frac{\partial w}{\partial s} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial s} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial s} = \frac{1}{r+s} - \frac{r-s}{(r-s)^2} + \left[\frac{1}{(r+s)^2}\right](2r) = \frac{2}{r+s}$$

93. $e^u \cos v - x = 0 \Rightarrow (e^u \cos v) \frac{\partial u}{\partial x} - (e^u \sin v) \frac{\partial v}{\partial x} = 1$; $e^u \sin v - y = 0 \Rightarrow (e^u \sin v) \frac{\partial u}{\partial x} + (e^u \cos v) \frac{\partial v}{\partial x} = 0$. Solving this system yields $\frac{\partial u}{\partial x} = e^{-u} \cos v$ and $\frac{\partial v}{\partial x} = -e^{-u} \sin v$. Similarly, $e^u \cos v - x = 0 \Rightarrow (e^u \cos v) \frac{\partial u}{\partial y} - (e^u \sin v) \frac{\partial v}{\partial y} = 0$ and $e^u \sin v - y = 0 \Rightarrow (e^u \sin v) \frac{\partial u}{\partial y} + (e^u \cos v) \frac{\partial v}{\partial y} = 1$. Solving this second system yields $\frac{\partial u}{\partial y} = e^{-u} \sin v$ and $\frac{\partial v}{\partial y} = e^{-u} \cos v$. Therefore $\left(\frac{\partial u}{\partial x} \mathbf{i} + \frac{\partial u}{\partial y} \mathbf{j}\right) \cdot \left(\frac{\partial v}{\partial x} \mathbf{i} + \frac{\partial v}{\partial y} \mathbf{j}\right) = \left[\left(e^{-u} \cos v\right) \mathbf{i} + \left(e^{-u} \sin v\right) \mathbf{j}\right] \cdot \left[\left(-e^{-u} \sin v\right) \mathbf{i} + \left(e^{-u} \cos v\right) \mathbf{j}\right] = 0 \Rightarrow$ the vectors are orthogonal \Rightarrow the angle between the vectors is the constant $\frac{\pi}{2}$.

94. $\frac{\partial g}{\partial \theta} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial \theta} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial \theta} = (-r \sin \theta) \frac{\partial f}{\partial x} + (r \cos \theta) \frac{\partial f}{\partial y}$
 $\Rightarrow \frac{\partial^2 g}{\partial \theta^2} = (-r \sin \theta) \left(\frac{\partial^2 f}{\partial x^2} \frac{\partial x}{\partial \theta} + \frac{\partial^2 f}{\partial y \partial x} \frac{\partial y}{\partial \theta}\right) - (r \cos \theta) \frac{\partial f}{\partial x} + (r \cos \theta) \left(\frac{\partial^2 f}{\partial x \partial y} \frac{\partial x}{\partial \theta} + \frac{\partial^2 f}{\partial y^2} \frac{\partial y}{\partial \theta}\right) - (r \sin \theta) \frac{\partial f}{\partial y}$
 $= (-r \sin \theta) \left(\frac{\partial x}{\partial \theta} + \frac{\partial y}{\partial \theta}\right) - (r \cos \theta) + (r \cos \theta) \left(\frac{\partial x}{\partial \theta} + \frac{\partial y}{\partial \theta}\right) - (r \sin \theta)$
 $= (-r \sin \theta + r \cos \theta)(-r \sin \theta + r \cos \theta) - (r \cos \theta + r \sin \theta) = (-2)(-2) - (0 + 2) = 4 - 2 = 2$ at $(r, \theta) = \left(2, \frac{\pi}{2}\right)$.

95. $(y+z)^2 + (z-x)^2 = 16 \Rightarrow \nabla f = -2(z-x)\mathbf{i} + 2(y+z)\mathbf{j} + 2(y+2z-x)\mathbf{k}$; if the normal line is parallel to the yz -plane, then x is constant $\Rightarrow \frac{\partial f}{\partial x} = 0 \Rightarrow -2(z-x) = 0 \Rightarrow z = x \Rightarrow (y+z)^2 + (z-z)^2 = 16 \Rightarrow y+z = \pm 4$.
 Let $x = t \Rightarrow z = t \Rightarrow y = -t \pm 4$. Therefore the points are $(t, -t \pm 4, t)$, t a real number.

96. Let $f(x, y, z) = xy + yz + zx - x - z^2 = 0$. If the tangent plane is to be parallel to the xy -plane, then ∇f is perpendicular to the xy -plane $\Rightarrow \nabla f \cdot \mathbf{i} = 0$ and $\nabla f \cdot \mathbf{j} = 0$. Now $\nabla f = (y + z - 1)\mathbf{i} + (x + z)\mathbf{j} + (y + x - 2z)\mathbf{k}$ so that $\nabla f \cdot \mathbf{i} = y + z - 1 = 0 \Rightarrow y + z = 1 \Rightarrow y = 1 - z$, and $\nabla f \cdot \mathbf{j} = x + z = 0 \Rightarrow x = -z$. Then $-z(1 - z) + (1 - z)z + z(-z) - (-z) - z^2 = 0 \Rightarrow z - 2z^2 = 0 \Rightarrow z = \frac{1}{2}$ or $z = 0$. Now $z = \frac{1}{2} \Rightarrow x = -\frac{1}{2}$ and $y = \frac{1}{2} \Rightarrow (-\frac{1}{2}, \frac{1}{2}, \frac{1}{2})$ is one desired point; $z = 0 \Rightarrow x = 0$ and $y = 1 \Rightarrow (0, 1, 0)$ is a second desired point.

97. $\nabla f = \lambda(x\mathbf{i} + y\mathbf{j} + z\mathbf{k}) \Rightarrow \frac{\partial f}{\partial x} = \lambda x \Rightarrow f(x, y, z) = \frac{1}{2}\lambda x^2 + g(y, z)$ for some function $g \Rightarrow \lambda y = \frac{\partial f}{\partial y} = \frac{\partial g}{\partial y} \Rightarrow g(y, z) = \frac{1}{2}\lambda y^2 + h(z)$ for some function $h \Rightarrow \lambda z = \frac{\partial f}{\partial z} = \frac{\partial g}{\partial z} = h'(z) \Rightarrow h(z) = \frac{1}{2}\lambda z^2 + C$ for some arbitrary constant $C \Rightarrow g(y, z) = \frac{1}{2}\lambda y^2 + (\frac{1}{2}\lambda z^2 + C) \Rightarrow f(x, y, z) = \frac{1}{2}\lambda x^2 + \frac{1}{2}\lambda y^2 + \frac{1}{2}\lambda z^2 + C \Rightarrow f(0, 0, a) = \frac{1}{2}\lambda a^2 + C$ and $f(0, 0, -a) = \frac{1}{2}\lambda(-a)^2 + C \Rightarrow f(0, 0, a) = f(0, 0, -a)$ for any constant a , as claimed.

98. $\left(\frac{df}{ds}\right)_{\mathbf{u},(0,0,0)} = \lim_{s \rightarrow 0} \frac{f(0+su_1, 0+su_2, 0+su_3) - f(0, 0, 0)}{s}, s > 0$
 $= \lim_{s \rightarrow 0} \frac{\sqrt{s^2 u_1^2 + s^2 u_2^2 + s^2 u_3^2} - 0}{s}, s > 0$
 $= \lim_{s \rightarrow 0} \frac{s\sqrt{u_1^2 + u_2^2 + u_3^2}}{s} = \lim_{s \rightarrow 0} |\mathbf{u}| = 1;$

however, $\nabla f = \frac{x}{\sqrt{x^2 + y^2 + z^2}} \mathbf{i} + \frac{y}{\sqrt{x^2 + y^2 + z^2}} \mathbf{j} + \frac{z}{\sqrt{x^2 + y^2 + z^2}} \mathbf{k}$ fails to exist at the origin $(0, 0, 0)$

99. Let $f(x, y, z) = xy + z - 2 \Rightarrow \nabla f = y\mathbf{i} + x\mathbf{j} + \mathbf{k}$. At $(1, 1, 1)$, we have $\nabla f = \mathbf{i} + \mathbf{j} + \mathbf{k} \Rightarrow$ the normal line is $x = 1 + t, y = 1 + t, z = 1 + t$, so at $t = -1 \Rightarrow x = 0, y = 0, z = 0$ and the normal line passes through the origin.

100. (b) $f(x, y, z) = x^2 - y^2 + z^2 = 4 \Rightarrow \nabla f = 2x\mathbf{i} - 2y\mathbf{j} + 2z\mathbf{k}$
 \Rightarrow at $(2, -3, 3)$ the gradient is $\nabla f = 4\mathbf{i} + 6\mathbf{j} + 6\mathbf{k}$
 which is normal to the surface
 (c) Tangent plane: $4x + 6y + 6z = 8$ or $2x + 3y + 3z = 4$
 Normal line: $x = 2 + 4t, y = -3 + 6t, z = 3 + 6t$

101. (a) y, z are independent with $w = x^2 e^{yz}$ and $z = x^2 - y^2 \Rightarrow \frac{\partial w}{\partial y} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial y} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial y} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial y}$
 $= (2xe^{yz}) \frac{\partial x}{\partial y} + (zx^2 e^{yz})(1) + (yx^2 e^{yz})(0); z = x^2 - y^2 \Rightarrow 0 = 2x \frac{\partial x}{\partial y} - 2y \Rightarrow \frac{\partial x}{\partial y} = \frac{y}{x};$ therefore,
 $\left(\frac{\partial w}{\partial y}\right)_z = (2xe^{yz})\left(\frac{y}{x}\right) + zx^2 e^{yz} = (2y + zx^2) e^{yz}$

- (b) z, x are independent with $w = x^2 e^{yz}$ and $z = x^2 - y^2 \Rightarrow \frac{\partial w}{\partial z} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial z} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial z} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial z}$
 $= (2xe^{yz})(0) + (zx^2 e^{yz}) \frac{\partial y}{\partial z} + (yx^2 e^{yz})(1)$; $z = x^2 - y^2 \Rightarrow 1 = 0 - 2y \frac{\partial y}{\partial z} \Rightarrow \frac{\partial y}{\partial z} = -\frac{1}{2y}$; therefore,
 $\left(\frac{\partial w}{\partial z}\right)_x = (zx^2 e^{yz})\left(-\frac{1}{2y}\right) + yx^2 e^{yz} = x^2 e^{yz} \left(y - \frac{z}{2y}\right)$
- (c) z, y are independent with $w = x^2 e^{yz}$ and $z = x^2 - y^2 \Rightarrow \frac{\partial w}{\partial z} = \frac{\partial w}{\partial x} \frac{\partial x}{\partial z} + \frac{\partial w}{\partial y} \frac{\partial y}{\partial z} + \frac{\partial w}{\partial z} \frac{\partial z}{\partial z}$
 $= (2xe^{yz}) \frac{\partial x}{\partial z} + (zx^2 e^{yz})(0) + (yx^2 e^{yz})(1)$; $z = x^2 - y^2 \Rightarrow 1 = 2x \frac{\partial x}{\partial z} - 0 \Rightarrow \frac{\partial x}{\partial z} = \frac{1}{2x}$; therefore,
 $\left(\frac{\partial w}{\partial z}\right)_y = (2xe^{yz})\left(\frac{1}{2x}\right) + yx^2 e^{yz} = (1 + x^2 y) e^{yz}$

102. (a) T, P are independent with $U = f(P, V, T)$ and $PV = nRT \Rightarrow \frac{\partial U}{\partial T} = \frac{\partial U}{\partial P} \frac{\partial P}{\partial T} + \frac{\partial U}{\partial V} \frac{\partial V}{\partial T} + \frac{\partial U}{\partial T} \frac{\partial T}{\partial T}$
 $= \left(\frac{\partial U}{\partial P}\right)(0) + \left(\frac{\partial U}{\partial V}\right)\left(\frac{\partial V}{\partial T}\right) + \left(\frac{\partial U}{\partial T}\right)(1)$; $PV = nRT \Rightarrow P \frac{\partial V}{\partial T} = nR \Rightarrow \frac{\partial V}{\partial T} = \frac{nR}{P}$; therefore,
 $\left(\frac{\partial U}{\partial T}\right)_P = \left(\frac{\partial U}{\partial V}\right)\left(\frac{nR}{P}\right) + \frac{\partial U}{\partial T}$
- (b) V, T are independent with $U = f(P, V, T)$ and $PV = nRT \Rightarrow \frac{\partial U}{\partial V} = \frac{\partial U}{\partial P} \frac{\partial P}{\partial V} + \frac{\partial U}{\partial V} \frac{\partial V}{\partial V} + \frac{\partial U}{\partial T} \frac{\partial T}{\partial V}$
 $= \left(\frac{\partial U}{\partial P}\right)\left(\frac{\partial P}{\partial V}\right) + \left(\frac{\partial U}{\partial V}\right)(1) + \left(\frac{\partial U}{\partial T}\right)(0)$; $PV = nRT \Rightarrow V \frac{\partial P}{\partial V} + P = (nR)\left(\frac{\partial T}{\partial V}\right) = 0 \Rightarrow \frac{\partial P}{\partial V} = -\frac{P}{V}$; therefore,
 $\left(\frac{\partial U}{\partial V}\right)_T = \left(\frac{\partial U}{\partial P}\right)\left(-\frac{P}{V}\right) + \frac{\partial U}{\partial V}$

CHAPTER 14 ADDITIONAL AND ADVANCED EXERCISES

1. By definition, $f_{xy}(0, 0) = \lim_{h \rightarrow 0} \frac{f_x(0, h) - f_x(0, 0)}{h}$ so we need to calculate the first partial derivatives in the numerator. For $(x, y) \neq (0, 0)$ we calculate $f_x(x, y)$ by applying the differentiation rules to the formula for $f(x, y)$: $f_x(x, y) = \frac{x^2 y - y^3}{x^2 + y^2} + (xy) \frac{(x^2 + y^2)(2x) - (x^2 - y^2)(2x)}{(x^2 + y^2)^2} = \frac{x^2 y - y^3}{x^2 + y^2} + \frac{4x^2 y^3}{(x^2 + y^2)^2} \xrightarrow{x \rightarrow 0} f(0, h) = \frac{h^3}{h^2} = -h$. For $(x, y) = (0, 0)$ we apply the definition: $f_x(0, 0) = \lim_{h \rightarrow 0} \frac{f(h, 0) - f(0, 0)}{h} = \lim_{h \rightarrow 0} \frac{0 - 0}{h} = 0$. Then by definition $f_{xy}(0, 0) = \lim_{h \rightarrow 0} \frac{-h - 0}{h} = -1$. Similarly, $f_{yx}(0, 0) = \lim_{h \rightarrow 0} \frac{f_y(h, 0) - f_y(0, 0)}{h}$, so for $(x, y) \neq (0, 0)$ we have $f_y(x, y) = \frac{x^3 - xy^2}{x^2 + y^2} - \frac{4x^3 y^2}{(x^2 + y^2)^2} \Rightarrow f_y(h, 0) = \frac{h^3}{h^2} = h$; for $(x, y) = (0, 0)$ we obtain $f_y(0, 0) = \lim_{h \rightarrow 0} \frac{f(0, h) - f(0, 0)}{h} = \lim_{h \rightarrow 0} \frac{0 - 0}{h} = 0$. Then by definition $f_{yx}(0, 0) = \lim_{h \rightarrow 0} \frac{h - 0}{h} = 1$. Note that $f_{xy}(0, 0) \neq f_{yx}(0, 0)$ in this case.
2. $\frac{\partial w}{\partial x} = 1 + e^x \cos y \Rightarrow w = x + e^x \cos y + g(y)$; $\frac{\partial w}{\partial y} = -e^x \sin y + g'(y) = 2y - e^x \sin y \Rightarrow g'(y) = 2y$
 $\Rightarrow g(y) = y^2 + C$; $w = \ln 2$ when $x = \ln 2$ and $y = 0 \Rightarrow \ln 2 = \ln 2 + e^{\ln 2} \cos 0 + 0^2 + C \Rightarrow 0 = 2 + C$
 $\Rightarrow C = -2$. Thus, $w = x + e^x \cos y + g(y) = x + e^x \cos y + y^2 - 2$.

3. Substitution of $u = u(x)$ and $v = v(x)$ in $g(u, v)$ gives $g(u(x), v(x))$ which is a function of the independent

$$\begin{aligned} \text{variable } x. \text{ Then, } g(u, v) &= \int_u^v f(t) dt \Rightarrow \frac{dg}{dx} = \frac{\partial g}{\partial u} \frac{du}{dx} + \frac{\partial g}{\partial v} \frac{dv}{dx} = \left(\frac{\partial}{\partial u} \int_u^v f(t) dt \right) \frac{du}{dx} + \left(\frac{\partial}{\partial v} \int_u^v f(t) dt \right) \frac{dv}{dx} \\ &= \left(-\frac{\partial}{\partial u} \int_u^u f(t) dt \right) \frac{du}{dx} + \left(\frac{\partial}{\partial v} \int_u^v f(t) dt \right) \frac{dv}{dx} = -f(u(x)) \frac{du}{dx} + f(v(x)) \frac{dv}{dx} = f(v(x)) \frac{dv}{dx} - f(u(x)) \frac{du}{dx} \end{aligned}$$

4. Applying the chain rules, $f_x = \frac{df}{dr} \frac{\partial r}{\partial x} \Rightarrow f_{xx} = \left(\frac{d^2 f}{dr^2} \right) \left(\frac{\partial r}{\partial x} \right)^2 + \frac{df}{dr} \frac{\partial^2 r}{\partial x^2}$. Similarly, $f_{yy} = \left(\frac{d^2 f}{dr^2} \right) \left(\frac{\partial r}{\partial y} \right)^2 + \frac{df}{dr} \frac{\partial^2 r}{\partial y^2}$ and

$$\begin{aligned} f_{zz} &= \left(\frac{d^2 f}{dr^2} \right) \left(\frac{\partial r}{\partial z} \right)^2 + \frac{df}{dr} \frac{\partial^2 r}{\partial z^2}. \text{ Moreover, } \frac{\partial r}{\partial x} = \frac{x}{\sqrt{x^2+y^2+z^2}} \Rightarrow \frac{\partial^2 r}{\partial x^2} = \frac{y^2+z^2}{(\sqrt{x^2+y^2+z^2})^3}, \frac{\partial r}{\partial y} = \frac{y}{\sqrt{x^2+y^2+z^2}} \\ \Rightarrow \frac{\partial^2 r}{\partial y^2} &= \frac{x^2+z^2}{(\sqrt{x^2+y^2+z^2})^3}; \text{ and } \frac{\partial r}{\partial z} = \frac{z}{\sqrt{x^2+y^2+z^2}} \Rightarrow \frac{\partial^2 r}{\partial z^2} = \frac{x^2+y^2}{(\sqrt{x^2+y^2+z^2})^3}. \text{ Next, } f_{xx} + f_{yy} + f_{zz} = 0 \\ \Rightarrow \left(\frac{d^2 f}{dr^2} \right) &\left(\frac{x^2}{x^2+y^2+z^2} \right) + \left(\frac{df}{dr} \right) \left(\frac{y^2+z^2}{(\sqrt{x^2+y^2+z^2})^3} \right) + \left(\frac{d^2 f}{dr^2} \right) \left(\frac{y^2}{x^2+y^2+z^2} \right) + \left(\frac{df}{dr} \right) \left(\frac{x^2+z^2}{(\sqrt{x^2+y^2+z^2})^3} \right) \\ &+ \left(\frac{d^2 f}{dr^2} \right) \left(\frac{z^2}{x^2+y^2+z^2} \right) + \left(\frac{df}{dr} \right) \left(\frac{x^2+y^2}{(\sqrt{x^2+y^2+z^2})^3} \right) = 0 \Rightarrow \frac{d^2 f}{dr^2} + \left(\frac{2}{\sqrt{x^2+y^2+z^2}} \right) \frac{df}{dr} = 0 \Rightarrow \frac{d^2 f}{dr^2} + \frac{2}{r} \frac{df}{dr} = 0 \\ \Rightarrow \frac{d}{dr} (f') &= \left(-\frac{2}{r} \right) f', \text{ where } f' = \frac{df}{dr} \Rightarrow \frac{df'}{f'} = -\frac{2}{r} dr \Rightarrow \ln f' = -2 \ln r + \ln C \Rightarrow f' = Cr^{-2}, \text{ or} \\ \frac{df}{dr} = Cr^{-2} &\Rightarrow f(r) = -\frac{C}{r} + b = \frac{a}{r} + b \text{ for some constants } a \text{ and } b \text{ (setting } a = -C) \end{aligned}$$

5. (a) Let $u = tx, v = ty$, and $w = f(u, v) = f(u(t, x), v(t, y)) = f(tx, ty) = t^n f(x, y)$, where t, x , and y are

$$\begin{aligned} \text{independent variables. 7. (a) $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k} \Rightarrow r = |\mathbf{r}| = \sqrt{x^2 + y^2 + z^2}$ and $\nabla r = \frac{x}{\sqrt{x^2 + y^2 + z^2}}\mathbf{i} + \frac{y}{\sqrt{x^2 + y^2 + z^2}}\mathbf{j} + \frac{z}{\sqrt{x^2 + y^2 + z^2}}\mathbf{k} = \frac{\mathbf{r}}{r}$
- (b) $r^n = \left(\sqrt{x^2 + y^2 + z^2}\right)^n$
 $\Rightarrow \nabla(r^n) = nx(x^2 + y^2 + z^2)^{(n/2)-1}\mathbf{i} + ny(x^2 + y^2 + z^2)^{(n/2)-1}\mathbf{j} + nz(x^2 + y^2 + z^2)^{(n/2)-1}\mathbf{k} = nr^{n-2}\mathbf{r}$
- (c) Let $n = 2$ in part (b). Then $\frac{1}{2}\nabla(r^2) = \mathbf{r} \Rightarrow \nabla\left(\frac{1}{2}r^2\right) = \mathbf{r} \Rightarrow \frac{r^2}{2} = \frac{1}{2}(x^2 + y^2 + z^2)$ is the function.
- (d) $d\mathbf{r} = dx\mathbf{i} + dy\mathbf{j} + dz\mathbf{k} \Rightarrow \mathbf{r} \cdot d\mathbf{r} = x dx + y dy + z dz$, and $dr = r_x dx + r_y dy + r_z dz = \frac{x}{r} dx + \frac{y}{r} dy + \frac{z}{r} dz$
 $\Rightarrow r dr = x dx + y dy + z dz = \mathbf{r} \cdot d\mathbf{r}$
- (e) $\mathbf{A} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k} \Rightarrow \mathbf{A} \cdot \mathbf{r} = ax + by + cz \Rightarrow \nabla(\mathbf{A} \cdot \mathbf{r}) = a\mathbf{i} + b\mathbf{j} + c\mathbf{k} = \mathbf{A}$
8. $f(g(t), h(t)) = c \Rightarrow 0 = \frac{df}{dt} = \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt} = \left(\frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j}\right) \cdot \left(\frac{dx}{dt}\mathbf{i} + \frac{dy}{dt}\mathbf{j}\right)$, where $\frac{dx}{dt}\mathbf{i} + \frac{dy}{dt}\mathbf{j}$ is the tangent vector
 $\Rightarrow \nabla f$ is orthogonal to the tangent vector
9. $f(x, y, z) = xy^2 - yz + \cos xy - 1 \Rightarrow \nabla f = (z^2 - y \sin xy)\mathbf{i} + (-z - x \sin xy)\mathbf{j} + (2xz - y)\mathbf{k} \Rightarrow \nabla f(0, 0, 1) = \mathbf{i} - \mathbf{j}$
 \Rightarrow the tangent plane is $x - y = 0$; $\mathbf{r} = (\ln t)\mathbf{i} + (t \ln t)\mathbf{j} + t\mathbf{k} \Rightarrow \mathbf{r}' = \left(\frac{1}{t}\right)\mathbf{i} + (\ln t + 1)\mathbf{j} + \mathbf{k}$; $x = y = 0, z = 1$
 $\Rightarrow t = 1 \Rightarrow \mathbf{r}'(1) = \mathbf{i} + \mathbf{j} + \mathbf{k}$. Since $(\mathbf{i} + \mathbf{j} + \mathbf{k}) \cdot (\mathbf{i} - \mathbf{j}) = \mathbf{r}'(1) \cdot \nabla f = 0$, \mathbf{r}' is parallel to the plane, and
 $\mathbf{r}(1) = 0\mathbf{i} + 0\mathbf{j} + \mathbf{k} \Rightarrow \mathbf{r}$ is contained in the plane.
10. Let $f(x, y, z) = x^3 + y^3 + z^3 - xyz \Rightarrow \nabla f = (3x^2 - yz)\mathbf{i} + (3y^2 - xz)\mathbf{j} + (3z^2 - xy)\mathbf{k}$
 $\Rightarrow \nabla f(0, -1, 1) = \mathbf{i} + 3\mathbf{j} + 3\mathbf{k} \Rightarrow$ the tangent plane is $x + 3y + 3z = 0$; $\mathbf{r} = \left(\frac{t^3}{4} - 2\right)\mathbf{i} + \left(\frac{4}{t} - 3\right)\mathbf{j} + (\cos(t-2))\mathbf{k}$
 $\Rightarrow \mathbf{r}' = \left(\frac{3t^2}{4}\right)\mathbf{i} - \left(\frac{4}{t^2}\right)\mathbf{j} - (\sin(t-2))\mathbf{k}$; $x = 0, y = -1, z = 1 \Rightarrow t = 2 \Rightarrow \mathbf{r}'(2) = 3\mathbf{i} - \mathbf{j}$. Since $\mathbf{r}'(2) \cdot \nabla f = 0 \Rightarrow \mathbf{r}'$ is parallel to the plane, and $\mathbf{r}(2) = -\mathbf{i} + \mathbf{k} \Rightarrow \mathbf{r}$ is contained in the plane.
11. $\frac{\partial z}{\partial x} = 3x^2 - 9y = 0$ and $\frac{\partial z}{\partial x} = 3y^2 - 9x = 0 \Rightarrow y = \frac{1}{3}x^2$ and $3\left(\frac{1}{3}x^2\right)^2 - 9x = 0 \Rightarrow \frac{1}{3}x^4 - 9x = 0$
 $\Rightarrow x(x^3 - 27) = 0 \Rightarrow x = 0$ or $x = 3$. Now $x = 0 \Rightarrow y = 0$ or $(0, 0)$ and $x = 3 \Rightarrow y = 3$ or $(3, 3)$. Next
 $\frac{\partial^2 z}{\partial x^2} = 6x, \frac{\partial^2 z}{\partial y^2} = 6y$, and $\frac{\partial^2 z}{\partial x \partial y} = -9$. For $(0, 0), \frac{\partial^2 z}{\partial x^2} \frac{\partial^2 z}{\partial y^2} - \left(\frac{\partial^2 z}{\partial x \partial y}\right)^2 = -81 \Rightarrow$ no extremum (a saddle point), and
 for $(3, 3), \frac{\partial^2 z}{\partial x^2} \frac{\partial^2 z}{\partial y^2} - \left(\frac{\partial^2 z}{\partial x \partial y}\right)^2 = 243 > 0$ and $\frac{\partial^2 z}{\partial x^2} = 18 > 0 \Rightarrow$ a local minimum.

12. $f(x, y) = 6xye^{-(2x+3y)} \Rightarrow f_x(x, y) = 6y(1-2x)e^{-(2x+3y)} = 0$ and $f_y(x, y) = 6x(1-3y)e^{-(2x+3y)} = 0 \Rightarrow x = 0$ and $y = 0$, or $x = \frac{1}{2}$ and $y = \frac{1}{3}$. The value $f(0, 0) = 0$ is on the boundary, and $f\left(\frac{1}{2}, \frac{1}{3}\right) = \frac{1}{e^2}$. On the positive y -axis, $f(0, y) = 0$, and on the positive x -axis, $f(x, 0) = 0$. As $x \rightarrow \infty$ or $y \rightarrow \infty$ we see that $f(x, y) \rightarrow 0$. Thus the absolute maximum of f in the closed first quadrant is $\frac{1}{e^2}$ at the point $\left(\frac{1}{2}, \frac{1}{3}\right)$.

13. Let $f(x, y, z) = \frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} - 1 \Rightarrow \nabla f = \frac{2x}{a^2} \mathbf{i} + \frac{2y}{b^2} \mathbf{j} + \frac{2z}{c^2} \mathbf{k} \Rightarrow$ an equation of the plane tangent at the point $P_0(x_0, y_0, z_0)$ is $\left(\frac{2x_0}{a^2}\right)x + \left(\frac{2y_0}{b^2}\right)y + \left(\frac{2z_0}{c^2}\right)z = \frac{2x_0^2}{a^2} + \frac{2y_0^2}{b^2} + \frac{2z_0^2}{c^2} = 2$ or $\left(\frac{x_0}{a^2}\right)x + \left(\frac{y_0}{b^2}\right)y + \left(\frac{z_0}{c^2}\right)z = 1$. The intercepts of the plane are $\left(\frac{a^2}{x_0}, 0, 0\right)$, $\left(0, \frac{b^2}{y_0}, 0\right)$ and $\left(0, 0, \frac{c^2}{z_0}\right)$. The volume of the tetrahedron formed by the plane and the coordinate planes is $V = \left(\frac{1}{3}\right)\left(\frac{1}{2}\right)\left(\frac{a^2}{x_0}\right)\left(\frac{b^2}{y_0}\right)\left(\frac{c^2}{z_0}\right) \Rightarrow$ we need to maximize $V(x, y, z) = \frac{(abc)^2}{6}(xyz)^{-1}$ subject to the constraint $f(x, y, z) = \frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$. Thus, $\left[-\frac{(abc)^2}{6}\right]\left(\frac{1}{x^2yz}\right) = \frac{2x}{a^2} \lambda$, $\left[-\frac{(abc)^2}{6}\right]\left(\frac{1}{xy^2z}\right) = \frac{2y}{b^2} \lambda$, and $\left[-\frac{(abc)^2}{6}\right]\left(\frac{1}{xyz^2}\right) = \frac{2z}{c^2} \lambda$. Multiply the first equation by a^2yz , the second by b^2xz , and the third by c^2xy . Then equate the first and second $\Rightarrow a^2y^2 = b^2x^2 \Rightarrow y = \frac{b}{a}x, x > 0$; equate the first and third $\Rightarrow a^2z^2 = c^2x^2 \Rightarrow z = \frac{c}{a}x, x > 0$; substitute into $f(x, y, z) = 0 \Rightarrow x = \frac{a}{\sqrt{3}} \Rightarrow y = \frac{b}{\sqrt{3}} \Rightarrow z = \frac{c}{\sqrt{3}} \Rightarrow V = \frac{\sqrt{3}}{2} abc$.

14. $2(x-u) = -\lambda, 2(y-v) = \lambda, -2(x-u) = \mu,$ and $-2(y-v) = -2\mu v \Rightarrow x-u = v-y, x-u = -\frac{\mu}{2},$ and $y-v = \mu v \Rightarrow x-u = -\mu v = -\frac{\mu}{2} \Rightarrow v = \frac{1}{2}$ or $\mu = 0$.

CASE 1: $\mu = 0 \Rightarrow x = u, y = v,$ and $\lambda = 0$; then $y = x+1 \Rightarrow v = u+1$ and $v^2 = u \Rightarrow v = v^2 + 1 \Rightarrow v^2 - v + 1 = 0 \Rightarrow v = \frac{1 \pm \sqrt{1-4}}{2} \Rightarrow$ no real solution.

CASE 2: $v = \frac{1}{2}$ and $u = v^2 \Rightarrow u = \frac{1}{4}; x - \frac{1}{4} = \frac{1}{2} - y$ and $y = x+1 \Rightarrow x - \frac{1}{4} = -x - \frac{1}{2} \Rightarrow 2x = -\frac{1}{4} \Rightarrow x = -\frac{1}{8} \Rightarrow y = \frac{7}{8}$.

Then $f\left(-\frac{1}{8}, \frac{7}{8}, \frac{1}{4}, \frac{1}{2}\right) = \left(-\frac{1}{8} - \frac{1}{4}\right)^2 + \left(\frac{7}{8} - \frac{1}{2}\right)^2 = 2\left(\frac{3}{8}\right)^2 \Rightarrow$ the minimum distance is $\frac{3}{8}\sqrt{2}$. (Notice that f has no maximum value.)

15. Let (x_0, y_0) be any point in R . We must show $\lim_{(x,y) \rightarrow (x_0,y_0)} f(x, y) = f(x_0, y_0)$ or, equivalently that

$\lim_{(h,k) \rightarrow (0,0)} |f(x_0+h, y_0+k) - f(x_0, y_0)| = 0$. Consider $f(x_0+h, y_0+k) - f(x_0, y_0) = [f(x_0+h, y_0+k) - f(x_0, y_0+k)] + [f(x_0, y_0+k) - f(x_0, y_0)]$. Let $F(x) = f(x, y_0+k)$ and apply the Mean Value Theorem: there exists ξ with $x_0 < \xi < x_0+h$ such that $F'(\xi)h = F(x_0+h) - F(x_0) \Rightarrow hf'_x(\xi, y_0+k) = f(x_0+h, y_0+k) - f(x_0, y_0+k)$. Similarly, $k f'_y(x_0, \eta) = f(x_0, y_0+k) - f(x_0, y_0)$ for some η with $y_0 < \eta < y_0+k$. Then $|f(x_0+h, y_0+k) - f(x_0, y_0)| \leq |hf'_x(\xi, y_0+k)| + |k f'_y(x_0, \eta)|$. If M, N are positive real numbers such that $|f'_x| \leq M$ and $|f'_y| \leq N$ for all (x, y) in the xy -plane, then

$$|f(x_0 + h, y_0 + k) - f(x_0, y_0)| \leq M|h| + N|k|. \text{ As } |(h, k) \rightarrow 0, |f(x_0 + h, y_0 + k) - f(x_0, y_0)| \rightarrow 0 \\ \Rightarrow \lim_{(h, k) \rightarrow (0, 0)} |f(x_0 + h, y_0 + k) - f(x_0, y_0)| = 0 \Rightarrow f \text{ is continuous at } (x_0, y_0).$$

16. At extreme values, ∇f and $\mathbf{v} = \frac{d\mathbf{r}}{dt}$ are orthogonal because $\frac{df}{dt} = \nabla f \cdot \frac{d\mathbf{r}}{dt} = 0$ by the First Derivative Theorem for Local Extreme Values.

17. $\frac{\partial f}{\partial x} = 0 \Rightarrow f(x, y) = h(y)$ is a function of y only. Also, $\frac{\partial g}{\partial y} = \frac{\partial f}{\partial x} = 0 \Rightarrow g(x, y) = k(x)$ is a function of x only.

Moreover, $\frac{\partial f}{\partial y} = \frac{\partial g}{\partial x} \Rightarrow h'(y) = k'(x)$ for all x and y . This can happen only if $h'(y) = k'(x) = c$ is a constant.

Integration gives $h(y) = cy + c_1$ and $k(x) = cx + c_2$, where c_1 and c_2 are constants. Therefore $f(x, y) = cy + c_1$ and $g(x, y) = cx + c_2$. Then $f(1, 2) = g(1, 2) = 5 \Rightarrow 5 = 2c + c_1 = c + c_2$, and $f(0, 0) = 4 \Rightarrow c_1 = 4 \Rightarrow c = \frac{1}{2} \Rightarrow c_2 = \frac{9}{2}$. Thus, $f(x, y) = \frac{1}{2}y + 4$ and $g(x, y) = \frac{1}{2}x + \frac{9}{2}$.

18. Let $g(x, y) = D_u f(x, y) = f_x(x, y)a + f_y(x, y)b$. Then $D_u g(x, y) = g_x(x, y)a + g_y(x, y)b \\ = f_{xx}(x, y)a^2 + f_{yx}(x, y)ab + f_{xy}(x, y)ba + f_{yy}(x, y)b^2 = f_{xx}(x, y)a^2 + 2f_{xy}(x, y)ab + f_{yy}(x, y)b^2$.

19. Since the particle is heat-seeking, at each point (x, y) it moves in the direction of maximal temperature increase, that is in the direction of $\nabla T(x, y) = (e^{-2y} \sin x)\mathbf{i} + (2e^{-2y} \cos x)\mathbf{j}$. Since $\nabla T(x, y)$ is parallel to the particle's velocity vector, it is tangent to the path $y = f(x)$ of the particle $\Rightarrow f'(x) = \frac{2e^{-2y} \cos x}{e^{-2y} \sin x} = 2 \cot x$.

Integration gives $f(x) = 2 \ln|\sin x| + C$ and $f\left(\frac{\pi}{4}\right) = 0 \Rightarrow 0 = 2 \ln\left|\sin \frac{\pi}{4}\right| + C \Rightarrow C = -2 \ln \frac{\sqrt{2}}{2} = \ln\left(\frac{2}{\sqrt{2}}\right)^2 = \ln 2$.

Therefore, the path of the particle is the graph of $y = 2 \ln|\sin x| + \ln 2$.

20. The line of travel is $x = t, y = t, z = 30 - 5t$, and the bullet hits the surface $z = 2x^2 + 3y^2$ when $30 - 5t = 2t^2 + 3t^2 \Rightarrow t^2 + t - 6 = 0 \Rightarrow (t + 3)(t - 2) = 0 \Rightarrow t = 2$ (since $t > 0$). Thus the bullet hits the surface at the point $(2, 2, 20)$. Now, the vector $4x\mathbf{i} + 6y\mathbf{j} - \mathbf{k}$ is normal to the surface at any (x, y, z) , so that $\mathbf{n} = 8\mathbf{i} + 12\mathbf{j} - \mathbf{k}$ is normal to the surface at $(2, 2, 20)$. If $\mathbf{v} = \mathbf{i} + \mathbf{j} - 5\mathbf{k}$, then the velocity of the particle after the ricochet is $\mathbf{w} = \mathbf{v} - 2 \text{proj}_{\mathbf{n}} \mathbf{v} = \mathbf{v} - \left(\frac{2\mathbf{v} \cdot \mathbf{n}}{|\mathbf{n}|^2}\right)\mathbf{n} = \mathbf{v} - \left(\frac{2 \cdot 25}{209}\right)\mathbf{n} = (\mathbf{i} + \mathbf{j} - 5\mathbf{k}) - \left(\frac{400}{209}\mathbf{i} + \frac{600}{209}\mathbf{j} - \frac{50}{209}\mathbf{k}\right)$

$$= -\frac{191}{209}\mathbf{i} - \frac{391}{209}\mathbf{j} - \frac{995}{209}\mathbf{k}.$$

21. (a) \mathbf{k} is a vector normal to $z = 10 - x^2 - y^2$ at the point $(0, 0, 10)$. So directions tangential to S at $(0, 0, 10)$ will be unit vectors $\mathbf{u} = a\mathbf{i} + b\mathbf{j}$. Also, $\nabla T(x, y, z) = (2xy + 4)\mathbf{i} + (x^2 + 2yz + 14)\mathbf{j} + (y^2 + 1)\mathbf{k}$
 $\Rightarrow \nabla T(0, 0, 10) = 4\mathbf{i} + 14\mathbf{j} + \mathbf{k}$. We seek the unit vector $\mathbf{u} = a\mathbf{i} + b\mathbf{j}$ such that $D_{\mathbf{u}}T(0, 0, 10) = (4\mathbf{i} + 14\mathbf{j} + \mathbf{k}) \cdot (a\mathbf{i} + b\mathbf{j}) = (4\mathbf{i} + 14\mathbf{j}) \cdot (a\mathbf{i} + b\mathbf{j})$ is a maximum. The maximum will occur when $a\mathbf{i} + b\mathbf{j}$ has the same direction as $4\mathbf{i} + 14\mathbf{j}$, or $\mathbf{u} = \frac{1}{\sqrt{53}}(2\mathbf{i} + 7\mathbf{j})$.

(b) A vector normal to S at $(1, 1, 8)$ is $\mathbf{n} = 2\mathbf{i} + 2\mathbf{j} + \mathbf{k}$. Now, $\nabla T(1, 1, 8) = 6\mathbf{i} + 31\mathbf{j} + 2\mathbf{k}$ and we seek the unit vector \mathbf{u} such that $D_{\mathbf{u}}T(1, 1, 8) = \nabla T \cdot \mathbf{u}$ has its largest value. Now write $\nabla T = \mathbf{v} + \mathbf{w}$, where \mathbf{v} is parallel to ∇T and \mathbf{w} is orthogonal to ∇T . Then $D_{\mathbf{u}}T = \nabla T \cdot \mathbf{u} = (\mathbf{v} + \mathbf{w}) \cdot \mathbf{u} = \mathbf{v} \cdot \mathbf{u} + \mathbf{w} \cdot \mathbf{u} = \mathbf{w} \cdot \mathbf{u}$. Thus

$$D_{\mathbf{u}}T(1, 1, 8) \text{ is a maximum when } \mathbf{u} \text{ has the same direction as } \mathbf{w}. \text{ Now, } \mathbf{w} = \nabla T - \left(\frac{\nabla T \cdot \mathbf{n}}{|\mathbf{n}|^2} \right) \mathbf{n}$$

$$= (6\mathbf{i} + 31\mathbf{j} + 2\mathbf{k}) - \left(\frac{12 + 62 + 2}{4 + 4 + 1} \right) (2\mathbf{i} + 2\mathbf{j} + \mathbf{k}) = \left(6 - \frac{152}{9} \right) \mathbf{i} + \left(31 - \frac{152}{9} \right) \mathbf{j} + \left(2 - \frac{76}{9} \right) \mathbf{k} = -\frac{98}{9} \mathbf{i} + \frac{127}{9} \mathbf{j} - \frac{58}{9} \mathbf{k}$$

$$\Rightarrow \mathbf{u} = \frac{\mathbf{w}}{|\mathbf{w}|} = -\frac{1}{\sqrt{29,097}} (98\mathbf{i} - 127\mathbf{j} + 58\mathbf{k}).$$

22. Suppose the surface (boundary) of the mineral deposit is the graph of $z = f(x, y)$ (where the z -axis points up into the air). Then $-\frac{\partial f}{\partial x} \mathbf{i} - \frac{\partial f}{\partial y} \mathbf{j} + \mathbf{k}$ is an outer normal to the mineral deposit at (x, y) and $\frac{\partial f}{\partial x} \mathbf{i} + \frac{\partial f}{\partial y} \mathbf{j}$ points in the direction of steepest ascent of the mineral deposit. This is in the direction of the vector $\frac{\partial f}{\partial x} \mathbf{i} + \frac{\partial f}{\partial y} \mathbf{j}$ at $(0, 0)$ (the location of the 1st borehole) that the geologists should drill their fourth borehole. To approximate this vector we use the fact that $(0, 0, -1000)$, $(0, 100, -950)$, and $(100, 0, -1025)$ lie on the graph of $z = f(x, y)$. The plane containing these three points is a good approximation to the tangent plane to $z = f(x, y)$ at the point

$$(0, 0, 0). \text{ A normal to this plane is } \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 100 & 50 \\ 100 & 0 & -25 \end{vmatrix} = -2500\mathbf{i} + 5000\mathbf{j} - 10,000\mathbf{k}, \text{ or } -\mathbf{i} + 2\mathbf{j} - 4\mathbf{k}. \text{ So at } (0, 0)$$

the vector $\frac{\partial f}{\partial x} \mathbf{i} + \frac{\partial f}{\partial y} \mathbf{j}$ is approximately $-\mathbf{i} + 2\mathbf{j}$. Thus the geologists should drill their fourth borehole in the direction of $\frac{1}{\sqrt{5}}(-\mathbf{i} + 2\mathbf{j})$ from the first borehole.

23. $w = e^{rt} \sin \pi x \Rightarrow w_t = re^{rt} \sin \pi x$ and $w_x = \pi e^{rt} \cos \pi x \Rightarrow w_{xx} = -\pi^2 e^{rt} \sin \pi x$; $w_{xx} = \frac{1}{c^2} w_t$, where c^2 is the positive constant determined by the material of the rod $\Rightarrow -\pi^2 e^{rt} \sin \pi x = \frac{1}{c^2} (re^{rt} \sin \pi x)$
 $\Rightarrow (r + c^2 \pi^2) e^{rt} \sin \pi x = 0 \Rightarrow r = -c^2 \pi^2 \Rightarrow w = e^{-c^2 \pi^2 t} \sin \pi x$

24. $w = e^{rt} \sin kx \Rightarrow w_t = re^{rt} \sin kx$ and $w_x = ke^{rt} \cos kx \Rightarrow w_{xx} = -k^2 e^{rt} \sin kx$; $w_{xx} = \frac{1}{c^2} w_t$
 $\Rightarrow -k^2 e^{rt} \sin kx = \frac{1}{c^2} (re^{rt} \sin kx) \Rightarrow (r + c^2 k^2) e^{rt} \sin kx = 0 \Rightarrow r = -c^2 k^2 \Rightarrow w = e^{-c^2 k^2 t} \sin kx$. Now,
 $w(L, t) = 0 \Rightarrow e^{-c^2 k^2 t} \sin kL = 0 \Rightarrow kL = n\pi$ for n an integer $\Rightarrow k = \frac{n\pi}{L} \Rightarrow w = e^{-c^2 n^2 \pi^2 t / L^2} \sin\left(\frac{n\pi}{L} x\right)$. As
 $t \rightarrow \infty, w \rightarrow 0$ since $\left| \sin\left(\frac{n\pi}{L} x\right) \right| \leq 1$ and $e^{-c^2 n^2 \pi^2 t / L^2} \rightarrow 0$.

$$30. \quad V = \iint_R f(x, y) \, dA = \int_0^1 \int_0^2 (4 - y^2) \, dy \, dx = \int_0^1 \left[4y - \frac{1}{3}y^3 \right]_0^2 dx = \int_0^1 \left(\frac{16}{3} \right) dx = \left[\frac{16}{3}x \right]_0^1 = \frac{16}{3}$$

Thus we choose $k = 2/27$.

32. $\int_0^{\pi/2} \sin(\sqrt{y}) \, dy$ is some number, say a . Then $\int_{-1}^1 \int_0^{\pi/2} x \sin(\sqrt{y}) \, dy \, dx = a \int_{-1}^1 x \, dx = 0$ since the integral of the odd function x over an interval symmetric to 0 is equal to 0.

33. By Fubini's Theorem,

$$\int_0^2 \int_0^1 \frac{x}{1+xy} \, dx \, dy = \int_0^1 \int_0^2 \frac{x}{1+xy} \, dy \, dx \\ = \int_0^1 \left(\ln(1+xy) \right)_{y=0}^{y=2} dx = \int_0^1 \ln(1+2x) \, dx = \frac{(1+2x)}{2} [\ln(1+2x) - 1] \Big|_0^1 = \frac{3}{2} \ln 3 - 1$$

34. By Fubini's Theorem,

$$\int_0^1 \int_0^3 xe^{xy} \, dx \, dy = \int_0^3 \int_0^1 xe^{xy} \, dy \, dx \\ = \int_0^3 \left(e^{xy} \right)_{y=0}^{y=1} dx = \int_0^3 (e^x - 1) \, dx = (e^x - x) \Big|_0^3 = e^3 - 4 \approx 16.086$$

35. (a) MAPLE gives $\int_0^1 \int_0^2 \frac{y-x}{(x+y)^3} \, dx \, dy = \frac{1}{3}$ and $\int_0^2 \int_0^1 \frac{y-x}{(x+y)^3} \, dy \, dx = -\frac{2}{3}$. This does not contradict

Fubini's Theorem since the integrand is not continuous on the region $R: 0 \leq x \leq 2, 0 \leq y \leq 1$.

36. Since f is continuous on R , for fixed u $f(u, v)$ is a continuous function of v and has an antiderivative with respect to v on R , call it $g(u, v)$. Then $\int_c^y f(u, v) dv = g(u, y) - g(u, c)$ and

$$F(x, y) = \int_a^x \int_c^y f(u, v) dv du = \int_a^x (g(u, y) - g(u, c)) du.$$

$$F_x = \frac{\partial}{\partial x} \int_a^x (g(u, y) - g(u, c)) du = g(x, y) - g(x, c).$$

Now taking the derivative with respect to y , we get

$$F_{xy} = \frac{\partial}{\partial y} (g(x, y) - g(x, c)) = f(x, y).$$

To evaluate F_{yx} we use Fubini's Theorem to rewrite $F(x, y)$ as $\int_c^y \int_a^x f(u, v) du dv$ and make a similar argument. The result is again $f(x, y)$.

79. To maximize the integral, we want the domain to include all points where the integrand is positive and to exclude all points where the integrand is negative. These criteria are met by the points (x, y) such that $4 - x^2 - 2y^2 \geq 0$ or $x^2 + 2y^2 \leq 4$, which is the ellipse $x^2 + 2y^2 = 4$ together with its interior.

These criteria are met by the points (x, y) such that $x^2 + y^2 - 9 \leq 0$ or $x^2 + y^2 \leq 9$, which is the closed disk of radius 3 centered at the origin.

81. No, it is not possible. By Fubini's theorem, the two orders of integration must give the same result.

82. One way would be to partition R into two triangles with the line $y=1$. The integral of f over R could then be written as a sum of integrals that could be evaluated by integrating first with respect to x and then with respect to y :

$$\iint_R f(x, y) dA = \int_0^1 \int_{2-2y}^{2-(y/2)} f(x, y) dx dy + \int_1^2 \int_{y-1}^{2-(y/2)} f(x, y) dx dy.$$

Partitioning R with the line $x=1$ would let us write the integral of f over R as a sum of iterated integrals with order $dy dx$.

Mathematica: (functions and bounds will vary)

You can integrate using the built-in integral signs or with the command **Integrate**. In the **Integrate** command, the integration begins with the variable on the right. (In this case, y going from 1 to x).

```
Clear[x, y, f]
f[x_, y_] := 1 / (x y)
Integrate[f[x, y], {x, 1, 3}, {y, 1, x}]
```

To reverse the order of integration, it is best to first plot the region over which the integration extends. This can be done with **ImplicitPlot** and all bounds involving both x and y can be plotted. A graphics package must be loaded. Remember to use the double equal sign for the equations of the bounding curves.

```
Clear[x, y, f]
<<Graphics`ImplicitPlot`
ImplicitPlot[{x == 2y, x == 4, y == 0, y == 1}, {x, 0, 4.1}, {y, 0, 1.1}];
f[x_, y_] := Exp[x^2]
Integrate[f[x, y], {x, 0, 2}, {y, 0, x/2}] + Integrate[f[x, y], {x, 2, 4}, {y, 0, 1}]
```

To get a numerical value for the result, use the numerical integrator, **NIntegrate**. Verify that this equals the original.

```
Integrate[f[x, y], {x, 0, 2}, {y, 0, x/2}] + NIntegrate[f[x, y], {x, 2, 4}, {y, 0, 1}]
NIntegrate[f[x, y], {y, 0, 1}, {x, 2y, 4}]
```

Another way to show a region is with the **FilledPlot** command. This assumes that functions are given as $y=f(x)$.

```
Clear[x, y, f]
<<Graphics`FilledPlot`
FilledPlot[{x^2, 9}, {x, 0, 3}, AxesLabels -> {x, y}];
f[x_, y_] := x Cos[y^2]
Integrate[f[x, y], {y, 0, 9}, {x, 0, Sqrt[y]}]
```

we use integration by parts with $u = \sqrt{4-x^2}$ and $dv = 1/2$ to find $\int \sqrt{4-x^2} dx$. Geometrically, the region R is a quarter of a circle of radius 2 with a triangle of area 2 removed, giving area $\pi - 2$.

24. The area of the region R is 4 times the shaded in the following figure.

The area integral will be easy to compute in polar coordinates, but in rectangular coordinates the calculation is awkward.

$$\iint_R dA = 4 \left[\int_0^1 \int_{\sqrt{1-x^2}}^{\sqrt{4-x^2}} 1 \, dy \, dx + \int_1^2 \int_0^{\sqrt{4-x^2}} 1 \, dy \, dx \right] = 4 \left[\left(\frac{\sqrt{3}}{2} + \frac{\pi}{12} \right) + \left(\frac{2\pi}{3} - \frac{\sqrt{3}}{2} \right) \right] = 4 \frac{3\pi}{4} = 3\pi$$

(As in Exercise 23, use integration by parts to evaluate the integrals $\int \sqrt{4-x^2} \, dx$ and $\int \sqrt{1-x^2} \, dx$.)

Geometrically the area is the difference between the area of a circle of radius 2 and the area of a circle of radius 1, or $4\pi - \pi = 3\pi$.

27. Let (x_i, y_i) be the location of the weather station in county i for $i = 1, \dots, 254$. The average temperature in

Texas at time t_0 is approximately $\frac{\sum_{i=1}^{254} T(x_i, y_i) \Delta A_i}{A}$, where $T(x_i, y_i)$ is the temperature at time t_0 at the weather station in county i , ΔA_i is the area of country i , and A is the area of Texas.

29. Since f is continuous on R , if $m \leq f(x, y) \leq M$, property 3(b) of double integrals gives us

$$\iint_R m \, dA \leq \iint_R f(x, y) \, dA \leq \iint_R M \, dA \quad \text{and hence } mA(R) \leq \iint_R f(x, y) \, dA \leq MA(R).$$

30. If $f(x, y)$ is positive at some point P in R or on the boundary of R then by the continuity of f there is a disk of positive radius around P (or if P is on the boundary, the intersection of such a disk with R) on which $f(x, y)$ is positive. This sub-region will make a positive contribution to the area $\iint_R f(x, y) dA$, and since $f(x, y)$ is never negative, $\iint_R f(x, y) dA$ will be greater than 0. This contradicts our assumption that $\iint_R f(x, y) dA = 0$, so $f(x, y)$ is positive nowhere on R and is thus equal to 0 at every point of R .

45.
$$\begin{aligned} \text{average} &= \frac{1}{\pi a^2} \int_0^{2\pi} \int_0^a [(r \cos \theta - h)^2 + r^2 \sin^2 \theta] r \, dr \, d\theta = \frac{1}{\pi a^2} \int_0^{2\pi} \int_0^a (r^3 - 2r^2 h \cos \theta + rh^2) \, dr \, d\theta \\ &= \frac{1}{\pi a^2} \int_0^{2\pi} \left(\frac{a^4}{4} - \frac{2a^3 h \cos \theta}{3} + \frac{a^2 h^2}{2} \right) d\theta = \frac{1}{\pi} \int_0^{2\pi} \left(\frac{a^2}{4} - \frac{2ah \cos \theta}{3} + \frac{h^2}{2} \right) d\theta = \frac{1}{\pi} \left[\frac{a^2 \theta}{4} - \frac{2ah \sin \theta}{3} + \frac{h^2 \theta}{2} \right]_0^{2\pi} \\ &= \frac{1}{2} (a^2 + 2h^2) \end{aligned}$$

47. The region R is shaded in the graph below.

The polar equation of the outer circle is just $r = 2$. The inner circle is $x^2 + (y - 1)^2 = 1$ or $x^2 + y^2 = 2y$. This is equivalent to $r^2 = 2r \sin \theta$ or $r = 2 \sin \theta$. The integrand is r in polar coordinates, so

$$\begin{aligned} \iint_R \sqrt{x^2 + y^2} \, dA &= \int_0^{\pi} \int_{2 \sin \theta}^2 r \cdot r \, dr \, d\theta \\ &= \int_0^{\pi} \left[\frac{r^3}{3} \right]_{2 \sin \theta}^2 d\theta = \int_0^{\pi} \frac{8}{3} (1 - \sin^3 \theta) \, d\theta \end{aligned}$$

Write the integrand as $\frac{8}{3} (1 - \sin \theta (1 - \cos^2 \theta))$. The indefinite integral is then $\frac{8}{3} \left(\theta + \cos \theta - \frac{1}{3} \cos^3 \theta \right)$ and the

definite integral is $\frac{8}{3} \left(\theta + \cos \theta - \frac{1}{3} \cos^3 \theta \right) \Big|_0^{\pi} = \frac{8}{9} (3\pi - 4)$

48. The region R is shaded in the graph below.

As θ ranges from $3\pi/4$ to $5\pi/4$ the ray at angle θ enters R at $r = \sec\theta$ and leaves R at $r = \sqrt{2}$. Thus

$$\begin{aligned} \iint_R (x^2 + y^2)^{-2} dA &= \int_{3\pi/4}^{5\pi/4} \int_{\sec\theta}^{\sqrt{2}} r^{-4} \cdot r dr d\theta \\ &= \int_{3\pi/4}^{5\pi/4} \left[-\frac{1}{2} r^{-2} \right]_{\sec\theta}^{\sqrt{2}} d\theta = \int_{3\pi/4}^{5\pi/4} \frac{1}{4} (2\cos^2\theta - 1) d\theta = \frac{1}{4} \int_{3\pi/4}^{5\pi/4} \cos 2\theta d\theta = \frac{1}{8} \left[\sin 2\theta \right]_{3\pi/4}^{5\pi/4} = \frac{1}{4} \end{aligned}$$

Mathematica: (functions and bounds will vary)

For 49 and 50, begin by drawing the region of integration with the **FilledPlot** command.

```
Clear[x, y, r, t]
```

```
<<Graphics`FilledPlot`
```

```
FilledPlot[{x, 1}, {x, 0, 1}, AspectRatio -> 1, AxesLabel -> {x, y}];
```

The picture demonstrates that r goes from 0 to the line $y=1$ or $r = 1/\sin[t]$, while t goes from $\pi/4$ to $\pi/2$.

```
f:= y / (x^2 + y^2)
```

```
topolar={x -> r Cos[t], y -> r Sin[t]};
```

```
fp= f/.topolar //Simplify
```

```
Integrate[r fp, {t, pi/4, pi/2}, {r, 0, 1/Sin[t]}]
```

For 51 and 52, drawing the region of integration with the `ImplicitPlot` command.

```
Clear[x, y]
```

```
<<Graphics`ImplicitPlot`
```

```
ImplicitPlot[{x==y, x==2-y, y==0, y==1}, {x, 0, 2.1}, {y, 0, 1.1}];
```

The picture shows that as t goes from 0 to $\pi/4$, r goes from 0 to the line $x=2-y$. **Solve** will find the bound for r .

```
bdr=Solve[r Cos[t]==2-r Sin[t], r]//Simplify
```

```
f:=Sqrt[x + y]
```

```
topolar={x -> r Cos[t], y -> r Sin[t]};
```

```
fp= f/.topolar //Simplify
```

```
Integrate[r fp, {t, 0, pi/4}, {r, 0, bdr[[1, 1, 2]]}]
```

These criteria are met by the points (x, y, z) such that $4x^2 + 4y^2 + z^2 - 4 \leq 0$ or $4x^2 + 4y^2 + z^2 \leq 4$, which is a solid ellipsoid centered at the origin.

48. To maximize the integral, we want the domain to include all points where the integrand is positive and to exclude all points where it is negative. These criteria are met by the points (x, y, z) such that $1 - x^2 - y^2 - z^2 \geq 0$ or $x^2 + y^2 + z^2 \leq 1$, which is a solid sphere of radius 1 centered at the origin.

80. Let the base radius of the cone be a and the height h , and place the cone's axis of symmetry along the z -axis

$\Rightarrow \bar{z} = \frac{M_{xy}}{M} = \left(\frac{h^2 a^2 \pi}{4} \right) \left(\frac{3}{\pi a^2 h} \right) = \frac{3}{4}h$, and $\bar{x} = \bar{y} = 0$, by symmetry \Rightarrow the centroid is one fourth of the way from the base to the vertex

81. The density distribution function is linear so it has the form $\delta(\rho) = k\rho + C$, where ρ is the distance from the center of the planet. Now, $\delta(R) = 0 \Rightarrow kR + C = 0$, and $\delta(\rho) = k\rho - kR$. It remains to determine the constant

$$\begin{aligned} k: \quad M &= \int_0^{2\pi} \int_0^\pi \int_0^R (k\rho - kR) \rho^2 \sin \phi \, d\rho \, d\phi \, d\theta = \int_0^{2\pi} \int_0^\pi \left[k \frac{\rho^4}{4} - kR \frac{\rho^3}{3} \right]_0^R \sin \phi \, d\phi \, d\theta \\ &= \int_0^{2\pi} \int_0^\pi k \left(\frac{R^4}{4} - \frac{R^4}{3} \right) \sin \phi \, d\phi \, d\theta = \int_0^{2\pi} \left(-\frac{k}{12} R^4 [-\cos \phi]_0^\pi \right) d\theta = \int_0^{2\pi} \left(-\frac{k}{6} R^4 \right) d\theta = -\frac{k\pi R^4}{3} \Rightarrow k = -\frac{3M}{\pi R^4} \\ &\Rightarrow \delta(\rho) = -\frac{3M}{\pi R^4} \rho + \frac{3M}{\pi R^4} R. \text{ At the center of the planet } \rho = 0 \Rightarrow \delta(0) = \left(\frac{3M}{\pi R^4} \right) R = \frac{3M}{\pi R^3}. \end{aligned}$$

82. The mass of the planet's atmosphere to an altitude h above the surface of the planet is the triple integral

$$\begin{aligned} M(h) &= \int_0^{2\pi} \int_0^\pi \int_R^h \mu_0 e^{-c(\rho-R)} \rho^2 \sin \phi \, d\rho \, d\phi \, d\theta = \int_R^h \int_0^{2\pi} \int_0^\pi \mu_0 e^{-c(\rho-R)} \rho^2 \sin \phi \, d\phi \, d\theta \, d\rho \\ &= \int_R^h \int_0^{2\pi} \left[\mu_0 e^{-c(\rho-R)} \rho^2 (-\cos \phi) \right]_0^\pi d\theta \, d\rho = 2 \int_R^h \int_0^{2\pi} \mu_0 e^{cR} e^{-c\rho} \rho^2 \, d\theta \, d\rho = 4\pi \mu_0 e^{cR} \int_R^h e^{-c\rho} \rho^2 \, d\rho \\ &= 4\pi \mu_0 e^{cR} \left[-\frac{\rho^2 e^{-c\rho}}{c} - \frac{2\rho e^{-c\rho}}{c^2} - \frac{2e^{-c\rho}}{c^3} \right]_R^h \text{ (by parts)} \\ &= 4\pi \mu_0 e^{cR} \left(-\frac{h^2 e^{-ch}}{c} - \frac{2he^{-ch}}{c^2} - \frac{2e^{-ch}}{c^3} + \frac{R^2 e^{-cR}}{c} + \frac{2Re^{-cR}}{c^2} + \frac{2e^{-cR}}{c^3} \right). \end{aligned}$$

The mass of the planet's atmosphere is therefore $M = \lim_{h \rightarrow \infty} M(h) = 4\pi \mu_0 \left(\frac{R^2}{c} + \frac{2R}{c^2} + \frac{2}{c^3} \right)$.

83. (a) A plane perpendicular to the x -axis has the form $x = a$ in rectangular coordinates $\Rightarrow r \cos \theta = a$
 $\Rightarrow r = \frac{a}{\cos \theta} \Rightarrow r = a \sec \theta$, in cylindrical coordinates.
 (b) A plane perpendicular to the y -axis has the form $y = b$ in rectangular coordinates $\Rightarrow r \sin \theta = b$
 $\Rightarrow r = \frac{b}{\sin \theta} \Rightarrow r = b \csc \theta$, in cylindrical coordinates.
84. $ax + by = c \Rightarrow a(r \cos \theta) + b(r \sin \theta) = c \Rightarrow r(a \cos \theta + b \sin \theta) = c \Rightarrow r = \frac{c}{a \cos \theta + b \sin \theta}$.

85. The equation $r = f(z)$ implies that the point $(r, \theta, z) = (f(z), \theta, z)$ will lie on the surface for all θ . In particular $(f(z), \theta + \pi, z)$ lies on the surface whenever $(f(z), \theta, z)$ does \Rightarrow the surface is symmetric with respect to the z -axis.

86. The equation $\rho = f(\phi)$ implies that the point $(\rho, \phi, \theta) = (f(\phi), \phi, \theta)$ lies on the surface for all θ . In particular, if $(f(\phi), \phi, \theta)$ lies on the surface, then $(f(\phi), \phi, \theta + \pi)$ lies on the surface, so the surface is symmetric with respect to the z -axis.

13. The region of integration R in the xy -plane is sketched in the figure at the right. The boundaries of the image G are obtained as follows, with G sketched at the right:

xy -equations for the boundary of R	Corresponding uv -equations for the boundary of G	Simplified uv -equations
$x = y$	$\frac{1}{3}(u + 2v) = \frac{1}{3}(u - v)$	$v = 0$

$y = 0$	$0 = \frac{1}{3}(u - v)$	$v = u$

Also, from Exercise 2, $\frac{\partial(x,y)}{\partial(u,v)} = J(u,v) = -\frac{1}{3} \Rightarrow \int_0^{2/3} \int_y^{2-2y} (x+2y)e^{(y-x)} dx dy = \int_0^2 \int_0^u ue^{-v} \left| -\frac{1}{3} \right| dv du$

and $\frac{\partial(x,y)}{\partial(u,v)} = J(u,v) = \begin{vmatrix} 1 & \frac{1}{2} \\ 0 & 1 \end{vmatrix} = 1$; next,

$u = x - \frac{v}{2} = x - \frac{y}{2}$ and $v = y$, so the boundaries of the region of integration R in the xy -plane are transformed to the boundaries of G :

xy -equations for the boundary of R	Corresponding uv -equations for the boundary of G	Simplified uv -equations
$x = \frac{y}{2}$	$u + \frac{v}{2} = \frac{v}{2}$	$u = 0$

$y = 0$	$v = 0$	$v = 0$
$y = 2$	$v = 2$	$v = 2$

$\Rightarrow \int_0^2 \int_{y/2}^{(y/2)+2} y^3(2x-y)e^{(2x-y)^2} dx dy = \int_0^2 \int_0^2 v^3(2u)e^{4u^2} du dv = \int_0^2 v^3 \left[\frac{1}{4} e^{4u^2} \right]_0^2 dv = \frac{1}{4} \int_0^2 v^3 (e^{16} - 1) dv$
 $= \frac{1}{4} (e^{16} - 1) \left[\frac{v^4}{4} \right]_0^2 = e^{16} - 1$

15. $x = \frac{u}{v}$ and $y = uv \Rightarrow \frac{y}{x} = v^2$ and $xy = u^2$; $\frac{\partial(x,y)}{\partial(u,v)} = J(u,v) = \begin{vmatrix} v^{-1} & -uv^{-2} \\ v & u \end{vmatrix} = v^{-1}u + v^{-1}u = \frac{2u}{v}$;

$y = x \Rightarrow uv = \frac{u}{v} \Rightarrow v = 1$, and $y = 4x \Rightarrow v = 2$; $xy = 1 \Rightarrow u = 1$, and $xy = 4 \Rightarrow u = 2$; thus

$\int_1^2 \int_{1/y}^y (x^2 + y^2) dx dy + \int_2^4 \int_{y/4}^{4/y} (x^2 + y^2) dx dy = \int_1^2 \int_1^2 \left(\frac{u^2}{v^2} + u^2 v^2 \right) \left(\frac{2u}{v} \right) du dv = \int_1^2 \int_1^2 \left(\frac{2u^3}{v^3} + 2u^3 v \right) du dv$

16. $x = u^2 - v^2$ and $y = 2uv$; $\frac{\partial(x,y)}{\partial(u,v)} = J(u,v) = \begin{vmatrix} 2u & -2v \\ 2v & 2u \end{vmatrix} = 4u^2 + 4v^2 = 4(u^2 + v^2)$;

$y = 2\sqrt{1-x} \Rightarrow y^2 = 4(1-x) \Rightarrow (2uv)^2 = 4(1-(u^2 - v^2)) \Rightarrow u = \pm 1$; $y = 0 \Rightarrow 2uv = 0 \Rightarrow u = 0$ or $v = 0$;

$x = 0 \Rightarrow u^2 - v^2 = 0 \Rightarrow u = v$ or $u = -v$; This gives us four triangular regions, but only the one in the quadrant where both u, v are positive maps into the region R in the xy -plane.

25. The first moment about the xy -coordinate plane for the semi-ellipsoid, $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$ using the transformation in Exercise 23 is, $M_{xy} = \iiint_D z \, dz \, dy \, dx = \iiint_G cw |J(u, v, w)| \, du \, dv \, dw$

$$= abc^2 \iiint_G w \, du \, dv \, dw = (abc^2) \cdot (M_{xy} \text{ of the hemisphere } x^2 + y^2 + z^2 = 1, z \geq 0) = \frac{abc^2 \pi}{4};$$

the mass of the semi-ellipsoid is $\frac{2abc\pi}{3} \Rightarrow \bar{z} = \left(\frac{abc^2 \pi}{4} \right) \left(\frac{3}{2abc\pi} \right) = \frac{3}{8}c$

26. A solid of revolution is symmetric about the axis of revolution, therefore, the height of the solid is solely a function of r . That is, $y = f(x) = f(r)$. Using cylindrical coordinates with $x = r \cos \theta$, $y = y$ and $z = r \sin \theta$, we have $V = \iiint_G r \, dy \, d\theta \, dr = \int_a^b \int_0^{2\pi} \int_0^{f(r)} r \, dy \, d\theta \, dr = \int_a^b \int_0^{2\pi} [r y]_0^{f(r)} \, d\theta \, dr = \int_a^b \int_0^{2\pi} r f(r) \, d\theta \, dr$

$$= \int_a^b [r\theta f(r)]_0^{2\pi} \, dr = \int_a^b 2\pi r f(r) \, dr.$$

In the last integral, r is a dummy or stand-in variable and as such it can be replaced by any variable name. Choosing x instead of r we have $V = \int_a^b 2\pi x f(x) \, dx$, which is the same result obtained using the shell method.

27. The region R is shaded in the graph below.

Solving explicitly for the transformation that gives x and y in terms of u and v yields a complicated expression for $\frac{\partial(x, y)}{\partial(u, v)}$. However, its reciprocal, $\frac{\partial(u, v)}{\partial(x, y)}$ is relatively easy to compute.

Since $u(x, y) = xy$ and $v(x, y) = y/x$, $J(x, y) = \begin{vmatrix} y & x \\ -\frac{y}{x^2} & \frac{1}{x} \end{vmatrix} = 2\frac{y}{x} = 2v$. Thus $J(u, v) = 1/2v$. In the uv -plane

the region corresponding to R is $G: \frac{1}{2} \leq u \leq 2, \frac{1}{2} \leq v \leq 2$. Thus v is positive and $|J(u, v)| = 1/2v$.

$$\iint_R dA = \int_{1/2}^2 \int_{1/2}^2 \frac{1}{2v} du dv = \int_{1/2}^2 \left(\frac{\ln u}{2} \right)_{1/2}^2 dv = \int_{1/2}^2 \ln 2 dv = \frac{3}{2} \ln 2$$

28. Under the given transformation, $y^2 = uv$, so

$$\iint_R y^2 dA = \int_{1/2}^2 \int_{1/2}^2 \frac{uv}{2v} du dv = \int_{1/2}^2 \left(\frac{u^2}{4} \right)_{1/2}^2 dv = \int_{1/2}^2 \frac{15}{16} dv = \frac{45}{32}$$

Then $9 = 25 - x^2 - y^2 \Rightarrow x^2 + y^2 = 16$ is the projection of the volume of water onto the xy -plane

$$\Rightarrow V = \int_0^{2\pi} \int_0^4 \int_{-\sqrt{25-r^2}}^{-3} dz r dr d\theta = \int_0^{2\pi} \int_0^4 \left(r\sqrt{25-r^2} - 3r \right) dr d\theta = \int_0^{2\pi} \left[-\frac{1}{3}(25-r^2)^{3/2} - \frac{3}{2}r^2 \right]_0^4 d\theta$$

3. Using cylindrical coordinates, $V = \int_0^{2\pi} \int_0^1 \int_0^{2-r(\cos\theta+\sin\theta)} dz r dr d\theta = \int_0^{2\pi} \int_0^1 (2r - r^2 \cos\theta - r^2 \sin\theta) dr d\theta$

25. For a height h in the bowl the volume of water is $V = \int_{-\sqrt{h}}^{\sqrt{h}} \int_{-\sqrt{h-x^2}}^{\sqrt{h-x^2}} \int_{x^2+y^2}^h dz dy dx$
 $= \int_{-\sqrt{h}}^{\sqrt{h}} \int_{-\sqrt{h-x^2}}^{\sqrt{h-x^2}} (h - x^2 - y^2) dy dx = \int_0^{2\pi} \int_0^{\sqrt{h}} (h - r^2) r dr d\theta = \int_0^{2\pi} \left[\frac{hr^2}{2} - \frac{r^4}{4} \right]_0^{\sqrt{h}} d\theta = \int_0^{2\pi} \frac{h^2}{4} d\theta = \frac{h^2\pi}{2}$.

Since the top of the bowl has area 10π , then we calibrate the bowl by comparing it to a right circular cylinder whose cross sectional area is 10π from $z = 0$ to $z = 10$. If such a cylinder contains $\frac{h^2\pi}{2}$ cubic inches of water to a depth w then we have $10\pi w = \frac{h^2\pi}{2} \Rightarrow w = \frac{h^2}{20}$. So for 1 inch of rain, $w = 1$ and $h = \sqrt{20}$; for 3 inches of rain, $w = 3$ and $h = \sqrt{60}$.

26. (a) An equation for the satellite dish in standard position is $z = \frac{1}{2}x^2 + \frac{1}{2}y^2$. Since the axis is tilted 30° , a unit vector $\mathbf{v} = 0\mathbf{i} + a\mathbf{j} + b\mathbf{k}$ normal to the plane of the water level satisfies

$$b = \mathbf{v} \cdot \mathbf{k} = \cos\left(\frac{\pi}{6}\right) = \frac{\sqrt{3}}{2}$$

$$\Rightarrow a = -\sqrt{1 - b^2} = -\frac{1}{2}$$

$$\Rightarrow \mathbf{v} = -\frac{1}{2}\mathbf{j} + \frac{\sqrt{3}}{2}\mathbf{k}$$

$$\Rightarrow -\frac{1}{2}(y - 1) + \frac{\sqrt{3}}{2}\left(z - \frac{1}{2}\right) = 0$$

$\Rightarrow z = \frac{1}{\sqrt{3}}y + \left(\frac{1}{2} - \frac{1}{\sqrt{3}}\right)$ is an equation of the plane of the water level. Therefore the volume of water is

$$V = \iiint_R \int_{\frac{1}{2}x^2 + \frac{1}{2}y^2}^{\frac{1}{\sqrt{3}}y + \frac{1}{2} - \frac{1}{\sqrt{3}}} dz dy dx, \text{ where } R \text{ is the interior of the ellipse } x^2 + y^2 - \frac{2}{\sqrt{3}}y - 1 + \frac{2}{\sqrt{3}} = 0. \text{ When } x = 0,$$

then $y = \alpha$ or $y = \beta$, $\alpha = \frac{\frac{2}{\sqrt{3}} + \sqrt{\frac{4}{3} - 4\left(\frac{2}{\sqrt{3}} - 1\right)}}{2}$ and $\beta = \frac{\frac{2}{\sqrt{3}} - \sqrt{\frac{4}{3} - 4\left(\frac{2}{\sqrt{3}} - 1\right)}}{2}$

$$\Rightarrow V = \int_{\alpha}^{\beta} \int_{-\left(\frac{2}{3}y + 1 - \frac{2}{\sqrt{3}}\right)^{1/2}}^{\left(\frac{2}{3}y + 1 - \frac{2}{\sqrt{3}}\right)^{1/2}} \int_{\frac{1}{2}x^2 + \frac{1}{2}y^2}^{\frac{1}{\sqrt{3}}y + \frac{1}{2} - \frac{1}{\sqrt{3}}} 1 dz dx dy$$

(b) $x = 0 \Rightarrow z = \frac{1}{2}y^2$ and $\frac{dz}{dy} = y$; $y = 1 \Rightarrow \frac{dz}{dy} = 1 \Rightarrow$ the tangent line has slope 1 or a 45° slant \Rightarrow at 45° and thereafter, the dish will not hold water.

27. The cylinder is given by $x^2 + y^2 = 1$ from $z = 1$ to $\infty \Rightarrow \iiint_D z(r^2 + z^2)^{-5/2} dV$

$$\begin{aligned}

 &= \lim_{a \rightarrow \infty} \int_0^{2\pi} \int_0^1 \left[\left(-\frac{1}{3}\right) \frac{r}{(r^2 + a^2)^{3/2}} + \left(\frac{1}{3}\right) \frac{r}{(r^2 + 1)^{3/2}} \right] dr d\theta = \lim_{a \rightarrow \infty} \int_0^{2\pi} \left[\frac{1}{3} (r^2 + a^2)^{-1/2} - \frac{1}{3} (r^2 + 1)^{-1/2} \right]_0^1 d\theta \\
 &= \lim_{a \rightarrow \infty} \int_0^{2\pi} \left[\frac{1}{3} (1 + a^2)^{-1/2} - \frac{1}{3} (2^{-1/2}) - \frac{1}{3} (a^2)^{-1/2} + \frac{1}{3} \right] d\theta = \lim_{a \rightarrow \infty} 2\pi \left[\frac{1}{3} (1 + a^2)^{-1/2} - \frac{1}{3} \left(\frac{\sqrt{2}}{2}\right) - \frac{1}{3} \left(\frac{1}{a}\right) + \frac{1}{3} \right] \\
 &= 2\pi \left[\frac{1}{3} - \left(\frac{1}{3}\right) \frac{\sqrt{2}}{2} \right].
 \end{aligned}$$

28. Let's see?

The length of the "unit" line segment is: $L = 2 \int_0^1 dx = 2.$

The area of the unit circle is: $A = 4 \int_0^1 \int_0^{\sqrt{1-x^2}} dy dx = \pi.$

The volume of the unit sphere is: $V = 8 \int_0^1 \int_0^{\sqrt{1-x^2}} \int_0^{\sqrt{1-x^2-y^2}} dz dy dx = \frac{4}{3} \pi.$

Therefore, the hypervolume of the unit 4-sphere should be:

$$V_{\text{hyper}} = 16 \int_0^1 \int_0^{\sqrt{1-x^2}} \int_0^{\sqrt{1-x^2-y^2}} \int_0^{\sqrt{1-x^2-y^2-z^2}} dw dz dy dx.$$

Mathematica is able to handle this integral, but we'll use the brute force approach.

- $g(x, y, z) = xy + yz + xz \Rightarrow \frac{\partial g}{\partial x} = y + z, \frac{\partial g}{\partial y} = x + z, \text{ and } \frac{\partial g}{\partial z} = y + x \Rightarrow \nabla g = (y + z)\mathbf{i} + (x + z)\mathbf{j} + (x + y)\mathbf{k}$
- $|\mathbf{F}|$ inversely proportional to the square of the distance from (x, y) to the origin $\Rightarrow \sqrt{(M(x, y))^2 + (N(x, y))^2} = \frac{k}{x^2 + y^2}, k > 0$; \mathbf{F} points toward the origin $\Rightarrow \mathbf{F}$ is in the direction of $\mathbf{n} = \frac{-x}{\sqrt{x^2 + y^2}} \mathbf{i} - \frac{y}{\sqrt{x^2 + y^2}} \mathbf{j} \Rightarrow \mathbf{F} = a\mathbf{n}$, for some constant $a > 0$. Then $M(x, y) = \frac{-ax}{\sqrt{x^2 + y^2}}$ and $N(x, y) = \frac{-ay}{\sqrt{x^2 + y^2}} \Rightarrow \sqrt{(M(x, y))^2 + (N(x, y))^2} = a \Rightarrow a = \frac{k}{x^2 + y^2} \Rightarrow \mathbf{F} = \frac{-kx}{(x^2 + y^2)^{3/2}} \mathbf{i} - \frac{ky}{(x^2 + y^2)^{3/2}} \mathbf{j}$, for any constant $k > 0$

6. Given $x^2 + y^2 = a^2 + b^2$, let $x = \sqrt{a^2 + b^2} \cos t$ and $y = -\sqrt{a^2 + b^2} \sin t$. Then
 $\mathbf{r} = \left(\sqrt{a^2 + b^2} \cos t\right)\mathbf{i} - \left(\sqrt{a^2 + b^2} \sin t\right)\mathbf{j}$ traces the circle in a clockwise direction as t goes from 0 to 2π
 $\Rightarrow \mathbf{v} = \left(-\sqrt{a^2 + b^2} \sin t\right)\mathbf{i} - \left(\sqrt{a^2 + b^2} \cos t\right)\mathbf{j}$ is tangent to the circle in a clockwise direction. Thus, let
 $\mathbf{F} = \mathbf{v} \Rightarrow \mathbf{F} = y\mathbf{i} - x\mathbf{j}$ and $\mathbf{F}(0, 0) = \mathbf{0}$.

9. Substitute the parametric representation for $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$ representing each path into the vector field \mathbf{F} , and calculate $\int_C \mathbf{F} \cdot \frac{d\mathbf{r}}{dt} dt$.

Thus $x^2 + y^2 = a^2 + b^2 \Rightarrow 2x + 2yy' = 0 \Rightarrow y' = -\frac{x}{y}$ is the slope of the tangent line at any point on the circle $\Rightarrow y' = -\frac{a}{b}$ at (a, b) . Let $\mathbf{v} = -b\mathbf{i} + a\mathbf{j} \Rightarrow |\mathbf{v}| = \sqrt{a^2 + b^2}$, with \mathbf{v} in a counterclockwise direction and tangent to the circle. Then let $P(x, y) = -y$ and $Q(x, y) = x \Rightarrow \mathbf{G} = -y\mathbf{i} + x\mathbf{j} \Rightarrow$ for (a, b) on $x^2 + y^2 = a^2 + b^2$ we have $\mathbf{G} = -b\mathbf{i} + a\mathbf{j}$ and $|\mathbf{G}| = \sqrt{a^2 + b^2}$.

Exercises 55 and 56 use vectors in 2 dimensions

```
Clear[x, y, t, f, r, v]

v[t_]:= r'[t]

If the integration takes too long or cannot be done, use NIntegrate to integrate numerically. This is suggested for Exercises 57 - 60 that use vectors in 3 dimensions. Be certain to leave spaces between variables to be multiplied.

39. (a) $\nabla f = \left(\frac{2x}{x^2+y^2} \right) \mathbf{i} + \left(\frac{2y}{x^2+y^2} \right) \mathbf{j} \Rightarrow M = \frac{2x}{x^2+y^2}$, $N = \frac{2y}{x^2+y^2}$; since M, N are discontinuous at $(0, 0)$, we compute $\int_C \nabla f \cdot \mathbf{n} ds$ directly since Green's Theorem does not apply. Let $x = a \cos t$, $y = a \sin t$
 $\Rightarrow dx = -a \sin t dt$, $dy = a \cos t dt$, $M = \frac{2}{a} \cos t$, $N = \frac{2}{a} \sin t$, $0 \leq t \leq 2\pi$, so $\int_C \nabla f \cdot \mathbf{n} ds = \int_C M dy - N dx$
 $= \int_0^{2\pi} \left[\left(\frac{2}{a} \cos t \right) (a \cos t) - \left(\frac{2}{a} \sin t \right) (-a \sin t) \right] dt = \int_0^{2\pi} 2(\cos^2 t + \sin^2 t) dt = 4\pi$. Note that this holds for any $a > 0$, so $\int_C \nabla f \cdot \mathbf{n} ds = 4\pi$ for any circle C centered at $(0, 0)$ traversed counterclockwise and $\int_C \nabla f \cdot \mathbf{n} ds = -4\pi$ if C is traversed clockwise.

(b) If K does not enclose the point $(0, 0)$ we may apply Green's Theorem: $\int_C \nabla f \cdot \mathbf{n} ds = \int_C M dy - N dx$
 $= \iint_R \left(\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y} \right) dx dy = \iint_R \left(\frac{2(y^2-x^2)}{(x^2+y^2)^2} + \frac{2(x^2-y^2)}{(x^2+y^2)^2} \right) dx dy = \iint_R 0 dx dy = 0$. If K does enclose the point $(0, 0)$ we proceed as follows:

Choose a small enough a so that the circle C centered at $(0, 0)$ of radius a lies entirely within K . Green's Theorem applies to the region R that lies between K and C . Thus, as before, $0 = \iint_R \left(\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y} \right) dx dy$
 $= \int_K M dy - N dx + \int_C M dy - N dx$ where K is traversed counterclockwise and C is traversed clockwise.

Hence by part (a) $0 = \left[\int_K M \, dy - N \, dx \right] - 4\pi \Rightarrow 4\pi = \int_K M \, dy - N \, dx = \int_K \nabla f \cdot \mathbf{n} \, ds$. We have shown:

$$\int_K \nabla f \cdot \mathbf{n} \, ds = \begin{cases} 0 & \text{if } (0, 0) \text{ lies inside } K \\ 4\pi & \text{if } (0, 0) \text{ lies outside } K \end{cases}$$

40. Assume a particle has a closed trajectory in R and let C_1 be the path $\Rightarrow C_1$ encloses a simply connected region $R_1 \Rightarrow C_1$ is a simple closed curve. Then the flux over R_1 is $\oint_{C_1} \mathbf{F} \cdot \mathbf{n} \, ds = 0$, since the velocity vectors \mathbf{F} are

tangent to C_1 . But $0 = \oint_{C_1} \mathbf{F} \cdot \mathbf{n} \, ds = \oint_{C_1} M \, dy - N \, dx = \iint_{R_1} \left(\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y} \right) dx \, dy \Rightarrow M_x + N_y = 0$, which is a

contradiction. Therefore, C_1 cannot be a closed trajectory.

$$\begin{aligned} 41. \int_{g_1(y)}^{g_2(y)} \frac{\partial N}{\partial x} dx \, dy &= N(g_2(y), y) - N(g_1(y), y) \Rightarrow \int_c^d \int_{g_1(y)}^{g_2(y)} \left(\frac{\partial N}{\partial x} dx \right) dy = \int_c^d [N(g_2(y), y) - N(g_1(y), y)] dy \\ &= \int_c^d N(g_2(y), y) dy - \int_c^d N(g_1(y), y) dy = \int_c^d N(g_2(y), y) dy + \int_d^c N(g_1(y), y) dy = \int_{C_2} N \, dy + \int_{C_1} N \, dy \\ &= \oint_C dy \Rightarrow \oint_C N \, dy = \iint_R \frac{\partial N}{\partial x} dx \, dy \end{aligned}$$

42. The curl of a conservative two-dimensional field is zero. The reasoning. A two-dimensional field $\mathbf{F} = M\mathbf{i} + N\mathbf{j}$ can be considered to be the restriction to the xy -plane of a three-dimensional field whose k component, P , is zero, and whose \mathbf{i} and \mathbf{j} components are independent of z . For such a field to be conservative, we must have $\frac{\partial N}{\partial x} = \frac{\partial M}{\partial y}$ by the component test in Section 16.3 $\Rightarrow \frac{\partial N}{\partial x} = \frac{\partial M}{\partial y}$, $\frac{\partial P}{\partial y} = \frac{\partial N}{\partial x}$, and $\frac{\partial M}{\partial z} = \frac{\partial P}{\partial x}$.

N := (x,y) -> x+3*y;
C := x^2+4*y^2 = 4;

'curlF_k' = curlF_k(x,y);
top,bot:= solve( C, y);               #(c)
left,right:= -2, 2;
q1:= Int( Int( curlF_k(x,y),y=bot..top ), x=left..right );

Mathematica: (functions and bounds will vary)

The **ImplicitPlot** command will be useful for 43 and 44, but is not needed for 45 and 46. In 46, the equation of the line from (0, 4) to (2, 0) must be determined first.

- In cylindrical coordinates, let $x = r \cos \theta$, $y = r \sin \theta$, $z = 9 - x^2 - y^2 = 9 - r^2$.
Then $\mathbf{r}(r, \theta) = (r \cos \theta)\mathbf{i} + (r \sin \theta)\mathbf{j} + (9 - r^2)\mathbf{k}$; $z \geq 0 \Rightarrow 9 - r^2 \geq 0 \Rightarrow r^2 \leq 9 \Rightarrow -3 \leq r \leq 3$, $0 \leq \theta \leq 2\pi$.
But $-3 \leq r \leq 0$ gives the same points as $0 \leq r \leq 3$, so let $0 \leq r \leq 3$.
- In cylindrical coordinates, let $x = r \cos \theta$, $y = r \sin \theta$, $z = \frac{\sqrt{x^2 + y^2}}{2} \Rightarrow z = \frac{r}{2}$.
Then $\mathbf{r}(r, \theta) = (r \cos \theta)\mathbf{i} + (r \sin \theta)\mathbf{j} + \left(\frac{r}{2}\right)\mathbf{k}$. For $0 \leq z \leq 3$, $0 \leq \frac{r}{2} \leq 3 \Rightarrow 0 \leq r \leq 6$; to get only the first octant, let $0 \leq \theta \leq \frac{\pi}{2}$.
- In cylindrical coordinates, let $x = r \cos \theta$, $y = r \sin \theta$, $z = 2\sqrt{x^2 + y^2} \Rightarrow z = 2r$.
Then $\mathbf{r}(r, \theta) = (r \cos \theta)\mathbf{i} + (r \sin \theta)\mathbf{j} + 2r\mathbf{k}$. For $2 \leq z \leq 4$, $2 \leq 2r \leq 4 \Rightarrow 1 \leq r \leq 2$, and let $0 \leq \theta \leq 2\pi$.
- In cylindrical coordinates, let $x = r \cos \theta$, $y = r \sin \theta$; since $x^2 + y^2 = r^2 \Rightarrow z^2 = 9 - (x^2 + y^2) = 9 - r^2 \Rightarrow z = \sqrt{9 - r^2}$, $z \geq 0$. Then $\mathbf{r}(r, \theta) = (r \cos \theta)\mathbf{i} + (r \sin \theta)\mathbf{j} + \sqrt{9 - r^2}\mathbf{k}$. Let $0 \leq \theta \leq 2\pi$. For the domain of r :

$$z = \sqrt{x^2 + y^2} \text{ and } x^2 + y^2 + z^2 = 9 \Rightarrow x^2 + y^2 + (\sqrt{x^2 + y^2})^2 = 9 \Rightarrow 2(x^2 + y^2) = 9 \Rightarrow 2r^2 = 9 \\ \Rightarrow r = \frac{3}{\sqrt{2}} \Rightarrow 0 \leq r \leq \frac{3}{\sqrt{2}}.$$

6. In cylindrical coordinates, $\mathbf{r}(r, \theta) = (r \cos \theta)\mathbf{i} + (r \sin \theta)\mathbf{j} + \sqrt{4 - r^2}\mathbf{k}$ (see Exercise 5 above with $x^2 + y^2 + z^2 = 4$, instead of $x^2 + y^2 + z^2 = 9$). For the first octant, let $0 \leq \theta \leq \frac{\pi}{2}$. For the domain of r :

$$z = \sqrt{x^2 + y^2} \text{ and } x^2 + y^2 + z^2 = 4 \Rightarrow x^2 + y^2 + (\sqrt{x^2 + y^2})^2 = 4 \Rightarrow 2(x^2 + y^2) = 4 \Rightarrow 2r^2 = 4 \Rightarrow r = \sqrt{2}.$$

Thus, let $\sqrt{2} \leq r \leq 2$ (to get the portion of the sphere between the cone and the xy -plane).

7. In spherical coordinates, $x = \rho \sin \phi \cos \theta$, $y = \rho \sin \phi \sin \theta$, $\rho = \sqrt{x^2 + y^2 + z^2} \Rightarrow \rho^2 = 3 \Rightarrow \rho = \sqrt{3}$
 $\Rightarrow z = \sqrt{3} \cos \phi$ for the sphere; $z = \frac{\sqrt{3}}{2} = \sqrt{3} \cos \phi \Rightarrow \cos \phi = \frac{1}{2} \Rightarrow \phi = \frac{\pi}{3}$; $z = -\frac{\sqrt{3}}{2} \Rightarrow -\frac{\sqrt{3}}{2} = \sqrt{3} \cos \phi$
 $\Rightarrow \cos \phi = -\frac{1}{2} \Rightarrow \phi = \frac{2\pi}{3}$. Then $\mathbf{r}(\phi, \theta) = (\sqrt{3} \sin \phi \cos \theta)\mathbf{i} + (\sqrt{3} \sin \phi \sin \theta)\mathbf{j} + (\sqrt{3} \cos \phi)\mathbf{k}$,
 $\frac{\pi}{3} \leq \phi \leq \frac{2\pi}{3}$ and $0 \leq \theta \leq 2\pi$.

8. In spherical coordinates, $x = \rho \sin \phi \cos \theta$, $y = \rho \sin \phi \sin \theta$, $\rho = \sqrt{x^2 + y^2 + z^2} \Rightarrow \rho^2 = 8 \Rightarrow \rho = \sqrt{8} = 2\sqrt{2}$
 $\Rightarrow x = 2\sqrt{2} \sin \phi \cos \theta$, $y = 2\sqrt{2} \sin \phi \sin \theta$, and $z = 2\sqrt{2} \cos \phi$. Thus let
 $\mathbf{r}(\phi, \theta) = (2\sqrt{2} \sin \phi \cos \theta)\mathbf{i} + (2\sqrt{2} \sin \phi \sin \theta)\mathbf{j} + (2\sqrt{2} \cos \phi)\mathbf{k}$; $z = -2 \Rightarrow -2 = 2\sqrt{2} \cos \phi$
 $\Rightarrow \cos \phi = -\frac{1}{\sqrt{2}} \Rightarrow \phi = \frac{3\pi}{4}$; $z = 2\sqrt{2} \Rightarrow 2\sqrt{2} = 2\sqrt{2} \cos \phi \Rightarrow \cos \phi = 1 \Rightarrow \phi = 0$. Thus $0 \leq \phi \leq \frac{3\pi}{4}$ and
 $0 \leq \theta \leq 2\pi$.

9. Since $z = 4 - y^2$, we can let \mathbf{r} be a function of x and $y \Rightarrow \mathbf{r}(x, y) = x\mathbf{i} + y\mathbf{j} + (4 - y^2)\mathbf{k}$. Then $z = 0$
 $\Rightarrow 0 = 4 - y^2 \Rightarrow y = \pm 2$. Thus, let $-2 \leq y \leq 2$ and $0 \leq x \leq 2$.

10. Since $y = x^2$, we can let \mathbf{r} be a function of x and $z \Rightarrow \mathbf{r}(x, z) = x\mathbf{i} + x^2\mathbf{j} + z\mathbf{k}$. Then $y = 2$
 $\Rightarrow x^2 = 2 \Rightarrow x = \pm\sqrt{2}$. Thus, let $-\sqrt{2} \leq x \leq \sqrt{2}$ and $0 \leq z \leq 3$.

11. When $x = 0$, let $y^2 + z^2 = 9$ be the circular section in the yz -plane. Use polar coordinates in the yz -plane
 $\Rightarrow y = 3 \cos \theta$ and $z = 3 \sin \theta$. Thus let $x = u$ and $\theta = v \Rightarrow \mathbf{r}(u, v) = u\mathbf{i} + (3 \cos v)\mathbf{j} + (3 \sin v)\mathbf{k}$ where
 $0 \leq u \leq 3$, and $0 \leq v \leq 2\pi$.

12. When $y = 0$, let $x^2 + z^2 = 4$ be the circular section in the xz -plane. Use polar coordinates in the xz -plane
 $\Rightarrow x = 2 \cos \theta$ and $z = 2 \sin \theta$. Thus let $y = u$ and $\theta = v \Rightarrow \mathbf{r}(u, v) = (2 \cos v)\mathbf{i} + u\mathbf{j} + (2 \sin v)\mathbf{k}$ where
 $-2 \leq u \leq 2$, and $0 \leq v \leq \pi$ (since we want the portion above the xy -plane).

13. (a) $x + y + z = 1 \Rightarrow z = 1 - x - y$. In cylindrical coordinates, let $x = r \cos \theta$ and $y = r \sin \theta$
 $\Rightarrow z = 1 - r \cos \theta - r \sin \theta \Rightarrow \mathbf{r}(r, \theta) = (r \cos \theta)\mathbf{i} + (r \sin \theta)\mathbf{j} + (1 - r \cos \theta - r \sin \theta)\mathbf{k}$, $0 \leq \theta \leq 2\pi$
and $0 \leq r \leq 3$.

(b) In a fashion similar to cylindrical coordinates, but working in the yz -plane instead of the xy -plane, let $y = u \cos v, z = u \sin v$ where $u = \sqrt{y^2 + z^2}$ and v is the angle formed by $(x, y, z), (x, 0, 0)$, and $(x, y, 0)$ with $(x, 0, 0)$ as vertex. Since $x + y + z = 1 \Rightarrow x = 1 - y - z \Rightarrow x = 1 - u \cos v - u \sin v$, then \mathbf{r} is a function of u and $v \Rightarrow \mathbf{r}(u, v) = (1 - u \cos v - u \sin v)\mathbf{i} + (u \cos v)\mathbf{j} + (u \sin v)\mathbf{k}, 0 \leq u \leq 3$ and $0 \leq v \leq 2\pi$.

14. (a) In a fashion similar to cylindrical coordinates, but working in the xz -plane instead of the xy -plane, let $x = u \cos v, z = u \sin v$ where $u = \sqrt{x^2 + z^2}$ and v is the angle formed by $(x, y, z), (y, 0, 0)$, and $(x, y, 0)$ with vertex $(y, 0, 0)$. Since $x - y + 2z = 2 \Rightarrow y = x + 2z - 2$, then $\mathbf{r}(u, v) = (u \cos v)\mathbf{i} + (u \cos v + 2u \sin v - 2)\mathbf{j} + (u \sin v)\mathbf{k}, 0 \leq u \leq \sqrt{3}$ and $0 \leq v \leq 2\pi$.

(b) In a fashion similar to cylindrical coordinates, but working in the yz -plane instead of the xy -plane, let $y = u \cos v, z = u \sin v$ where $u = \sqrt{y^2 + z^2}$ and v is the angle formed by $(x, y, z), (x, 0, 0)$, and $(x, y, 0)$ with vertex $(x, 0, 0)$. Since $x - y + 2z = 2 \Rightarrow x = y - 2z + 2$, then $\mathbf{r}(u, v) = (u \cos v - 2u \sin v + 2)\mathbf{i} + (u \cos v)\mathbf{j} + (u \sin v)\mathbf{k}, 0 \leq u \leq \sqrt{2}$ and $0 \leq v \leq 2\pi$.

15. Let $x = w \cos v$ and $z = w \sin v$. Then $(x - 2)^2 + z^2 = 4 \Rightarrow x^2 - 4x + z^2 = 0 \Rightarrow w^2 \cos^2 v - 4w \cos v + w^2 \sin^2 v = 0 \Rightarrow w^2 - 4w \cos v = 0 \Rightarrow w = 0$ or $w - 4 \cos v = 0 \Rightarrow w = 0$ or $w = 4 \cos v$. Now $w = 0 \Rightarrow x = 0$ and $y = 0$, which is a line not a cylinder. Therefore, let $w = 4 \cos v \Rightarrow x = (4 \cos v)(\cos v) = 4 \cos^2 v$ and $z = 4 \cos v \sin v$. Finally, let $y = u$. Then $\mathbf{r}(u, v) = (4 \cos^2 v)\mathbf{i} + u\mathbf{j} + (4 \cos v \sin v)\mathbf{k}, -\frac{\pi}{2} \leq v \leq \frac{\pi}{2}$ and $0 \leq u \leq 3$.

16. Let $y = w \cos v$ and $z = w \sin v$. Then $y^2 + (z - 5)^2 = 25 \Rightarrow y^2 + z^2 - 10z = 0 \Rightarrow w^2 \cos^2 v + w^2 \sin^2 v - 10w \sin v = 0 \Rightarrow w^2 - 10w \sin v = 0 \Rightarrow w(w - 10 \sin v) = 0 \Rightarrow w = 0$ or $w = 10 \sin v$. Now $w = 0 \Rightarrow y = 0$ and $z = 0$, which is a line not a cylinder. Therefore, let $w = 10 \sin v \Rightarrow y = 10 \sin v \cos v$ and $z = 10 \sin^2 v$. Finally, let $x = u$. Then $\mathbf{r}(u, v) = u\mathbf{i} + (10 \sin v \cos v)\mathbf{j} + (10 \sin^2 v)\mathbf{k}, 0 \leq u \leq 10$ and $0 \leq v \leq \pi$.

17. Let $x = r \cos \theta$ and $y = r \sin \theta$. Then $\mathbf{r}(r, \theta) = (r \cos \theta)\mathbf{i} + (r \sin \theta)\mathbf{j} + \left(\frac{2 - r \sin \theta}{2}\right)\mathbf{k}, 0 \leq r \leq 1$ and $0 \leq \theta \leq 2\pi \Rightarrow \mathbf{r}_r = (\cos \theta)\mathbf{i} + (\sin \theta)\mathbf{j} - \left(\frac{\sin \theta}{2}\right)\mathbf{k}$ and $\mathbf{r}_\theta = (-r \sin \theta)\mathbf{i} + (r \cos \theta)\mathbf{j} - \left(\frac{r \cos \theta}{2}\right)\mathbf{k}$

$$\begin{aligned} \Rightarrow \mathbf{r}_r \times \mathbf{r}_\theta &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \cos \theta & \sin \theta & -\frac{\sin \theta}{2} \\ -r \sin \theta & r \cos \theta & -\frac{r \cos \theta}{2} \end{vmatrix} \\ &= \left(\frac{-r \sin \theta \cos \theta}{2} + \frac{(\sin \theta)(r \cos \theta)}{2}\right)\mathbf{i} + \left(\frac{r \sin^2 \theta}{2} + \frac{r \cos^2 \theta}{2}\right)\mathbf{j} + (r \cos^2 \theta + r \sin^2 \theta)\mathbf{k} = \frac{r}{2}\mathbf{j} + r\mathbf{k} \\ \Rightarrow |\mathbf{r}_r \times \mathbf{r}_\theta| &= \sqrt{\frac{r^2}{4} + r^2} = \frac{\sqrt{5}r}{2} \Rightarrow A = \int_0^{2\pi} \int_0^1 \frac{\sqrt{5}r}{2} dr d\theta = \int_0^{2\pi} \left[\frac{\sqrt{5}r^2}{4}\right]_0^1 d\theta = \int_0^{2\pi} d\theta = \frac{\pi\sqrt{5}}{2} \end{aligned}$$

 $\iint_{\text{cube}} (x + y + z) d\sigma = 3(a^3 + 2a^3) = 9a^3$.

10. On the face S in the xz -plane, we have $y = 0 \Rightarrow f(x, y, z) = y = 0$ and $G(x, y, z) = G(x, 0, z) = z \Rightarrow \mathbf{p} = \mathbf{j}$ and $\nabla f = \mathbf{j} \Rightarrow |\nabla f| = 1$ and $|\nabla f \cdot \mathbf{p}| = 1 \Rightarrow d\sigma = dx dz \Rightarrow \iint_S G d\sigma = \iint_S (y + z) d\sigma = \int_0^1 \int_0^2 z dx dz = \int_0^1 2z dz = 1$.
 On the face in the xy -plane, we have $z = 0 \Rightarrow f(x, y, z) = z = 0$ and $G(x, y, z) = G(x, y, 0) = y \Rightarrow \mathbf{p} = \mathbf{k}$ and $\nabla f = \mathbf{k} \Rightarrow |\nabla f| = 1$ and $|\nabla f \cdot \mathbf{p}| = 1 \Rightarrow d\sigma = dx dy \Rightarrow \iint_S G d\sigma = \iint_S y d\sigma = \int_0^1 \int_0^2 y dx dy = 1$.
 On the triangular face in the plane $x = 2$ we have $f(x, y, z) = x = 2$ and $G(x, y, z) = G(2, y, z) = y + z \Rightarrow \mathbf{p} = \mathbf{i}$ and $\nabla f = \mathbf{i} \Rightarrow |\nabla f| = 1$ and $|\nabla f \cdot \mathbf{p}| = 1 \Rightarrow d\sigma = dz dy \Rightarrow \iint_S G d\sigma = \iint_S (y + z) d\sigma$
 $= \int_0^1 \int_0^{1-y} (y + z) dz dy = \int_0^1 \frac{1}{2}(1 - y^2) dy = \frac{1}{3}$.
 On the triangular face in the yz -plane we have $x = 0 \Rightarrow f(x, y, z) = x = 0$ and $G(x, y, z) = G(0, y, z) = y + z \Rightarrow \mathbf{p} = \mathbf{i}$ and $\nabla f = \mathbf{i} \Rightarrow |\nabla f| = 1$ and $|\nabla f \cdot \mathbf{p}| = 1 \Rightarrow d\sigma = dz dy \Rightarrow \iint_S G d\sigma = \iint_S (y + z) d\sigma$
 $= \int_0^1 \int_0^{1-y} (y + z) dz dy = \frac{1}{3}$.
 Finally, on the sloped face, we have $y + z = 1 \Rightarrow f(x, y, z) = y + z = 1$ and $G(x, y, z) = y + z = 1 \Rightarrow \mathbf{p} = \mathbf{k}$ and $\nabla f = \mathbf{j} + \mathbf{k} \Rightarrow |\nabla f| = \sqrt{2}$ and $|\nabla f \cdot \mathbf{p}| = 1 \Rightarrow d\sigma = \sqrt{2} dx dy \Rightarrow \iint_S G d\sigma = \iint_S (y + z) d\sigma = \int_0^1 \int_0^2 \sqrt{2} dx dy = 2\sqrt{2}$.
 Therefore, $\iint_{\text{wedge}} G(x, y, z) d\sigma = 1 + 1 + \frac{1}{3} + \frac{1}{3} + 2\sqrt{2} = \frac{8}{3} + 2\sqrt{2}$

11. On the faces in the coordinate planes, $G(x, y, z) = 0 \Rightarrow$ the integral over these faces is 0.

On the face $x = a$, we have $f(x, y, z) = x = a$ and $G(x, y, z) = G(a, y, z) = ayz \Rightarrow \mathbf{p} = \mathbf{i}$ and

$$\nabla f = \mathbf{i} \Rightarrow |\nabla f| = 1 \text{ and } |\nabla f \cdot \mathbf{p}| = 1 \Rightarrow d\sigma = dy dz \Rightarrow \iint_S G d\sigma = \iint_S ayz d\sigma = \int_0^c \int_0^b ayz dy dz = \frac{ab^2c^2}{4}.$$

On the face $y = b$, we have $f(x, y, z) = y = b$ and $G(x, y, z) = G(x, b, z) = bxz \Rightarrow \mathbf{p} = \mathbf{j}$ and

$$\nabla f = \mathbf{j} \Rightarrow |\nabla f| = 1 \text{ and } |\nabla f \cdot \mathbf{p}| = 1 \Rightarrow d\sigma = dx dz \Rightarrow \iint_S G d\sigma = \iint_S bxz d\sigma = \int_0^c \int_0^b bxz dx dz = \frac{a^2bc^2}{4}.$$

On the face $z = c$, we have $f(x, y, z) = z = c$ and $G(x, y, z) = G(x, y, c) = cxy \Rightarrow \mathbf{p} = \mathbf{k}$ and

$$\nabla f = \mathbf{k} \Rightarrow |\nabla f| = 1 \text{ and } |\nabla f \cdot \mathbf{p}| = 1 \Rightarrow d\sigma = dy dx \Rightarrow \iint_S G d\sigma = \iint_S cxy d\sigma = \int_0^b \int_0^a cxy dx dy = \frac{a^2b^2c}{4}.$$

Therefore,
$$\iint_S G(x, y, z) d\sigma = \frac{abc(ab+ac+bc)}{4}.$$

12. On the face $x = a$, we have $f(x, y, z) = x = a$ and $G(x, y, z) = G(a, y, z) = ayz \Rightarrow \mathbf{p} = \mathbf{i}$ and

$$|\nabla f| = 3 \text{ and } |\nabla f \cdot \mathbf{p}| = 1 \Rightarrow d\sigma = 3 dy dx; \quad z = 0 \Rightarrow 2x + 2y = 2 \Rightarrow y = 1 - x \Rightarrow \iint_S G d\sigma = \iint_S (2 - x - y) d\sigma$$

$x^2 + y^2 \leq 1$ in the xy -plane.

11. For the upper hemisphere with $z \geq 0$, the boundary C is the unit circle of radius 1 centered at the origin in the xy -plane. An outward normal on the upper hemisphere corresponds to counterclockwise circulation around the boundary, so the boundary can be parametrized as $\mathbf{r}(\theta) = (\cos \theta)\mathbf{i} + (\sin \theta)\mathbf{j} + 0\mathbf{k}$, with $0 \leq \theta \leq 2\pi$. Thus

$d\mathbf{r} = (-\sin \theta d\theta)\mathbf{i} + (\cos \theta d\theta)\mathbf{j}$. For the field $\mathbf{A} = (y + \sqrt{z})\mathbf{i} + e^{xyz}\mathbf{j} + (\cos xz)\mathbf{k}$, the flux of $\mathbf{F} = \nabla \times \mathbf{A}$ across the upper hemisphere is, by Stokes' Theorem, equal to the circulation of \mathbf{A} on the boundary. Since $z = 0$ and $y = \sin \theta$ on the boundary, the field \mathbf{A} on the boundary is $(\sin \theta)\mathbf{i} + \mathbf{j} + \mathbf{k}$. The circulation of \mathbf{A} on C is

$$\begin{aligned} \oint_C \mathbf{A} \cdot d\mathbf{r} &= \oint_C ((\sin \theta)\mathbf{i} + \mathbf{j} + \mathbf{k}) \cdot ((-\sin \theta d\theta)\mathbf{i} + (\cos \theta d\theta)\mathbf{j}) = \int_0^{2\pi} (\cos \theta - \sin^2 \theta) d\theta \\ &= \int_0^{2\pi} \left(\cos \theta + \frac{1}{2}(\cos 2\theta - 1)\right) d\theta = -\pi \end{aligned}$$

12. Since the outward normal on the bottom hemisphere corresponds to clockwise circulation on the boundary, the flux of \mathbf{F} through the bottom hemisphere will be π and the total flux through the sphere will be 0.

&= \int_0^{2\pi} \left(-\frac{16}{3}\cos\theta - \pi\sin\theta - 4\pi\sin\theta\cos\theta \right) d\theta = \left[-\frac{16}{3}\sin\theta + \pi\cos\theta - 2\pi\sin^2\theta \right]_0^{2\pi} = 0
\end{aligned}$$

19. We first compute the circulation of $\mathbf{F} = y\mathbf{i} - x\mathbf{j} + x^2\mathbf{k}$ on the curve C given by

$$\begin{aligned}
\mathbf{r}(t) &= (2\cos t)\mathbf{i} + (2\sin t)\mathbf{j} + (3 - 2\cos^3 t)\mathbf{k} \quad \text{for } 0 \leq t \leq 2\pi. \quad \text{On } C \quad \mathbf{F} = (2\sin t)\mathbf{i} - (2\cos t)\mathbf{j} + (4\cos^2 t)\mathbf{k}, \text{ and} \\
d\mathbf{r} &= (-2\sin t \, dt)\mathbf{i} + (2\cos t \, dt)\mathbf{j} - (6\sin t \cos^2 t \, dt)\mathbf{k}.
\end{aligned}$$

$$\begin{aligned}
\oint_C \mathbf{F} \cdot d\mathbf{r} &= \oint_C ((2\sin t)\mathbf{i} - (2\cos t)\mathbf{j} + (4\cos^2 t)\mathbf{k}) \cdot ((-2\sin t \, dt)\mathbf{i} + (2\cos t \, dt)\mathbf{j} - (6\sin t \cos^2 t \, dt)\mathbf{k}) \\
&= -4 \int_0^{2\pi} (\sin^2 t + \cos^2 t + 6\sin t \cos^4 t) \, dt = -4 \int_0^{2\pi} (1 + 6\sin t \cos^4 t) \, dt = -8\pi.
\end{aligned}$$

Now we find the flux of $\nabla \times \mathbf{F}$ across the surface S . Note that counterclockwise circulation on C corresponds to inward normals on the cylindrical portion of S and upward normals on the base disk.

For the field $\mathbf{F} = y\mathbf{i} - x\mathbf{j} + x^2\mathbf{k}$, $\nabla \times \mathbf{F} = (-2x)\mathbf{j} - 2\mathbf{k}$.

On the base disk, the unit upward normal is \mathbf{k} so $\nabla \times \mathbf{F} \cdot \mathbf{n} = ((-2x)\mathbf{j} - 2\mathbf{k}) \cdot \mathbf{k} = -2$. The integral of the constant -2 over a disk of area 4π is -8π , so to verify Stokes' Theorem in this case it remains to show that the flux across the cylindrical portion of S is 0.

We'll reuse the parameter t and parametrize the cylinder by $\mathbf{s}(t, z) = (2\cos t)\mathbf{i} + (2\sin t)\mathbf{j} + z\mathbf{k}$ with

$0 \leq z \leq 3 - 2\cos^3 t$. An inward unit normal is $(-\cos t)\mathbf{i} + (-\sin t)\mathbf{j}$ and the area element is $d\sigma = 2 \, dz \, dt$. On the cylinder the field $\nabla \times \mathbf{F} = (-4\cos t)\mathbf{j} - 2\mathbf{k}$. Thus

$$\begin{aligned}
\iint_S \nabla \times \mathbf{F} \cdot \mathbf{n} \, d\sigma &= \iint_S ((-4\cos t)\mathbf{j} - 2\mathbf{k}) \cdot ((-\cos t)\mathbf{i} + (-\sin t)\mathbf{j}) \, d\sigma \\
&= \int_0^{2\pi} \int_0^{3-2\cos^3 t} (4\sin t \cos t) \, 2 \, dz \, dt = 8 \int_0^{2\pi} (\sin t \cos t)(3 - 2\cos^3 t) \, dt \\
&= 8 \int_0^{2\pi} \left(3\sin t \cos t - 2\sin t \cos^4 t \right) dt = 8 \left(\frac{3}{2}\sin^2 t + \frac{2}{5}\cos^5 t \right) \Big|_0^{2\pi} = 0
\end{aligned}$$

20. The boundary C of the paraboloid S given by $z = 4 - x^2 - y^2$ is the circle of radius 2 centered at the origin in the xy -plane. An upward normal on the paraboloid corresponds to counterclockwise circulation around C , so we can parametrize C by $\mathbf{r}(t) = (2\cos t)\mathbf{i} + (2\sin t)\mathbf{j}$ for $0 \leq t \leq 2\pi$, with $d\mathbf{r} = (-2\sin t \, dt)\mathbf{i} + (2\cos t \, dt)\mathbf{j}$. On C the field $\mathbf{F} = 2xy\mathbf{i} + x\mathbf{j} + (y+z)\mathbf{k}$ is equal to $(8\cos t \sin t)\mathbf{i} + (2\cos t)\mathbf{j} + (2\sin t)\mathbf{k}$.

$$\begin{aligned} \oint_C \mathbf{F} \cdot d\mathbf{r} &= \oint_C ((8 \cos t \sin t)\mathbf{i} + (2 \cos t)\mathbf{j} + (2 \sin t)\mathbf{k}) \cdot ((-2 \sin t) dt \mathbf{i} + (2 \cos t) dt \mathbf{j}) \\ &= 4 \int_0^{2\pi} (-4 \cos t \sin^2 t + \cos^2 t) dt = 4 \left[-\frac{4}{3} \sin^3 t + \frac{1}{4} \sin 2t + \frac{1}{2} t \right]_0^{2\pi} = 4\pi \end{aligned}$$

Now for comparison we integrate $\nabla \times \mathbf{F} = \mathbf{i} + (1 - 2x)\mathbf{k}$ over the paraboloid S . We can parametrize the paraboloid as $\mathbf{s}(u, t) = (u \cos t)\mathbf{i} + (u \sin t)\mathbf{j} + (4 - u^2)\mathbf{k}$ with $0 \leq u \leq 2$ and $0 \leq t \leq 2\pi$. Thus on S the field $\nabla \times \mathbf{F}$ is equal to $\mathbf{i} + (1 - 2u \cos t)\mathbf{k}$.

First we find the vector area element:

$$\begin{aligned} \mathbf{s}_u \times \mathbf{s}_t &= ((\cos t)\mathbf{i} + (\sin t)\mathbf{j} + (-2u)\mathbf{k}) \times ((-u \sin t)\mathbf{i} + (u \cos t)\mathbf{j} + 0\mathbf{k}) \\ &= (2u^2 \cos t)\mathbf{i} + (2u^2 \sin t)\mathbf{j} + u\mathbf{k} \end{aligned}$$

which is upward, as we require. The integral of the outward component of the field is then

$$\begin{aligned} \iint_S (\nabla \times \mathbf{F}) \cdot (\mathbf{s}_u \times \mathbf{s}_t) du dt &= \int_0^{2\pi} \int_0^2 (\mathbf{i} + (1 - 2u \cos t)\mathbf{k}) \cdot ((2u^2 \cos t)\mathbf{i} + (2u^2 \sin t)\mathbf{j} + u\mathbf{k}) du dt \\ &= \int_0^{2\pi} \int_0^2 u du dt = \int_0^{2\pi} \left[\frac{u^2}{2} \right]_0^2 dt = 4\pi \end{aligned}$$

Thus the circulation of \mathbf{F} around the boundary of the paraboloid is equal to the flux of $\nabla \times \mathbf{F}$ through the paraboloid.

21. (a) $\mathbf{F} = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k} \Rightarrow \text{curl } \mathbf{F} = \mathbf{0} \Rightarrow \oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n} d\sigma = \iint_S 0 d\sigma = 0$
 (b) Let $f(x, y, z) = x^2 y^2 z^3 \Rightarrow \nabla \times \mathbf{F} = \nabla \times \nabla f = \mathbf{0} \Rightarrow \text{curl } \mathbf{F} = \mathbf{0} \Rightarrow \oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n} d\sigma = \iint_S 0 d\sigma = 0$
 (c) $\mathbf{F} = \nabla \times (x\mathbf{i} + y\mathbf{j} + z\mathbf{k}) = \mathbf{0} \Rightarrow \nabla \times \mathbf{F} = \mathbf{0} \Rightarrow \oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n} d\sigma = \iint_S 0 d\sigma = 0$
 (d) $\mathbf{F} = \nabla f \Rightarrow \nabla \times \mathbf{F} = \nabla \times \nabla f = \mathbf{0} \Rightarrow \oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n} d\sigma = \iint_S 0 d\sigma = 0$

22. $\mathbf{F} = \nabla f = \frac{1}{2}(x^2 + y^2 + z^2)^{-3/2} (2x)\mathbf{i} - \frac{1}{2}(x^2 + y^2 + z^2)^{-3/2} (2y)\mathbf{j} - \frac{1}{2}(x^2 + y^2 + z^2)^{-3/2} (2z)\mathbf{k}$
 $= -x(x^2 + y^2 + z^2)^{-3/2} \mathbf{i} - y(x^2 + y^2 + z^2)^{-3/2} \mathbf{j} - z(x^2 + y^2 + z^2)^{-3/2} \mathbf{k}$

(a) $\mathbf{r} = (a \cos t)\mathbf{i} + (a \sin t)\mathbf{j}, 0 \leq t \leq 2\pi \Rightarrow \frac{d\mathbf{r}}{dt} = (-a \sin t)\mathbf{i} + (a \cos t)\mathbf{j}$
 $\Rightarrow \mathbf{F} \cdot \frac{d\mathbf{r}}{dt} = -x(x^2 + y^2 + z^2)^{-3/2} (-a \sin t) - y(x^2 + y^2 + z^2)^{-3/2} (a \cos t)$
 $= \left(-\frac{a \cos t}{a^3}\right)(-a \sin t) - \left(\frac{a \sin t}{a^3}\right)(a \cos t) = 0 \Rightarrow \oint_C \mathbf{F} \cdot d\mathbf{r} = 0$

(b) $\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n} d\sigma = \iint_S \nabla \times \nabla f \cdot \mathbf{n} d\sigma = \iint_S \mathbf{0} \cdot \mathbf{n} d\sigma = \iint_S 0 d\sigma = 0$

23. Let $\mathbf{F} = 2y\mathbf{i} + 3z\mathbf{j} - x\mathbf{k} \Rightarrow \nabla \times \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 2y & 3z & -x \end{vmatrix} = -3\mathbf{i} + \mathbf{j} - 2\mathbf{k}; \mathbf{n} = \frac{2\mathbf{i} + 2\mathbf{j} + \mathbf{k}}{3} \Rightarrow \nabla \times \mathbf{F} \cdot \mathbf{n} = -2$
 $\Rightarrow \oint_C 2y \, dx + 3z \, dy - x \, dz = \oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n} \, d\sigma = \iint_S -2 \, d\sigma = -2 \iint_S d\sigma$, where $\iint_S d\sigma$ is the area of the region enclosed by C on the plane S : $2x + 2y + z = 2$

24. $\nabla \times \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x & y & z \end{vmatrix} = \mathbf{0}$

25. Suppose $\mathbf{F} = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$ exists such that $\nabla \times \mathbf{F} = \left(\frac{\partial P}{\partial y} - \frac{\partial N}{\partial z}\right)\mathbf{i} + \left(\frac{\partial M}{\partial z} - \frac{\partial P}{\partial x}\right)\mathbf{j} + \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right)\mathbf{k} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$.

Then $\frac{\partial}{\partial x} \left(\frac{\partial P}{\partial y} - \frac{\partial N}{\partial z}\right) = \frac{\partial}{\partial x}(x) \Rightarrow \frac{\partial^2 P}{\partial x \partial y} - \frac{\partial^2 N}{\partial x \partial z} = 1$.

Likewise, $\frac{\partial}{\partial y} \left(\frac{\partial M}{\partial z} - \frac{\partial P}{\partial x}\right) = \frac{\partial}{\partial y}(y) \Rightarrow \frac{\partial^2 M}{\partial y \partial z} - \frac{\partial^2 P}{\partial y \partial x} = 1$ and $\frac{\partial}{\partial z} \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) = \frac{\partial}{\partial z}(z) \Rightarrow \frac{\partial^2 N}{\partial z \partial x} - \frac{\partial^2 M}{\partial z \partial y} = 1$.

Summing the calculated equations $\Rightarrow \left(\frac{\partial^2 P}{\partial x \partial y} - \frac{\partial^2 P}{\partial y \partial x}\right) + \left(\frac{\partial^2 N}{\partial z \partial x} - \frac{\partial^2 N}{\partial x \partial z}\right) + \left(\frac{\partial^2 M}{\partial y \partial z} - \frac{\partial^2 M}{\partial z \partial y}\right) = 3$ or $0 = 3$

(assuming the second mixed partials are equal). This result is a contradiction, so there is no field \mathbf{F} such that $\text{curl } \mathbf{F} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$.

26. Yes: If $\nabla \times \mathbf{F} = \mathbf{0}$, then the circulation of \mathbf{F} around the boundary C of any oriented surface S in the domain of \mathbf{F} is zero. The reason is this: By Stokes' theorem, circulation $= \oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n} \, d\sigma = \iint_S \mathbf{0} \cdot \mathbf{n} \, d\sigma = 0$.

27. $r = \sqrt{x^2 + y^2} \Rightarrow r^4 = (x^2 + y^2)^2 \Rightarrow \mathbf{F} = \nabla(r^4) = 4x(x^2 + y^2)\mathbf{i} + 4y(x^2 + y^2)\mathbf{j} = M\mathbf{i} + N\mathbf{j}$
 $\Rightarrow \oint_C \nabla(r^4) \cdot \mathbf{n} \, ds = \oint_C \mathbf{F} \cdot \mathbf{n} \, ds = \oint_C M \, dy - N \, dx = \iint_R \left(\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y}\right) dx \, dy$
 $= \iint_R \left[4(x^2 + y^2) + 8x^2 + 4(x^2 + y^2) + 8y^2\right] dA = \iint_R 16(x^2 + y^2) dA = 16 \iint_R x^2 \, dA + 16 \iint_R y^2 \, dA$
 $= 16I_y + 16I_x$.

28. $\frac{\partial P}{\partial y} = 0, \frac{\partial N}{\partial z} = 0, \frac{\partial M}{\partial z} = 0, \frac{\partial P}{\partial x} = 0, \frac{\partial N}{\partial x} = \frac{y^2 - x^2}{(x^2 + y^2)^2}, \frac{\partial M}{\partial y} = \frac{y^2 - x^2}{(x^2 + y^2)^2} \Rightarrow \text{curl } \mathbf{F} = \left[\frac{y^2 - x^2}{(x^2 + y^2)^2} - \frac{y^2 - x^2}{(x^2 + y^2)^2} \right] \mathbf{k} = \mathbf{0}$.

However, $x^2 + y^2 = 1 \Rightarrow \mathbf{r} = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} \Rightarrow \frac{d\mathbf{r}}{dt} = (-\sin t)\mathbf{i} + (\cos t)\mathbf{j}$

$\Rightarrow \mathbf{F} = (-\sin t)\mathbf{i} + (\cos t)\mathbf{j} \Rightarrow \mathbf{F} \cdot \frac{d\mathbf{r}}{dt} = \sin^2 t + \cos^2 t = 1 \Rightarrow \oint_C \mathbf{F} \cdot d\mathbf{r} = \int_0^{2\pi} 1 \, dt = 2\pi$ which is not zero.

14. Let $\rho = \sqrt{x^2 + y^2 + z^2}$. Then $\frac{\partial \rho}{\partial x} = \frac{x}{\rho}$, $\frac{\partial \rho}{\partial y} = \frac{y}{\rho}$, $\frac{\partial \rho}{\partial z} = \frac{z}{\rho} \Rightarrow \frac{\partial}{\partial x} \left(\frac{x}{\rho} \right) = \frac{1}{\rho} - \left(\frac{x}{\rho^2} \right) \frac{\partial \rho}{\partial x} = \frac{1}{\rho} - \frac{x^2}{\rho^3}$. 16. $\frac{\partial}{\partial x} \left[\ln(x^2 + y^2) \right] = \frac{2x}{x^2 + y^2}$, $\frac{\partial}{\partial y} \left(-\frac{2z}{x} \tan^{-1} \frac{y}{x} \right) = \left(-\frac{2z}{x} \right) \left[\frac{\left(\frac{1}{x} \right)}{1 + \left(\frac{y}{x} \right)^2} \right] = -\frac{2z}{x^2 + y^2}$, $\frac{\partial}{\partial z} \left(z\sqrt{x^2 + y^2} \right) = \sqrt{x^2 + y^2}$

$$= \int_0^{2\pi} \left[6(\sqrt{2} - 1) \cos \theta - 3 \ln \sqrt{2} + 2\sqrt{2} - 1 \right] d\theta = 2\pi \left(-\frac{3}{2} \ln 2 + 2\sqrt{2} - 1 \right)$$

17. (a) $\frac{\partial}{\partial x}(x) = 1$, $\frac{\partial}{\partial y}(y) = 1$, $\frac{\partial}{\partial z}(z) = 1 \Rightarrow \nabla \cdot \mathbf{F} = 3 \Rightarrow \text{Flux} = \iiint_D 3 dV = 3 \iiint_D dV = 3$ (Volume of the solid)

(b) If \mathbf{F} is orthogonal to \mathbf{n} at every point of S , then $\mathbf{F} \cdot \mathbf{n} = 0$ everywhere $\Rightarrow \text{Flux} = \iint_S \mathbf{F} \cdot \mathbf{n} d\sigma = 0$. But the

flux is 3 (Volume of the solid) $\neq 0$, so \mathbf{F} is not orthogonal to \mathbf{n} at every point.

18. Yes, the outward flux through the top is 5. The reason is this: Since $\nabla \cdot \mathbf{F} = \nabla \cdot (x\mathbf{i} - 2y\mathbf{j} + (z+3)\mathbf{k}) = 1 - 2 + 1 = 0$, the outward flux across the closed cubelike surface is 0 by the Divergence Theorem. The flux across the top is therefore the negative of the flux across the sides and base. Routine calculations show that the sum of these latter fluxes is -5 . (The flux across the sides that lie in the xz -plane and the yz -plane are 0, while the flux across the xy -plane is -3 .) Therefore the flux across the top is 5.

19. For the field $\mathbf{F} = (y \cos 2x)\mathbf{i} + (y^2 \sin 2x)\mathbf{j} + (x^2 y + x)\mathbf{k}$, $\nabla \cdot \mathbf{F} = -2y \sin 2x + 2y \sin 2x + 1 = 1$. If \mathbf{F} were the curl of a field \mathbf{A} whose component functions have continuous second partial derivatives, then we would have $\text{div } \mathbf{F} = \text{div}(\text{curl } \mathbf{A}) = \nabla \cdot (\nabla \times \mathbf{A}) = 0$. Since $\text{div } \mathbf{F} = 1$, \mathbf{F} is not the curl of such a field.

20. From the Divergence Theorem, $\iint_S \nabla f \cdot \mathbf{n} d\sigma = \iiint_D \nabla \cdot \nabla f dV = \iiint_D \left(\frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} + \frac{\partial^2 f}{\partial z^2} \right) dV$. Now,

$$f(x, y, z) = \ln \sqrt{x^2 + y^2 + z^2} = \frac{1}{2} \ln(x^2 + y^2 + z^2) \Rightarrow \frac{\partial f}{\partial x} = \frac{x}{x^2 + y^2 + z^2}, \frac{\partial f}{\partial y} = \frac{y}{x^2 + y^2 + z^2}, \frac{\partial f}{\partial z} = \frac{z}{x^2 + y^2 + z^2}$$

$$\Rightarrow \frac{\partial^2 f}{\partial x^2} = \frac{-x^2 + y^2 + z^2}{(x^2 + y^2 + z^2)^2}, \frac{\partial^2 f}{\partial y^2} = \frac{x^2 - y^2 + z^2}{(x^2 + y^2 + z^2)^2}, \frac{\partial^2 f}{\partial z^2} = \frac{x^2 + y^2 - z^2}{(x^2 + y^2 + z^2)^2}, \Rightarrow \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} + \frac{\partial^2 f}{\partial z^2} = \frac{x^2 + y^2 + z^2}{(x^2 + y^2 + z^2)^2} = \frac{1}{x^2 + y^2 + z^2}$$

$$\begin{aligned} \Rightarrow \iint_S \nabla f \cdot \mathbf{n} \, d\sigma &= \iiint_D \frac{dV}{x^2+y^2+z^2} = \int_0^{\pi/2} \int_0^{\pi/2} \int_0^a \frac{\rho^2 \sin \phi}{\rho^2} \, d\rho \, d\phi \, d\theta = \int_0^{\pi/2} \int_0^{\pi/2} a \sin \phi \, d\phi \, d\theta \\ &= \int_0^{\pi/2} [-a \cos \phi]_0^{\pi/2} \, d\theta = \int_0^{\pi/2} a \, d\theta = \frac{\pi a}{2} \end{aligned}$$

21. The integral's value never exceeds the surface area of S . Since $|\mathbf{F}| \leq 1$, we have $|\mathbf{F} \cdot \mathbf{n}| = |\mathbf{F}| |\mathbf{n}| \leq (1)(1) = 1$ and

$$\begin{aligned} \iint_D \nabla \cdot \mathbf{F} \, d\sigma &= \iint_S \mathbf{F} \cdot \mathbf{n} \, d\sigma && \text{[Divergence Theorem]} \\ &\leq \iint_S |\mathbf{F} \cdot \mathbf{n}| \, d\sigma && \text{[A property of integrals]} \\ &\leq \iint_S (1) \, d\sigma && \text{[}|\mathbf{F} \cdot \mathbf{n}| \leq 1\text{]} \\ &= \text{Area of } S. \end{aligned}$$

22. $\nabla \cdot \mathbf{F} = -2x - 4y - 6z + 12 \Rightarrow \text{Flux} = \int_0^a \int_0^b \int_0^1 (-2x - 4y - 6z + 12) \, dz \, dy \, dx = \int_0^a \int_0^b (-2x - 4y + 9) \, dy \, dx = \int_0^a (-2xb - 2b^2 + 9b) \, dx = -a^2b - 2ab^2 + 9ab = ab(-a - 2b + 9) = f(a, b); \frac{\partial f}{\partial a} = -2ab - 2b^2 + 9b$ and $\frac{\partial f}{\partial b} = -a^2 - 4ab + 9a$ so that $\frac{\partial f}{\partial a} = 0$ and $\frac{\partial f}{\partial b} = 0 \Rightarrow b(-2a - 2b + 9) = 0$ and $a(-a - 4b + 9) = 0 \Rightarrow b = 0$ or $-2a - 2b + 9 = 0$, and $a = 0$ or $-a - 4b + 9 = 0$. Now $b = 0$ or $a = 0 \Rightarrow \text{Flux} = 0; -2a - 2b + 9 = 0$ and $-a - 4b + 9 = 0 \Rightarrow 3a - 9 = 0 \Rightarrow a = 3 \Rightarrow b = \frac{3}{2}$ so that $f\left(3, \frac{3}{2}\right) = \frac{27}{2}$ is the maximum flux.

23. By the Divergence Theorem, the net outward flux of the field $\mathbf{F} = xy\mathbf{i} + (\sin xz + y^2)\mathbf{j} + (e^{xy^2} + x)\mathbf{k}$ over the surface S will be equal to the integral of $\nabla \cdot \mathbf{F} = y + 2y = 3y$ over the region D bounded by S . We will integrate using the area in the xz -plane bounded by $z = 0$ and $z = 1 - x^2$ as the base. The y height at any point (x, z) will be $2 - z$. Thus the integral of $\text{div } \mathbf{F}$ over D is

$$\begin{aligned} \int_{-1}^1 \int_0^{1-x^2} \int_0^{2-z} 3y \, dy \, dz \, dx &= \int_{-1}^1 \int_0^{1-x^2} \left[\frac{3}{2} y^2 \right]_0^{2-z} \, dz \, dx = \int_{-1}^1 \int_0^{1-x^2} \frac{3}{2} (2-z)^2 \, dz \, dx \\ &= \int_{-1}^1 \left[-\frac{1}{2} (2-z)^3 \right]_0^{1-x^2} \, dx = \int_{-1}^1 4 - \frac{1}{2} (x^2 + 1)^3 \, dx = \left(\frac{7}{2} x - \frac{1}{3} x^3 - \frac{3}{10} x^5 - \frac{1}{14} x^7 \right) \Big|_{-1}^1 = \frac{184}{35} \end{aligned}$$

24. The field $\mathbf{F} = (x\mathbf{i} + y\mathbf{j} + z\mathbf{k}) / (x^2 + y^2 + z^2)^{3/2}$ is discussed in Example 5 in Section 16.8, where we show that the flux of \mathbf{F} across any closed surface enclosing the origin is 4π . Note that the divergence of \mathbf{F} is not defined at the origin, so we need an argument like that shown in Example 5.

25. (a) $\text{div}(\mathbf{gF}) = \nabla \cdot \mathbf{gF} = \frac{\partial}{\partial x}(gM) + \frac{\partial}{\partial y}(gN) + \frac{\partial}{\partial z}(gP) = \left(g \frac{\partial M}{\partial x} + M \frac{\partial g}{\partial x} \right) + \left(g \frac{\partial N}{\partial y} + N \frac{\partial g}{\partial y} \right) + \left(g \frac{\partial P}{\partial z} + P \frac{\partial g}{\partial z} \right)$
 $= \left(M \frac{\partial g}{\partial x} + N \frac{\partial g}{\partial y} + P \frac{\partial g}{\partial z} \right) + g \left(\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y} + \frac{\partial P}{\partial z} \right) = g \nabla \cdot \mathbf{F} + \nabla g \cdot \mathbf{F}$

26. (a) Let $\mathbf{F}_1 = M_1\mathbf{i} + N_1\mathbf{j} + P_1\mathbf{k}$ and $\mathbf{F}_2 = M_2\mathbf{i} + N_2\mathbf{j} + P_2\mathbf{k}$

27. Let $\mathbf{F}_1 = M_1\mathbf{i} + N_1\mathbf{j} + P_1\mathbf{k}$ and $\mathbf{F}_2 = M_2\mathbf{i} + N_2\mathbf{j} + P_2\mathbf{k}$.

consider the \mathbf{i} -component only: $\frac{\partial}{\partial y}(M_1N_2 - N_1M_2) - \frac{\partial}{\partial z}(P_1M_2 - M_1P_2)$

$$\begin{aligned}
 &= N_2 \frac{\partial M_1}{\partial y} + M_1 \frac{\partial N_2}{\partial y} - M_2 \frac{\partial N_1}{\partial y} - N_1 \frac{\partial M_2}{\partial y} - M_2 \frac{\partial P_1}{\partial z} - P_1 \frac{\partial M_2}{\partial z} + P_2 \frac{\partial M_1}{\partial z} + M_1 \frac{\partial P_2}{\partial z} \\
 &= \left(N_2 \frac{\partial M_1}{\partial y} + P_2 \frac{\partial M_1}{\partial z} \right) - \left(N_1 \frac{\partial M_2}{\partial y} + P_1 \frac{\partial M_2}{\partial z} \right) + \left(\frac{\partial N_2}{\partial y} + \frac{\partial P_2}{\partial z} \right) M_1 - \left(\frac{\partial N_1}{\partial y} + \frac{\partial P_1}{\partial z} \right) M_2

$$= \left(M_2 \frac{\partial M_1}{\partial x} + N_2 \frac{\partial M_1}{\partial y} + P_2 \frac{\partial M_1}{\partial z} \right) - \left(M_1 \frac{\partial M_2}{\partial x} + N_1 \frac{\partial M_2}{\partial y} + P_1 \frac{\partial M_2}{\partial z} \right) + \left(\frac{\partial M_2}{\partial x} + \frac{\partial N_2}{\partial y} + \frac{\partial P_2}{\partial z} \right) M_1 - \left(\frac{\partial M_1}{\partial x} + \frac{\partial N_1}{\partial y} + \frac{\partial P_1}{\partial z} \right) M_2$$

Now, **i**-comp of $(\mathbf{F}_2 \cdot \nabla) \mathbf{F}_1 = \left(M_2 \frac{\partial}{\partial x} + N_2 \frac{\partial}{\partial y} + P_2 \frac{\partial}{\partial z} \right) M_1 = \left(M_2 \frac{\partial M_1}{\partial x} + N_2 \frac{\partial M_1}{\partial y} + P_2 \frac{\partial M_1}{\partial z} \right)$;

likewise, **i**-comp of $(\mathbf{F}_1 \cdot \nabla) \mathbf{F}_2 = \left(M_1 \frac{\partial M_2}{\partial x} + N_1 \frac{\partial M_2}{\partial y} + P_1 \frac{\partial M_2}{\partial z} \right)$;

i comp of $(\nabla \cdot \mathbf{F}_2) \mathbf{F}_1 = \left(\frac{\partial M_2}{\partial x} + \frac{\partial N_2}{\partial y} + \frac{\partial P_2}{\partial z} \right) M_1$ and **i**-comp of $(\nabla \cdot \mathbf{F}_1) \mathbf{F}_2 = \left(\frac{\partial M_1}{\partial x} + \frac{\partial N_1}{\partial y} + \frac{\partial P_1}{\partial z} \right) M_2$.

Similar results hold for the **j** and **k** components of $\nabla \times (\mathbf{F}_1 \times \mathbf{F}_2)$. In summary, since the corresponding components are equal, we have the result $\nabla \times (\mathbf{F}_1 \times \mathbf{F}_2) = (\mathbf{F}_2 \cdot \nabla) \mathbf{F}_1 - (\mathbf{F}_1 \cdot \nabla) \mathbf{F}_2 + (\nabla \cdot \mathbf{F}_2) \mathbf{F}_1 - (\nabla \cdot \mathbf{F}_1) \mathbf{F}_2$

(b) Here again we consider only the **i**-component of each expression. Thus, the **i**-comp of $\nabla (\mathbf{F}_1 \cdot \mathbf{F}_2)$

$$= \frac{\partial}{\partial x} (M_1 M_2 + N_1 N_2 + P_1 P_2) = \left(M_1 \frac{\partial M_2}{\partial x} + M_2 \frac{\partial M_1}{\partial x} + N_1 \frac{\partial N_2}{\partial x} + N_2 \frac{\partial N_1}{\partial x} + P_1 \frac{\partial P_2}{\partial x} + P_2 \frac{\partial P_1}{\partial x} \right)$$

i-comp of $(\mathbf{F}_1 \cdot \nabla) \mathbf{F}_2 = \left(M_1 \frac{\partial M_2}{\partial x} + N_1 \frac{\partial M_2}{\partial y} + P_1 \frac{\partial M_2}{\partial z} \right)$,

i-comp of $(\mathbf{F}_2 \cdot \nabla) \mathbf{F}_1 = \left(M_2 \frac{\partial M_1}{\partial x} + N_2 \frac{\partial M_1}{\partial y} + P_2 \frac{\partial M_1}{\partial z} \right)$,

i-comp of $\mathbf{F}_1 \times (\nabla \times \mathbf{F}_2) = N_1 \left(\frac{\partial N_2}{\partial x} - \frac{\partial M_2}{\partial y} \right) - P_1 \left(\frac{\partial M_2}{\partial z} - \frac{\partial P_2}{\partial x} \right)$, and

i-comp of $\mathbf{F}_2 \times (\nabla \times \mathbf{F}_1) = N_2 \left(\frac{\partial N_1}{\partial x} - \frac{\partial M_1}{\partial y} \right) - P_2 \left(\frac{\partial M_1}{\partial z} - \frac{\partial P_1}{\partial x} \right)$.

Since corresponding components are equal, we see that

$$\nabla (\mathbf{F}_1 \cdot \mathbf{F}_2) = (\mathbf{F}_1 \cdot \nabla) \mathbf{F}_2 + (\mathbf{F}_2 \cdot \nabla) \mathbf{F}_1 + \mathbf{F}_1 \times (\nabla \times \mathbf{F}_2) + \mathbf{F}_2 \times (\nabla \times \mathbf{F}_1), \text{ as claimed.}$$

28. (a) From the Divergence Theorem, $\iint_S \nabla f \cdot \mathbf{n} d\sigma = \iiint_D \nabla \cdot \nabla f dV = \iiint_D (\nabla^2 f) dV = \iiint_D 0 dV = 0$

(b) From the Divergence Theorem, $\iint_S f \nabla f \cdot \mathbf{n} d\sigma = \iiint_D \nabla \cdot f \nabla f dV$. Now,

$$\begin{aligned} f \nabla f &= \left(f \frac{\partial f}{\partial x} \right) \mathbf{i} + \left(f \frac{\partial f}{\partial y} \right) \mathbf{j} + \left(f \frac{\partial f}{\partial z} \right) \mathbf{k} \Rightarrow \nabla \cdot f \nabla f = \left[f \frac{\partial^2 f}{\partial x^2} + \left(\frac{\partial f}{\partial x} \right)^2 \right] + \left[f \frac{\partial^2 f}{\partial y^2} + \left(\frac{\partial f}{\partial y} \right)^2 \right] + \left[f \frac{\partial^2 f}{\partial z^2} + \left(\frac{\partial f}{\partial z} \right)^2 \right] \\ &= f \nabla^2 f + |\nabla f|^2 = 0 + |\nabla f|^2 \text{ since } f \text{ is harmonic} \Rightarrow \iint_S f \nabla f \cdot \mathbf{n} d\sigma = \iiint_D |\nabla f|^2 dV, \text{ as claimed.} \end{aligned}$$

29. $\iint_S f \nabla g \cdot \mathbf{n} d\sigma = \iiint_D \nabla \cdot f \nabla g dV = \iiint_D \nabla \cdot \left(f \frac{\partial g}{\partial x} \mathbf{i} + f \frac{\partial g}{\partial y} \mathbf{j} + f \frac{\partial g}{\partial z} \mathbf{k} \right) dV$

$$= \iiint_D \left(f \frac{\partial^2 g}{\partial x^2} + \frac{\partial f}{\partial x} \frac{\partial g}{\partial x} + f \frac{\partial^2 g}{\partial y^2} + \frac{\partial f}{\partial y} \frac{\partial g}{\partial y} + f \frac{\partial^2 g}{\partial z^2} + \frac{\partial f}{\partial z} \frac{\partial g}{\partial z} \right) dV$$

$$= \iiint_D \left[f \left(\frac{\partial^2 g}{\partial x^2} + \frac{\partial^2 g}{\partial y^2} + \frac{\partial^2 g}{\partial z^2} \right) + \left(\frac{\partial f}{\partial x} \frac{\partial g}{\partial x} + \frac{\partial f}{\partial y} \frac{\partial g}{\partial y} + \frac{\partial f}{\partial z} \frac{\partial g}{\partial z} \right) \right] dV = \iiint_D \left(f \nabla^2 g + \nabla f \cdot \nabla g \right) dV$$

30. By Exercise 29, $\iint_S f \nabla g \cdot \mathbf{n} \, d\sigma = \iiint_D (f \nabla^2 g + \nabla f \cdot \nabla g) \, dV$ and by interchanging the roles of f and g ,

$$\iint_S g \nabla f \cdot \mathbf{n} \, d\sigma = \iiint_D (g \nabla^2 f + \nabla g \cdot \nabla f) \, dV. \text{ Subtracting the second equation from the first yields:}$$

$$\iint_S (f \nabla g - g \nabla f) \cdot \mathbf{n} \, d\sigma = \iiint_D (f \nabla^2 g - g \nabla^2 f) \, dV \text{ since } \nabla f \cdot \nabla g = \nabla g \cdot \nabla f.$$

31. (a) The integral $\iiint_D p(t, x, y, z) \, dV$ represents the mass of the fluid at any time t . The equation says that the instantaneous rate of change of mass is flux of the fluid through the surface S enclosing the region D : the mass decreases if the flux is outward (so the fluid flows out of D), and increases if the flow is inward (interpreting \mathbf{n} as the outward pointing unit normal to the surface).

(b) $\iiint_D \frac{\partial p}{\partial t} \, dV = \frac{d}{dt} \iiint_D p \, dV = - \iint_S p \mathbf{v} \cdot \mathbf{n} \, d\sigma = - \iiint_D \nabla \cdot p \mathbf{v} \, dV \Rightarrow \frac{\partial p}{\partial t} = - \nabla \cdot p \mathbf{v}$

Since the law is to hold for all regions D , $\nabla \cdot p \mathbf{v} + \frac{\partial p}{\partial t} = 0$, as claimed

32. (a) ∇T points in the direction of maximum change of the temperature, so if the solid is heating up at the point the temperature is greater in a region surrounding the point $\Rightarrow \nabla T$ points away from the point $\Rightarrow -\nabla T$ points toward the point $\Rightarrow -\nabla T$ points in the direction the heat flows.

(b) Assuming the Law of Conservation of Mass (Exercise 31) with $-k \nabla T = p \mathbf{v}$ and $c \rho T = p$, we have

$$\frac{d}{dt} \iiint_D c \rho T \, dV = - \iint_S -k \nabla T \cdot \mathbf{n} \, d\sigma \Rightarrow \text{the continuity equation, } \nabla \cdot (-k \nabla T) + \frac{\partial}{\partial t} (c \rho T) = 0$$

$$\Rightarrow c \rho \frac{\partial T}{\partial t} = - \nabla \cdot (-k \nabla T) = k \nabla^2 T \Rightarrow \frac{\partial T}{\partial t} = \frac{k}{c \rho} \nabla^2 T = K \nabla^2 T, \text{ as claimed}$$

(b) $\mathbf{F}(x, y, z) = z\mathbf{i} + y\mathbf{k}$ is $\mathbf{0}$ only on the line $x = t, y = 0, z = 0$ and $\text{curl } \mathbf{F}(x, y, z) = \mathbf{i} + \mathbf{j}$ is never $\mathbf{0}$.

(c) $\mathbf{F}(x, y, z) = z\mathbf{i}$ is $\mathbf{0}$ only when $z = 0$ (the xy -plane) and $\text{curl } \mathbf{F}(x, y, z) = \mathbf{j}$ is never $\mathbf{0}$.
- $\mathbf{F} = yz^2\mathbf{i} + xz^2\mathbf{j} + 2xyz\mathbf{k}$ and $\mathbf{n} = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\sqrt{x^2 + y^2 + z^2}} = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{R}$, so \mathbf{F} is parallel to \mathbf{n} when $yz = \frac{cx^2}{R}, xz = \frac{cy}{R}$,
and $2xyz = \frac{cz}{R} \Rightarrow \frac{yz^2}{x} = \frac{xz^2}{y} = 2xy \Rightarrow y^2 = x^2 \Rightarrow y = \pm x$ and $z^2 = \pm \frac{c}{R} = 2x^2 \Rightarrow z = \pm \sqrt{2}x$. Also,
 $x^2 + y^2 + z^2 = R^2 \Rightarrow x^2 + x^2 + 2x^2 = R^2 \Rightarrow 4x^2 = R^2 \Rightarrow x = \pm \frac{R}{2}$. Thus the points are: $\left(\frac{R}{2}, \frac{R}{2}, \frac{\sqrt{2}R}{2}\right)$,

$$\left(\frac{R}{2}, \frac{R}{2}, -\frac{\sqrt{2}R}{2}\right), \left(-\frac{R}{2}, -\frac{R}{2}, \frac{\sqrt{2}R}{2}\right), \left(-\frac{R}{2}, -\frac{R}{2}, -\frac{\sqrt{2}R}{2}\right), \left(\frac{R}{2}, -\frac{R}{2}, \frac{\sqrt{2}R}{2}\right), \left(\frac{R}{2}, -\frac{R}{2}, -\frac{\sqrt{2}R}{2}\right),$$

$$\left(-\frac{R}{2}, \frac{R}{2}, \frac{\sqrt{2}R}{2}\right), \left(-\frac{R}{2}, \frac{R}{2}, -\frac{\sqrt{2}R}{2}\right)$$

7. Set up the coordinate system so that $(a, b, c) = (0, R, 0) \Rightarrow \delta(x, y, z) = \sqrt{x^2 + (y-R)^2 + z^2}$
 $= \sqrt{x^2 + y^2 + z^2 - 2Ry + R^2} = \sqrt{2R^2 - 2Ry}$; let $f(x, y, z) = x^2 + y^2 + z^2 - R^2$ and $\mathbf{p} = \mathbf{i}$
 $\Rightarrow \nabla f = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k} \Rightarrow |\nabla f| = 2\sqrt{x^2 + y^2 + z^2} = 2R \Rightarrow d\sigma = \frac{|\nabla f|}{|\nabla f \cdot \mathbf{i}|} dz dy = \frac{2R}{2x} dz dy$
 $\Rightarrow \text{Mass} = \iint_S \delta(x, y, z) d\sigma = \iint_{R_{yz}} \sqrt{2R^2 - 2Ry} \left(\frac{R}{x}\right) dz dy = R \iint_{R_{yz}} \frac{\sqrt{2R^2 - 2Ry}}{\sqrt{R^2 - y^2 - z^2}} dz dy$
 $= 4R \int_{-R}^R \int_0^{\sqrt{R^2 - y^2}} \frac{\sqrt{2R^2 - 2Ry}}{\sqrt{R^2 - y^2 - z^2}} dz dy = 4R \int_{-R}^R \sqrt{2R^2 - 2Ry} \sin^{-1} \left(\frac{z}{\sqrt{R^2 - y^2}} \right) \Big|_0^{\sqrt{R^2 - y^2}} dy$
 $= 2\pi R \int_{-R}^R \sqrt{2R^2 - 2Ry} dy = 2\pi R \left(\frac{-1}{3R}\right) (2R^2 - 2Ry)^{3/2} \Big|_{-R}^R = \frac{16\pi R^3}{3}$

8. $\mathbf{r}(r, \theta) = (r \cos \theta)\mathbf{i} + (r \sin \theta)\mathbf{j} + \theta\mathbf{k}, 0 \leq r \leq 1, 0 \leq \theta \leq 2\pi \Rightarrow \mathbf{r}_r \times \mathbf{r}_\theta = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \cos \theta & \sin \theta & 0 \\ -r \sin \theta & r \cos \theta & 1 \end{vmatrix}$
 $= (\sin \theta)\mathbf{i} - (\cos \theta)\mathbf{j} + r\mathbf{k} \Rightarrow |\mathbf{r}_r \times \mathbf{r}_\theta| = \sqrt{1 + r^2}; \delta = 2\sqrt{x^2 + y^2} = 2\sqrt{r^2 \cos^2 \theta + r^2 \sin^2 \theta} = 2r$
 $\Rightarrow \text{Mass} = \iint_S \delta(x, y, z) d\sigma = \int_0^{2\pi} \int_0^1 2r\sqrt{1+r^2} dr d\theta = \int_0^{2\pi} \left[\frac{2}{3}(1+r^2)^{3/2} \right]_0^1 d\theta = \int_0^{2\pi} \frac{2}{3}(2\sqrt{2} - 1) d\theta$
 $= \frac{4\pi}{3}(2\sqrt{2} - 1)$

9. $M = x^2 + 4xy$ and $N = -6y \Rightarrow \frac{\partial M}{\partial x} = 2x + 4y$ and $\frac{\partial N}{\partial y} = -6 \Rightarrow \text{Flux} = \int_0^b \int_0^a (2x + 4y - 6) dx dy$
 $= \int_0^b (a^2 + 4ay - 6a) dy = a^2b + 2ab^2 - 6ab$. We want to minimize
 $f(a, b) = a^2b + 2ab^2 - 6ab = ab(a + 2b - 6)$. Thus, $f_a(a, b) = 2ab + 2b^2 - 6b = 0$ and
 $f_b(a, b) = a^2 + 4ab - 6a = 0 \Rightarrow b(2a + 2b - 6) = 0 \Rightarrow b = 0$ or $b = -a + 3$. Now $b = 0 \Rightarrow a^2 - 6a = 0 \Rightarrow a = 0$
or $a = 6 \Rightarrow (0, 0)$ and $(6, 0)$ are critical points. On the other hand, $b = -a + 3 \Rightarrow a^2 + 4a(-a + 3) - 6a = 0$
 $\Rightarrow -3a^2 + 6a = 0 \Rightarrow a = 0$ or $a = 2 \Rightarrow (0, 3)$ and $(2, 1)$ are also critical points. The flux at $(0, 0) = 0$, the flux at
 $(6, 0) = 0$, the flux at $(0, 3) = 0$ and the flux at $(2, 1) = -4$. Therefore, the flux is minimized at $(2, 1)$ with
value -4 .

10. A plane through the origin has equation $ax + by + cz = 0$. Consider first the case when $c \neq 0$. Assume the plane is given by $z = ax + by$ and let $f(x, y, z) = x^2 + y^2 + z^2 = 4$. Let C denote the circle of intersection of the plane with the sphere. By Stokes' Theorem, $\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n} d\sigma$, where \mathbf{n} is a unit normal to the plane. Let

$\mathbf{r}(x, y) = x\mathbf{i} + y\mathbf{j} + (ax + by)\mathbf{k}$ be a parametrization of the surface. Then $\mathbf{r}_x \times \mathbf{r}_y = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 0 & a \\ 0 & 1 & b \end{vmatrix} = -a\mathbf{i} - b\mathbf{j} + \mathbf{k}$

$\Rightarrow d\sigma = |\mathbf{r}_x \times \mathbf{r}_y| dx dy = \sqrt{a^2 + b^2 + 1} dx dy$. Also, $\nabla \times \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ z & x & y \end{vmatrix} = \mathbf{i} + \mathbf{j} + \mathbf{k}$ and $\mathbf{n} = \frac{a\mathbf{i} + b\mathbf{j} - \mathbf{k}}{\sqrt{a^2 + b^2 + 1}}$

$\Rightarrow \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n} d\sigma = \iint_{R_{xy}} \frac{a+b-1}{\sqrt{a^2 + b^2 + 1}} \sqrt{a^2 + b^2 + 1} dx dy = \iint_{R_{xy}} (a+b-1) dx dy = (a+b-1) \iint_{R_{xy}} dx dy$. Now

$x^2 + y^2 + (ax + by)^2 = 4 \Rightarrow \left(\frac{a^2+1}{4}\right)x^2 + \left(\frac{b^2+1}{4}\right)y^2 + \left(\frac{ab}{2}\right)xy = 1 \Rightarrow$ the region R_{xy} is the interior of the ellipse

$Ax^2 + Bxy + Cy^2 = 1$ in the xy -plane, where $A = \frac{a^2+1}{4}$, $B = \frac{ab}{2}$, and $C = \frac{b^2+1}{4}$. The area of the ellipse is

$\frac{2\pi}{\sqrt{4AC-B^2}} = \frac{4\pi}{\sqrt{a^2+b^2+1}} \Rightarrow \oint_C \mathbf{F} \cdot d\mathbf{r} = h(a, b) = \frac{4\pi(a+b-1)}{\sqrt{a^2+b^2+1}}$. Thus we optimize $H(a, b) = \frac{(a+b-1)^2}{a^2+b^2+1}$:

$\frac{\partial H}{\partial a} = \frac{2(a+b-1)(b^2+1+a-ab)}{(a^2+b^2+1)^2} = 0$ and $\frac{\partial H}{\partial b} = \frac{2(a+b-1)(a^2+1+b-ab)}{(a^2+b^2+1)^2} = 0 \Rightarrow a+b-1=0$, or $b^2+1+a-ab=0$ and

$a^2+1+b-ab=0 \Rightarrow a+b-1=0$, or $a^2-b^2+(b-a)=0 \Rightarrow a+b-1=0$, or $(a-b)(a+b-1)=0$

$\Rightarrow a+b-1=0$ or $a=b$. The critical values $a+b-1=0$ give a saddle. If $a=b$, then $0 = b^2+1+a-ab$

$\Rightarrow a^2+1+a-a^2=0 \Rightarrow a=-1 \Rightarrow b=-1$. Thus, the point $(a, b) = (-1, -1)$ gives a local extremum for

$\oint_C \mathbf{F} \cdot d\mathbf{r} \Rightarrow z = -x - y \Rightarrow x + y + z = 0$ is the desired plane, if $c \neq 0$.

Note: Since $h(-1, -1)$ is negative, the circulation about \mathbf{n} is clockwise, so $-\mathbf{n}$ is the correct pointing normal for the counterclockwise circulation. Thus $\iint_S \nabla \times \mathbf{F} \cdot (-\mathbf{n}) d\sigma$ actually gives the maximum circulation.

If $c = 0$, one can see that the corresponding problem is equivalent to the calculation above when $b = 0$, which does not lead to a local extreme.

11. (a) Partition the string into small pieces. Let $\Delta_i s$ be the length of the i^{th} piece. Let (x_i, y_i) be a point in the i^{th} piece. The work done by gravity in moving the i^{th} piece to the x -axis is approximately

$W_i = (gx_i y_i \Delta_i s) y_i$ where $x_i y_i \Delta_i s$ is approximately the mass of the i^{th} piece. The total work done by

gravity in moving the string to the x -axis is $\sum_i W_i = \sum_i gx_i y_i^2 \Delta_i s \Rightarrow \text{Work} = \int_C gxy^2 ds$

(b) $\text{Work} = \int_C gxy^2 ds = \int_0^{\pi/2} g(2 \cos t)(4 \sin^2 t) \sqrt{4 \sin^2 t + 4 \cos^2 t} dt = 16g \int_0^{\pi/2} \cos t \sin^2 t dt$
 $= \left[16g \left(\frac{\sin^3 t}{3} \right) \right]_0^{\pi/2} = \frac{16}{3} g$

(c) $\bar{x} = \frac{\int_C x(xy) ds}{\int_C xy ds}$ and $\bar{y} = \frac{\int_C y(xy) ds}{\int_C xy ds}$; the mass of the string is $\int_C xy ds$ and the weight of the string is

$g \int_C xy ds$. Therefore, the work done in moving the point mass at (\bar{x}, \bar{y}) to the x -axis is

$W = \left(g \int_C xy ds \right) \bar{y} = g \int_C xy^2 ds = \frac{16}{3} g$.

12. (a) Partition the sheet into small pieces. Let $\Delta_i\sigma$ be the area of the i^{th} piece and select a point (x_i, y_i, z_i) in the i^{th} piece. The mass of the i^{th} piece is approximately $x_i y_i \Delta_i\sigma$. The work done by gravity in moving the i^{th} piece to the xy -plane is approximately $(gx_i y_i \Delta_i\sigma)z_i = gx_i y_i z_i \Delta_i\sigma \Rightarrow \text{Work} = \iint_S gxyz \, d\sigma$.

$$\begin{aligned} \text{(b)} \quad \iint_S gxyz \, d\sigma &= g \iint_{R_{xy}} xy(1-x-y)\sqrt{1+(-1)^2+(-1)^2} \, dA = \sqrt{3}g \int_0^1 \int_0^{1-x} (xy - x^2y - xy^2) \, dy \, dx \\ &= \sqrt{3}g \int_0^1 \left[\frac{1}{2}xy^2 - \frac{1}{2}x^2y^2 - \frac{1}{3}xy^3 \right]_0^{1-x} dx = \sqrt{3}g \int_0^1 \left[\frac{1}{6}x - \frac{1}{2}x^2 + \frac{1}{2}x^3 - \frac{1}{6}x^4 \right] dx \\ &= \sqrt{3}g \left[\frac{1}{12}x^2 - \frac{1}{6}x^3 + \frac{1}{6}x^4 - \frac{1}{30}x^5 \right]_0^1 = \sqrt{3}g \left(\frac{1}{12} - \frac{1}{30} \right) = \frac{\sqrt{3}g}{20} \end{aligned}$$

- (c) The center of mass of the sheet is the point $(\bar{x}, \bar{y}, \bar{z})$ where $\bar{z} = \frac{M_{xy}}{M}$ with $M_{xy} = \iint_S xyz \, d\sigma$ and

$$M = \iint_S xy \, d\sigma. \text{ The work done by gravity in moving the point mass at } (\bar{x}, \bar{y}, \bar{z}) \text{ to the } xy\text{-plane is}$$

$$gM\bar{z} = gM \left(\frac{M_{xy}}{M} \right) = gM_{xy} = \iint_S gxyz \, d\sigma = \frac{\sqrt{3}g}{20}.$$

13. (a) Partition the sphere $x^2 + y^2 + (z-2)^2 = 1$ into small pieces. Let $\Delta_i\sigma$ be the surface area of the i^{th} piece and let (x_i, y_i, z_i) be a point on the i^{th} piece. The force due to pressure on the i^{th} piece is approximately $w(4-z_i)\Delta_i\sigma$. The total force on S is approximately $\sum_i w(4-z_i)\Delta_i\sigma$. This gives the actual force to be

$$\iint_S w(4-z) \, d\sigma.$$

- (b) The upward buoyant force is a result of the \mathbf{k} -component of the force on the ball due to liquid pressure. The force on the ball at (x, y, z) is $w(4-z)(-\mathbf{n}) = w(z-4)\mathbf{n}$, where \mathbf{n} is the outer unit normal at (x, y, z) . Hence the \mathbf{k} -component of this force is $w(z-4)\mathbf{n} \cdot \mathbf{k} = w(z-4)\mathbf{k} \cdot \mathbf{n}$. The (magnitude of the) buoyant force on the ball is obtained by adding up all these \mathbf{k} -components to obtain $\iint_S w(z-4)\mathbf{k} \cdot \mathbf{n} \, d\sigma$.

- (c) The Divergence Theorem says $\iint_S w(z-4)\mathbf{k} \cdot \mathbf{n} \, d\sigma = \iiint_D \text{div}(w(z-4)\mathbf{k}) \, dV = \iiint_D w \, dV$, where D is

$$x^2 + y^2 + (z-2)^2 \leq 1 \Rightarrow \iint_S w(z-4)\mathbf{k} \cdot \mathbf{n} \, d\sigma = w \iiint_D 1 \, dV = \frac{4}{3}\pi w, \text{ the weight of the fluid if it were to occupy the region } D.$$

14. The surface S is $z = \sqrt{x^2 + y^2}$ from $z = 1$ to $z = 2$. Partition S into small pieces and let $\Delta_i\sigma$ be the area of the i^{th} piece. Let (x_i, y_i, z_i) be a point on the i^{th} piece. Then the magnitude of the force on the i^{th} piece due to liquid pressure is approximately $F_i = w(2-z_i)\Delta_i\sigma \Rightarrow$ the total force on S is approximately

$$\begin{aligned} \sum_i F_i &= \sum w(2-z_i)\Delta_i\sigma \Rightarrow \text{the actual force is } \iint_S w(2-z) \, d\sigma = \iint_{R_{xy}} w \left(2 - \sqrt{x^2 + y^2} \right) \sqrt{1 + \frac{x^2}{x^2+y^2} + \frac{y^2}{x^2+y^2}} \, dA \\ &= \iint_{R_{xy}} \sqrt{2}w \left(2 - \sqrt{x^2 + y^2} \right) \, dA = \int_0^{2\pi} \int_1^2 \sqrt{2}w(2-r)r \, dr \, d\theta = \int_0^{2\pi} \sqrt{2}w \left[r^2 - \frac{1}{3}r^3 \right]_1^2 \, d\theta = \int_0^{2\pi} \frac{2\sqrt{2}w}{3} \, d\theta = \frac{4\sqrt{2}\pi w}{3} \end{aligned}$$

15. Assume that S is a surface to which Stokes' Theorem applies. Then $\oint_C \mathbf{E} \cdot d\mathbf{r} = \iint_S (\nabla \times \mathbf{E}) \cdot \mathbf{n} \, d\sigma$
 $= \iint_S \left(-\frac{\partial \mathbf{B}}{\partial t}\right) \cdot \mathbf{n} \, d\sigma = -\frac{\partial}{\partial t} \iint_S \mathbf{B} \cdot \mathbf{n} \, d\sigma$. Thus the voltage around a loop equals the negative of the rate of change of magnetic flux through the loop.

16. According to Gauss's Law, $\iint_S \mathbf{F} \cdot \mathbf{n} \, d\sigma = 4\pi GmM$ for any surface enclosing the origin. But if $\mathbf{F} = \nabla \times \mathbf{H}$ then the integral over such a closed surface would have to be 0 by the Divergence Theorem since $\text{div } \mathbf{F} = 0$.

17. $\oint_C f \nabla g \cdot d\mathbf{r} = \iint_S \nabla \times (f \nabla g) \cdot \mathbf{n} \, d\sigma$ (Stokes' Theorem)
 $= \iint_S (f \nabla \times \nabla g + \nabla f \times \nabla g) \cdot \mathbf{n} \, d\sigma$ (Section 16.8, Exercise 19b)
 $= \iint_S [(f)(\mathbf{0}) + \nabla f \times \nabla g] \cdot \mathbf{n} \, d\sigma$ (Section 16.7, Equation 8)
 $= \iint_S (\nabla f \times \nabla g) \cdot \mathbf{n} \, d\sigma$

18. $\nabla \times \mathbf{F}_1 = \nabla \times \mathbf{F}_2 \Rightarrow \nabla \times (\mathbf{F}_2 - \mathbf{F}_1) = \mathbf{0} \Rightarrow \mathbf{F}_2 - \mathbf{F}_1$ is conservative $\Rightarrow \mathbf{F}_2 - \mathbf{F}_1 = \nabla f$; also, $\nabla \cdot \mathbf{F}_1 = \nabla \cdot \mathbf{F}_2 \Rightarrow \nabla \cdot (\mathbf{F}_2 - \mathbf{F}_1) = 0 \Rightarrow \nabla^2 f = 0$ (so f is harmonic). Finally, on the surface S , $\nabla f \cdot \mathbf{n} = (\mathbf{F}_2 - \mathbf{F}_1) \cdot \mathbf{n} = \mathbf{F}_2 \cdot \mathbf{n} - \mathbf{F}_1 \cdot \mathbf{n} = 0$. Now, $\nabla \cdot (f \nabla f) = \nabla f \cdot \nabla f + f \nabla^2 f$ so the Divergence Theorem gives
 $\iiint_D |\nabla f|^2 \, dV + \iiint_D f \nabla^2 f \, dV = \iiint_D \nabla \cdot (f \nabla f) \, dV = \iint_S f \nabla f \cdot \mathbf{n} \, d\sigma = 0$, and since $\nabla^2 f = 0$ we have
 $\iiint_D |\nabla f|^2 \, dV + 0 = 0 \Rightarrow \iiint_D |\mathbf{F}_2 - \mathbf{F}_1|^2 \, dV = 0 = \iint_S f \nabla f \cdot \mathbf{n} \, d\sigma = 0$, as claimed.

19. False; let $\mathbf{F} = y\mathbf{i} + x\mathbf{j} \neq \mathbf{0} \Rightarrow \nabla \cdot \mathbf{F} = \frac{\partial}{\partial x}(y) + \frac{\partial}{\partial y}(x) = 0$ and $\nabla \times \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x & y & 0 \end{vmatrix} = 0\mathbf{i} + 0\mathbf{j} + 0\mathbf{k} = \mathbf{0}$

20. $|\mathbf{r}_u \times \mathbf{r}_v|^2 = |\mathbf{r}_u|^2 |\mathbf{r}_v|^2 \sin^2 \theta = |\mathbf{r}_u|^2 |\mathbf{r}_v|^2 (1 - \cos^2 \theta) = |\mathbf{r}_u|^2 |\mathbf{r}_v|^2 - |\mathbf{r}_u|^2 |\mathbf{r}_v|^2 \cos^2 \theta = |\mathbf{r}_u|^2 |\mathbf{r}_v|^2 - (\mathbf{r}_u \cdot \mathbf{r}_v)^2$
 $\Rightarrow |\mathbf{r}_u \times \mathbf{r}_v|^2 = EG - F^2 \Rightarrow d\sigma = |\mathbf{r}_u \times \mathbf{r}_v| \, du \, dv = \sqrt{EG - F^2} \, du \, dv$

21. $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k} \Rightarrow \nabla \cdot \mathbf{r} = 1 + 1 + 1 = 3 \Rightarrow \iiint_D \nabla \cdot \mathbf{r} \, dV = 3 \iiint_D dV = 3V \Rightarrow V = \frac{1}{3} \iiint_D \nabla \cdot \mathbf{r} \, dV = \frac{1}{3} \iint_S \mathbf{r} \cdot \mathbf{n} \, d\sigma$, by the Divergence Theorem

61. Let r_1 and r_2 be real roots with $r_1 \neq r_2$. If $e^{r_1 x}$ and $e^{r_2 x}$ are linearly independent, then $e^{r_1 x}$ is not a constant multiple of $e^{r_2 x}$ (and vice versa). Assume that $e^{r_1 x}$ is a constant multiple of $e^{r_2 x}$, then for some nonzero constant c , $e^{r_1 x} = c e^{r_2 x} \Rightarrow \frac{e^{r_1 x}}{e^{r_2 x}} = c \Rightarrow e^{r_1 x - r_2 x} = c \Rightarrow e^{(r_1 - r_2)x} = c$. Since $r_1 \neq r_2$, c is not a constant, which is a contradiction. Thus $e^{r_1 x}$ and $e^{r_2 x}$ are linearly independent.

62. Let r be the only repeated real root. If e^{rx} and $x e^{rx}$ are linearly independent, then e^{rx} is not a constant multiple of $x e^{rx}$ (and vice versa). Assume that $x e^{rx}$ is a constant multiple of e^{rx} , then for some nonzero constant c , $x e^{rx} = c e^{rx} \Rightarrow x e^{rx} - c e^{rx} = 0 \Rightarrow e^{rx}(x - c) = 0 \Rightarrow e^{rx} = 0$ or $x - c = 0$. Since $e^{rx} \neq 0 \Rightarrow x = c$, thus c is not a constant, which is a contradiction. Thus e^{rx} and $x e^{rx}$ are linearly independent.

63. Let $r_1 = \alpha + i\beta$ and $r_2 = \alpha - i\beta$ be complex roots. If $e^{\alpha x} \cos \beta x$ and $e^{\alpha x} \sin \beta x$ are linearly independent, then $e^{\alpha x} \cos \beta x$ is not a constant multiple of $e^{\alpha x} \sin \beta x$ (and vice versa). Assume that $e^{\alpha x} \cos \beta x$ is a constant multiple of $e^{\alpha x} \sin \beta x$, then for some nonzero constant c , $e^{\alpha x} \cos \beta x = c e^{\alpha x} \sin \beta x \Rightarrow e^{\alpha x} \cos \beta x - c e^{\alpha x} \sin \beta x = 0 \Rightarrow e^{\alpha x} (\cos \beta x - c \sin \beta x) = 0 \Rightarrow e^{\alpha x} = 0$ or $\cos \beta x - c \sin \beta x = 0$. Since $e^{\alpha x} \neq 0 \Rightarrow c = \cot \beta x$, thus c is not a constant, which is a contradiction. Thus $e^{\alpha x} \cos \beta x$ and $e^{\alpha x} \sin \beta x$ are linearly independent.

Then $P(x)y_3'' + Q(x)y_3' + R(x)y_3 = P(x)(y_1'' + y_2'') + Q(x)(y_1' + y_2') + R(x)(y_1 + y_2) = P(x)y_1'' + P(x)y_2'' + Q(x)y_1' + Q(x)y_2' + R(x)y_1 + R(x)y_2 = P(x)y_1'' + Q(x)y_1' + R(x)y_1 + P(x)y_2'' + Q(x)y_2' + R(x)y_2 = 0 + 0 = 0$. Let $y_4 = y_1 - y_2 \Rightarrow y_4' = y_1' - y_2' \Rightarrow y_4'' = y_1'' - y_2''$. Then $P(x)y_4'' + Q(x)y_4' + R(x)y_4 = P(x)(y_1'' - y_2'') + Q(x)(y_1' - y_2') + R(x)(y_1 - y_2) = P(x)y_1'' - P(x)y_2'' + Q(x)y_1' - Q(x)y_2' + R(x)y_1 - R(x)y_2 = P(x)y_1'' + Q(x)y_1' + R(x)y_1 - [P(x)y_2'' + Q(x)y_2' + R(x)y_2] = 0 - 0 = 0$. Thus y_3 and y_4 are both solutions. Suppose that y_3 is a constant multiple of y_4 , then there is a nonzero constant c such that $y_3 = c y_4$. $\Rightarrow y_1 + y_2 = c(y_1 - y_2)$. If we solve this equation for y_1 we obtain $y_1 = -\frac{1+c}{1-c}y_2 \Rightarrow y_1$ is a constant multiple of y_2 , which is a contradiction since y_1 and y_2 are linearly independent $\Rightarrow y_1 + y_2$ and $y_1 - y_2$ are linearly independent.
65. (a) $y'' + 4y = 0, y(0) = 0, y(\pi) = 1 \Rightarrow r^2 + 4 = 0 \Rightarrow r = 0 \pm 2i \Rightarrow y = e^{0 \cdot x}(c_1 \cos 2x + c_2 \sin 2x) \Rightarrow y = c_1 \cos 2x + c_2 \sin 2x; y(0) = 0 \Rightarrow c_1 = 0$, and $y(\pi) = 1 \Rightarrow c_1 = 1 \Rightarrow$ no solution
- (b) $y'' + 4y = 0, y(0) = 0, y(\pi) = 0 \Rightarrow r^2 + 4 = 0 \Rightarrow r = 0 \pm 2i \Rightarrow y = e^{0 \cdot x}(c_1 \cos 2x + c_2 \sin 2x) \Rightarrow y = c_1 \cos 2x + c_2 \sin 2x; y(0) = 0 \Rightarrow c_1 = 0$, and $y(\pi) = 0 \Rightarrow c_1 = 0 \Rightarrow c_1 = 0, c_2$ can be any real number $\Rightarrow y = c_2 \sin 2x$
66. Let a, b , and c be positive constants, then $r = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} = -\frac{b}{2a} \pm \frac{\sqrt{b^2 - 4ac}}{2a}$. There are three cases to consider.
- Case I: Two distinct real solutions $\Rightarrow b^2 - 4ac > 0$. Since a, b , and c are positive $\Rightarrow 4ac > 0$ and $b > 0 \Rightarrow -4ac < 0$ and $-b < 0 \Rightarrow 0 < b^2 - 4ac < b^2 \Rightarrow 0 < \sqrt{b^2 - 4ac} < b \Rightarrow -b + \sqrt{b^2 - 4ac} < 0$ and $-b - \sqrt{b^2 - 4ac} < 0$. Since $2a > 0 \Rightarrow \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} < 0$. Thus $r_1 = \frac{-b + \sqrt{b^2 - 4ac}}{2a} < 0$ and $r_2 = \frac{-b - \sqrt{b^2 - 4ac}}{2a} < 0$. The general solution to the differential equation is $y = c_1 e^{r_1 x} + c_2 e^{r_2 x}$. $\lim_{x \rightarrow \infty} (c_1 e^{r_1 x} + c_2 e^{r_2 x}) = 0 + 0 = 0$.
- Case II: One repeated real solution $\Rightarrow b^2 - 4ac = 0$. Since a, b , and c are positive $\Rightarrow 2a > 0$ and $-b < 0 \Rightarrow r = -\frac{b}{2a} < 0$. The general solution to the differential equation is $y = c_1 e^{rx} + c_2 x e^{rx}$. Since $r < 0 \Rightarrow -r > 0$. $\lim_{x \rightarrow \infty} (c_1 e^{rx} + c_2 x e^{rx}) = \lim_{x \rightarrow \infty} (c_1 e^{rx} + \frac{c_2 x}{e^{-rx}}) = \lim_{x \rightarrow \infty} (c_1 e^{rx}) + \lim_{x \rightarrow \infty} (\frac{c_2 x}{e^{-rx}}) = 0 + \lim_{x \rightarrow \infty} (\frac{c_2}{-r e^{-rx}}) = 0$, using L'Hopital's rule to evaluate the limit of the second expression.
- Case III: Two complex, nonreal solutions $\Rightarrow b^2 - 4ac < 0 \Rightarrow 4ac - b^2 > 0$. Since a, b , and c are positive $\Rightarrow 2a > 0$ and $-b < 0 \Rightarrow -\frac{b}{2a} < 0$. The roots are $r_1 = -\frac{b}{2a} + \frac{\sqrt{4ac - b^2}}{2a}i$ and $r_2 = -\frac{b}{2a} - \frac{\sqrt{4ac - b^2}}{2a}i$, thus $\alpha = -\frac{b}{2a} < 0$ and $\beta = \frac{\sqrt{4ac - b^2}}{2a} > 0$. The general solution to the differential equation is $y = e^{\alpha x}(c_1 \cos \beta x + c_2 \sin \beta x)$. Since $-1 \leq \sin \beta x \leq 1$ and $-1 \leq \cos \beta x \leq 1 \Rightarrow -|c_2| \leq c_2 \sin \beta x \leq |c_2|$ and $-|c_1| \leq c_1 \cos \beta x \leq |c_1| \Rightarrow -|c_1| - |c_2| \leq c_1 \cos \beta x + c_2 \sin \beta x \leq |c_1| + |c_2| \Rightarrow e^{\alpha x}(-|c_1| - |c_2|) \leq e^{\alpha x}(c_1 \cos \beta x + c_2 \sin \beta x) \leq e^{\alpha x}(|c_1| + |c_2|) \lim_{x \rightarrow \infty} [e^{\alpha x}(-|c_1| - |c_2|)] = (-|c_1| - |c_2|) \lim_{x \rightarrow \infty} e^{\alpha x} = 0$ and $\lim_{x \rightarrow \infty} [e^{\alpha x}(|c_1| + |c_2|)] = (|c_1| + |c_2|) \lim_{x \rightarrow \infty} e^{\alpha x} = 0$ thus by the Sandwich theorem, $\lim_{x \rightarrow \infty} [e^{\alpha x}(c_1 \cos \beta x + c_2 \sin \beta x)] = 0$.

Note that in each coefficient equation, the coefficient of c_1 can be given by $\frac{(-1)^{n-1}}{(n-1)!}$. To find the coefficient of c_0 , note that:

$$-\frac{1}{2} = -\left(1 - \frac{1}{2}\right) = -\left(\frac{1!}{1!} - \frac{1}{2!}\right), \frac{1}{3} = \frac{1}{2} - \frac{1}{6} = \frac{1}{2!} - \frac{1}{3!}, -\frac{1}{8} = -\left(\frac{1}{6} - \frac{1}{24}\right) = -\left(\frac{1}{3!} - \frac{1}{4!}\right), \frac{1}{30} = \frac{1}{24} - \frac{1}{120} = \frac{1}{4!} - \frac{1}{5!}$$

so the coefficient of c_0 can be given by $(-1)^{n-1}\left[\frac{1}{(n-1)!} - \frac{1}{n!}\right] = \frac{(-1)^{n-1}}{(n-1)!} + \frac{(-1)^n}{n!}$. Thus $c_n = \left[\frac{(-1)^{n-1}}{(n-1)!} + \frac{(-1)^n}{n!}\right]c_0 + \frac{(-1)^{n-1}}{(n-1)!}c_1$

Note that if we use the techniques of Section 17.2, our solution is $y = a e^x + b e^{2x} = a \sum_{n=0}^{\infty} \frac{x^n}{n!} + b \sum_{n=0}^{\infty} \frac{(2x)^n}{n!}$. Thus

$$(a + b) + (a + 2b)x + \dots = c_0 + c_1x + \left(\frac{3}{2}c_1 - c_0\right)x^2 + \left(\frac{7}{6}c_1 - c_0\right)x^3 + \left(\frac{5}{8}c_1 - \frac{7}{12}c_0\right)x^4 + \left(\frac{31}{120}c_1 - \frac{1}{4}c_0\right)x^5 + \dots$$

If the series are equivalent, then take $c_0 = a + b$ and $c_1 = a + 2b$ and substitute in our first series for c_0 and c_1 to obtain

$$\begin{aligned} y &= (a + b) + (a + 2b)x + \left(\frac{3}{2}(a + 2b) - (a + b)\right)x^2 + \left(\frac{7}{6}(a + 2b) - (a + b)\right)x^3 + \left(\frac{5}{8}(a + 2b) - \frac{7}{12}(a + b)\right)x^4 \\ &\quad + \left(\frac{31}{120}(a + 2b) - \frac{1}{4}(a + b)\right)x^5 + \left(\frac{7}{80}(a + 2b) - \frac{31}{360}(a + b)\right)x^6 + \dots \\ &= (a + b) + (a + 2b)x + \left(\frac{1}{2}a + 2b\right)x^2 + \left(\frac{1}{6}a + \frac{4}{3}b\right)x^3 + \left(\frac{1}{24}a + \frac{2}{3}b\right)x^4 + \left(\frac{1}{120}a + \frac{4}{15}b\right)x^5 + \left(\frac{1}{720}a + \frac{4}{45}b\right)x^6 + \dots \\ &= a + ax + \frac{1}{2}ax^2 + \frac{1}{6}ax^3 + \frac{1}{24}ax^4 + \frac{1}{120}ax^5 + \frac{1}{720}ax^6 + \dots + b + 2bx + 2bx^2 + \frac{4}{3}bx^3 + \frac{2}{3}bx^4 + \frac{4}{15}bx^5 + \frac{4}{45}bx^6 + \dots \\ &= a \left(1 + x + \frac{1}{2!}x^2 + \frac{1}{3!}x^3 + \frac{1}{4!}x^4 + \frac{1}{5!}x^5 + \frac{1}{6!}x^6 + \dots \right) + b \left(1 + 2x + \frac{(2x)^2}{2!} + \frac{(2x)^3}{3!} + \frac{(2x)^4}{4!} + \frac{(2x)^5}{5!} + \frac{(2x)^6}{6!} + \dots \right) \\ &= a \sum_{n=0}^{\infty} \frac{x^n}{n!} + b \sum_{n=0}^{\infty} \frac{(2x)^n}{n!} = a e^x + b e^{2x} \end{aligned}$$
