#### **Engineering Economy**

### [4] Effective Interest Rates

- Suppose that you deposited \$1,000 in a savings account at the beginning of a year where the <u>annual</u> interest rate is 18% (<u>not realistic!!</u>)
- [1] What would be the future worth?
- [2] What would be the future worth if <u>the interest is</u> <u>compounded monthly</u>?

[1] When compounding <u>yearly</u> and with an interest rate of 18% per year

Apparently, the end-of-year amount = 1,000(1+18%)= \$1,180

[2] When compounding <u>monthly</u>

- For each month, we have an interest rate of 0.18/12 = 1.5%
- The future worth F = P(1+i)<sup>12</sup> = 1,000(1+0.015)<sup>12</sup> = \$1,195.61
- Thus, the <u>annual effective interest rate</u> = 19.561%

\$1,195.61

#### Compounding and Effective Interest Rates

Compounding with monthly and annual interest rates

Compounding with monthly and semi-annual interest rates

#### **Compounding and Effective Interest Rates**

# compounding with monthly, semiannual, and annual interest rates

#### Compounding and Effective Interest Rates

#### compounding with quarterly and annual interest rates

#### **Necessary Definitions**

- Time period (t): the period over which the interest is expressed (1% per month or 18% per year)
- <u>Compounding period (CP)</u>: the <u>shortest</u> time unit over which interest is charged or earned or <u>COMPUTED</u> (18% per year compounded monthly)
- <u>Compounding frequency</u>: the number of times compounding occurs within the time period (or payment period)
- Payment period (PP): frequency of the payments or receipts which is the cash flow transaction period

#### **Necessary Definitions**

\$1,195.61

- Time period = ? months
- Payment period = ? months
- Compounding period = ? month
- Compounding frequency = ?
- Interest rate per compounding period = ? %

#### Nominal and Effective Interest Rates

- <u>Nominal</u> interest rate: this is the <u>annual interest rate</u>. It does not consider any compounding
- <u>Effective</u> interest rate: the actual rate that should be considered for the payment period. It implies the compounding of the interest <u>within</u> the time period of interest

#### Calculation of the Effective Interest Rate

- r = nominal interest rate per year (<u>or per payment period</u>)
- m = number of *compounding periods* per year (<u>or per</u> <u>payment period</u>)
- i = effective interest rate per compounding period which can be viewed as the nominal interest rate per the compounding period
- i<sub>a</sub> = effective interest rate per year (<u>or per payment</u> <u>period</u>)

#### Calculation of the Effective Interest Rate

Determine the payment period [PP]

Determine the nominal interest rate per payment period [r/PP]

Determine the compounding frequency within PP [m]

#### Calculation of the Effective Interest Rate

#### Effective i<sub>a</sub> for Selected i

| TABLE 4–3                  | Effective Annua         | I Interest Rates f           | or Selected Nom             | inal Rates                 |                            |                                      |

#### TABLE 3.1 Various Interest Statements and Their Interpretations

#### (2)(3)(1)Nominal or Interest Compounding **Rate Statement** Effective Interest Period 15% per year compounded monthly Nominal Monthly Effective 15% per year Yearly Effective 15% per year compounded monthly 20% per year compounded quarterly Nominal 2% per month compounded weekly 2% per month 2% per month compounded monthly Effective 6% per quarter Effective 2% per month compounded daily 1% per week compounded continuously 17

#### TABLE 3.2 Specific Examples of Interest Statements and Interpretations

- Find the amount after <u>10 years</u> for the given cash flow diagram if the interest rate is <u>12% per year</u> compounded <u>semiannually</u>
- We need to find the effective interest rate per year (for the payment period). Thus, r = 12% for a period of 1 year that includes 2 compounding periods m = 2 → i<sub>a</sub> = (1+0.12/2)<sup>2</sup> 1 = 12.36%
- F = 1,000(F/P,12.36%,10)+3,000(F/P,12.36,6) +1,500(F/P,12.36%,4) = \$11,634

 A second way to solve this question is as follows:
 F = 1,000(F/P,6%,20)+3,000(F/P,6%,12)+1,500(F/P,6%, 8) = \$11,634

- For the past 7 years, an engineer was paying every <u>6 months</u> for the software maintenance. What is the equivalent amount after the last payment. Assume an interest rate of 20% per year and that the interest is compounded quarterly
- We have: a payment period of ½ year through which the nominal interest rate is r = 10% and we have within this ½ year 2 compounding periods (m=2)
- The effective interest rate per 6 months (½ year)

$$i_a = (1+0.1/2)^2 - 1 = 10.25\%$$

F =A(F/A,i, n) = 500(F/A,10.25%,14) = \$14,244

- Find the effective interest rate per <u>quarter</u> at a nominal rate of 8% compounded (a) quarterly, (b) monthly, (c) weekly, and (d) daily
- Quarterly compounded

r = 8%/4=2%, m = 1, 
$$i_q$$
 = (1+0.02/1)<sup>1</sup> – 1 = 2%

Monthly compounded

r = 2%, m = 3, 
$$i_q = (1+0.02/3)^3 - 1 = 2.013\%$$

Weekly compounded

r = 2%, m = 13,  $i_q = (1+0.02/13)^{13} - 1 = 2.0186\%$ 

- Daily compounded
- r = 2%, m = 91.25,  $i_q = (1+0.02/91.25)^{91.25} 1$ =2.0199%

#### **Continuous Compounding**

- When we have a large number of compounding periods (m), <u>the interest rate per compounding period (r/m)</u> becomes very small
- If m approaches infinity, r/m approaches zero
- In this case, we have a <u>continuous compounding</u> that can be expressed using the following formula:

$$i_{a} = e^{r} - 1$$

As an example, the effective <u>annual</u> interest rate for a nominal interest rate of 12% compounded <u>continuously</u> is i<sub>a</sub> = e<sup>0.12</sup> – 1 = 12.7497%

#### **Continuous Compounding - Example**

- Find the effective interest rate per <u>quarter</u> at a nominal rate of 8% compounded continuously
- Continuous compounding r = 8%/4 = 2% (because r is for a quarter)  $i_a = e^{0.02} - 1 = 2.0201\%$

#### Summary of the Past Example

| 8%         | 8%         | 8%          | 8%                 | 8%           |
|------------|------------|-------------|--------------------|--------------|
| compounded | compounded | compounded  | compounded         | compounded   |
| quarterly  | monthly    | weekly      | <mark>daily</mark> | continuously |
| Payments   | Payments   | Payments    | Payments           | Payments     |
| occur      | occur      | occur       | occur              | occur        |
| quarterly  | quarterly  | quarterly   | quarterly          | quarterly    |
| 2.000% per | 2.013% per | 2.0186% per | 2.0199% per        | 2.0201% per  |
| quarter    | quarter    | quarter     | quarter            | quarter      |

- Suppose you make \$500 monthly deposits to a savings account that pays interest at a rate of 10% compounded quarterly
- Compute the balance at the end of 10 years

- The quarterly interest rate = 10%/4 = 2.5%
- Since the payments are made monthly, then we need to find out the effective monthly interest rate (i<sub>m</sub>) that yields the same quarterly compounding

• 
$$(1+i_m)^3 - 1 = i_q \rightarrow i_m = 0.826\%$$

 Since the payments are made on monthly basis, then for 10 years we have 120 periods of 0.826% interest rate (for each month) and monthly payments of \$500

- A municipality intends to construct a water supply project after 6 years from now
- In order to make available the entire cost of the project at the beginning of project implementation, it was decided to invest in a savings account for 6 years starting from now
- The municipality is to deposit now \$750,000. In addition, it will deposit \$120,000 by the end of the *second* year, \$230,000 by the end of the *third* year and \$70,000 by the end of the *fifth* year

- The investment plan goes as follows: in the <u>first</u> year interest is compounded *continuously*, in the <u>second</u> year it is compounded *daily*, in the <u>third</u> year it is compounded *weekly*, in the <u>fourth</u> year it is compounded *monthly*, in the <u>fifth</u> year it is compounded *quarterly*, and in the <u>last year</u> it is compounded *semi-annually*
- If the nominal interest rate is 12%, answer the following questions:
  - Calculate the <u>interest amount</u> by the end of each year
  - What is the <u>total future worth</u> of this investment by the end of the sixth year?

| 0                          | \$750,000                              |                                     |   |  |   |   |

- An investment plan works as follows: you deposit \$1,200 now and every six months for three years. In the first year, the interest is compounded monthly, in the second year it is compounded weekly, while in the third year it is compounded daily. The nominal interest rate is 10% per year
- For this scenario, compute the <u>future worth</u>

$$F = 1,200 + 1,200 (FIP, i_3,1) + 1,200 (FIP, i_3,2) + [1,200 (FIP, i_2,1) + 1,200 (FIP, i_2,2)] [(FIP, i_3,2)] + [1,200 (FIP, i_1,1)] [(FIP, i_2,2)] [(FIP, i_3,2)] + [1,200 (FIP, i_1,1)] [(FIP, i_2,2)] [(FIP, i_3,2)] F = $9,806.67$$
